This is an overloaded member function, provided for convenience. It differs from the above function only in what argument(s) it accepts.
Creates a new QCPTextElement instance and sets default values. The initial text is empty (setText).

17.672.2.2 QCPTextElement() [2/5]

```
QCPTextElement::QCPTextElement (
            QCustomPlot * parentPlot,
            const QString & text )
```

This is an overloaded member function, provided for convenience. It differs from the above function only in what argument(s) it accepts.
Creates a new QCPTextElement instance and sets default values.
The initial text is set to *text*.

17.672.2.3 QCPTextElement() [3/5]

```
QCPTextElement::QCPTextElement (
            QCustomPlot * parentPlot,
            const QString & text,
            double pointSize )
```

This is an overloaded member function, provided for convenience. It differs from the above function only in what argument(s) it accepts.
Creates a new QCPTextElement instance and sets default values.
The initial text is set to *text* with *pointSize*.

17.672.2.4 QCPTextElement() [4/5]

```
QCPTextElement::QCPTextElement (
            QCustomPlot * parentPlot,
            const QString & text,
            const QString & fontFamily,
            double pointSize )
```

This is an overloaded member function, provided for convenience. It differs from the above function only in what argument(s) it accepts.
Creates a new QCPTextElement instance and sets default values.
The initial text is set to *text* with *pointSize* and the specified *fontFamily*.

17.672.2.5 QCPTextElement() [5/5]

```
QCPTextElement::QCPTextElement (
            QCustomPlot * parentPlot,
            const QString & text,
            const QFont & font )
```

This is an overloaded member function, provided for convenience. It differs from the above function only in what argument(s) it accepts.
Creates a new QCPTextElement instance and sets default values.
The initial text is set to *text* with the specified *font*.

17.672.3 Member Function Documentation

17.672.3.1 applyDefaultAntialiasingHint()

```
void QCPTextElement::applyDefaultAntialiasingHint (
            QCPPainter * painter ) const  [protected], [virtual]
```

Reimplemented from QCPLayoutElement.

17.672.3.2 clicked

```
void QCPTextElement::clicked (
            QMouseEvent * event )  [signal]
```

This signal is emitted when the text element is clicked.

See also

doubleClicked, selectTest

17.672.3.3 deselectEvent()

```
void QCPTextElement::deselectEvent (
            bool * selectionStateChanged )  [protected], [virtual]
```

Reimplemented from QCPLayerable.

17.672.3.4 doubleClicked

```
void QCPTextElement::doubleClicked (
            QMouseEvent * event )  [signal]
```

This signal is emitted when the text element is double clicked.

See also

clicked, selectTest

17.672.3.5 draw()

```
void QCPTextElement::draw (
            QCPPainter * painter )  [protected], [virtual]
```

Reimplemented from QCPLayoutElement.

17.672.3.6 maximumOuterSizeHint()

```
QSize QCPTextElement::maximumOuterSizeHint ( ) const  [protected], [virtual]
```

Returns the suggested maximum size this layout element (the outerRect) may be expanded to, if no manual maximum size is set.
if a maximum size (setMaximumSize) was not set manually, parent layouts use the returned size (usually indirectly through QCPLayout::getFinalMaximumOuterSize) to determine the maximum allowed size of this layout element.
A manual maximum size is considered set if it is smaller than Qt's QWIDGETSIZE_MAX.
The default implementation simply returns QWIDGETSIZE_MAX for both width and height, implying no suggested maximum size. Reimplementations may use their detailed knowledge about the layout element's content to provide size hints.
Reimplemented from QCPLayoutElement.

17.672.3.7 minimumOuterSizeHint()

```
QSize QCPTextElement::minimumOuterSizeHint ( ) const  [protected], [virtual]
```

Returns the suggested minimum size this layout element (the outerRect) may be compressed to, if no manual minimum size is set.
if a minimum size (setMinimumSize) was not set manually, parent layouts use the returned size (usually indirectly through QCPLayout::getFinalMinimumOuterSize) to determine the minimum allowed size of this layout element.
A manual minimum size is considered set if it is non-zero.
The default implementation simply returns the sum of the horizontal margins for the width and the sum of the vertical margins for the height. Reimplementations may use their detailed knowledge about the layout element's content to provide size hints.
Reimplemented from QCPLayoutElement.

17.672.3.8 mouseDoubleClickEvent()

```
void QCPTextElement::mouseDoubleClickEvent (
            QMouseEvent * event,
            const QVariant & details )  [virtual]
```

Emits the doubleClicked signal.
\seebaseclassmethod
Reimplemented from QCPLayerable.

17.672.3.9 mousePressEvent()

```
void QCPTextElement::mousePressEvent (
            QMouseEvent * event,
            const QVariant & details )  [virtual]
```

Accepts the mouse event in order to emit the according click signal in the mouseReleaseEvent.
\seebaseclassmethod
Reimplemented from QCPLayerable.

