Purpose
- Show the current whole-cell pipeline
- around the shared state object.

Required content
- shared state
- expression and degradation
- growth and checkpoints
- fate/division routing

Accessibility
- A layered pipeline where biochemical,
- expression, growth, and routing components
- all read and write the same shared state.

Validation
- The diagram must match the component ordering used by the didactic whole-cell applications.

The source block remains the authoritative specification.
The rendered asset is a compact visual summary.