17.672.3.10 mouseReleaseEvent()

```
void QCPTextElement::mouseReleaseEvent (
            QMouseEvent * event,
            const QPointF & startPos )  [virtual]
```

Emits the clicked signal if the cursor hasn't moved by more than a few pixels since the mousePressEvent.
\seebaseclassmethod
Reimplemented from QCPLayerable.

17.672.3.11 selectEvent()

```
void QCPTextElement::selectEvent (
            QMouseEvent * event,
            bool additive,
            const QVariant & details,
            bool * selectionStateChanged )  [protected], [virtual]
```

Reimplemented from QCPLayerable.

17.672.3.12 selectionChanged

```
void QCPTextElement::selectionChanged (
            bool selected )  [signal]
```

This signal is emitted when the selection state has changed to *selected*, either by user interaction or by a direct call to setSelected.

See also

setSelected, setSelectable

17.672.3.13 selectTest()

```
double QCPTextElement::selectTest (
            const QPointF & pos,
            bool onlySelectable,
            QVariant * details = nullptr ) const  [virtual]
```

Returns 0.99*selectionTolerance (see QCustomPlot::setSelectionTolerance) when *pos* is within the bounding box of the text element's text. Note that this bounding box is updated in the draw call.
If *pos* is outside the text's bounding box or if *onlySelectable* is true and this text element is not selectable (setSelectable), returns -1.
\seebaseclassmethod
Reimplemented from QCPLayoutElement.

17.672.3.14 setFont()

```
void QCPTextElement::setFont (
            const QFont & font )
```

Sets the *font* of the text.

See also

setTextColor, setSelectedFont

17.672.3.15 setSelectable()

```
void QCPTextElement::setSelectable (
            bool selectable )
```

Sets whether the user may select this text element.
Note that even when *selectable* is set to `false`, the selection state may be changed programmatically via setSelected.

17.672.3.16 setSelected()

```
void QCPTextElement::setSelected (
            bool selected )
```

Sets the selection state of this text element to *selected*. If the selection has changed, selectionChanged is emitted.
Note that this function can change the selection state independently of the current setSelectable state.

17.672.3.17 setSelectedFont()

```
void QCPTextElement::setSelectedFont (
            const QFont & font )
```

Sets the *font* of the text that will be used if the text element is selected (setSelected).

See also

setFont

17.672.3.18 setSelectedTextColor()

```
void QCPTextElement::setSelectedTextColor (
            const QColor & color )
```

Sets the *color* of the text that will be used if the text element is selected (setSelected).

See also

setTextColor

17.672.3.19 setText()

```
void QCPTextElement::setText (
            const QString & text )
```

Sets the text that will be displayed to *text*. Multiple lines can be created by insertion of "\n".

See also

setFont, setTextColor, setTextFlags

17.672.3.20 setTextColor()

```
void QCPTextElement::setTextColor (
            const QColor & color )
```

Sets the *color* of the text.

See also

setFont, setSelectedTextColor

17.672.3.21 setTextFlags()

```
void QCPTextElement::setTextFlags (
            int flags )
```

Sets options for text alignment and wrapping behaviour. *flags* is a bitwise OR-combination of `Qt::AlignmentFlag` and `Qt::TextFlag` enums.
Possible enums are:

- Qt::AlignLeft
- Qt::AlignRight
- Qt::AlignHCenter
- Qt::AlignJustify
- Qt::AlignTop
- Qt::AlignBottom
- Qt::AlignVCenter
- Qt::AlignCenter
- Qt::TextDontClip
- Qt::TextSingleLine
- Qt::TextExpandTabs
- Qt::TextShowMnemonic
- Qt::TextWordWrap
- Qt::TextIncludeTrailingSpaces

17.673.1 Detailed Description

Represents two doubles as a mathematical 2D vector.
This class acts as a replacement for QVector2D with the advantage of double precision instead of single, and some convenience methods tailored for the QCustomPlot library.

17.673.2 Constructor & Destructor Documentation

17.673.2.1 QCPVector2D() [1/4]

```
QCPVector2D::QCPVector2D ( )
```

Creates a QCPVector2D object and initializes the x and y coordinates to 0.

17.673.2.2 QCPVector2D() [2/4]

```
QCPVector2D::QCPVector2D (
            double x,
            double y )
```

Creates a QCPVector2D object and initializes the *x* and *y* coordinates with the specified values.

17.673.2.3 QCPVector2D() [3/4]

```
QCPVector2D::QCPVector2D (
            const QPoint & point )
```

Creates a QCPVector2D object and initializes the x and y coordinates respective coordinates of the specified *point*.

17.673.2.4 QCPVector2D() [4/4]

```
QCPVector2D::QCPVector2D (
            const QPointF & point )
```

Creates a QCPVector2D object and initializes the x and y coordinates respective coordinates of the specified *point*.

17.673.3 Member Function Documentation

17.673.3.1 angle()

```
double QCPVector2D::angle ( ) const  [inline]
```

Returns the angle of the vector in radians. The angle is measured between the positive x line and the vector, counter-clockwise in a mathematical coordinate system (y axis upwards positive). In screen/widget coordinates where the y axis is inverted, the angle appears clockwise.

17.673.3.2 distanceSquaredToLine() [1/2]

```
double QCPVector2D::distanceSquaredToLine (
            const QCPVector2D & start,
            const QCPVector2D & end ) const
```

This is an overloaded member function, provided for convenience. It differs from the above function only in what argument(s) it accepts.
Returns the squared shortest distance of this vector (interpreted as a point) to the finite line segment given by *start* and *end*.

See also

distanceToStraightLine

17.673.3.3 distanceSquaredToLine() [2/2]

```
double QCPVector2D::distanceSquaredToLine (
            const QLineF & line ) const
```

This is an overloaded member function, provided for convenience. It differs from the above function only in what argument(s) it accepts.
Returns the squared shortest distance of this vector (interpreted as a point) to the finite line segment given by *line*.

See also

distanceToStraightLine

17.673.3.4 distanceToStraightLine()

```
double QCPVector2D::distanceToStraightLine (
            const QCPVector2D & base,
            const QCPVector2D & direction ) const
```

Returns the shortest distance of this vector (interpreted as a point) to the infinite straight line given by a *base* point and a *direction* vector.

See also

distanceSquaredToLine

17.673.3.5 dot()

```
double QCPVector2D::dot (
            const QCPVector2D & vec ) const  [inline]
```

Returns the dot/scalar product of this vector with the specified vector *vec*.

17.673.3.6 isNull()

```
bool QCPVector2D::isNull ( ) const  [inline]
```

Returns whether this vector is null. A vector is null if `qIsNull` returns true for both x and y coordinates, i.e. if both are binary equal to 0.

17.673.3.7 length()

```
double QCPVector2D::length ( ) const  [inline]
```
Returns the length of this vector.

See also

lengthSquared

17.673.3.8 lengthSquared()

```
double QCPVector2D::lengthSquared ( ) const  [inline]
```
Returns the squared length of this vector. In some situations, e.g. when just trying to find the shortest vector of a group, this is faster than calculating length, because it avoids calculation of a square root.

See also

length

17.673.3.9 normalize()

```
void QCPVector2D::normalize ( )
```
Normalizes this vector. After this operation, the length of the vector is equal to 1.
If the vector has both entries set to zero, this method does nothing.

See also

normalized, length, lengthSquared

17.673.3.10 normalized()

```
QCPVector2D QCPVector2D::normalized ( ) const
```
Returns a normalized version of this vector. The length of the returned vector is equal to 1.
If the vector has both entries set to zero, this method returns the vector unmodified.

See also

normalize, length, lengthSquared

17.673.3.11 operator*=()

```
QCPVector2D & QCPVector2D::operator*= (
            double factor )
```
Scales this vector by the given *factor*, i.e. the x and y components are multiplied by *factor*.

17.673.3.12 operator+=()

```
QCPVector2D & QCPVector2D::operator+= (
            const QCPVector2D & vector )
```
Adds the given *vector* to this vector component-wise.

17.673.3.13 operator-=()

```
QCPVector2D & QCPVector2D::operator-= (
            const QCPVector2D & vector )
```
subtracts the given *vector* from this vector component-wise.

17.673.3.14 operator/=()

```
QCPVector2D & QCPVector2D::operator/= (
            double divisor )
```
Scales this vector by the given *divisor*, i.e. the x and y components are divided by *divisor*.

17.673.3.15 perpendicular()

```
QCPVector2D QCPVector2D::perpendicular ( ) const  [inline]
```
Returns a vector perpendicular to this vector, with the same length.

17.673.3.16 setX()

```
void QCPVector2D::setX (
            double x )  [inline]
```
Sets the x coordinate of this vector to *x*.

See also

setY

17.673.3.17 setY()

```
void QCPVector2D::setY (
            double y )  [inline]
```
Sets the y coordinate of this vector to *y*.

See also

setX

17.673.3.18 toPoint()

```
QPoint QCPVector2D::toPoint ( ) const  [inline]
```
Returns a QPoint which has the x and y coordinates of this vector, truncating any floating point information.

See also

toPointF

17.673.3.19 toPointF()

```
QPointF QCPVector2D::toPointF ( ) const  [inline]
```
Returns a QPointF which has the x and y coordinates of this vector.

See also

toPoint

17.673.4 Friends And Related Symbol Documentation

17.673.4.1 operator<<()

```
QDebug operator<< (
            QDebug d,
            const QCPVector2D & vec )  [related]
```
Prints *vec* in a human readable format to the qDebug output.
The documentation for this class was generated from the following files:

- applications/gui/genesys/qcustomplot.h
- applications/gui/genesys/qcustomplot.cpp

17.674 QCustomPlot Class Reference

The central class of the library. This is the QWidget which displays the plot and interacts with the user.
Inheritance diagram for QCustomPlot:

17.674.1 Detailed Description

The central class of the library. This is the QWidget which displays the plot and interacts with the user.
For tutorials on how to use QCustomPlot, see the website
http://www.qcustomplot.com/

17.674.2 Member Enumeration Documentation

17.674.2.1 LayerInsertMode

`enum QCustomPlot::LayerInsertMode`
Defines how a layer should be inserted relative to an other layer.

See also

addLayer, moveLayer

Enumerator

limBelow	Layer is inserted below other layer.
limAbove	Layer is inserted above other layer.

17.674.2.2 RefreshPriority

`enum QCustomPlot::RefreshPriority`
Defines with what timing the QCustomPlot surface is refreshed after a replot.

See also

replot

Enumerator

rpImmediateRefresh	Replots immediately and repaints the widget immediately by calling QWidget::repaint() after the replot.
rpQueuedRefresh	Replots immediately, but queues the widget repaint, by calling QWidget::update() after the replot. This way multiple redundant widget repaints can be avoided.
rpRefreshHint	Whether to use immediate or queued refresh depends on whether the plotting hint QCP::phImmediateRefresh is set, see setPlottingHints.
rpQueuedReplot	Queues the entire replot for the next event loop iteration. This way multiple redundant replots can be avoided. The actual replot is then done with rpRefreshHint priority.

17.674.3 Constructor & Destructor Documentation

17.674.3.1 QCustomPlot()

```
QCustomPlot::QCustomPlot (
            QWidget * parent = nullptr )  [explicit]
```
Constructs a QCustomPlot and sets reasonable default values.

17.674.4 Member Function Documentation

17.674.4.1 addGraph()

```
QCPGraph * QCustomPlot::addGraph (
            QCPAxis * keyAxis = nullptr,
            QCPAxis * valueAxis = nullptr )
```
Creates a new graph inside the plot. If *keyAxis* and *valueAxis* are left unspecified (0), the bottom (xAxis) is used as key and the left (yAxis) is used as value axis. If specified, *keyAxis* and *valueAxis* must reside in this QCustomPlot.
keyAxis will be used as key axis (typically "x") and *valueAxis* as value axis (typically "y") for the graph.
Returns a pointer to the newly created graph, or `nullptr` if adding the graph failed.

See also

graph, graphCount, removeGraph, clearGraphs

17.674.4.2 addLayer()

```
bool QCustomPlot::addLayer (
            const QString & name,
            QCPLayer * otherLayer = nullptr,
            QCustomPlot::LayerInsertMode insertMode = limAbove )
```

Adds a new layer to this QCustomPlot instance. The new layer will have the name *name*, which must be unique. Depending on *insertMode*, it is positioned either below or above *otherLayer*.
Returns true on success, i.e. if there is no other layer named *name* and *otherLayer* is a valid layer inside this QCustomPlot.
If *otherLayer* is 0, the highest layer in the QCustomPlot will be used.
For an explanation of what layers are in QCustomPlot, see the documentation of QCPLayer.

See also

layer, moveLayer, removeLayer

17.674.4.3 afterLayout

```
void QCustomPlot::afterLayout ( )  [signal]
```

This signal is emitted immediately after the layout step has been completed, which occurs right before drawing the plot. This is typically during a call to replot, and in such cases this signal is emitted in between the signals beforeReplot and afterReplot. Unlike those signals however, this signal is also emitted during off-screen painting, such as when calling toPixmap or savePdf.
The layout step queries all layouts and layout elements in the plot for their proposed size and arranges the objects accordingly as preparation for the subsequent drawing step. Through this signal, you have the opportunity to update certain things in your plot that depend crucially on the exact dimensions/positioning of layout elements such as axes and axis rects.

Warning

However, changing any parameters of this QCustomPlot instance which would normally affect the layouting (e.g. axis range order of magnitudes, tick label sizes, etc.) will not issue a second run of the layout step. It will propagate directly to the draw step and may cause graphical inconsistencies such as overlapping objects, if sizes or positions have changed.

See also

updateLayout, beforeReplot, afterReplot

17.674.4.4 afterReplot

```
void QCustomPlot::afterReplot ( )  [signal]
```

This signal is emitted immediately after a replot has taken place (caused by a call to the slot replot).
It is safe to mutually connect the replot slot with this signal on two QCustomPlots to make them replot synchronously, it won't cause an infinite recursion.

See also

replot, beforeReplot, afterLayout

17.674.4.5 axisClick

```
void QCustomPlot::axisClick (
            QCPAxis * axis,
            QCPAxis::SelectablePart part,
            QMouseEvent * event )  [signal]
```

This signal is emitted when an axis is clicked.
event is the mouse event that caused the click, *axis* is the axis that received the click and *part* indicates the part of the axis that was clicked.

See also

axisDoubleClick

17.674.4.6 axisDoubleClick

```
void QCustomPlot::axisDoubleClick (
            QCPAxis * axis,
            QCPAxis::SelectablePart part,
            QMouseEvent * event )  [signal]
```

This signal is emitted when an axis is double clicked.
event is the mouse event that caused the click, *axis* is the axis that received the click and *part* indicates the part of the axis that was clicked.

See also

axisClick

17.674.4.7 axisRect()

```
QCPAxisRect * QCustomPlot::axisRect (
            int index = 0 ) const
```

Returns the axis rect with *index*.
Initially, only one axis rect (with index 0) exists in the plot. If multiple axis rects were added, all of them may be accessed with this function in a linear fashion (even when they are nested in a layout hierarchy or inside other axis rects via QCPAxisRect::insetLayout).
The order of the axis rects is given by the fill order of the QCPLayout that is holding them. For example, if the axis rects are in the top level grid layout (accessible via QCustomPlot::plotLayout), they are ordered from left to right, top to bottom, if the layout's default setFillOrder of foColumnsFirst wasn't changed.
If you want to access axis rects by their row and column index, use the layout interface. For example, use QCPLayoutGrid::element of the top level grid layout, and `qobject_cast` the returned layout element to QCPAxisRect. (See also thelayoutsystem.)

See also

axisRectCount, axisRects, QCPLayoutGrid::setFillOrder

17.674.4.8 axisRectAt()

```
QCPAxisRect * QCustomPlot::axisRectAt (
            const QPointF & pos ) const
```

Returns the layout element of type QCPAxisRect at pixel position *pos*. This method ignores other layout elements even if they are visually in front of the axis rect (e.g. a QCPLegend). If there is no axis rect at that position, returns `nullptr`.
Only visible axis rects are used. If QCPLayoutElement::setVisible on the axis rect itself or on any of its parent elements is set to false, it will not be considered.

See also

layoutElementAt

17.674.4.9 axisRectCount()

```
int QCustomPlot::axisRectCount ( ) const
```

Returns the number of axis rects in the plot.
All axis rects can be accessed via QCustomPlot::axisRect().
Initially, only one axis rect exists in the plot.

See also

axisRect, axisRects

17.674.4.10 axisRects()

```
QList< QCPAxisRect * > QCustomPlot::axisRects ( ) const
```

Returns all axis rects in the plot.
The order of the axis rects is given by the fill order of the QCPLayout that is holding them. For example, if the axis rects are in the top level grid layout (accessible via QCustomPlot::plotLayout), they are ordered from left to right, top to bottom, if the layout's default setFillOrder of foColumnsFirst wasn't changed.

See also

axisRectCount, axisRect, QCPLayoutGrid::setFillOrder

17.674.4.11 beforeReplot

```
void QCustomPlot::beforeReplot ( )  [signal]
```

This signal is emitted immediately before a replot takes place (caused by a call to the slot replot).
It is safe to mutually connect the replot slot with this signal on two QCustomPlots to make them replot synchronously, it won't cause an infinite recursion.

See also

replot, afterReplot, afterLayout

17.674.4.12 clearGraphs()

```
int QCustomPlot::clearGraphs ( )
```

Removes all graphs from the plot and deletes them. Corresponding legend items are also removed from the default legend (QCustomPlot::legend).
Returns the number of graphs removed.

See also

removeGraph

17.674.4.13 clearItems()

```
int QCustomPlot::clearItems ( )
```

Removes all items from the plot and deletes them.
Returns the number of items removed.

See also

removeItem

17.674.4.14 clearPlottables()

```
int QCustomPlot::clearPlottables ( )
```

Removes all plottables from the plot and deletes them. Corresponding legend items are also removed from the default legend (QCustomPlot::legend).
Returns the number of plottables removed.

See also

removePlottable

17.674.4.15 currentLayer()

```
QCPLayer * QCustomPlot::currentLayer ( ) const
```

Returns the layer that is set as current layer (see setCurrentLayer).

17.674.4.16 deselectAll()

```
void QCustomPlot::deselectAll ( )
```

Deselects all layerables (plottables, items, axes, legends,...) of the QCustomPlot.
Since calling this function is not a user interaction, this does not emit the selectionChangedByUser signal. The individual selectionChanged signals are emitted though, if the objects were previously selected.

See also

setInteractions, selectedPlottables, selectedItems, selectedAxes, selectedLegends

17.674.4.17 graph() [1/2]

```
QCPGraph * QCustomPlot::graph ( ) const
```

This is an overloaded member function, provided for convenience. It differs from the above function only in what argument(s) it accepts.
Returns the last graph, that was created with addGraph. If there are no graphs in the plot, returns `nullptr`.

See also

graphCount, addGraph

17.674.4.18 graph() [2/2]

```
QCPGraph * QCustomPlot::graph (
            int index ) const
```

Returns the graph with *index*. If the index is invalid, returns `nullptr`.
There is an overloaded version of this function with no parameter which returns the last created graph, see QCustomPlot::graph()

See also

graphCount, addGraph

17.674.4.19 graphCount()

```
int QCustomPlot::graphCount ( ) const
```

Returns the number of currently existing graphs in the plot

See also

graph, addGraph

17.674.4.20 hasInvalidatedPaintBuffers()

```
bool QCustomPlot::hasInvalidatedPaintBuffers ( )  [protected]
```

This method returns whether any of the paint buffers held by this QCustomPlot instance are invalidated.
If any buffer is invalidated, a partial replot (QCPLayer::replot) is not allowed and always causes a full replot (QCustomPlot::replot) of all layers. This is the case when for example the layer order has changed, new layers were added or removed, layer modes were changed (QCPLayer::setMode), or layerables were added or removed.

See also

QCPAbstractPaintBuffer::setInvalidated

17.674.4.21 hasItem()

```
bool QCustomPlot::hasItem (
            QCPAbstractItem * item ) const
```

Returns whether this QCustomPlot contains the *item*.

See also

item

17.674.4.22 hasPlottable()

```
bool QCustomPlot::hasPlottable (
            QCPAbstractPlottable * plottable ) const
```

Returns whether this QCustomPlot instance contains the *plottable*.

17.674.4.23 item() [1/2]

```
QCPAbstractItem * QCustomPlot::item ( ) const
```

This is an overloaded member function, provided for convenience. It differs from the above function only in what argument(s) it accepts.
Returns the last item that was added to this plot. If there are no items in the plot, returns `nullptr`.

See also

itemCount

17.674.4.24 item() [2/2]

```
QCPAbstractItem * QCustomPlot::item (
            int index ) const
```

Returns the item with *index*. If the index is invalid, returns `nullptr`.
There is an overloaded version of this function with no parameter which returns the last added item, see QCustomPlot::item()

See also

itemCount

17.674.4.25 itemAt() [1/2]

```
template<class ItemType >
ItemType * QCustomPlot::itemAt (
            const QPointF & pos,
            bool onlySelectable = false ) const
```

Returns the item at the pixel position *pos*. The item type (a QCPAbstractItem subclass) that shall be taken into consideration can be specified via the template parameter. Items that only consist of single lines (e.g. QCPItemLine or QCPItemCurve) have a tolerance band around them, see setSelectionTolerance. If multiple items come into consideration, the one closest to *pos* is returned.
If *onlySelectable* is true, only items that are selectable (QCPAbstractItem::setSelectable) are considered.
If there is no item at *pos*, returns `nullptr`.

See also

plottableAt, layoutElementAt

17.674.4.26 itemAt() [2/2]

```
QCPAbstractItem * QCustomPlot::itemAt (
            const QPointF & pos,
            bool onlySelectable = false ) const
```

Returns the item at the pixel position *pos*. Since it can capture all items, the return type is the abstract base class of all items, QCPAbstractItem.
For details, and if you wish to specify a certain item type (e.g. QCPItemLine), see the template method itemAt<ItemType>()

See also

itemAt<ItemType>(), plottableAt, layoutElementAt

17.674.4.27 itemClick

```
void QCustomPlot::itemClick (
            QCPAbstractItem * item,
            QMouseEvent * event )  [signal]
```

This signal is emitted when an item is clicked.
event is the mouse event that caused the click and *item* is the item that received the click.

See also

itemDoubleClick

17.674.4.28 itemCount()

```
int QCustomPlot::itemCount ( ) const
```

Returns the number of currently existing items in the plot

See also

item

17.674.4.29 itemDoubleClick

```
void QCustomPlot::itemDoubleClick (
            QCPAbstractItem * item,
            QMouseEvent * event )  [signal]
```

This signal is emitted when an item is double clicked.
event is the mouse event that caused the click and *item* is the item that received the click.

See also

itemClick

17.674.4.30 layer() [1/2]

```
QCPLayer * QCustomPlot::layer (
            const QString & name ) const
```

Returns the layer with the specified *name*. If there is no layer with the specified name, `nullptr` is returned.
Layer names are case-sensitive.

See also

addLayer, moveLayer, removeLayer

17.674.4.31 layer() [2/2]

```
QCPLayer * QCustomPlot::layer (
            int index ) const
```

This is an overloaded member function, provided for convenience. It differs from the above function only in what argument(s) it accepts.
Returns the layer by *index*. If the index is invalid, `nullptr` is returned.

See also

addLayer, moveLayer, removeLayer

17.674.4.32 layerCount()

```
int QCustomPlot::layerCount ( ) const
```

Returns the number of currently existing layers in the plot

See also

layer, addLayer

17.674.4.33 layoutElementAt()

```
QCPLayoutElement * QCustomPlot::layoutElementAt (
            const QPointF & pos ) const
```

Returns the layout element at pixel position *pos*. If there is no element at that position, returns `nullptr`.
Only visible elements are used. If QCPLayoutElement::setVisible on the element itself or on any of its parent elements is set to false, it will not be considered.

See also

itemAt, plottableAt

17.674.4.34 legendClick

```
void QCustomPlot::legendClick (
            QCPLegend * legend,
            QCPAbstractLegendItem * item,
            QMouseEvent * event )  [signal]
```

This signal is emitted when a legend (item) is clicked.
event is the mouse event that caused the click, *legend* is the legend that received the click and *item* is the legend item that received the click. If only the legend and no item is clicked, *item* is `nullptr`. This happens for a click inside the legend padding or the space between two items.

See also

legendDoubleClick

17.674.4.35 legendDoubleClick

```
void QCustomPlot::legendDoubleClick (
            QCPLegend * legend,
            QCPAbstractLegendItem * item,
            QMouseEvent * event )  [signal]
```

This signal is emitted when a legend (item) is double clicked.
event is the mouse event that caused the click, *legend* is the legend that received the click and *item* is the legend item that received the click. If only the legend and no item is clicked, *item* is `nullptr`. This happens for a click inside the legend padding or the space between two items.

See also

legendClick

17.674.4.36 mouseDoubleClick

```
void QCustomPlot::mouseDoubleClick (
            QMouseEvent * event )  [signal]
```

This signal is emitted when the QCustomPlot receives a mouse double click event.

17.674.4.37 mouseMove

```
void QCustomPlot::mouseMove (
            QMouseEvent * event )  [signal]
```

This signal is emitted when the QCustomPlot receives a mouse move event.
It is emitted before QCustomPlot handles any other mechanism like range dragging. So a slot connected to this signal can still influence the behaviour e.g. with QCPAxisRect::setRangeDrag or QCPAxisRect::setRangeDragAxes.

Warning

> It is discouraged to change the drag-axes with QCPAxisRect::setRangeDragAxes here, because the dragging starting point was saved the moment the mouse was pressed. Thus it only has a meaning for the range drag axes that were set at that moment. If you want to change the drag axes, consider doing this in the mousePress signal instead.

17.674.4.38 mousePress

```
void QCustomPlot::mousePress (
            QMouseEvent * event )  [signal]
```

This signal is emitted when the QCustomPlot receives a mouse press event.
It is emitted before QCustomPlot handles any other mechanism like range dragging. So a slot connected to this signal can still influence the behaviour e.g. with QCPAxisRect::setRangeDrag or QCPAxisRect::setRangeDragAxes.

17.674.4.39 mouseRelease

```
void QCustomPlot::mouseRelease (
            QMouseEvent * event )  [signal]
```

This signal is emitted when the QCustomPlot receives a mouse release event.
It is emitted before QCustomPlot handles any other mechanisms like object selection. So a slot connected to this signal can still influence the behaviour e.g. with setInteractions or QCPAbstractPlottable::setSelectable.

17.674.4.40 mouseWheel

```
void QCustomPlot::mouseWheel (
            QWheelEvent * event )  [signal]
```

This signal is emitted when the QCustomPlot receives a mouse wheel event.
It is emitted before QCustomPlot handles any other mechanisms like range zooming. So a slot connected to this signal can still influence the behaviour e.g. with QCPAxisRect::setRangeZoom, QCPAxisRect::setRangeZoomAxes or QCPAxisRect::setRangeZoomFactor.

17.674.4.41 moveLayer()

```
bool QCustomPlot::moveLayer (
            QCPLayer * layer,
            QCPLayer * otherLayer,
            QCustomPlot::LayerInsertMode insertMode = limAbove )
```

Moves the specified *layer* either above or below *otherLayer*. Whether it's placed above or below is controlled with *insertMode*.
Returns true on success, i.e. when both *layer* and *otherLayer* are valid layers in the QCustomPlot.

See also

> layer, addLayer, moveLayer

17.674.4.42 plotLayout()

```
QCPLayoutGrid * QCustomPlot::plotLayout ( ) const  [inline]
```

Returns the top level layout of this QCustomPlot instance. It is a QCPLayoutGrid, initially containing just one cell with the main QCPAxisRect inside.

17.674.4.43 plottable() [1/2]

```
QCPAbstractPlottable * QCustomPlot::plottable ( )
```

This is an overloaded member function, provided for convenience. It differs from the above function only in what argument(s) it accepts.
Returns the last plottable that was added to the plot. If there are no plottables in the plot, returns `nullptr`.

See also

plottableCount

17.674.4.44 plottable() [2/2]

```
QCPAbstractPlottable * QCustomPlot::plottable (
            int index )
```

Returns the plottable with *index*. If the index is invalid, returns `nullptr`.
There is an overloaded version of this function with no parameter which returns the last added plottable, see QCustomPlot::plottable()

See also

plottableCount

17.674.4.45 plottableAt() [1/2]

```
template<class PlottableType >
PlottableType * QCustomPlot::plottableAt (
            const QPointF & pos,
            bool onlySelectable = false,
            int * dataIndex = nullptr ) const
```

Returns the plottable at the pixel position *pos*. The plottable type (a QCPAbstractPlottable subclass) that shall be taken into consideration can be specified via the template parameter.
Plottables that only consist of single lines (like graphs) have a tolerance band around them, see setSelectionTolerance. If multiple plottables come into consideration, the one closest to *pos* is returned.
If *onlySelectable* is true, only plottables that are selectable (QCPAbstractPlottable::setSelectable) are considered.
if *dataIndex* is non-null, it is set to the index of the plottable's data point that is closest to *pos*.
If there is no plottable of the specified type at *pos*, returns `nullptr`.

See also

itemAt, layoutElementAt

17.674.4.46 plottableAt() [2/2]

```
QCPAbstractPlottable * QCustomPlot::plottableAt (
            const QPointF & pos,
            bool onlySelectable = false,
            int * dataIndex = nullptr ) const
```

Returns any plottable at the pixel position *pos*. Since it can capture all plottables, the return type is the abstract base class of all plottables, QCPAbstractPlottable.
For details, and if you wish to specify a certain plottable type (e.g. QCPGraph), see the template method plottableAt<PlottableType>()

See also

plottableAt<PlottableType>(), itemAt, layoutElementAt

17.674.4.47 plottableClick

```
void QCustomPlot::plottableClick (
            QCPAbstractPlottable * plottable,
            int dataIndex,
            QMouseEvent * event )  [signal]
```

This signal is emitted when a plottable is clicked.
event is the mouse event that caused the click and *plottable* is the plottable that received the click. The parameter *dataIndex* indicates the data point that was closest to the click position.

See also

plottableDoubleClick

17.674.4.48 plottableCount()

```
int QCustomPlot::plottableCount ( ) const
```

Returns the number of currently existing plottables in the plot

See also

plottable

17.674.4.49 plottableDoubleClick

```
void QCustomPlot::plottableDoubleClick (
            QCPAbstractPlottable * plottable,
            int dataIndex,
            QMouseEvent * event )  [signal]
```

This signal is emitted when a plottable is double clicked.
event is the mouse event that caused the click and *plottable* is the plottable that received the click. The parameter *dataIndex* indicates the data point that was closest to the click position.

See also

plottableClick

17.674.4.50 removeGraph() [1/2]

```
bool QCustomPlot::removeGraph (
            int index )
```

This is an overloaded member function, provided for convenience. It differs from the above function only in what argument(s) it accepts.
Removes and deletes the graph by its *index*.

17.674.4.51 removeGraph() [2/2]

```
bool QCustomPlot::removeGraph (
            QCPGraph * graph )
```

Removes the specified *graph* from the plot and deletes it. If necessary, the corresponding legend item is also removed from the default legend (QCustomPlot::legend). If any other graphs in the plot have a channel fill set towards the removed graph, the channel fill property of those graphs is reset to `nullptr` (no channel fill).
Returns true on success.

See also

clearGraphs

17.674.4.52 removeItem() [1/2]

```
bool QCustomPlot::removeItem (
            int index )
```

This is an overloaded member function, provided for convenience. It differs from the above function only in what argument(s) it accepts.
Removes and deletes the item by its *index*.

17.674.4.53 removeItem() [2/2]

```
bool QCustomPlot::removeItem (
            QCPAbstractItem * item )
```

Removes the specified item from the plot and deletes it.
Returns true on success.

See also

clearItems

17.674.4.54 removeLayer()

```
bool QCustomPlot::removeLayer (
            QCPLayer * layer )
```

Removes the specified *layer* and returns true on success.
All layerables (e.g. plottables and items) on the removed layer will be moved to the layer below *layer*. If *layer* is the bottom layer, the layerables are moved to the layer above. In both cases, the total rendering order of all layerables in the QCustomPlot is preserved.
If *layer* is the current layer (setCurrentLayer), the layer below (or above, if bottom layer) becomes the new current layer.
It is not possible to remove the last layer of the plot.

See also

layer, addLayer, moveLayer

17.674.4.55 removePlottable() [1/2]

```
bool QCustomPlot::removePlottable (
            int index )
```

This is an overloaded member function, provided for convenience. It differs from the above function only in what argument(s) it accepts.
Removes and deletes the plottable by its *index*.

17.674.4.56 removePlottable() [2/2]

```
bool QCustomPlot::removePlottable (
            QCPAbstractPlottable * plottable )
```

Removes the specified plottable from the plot and deletes it. If necessary, the corresponding legend item is also removed from the default legend (QCustomPlot::legend).
Returns true on success.

See also

clearPlottables

17.674.4.57 replot()

```
void QCustomPlot::replot (
            QCustomPlot::RefreshPriority refreshPriority = QCustomPlot::rpRefreshHint )
```

Causes a complete replot into the internal paint buffer(s). Finally, the widget surface is refreshed with the new buffer contents. This is the method that must be called to make changes to the plot, e.g. on the axis ranges or data points of graphs, visible.
The parameter *refreshPriority* can be used to fine-tune the timing of the replot. For example if your application calls replot very quickly in succession (e.g. multiple independent functions change some aspects of the plot and each wants to make sure the change gets replotted), it is advisable to set *refreshPriority* to QCustomPlot::rpQueuedReplot. This way, the actual replotting is deferred to the next event loop iteration. Multiple successive calls of replot with this priority will only cause a single replot, avoiding redundant replots and improving performance.
Under a few circumstances, QCustomPlot causes a replot by itself. Those are resize events of the QCustomPlot widget and user interactions (object selection and range dragging/zooming).
Before the replot happens, the signal beforeReplot is emitted. After the replot, afterReplot is emitted. It is safe to mutually connect the replot slot with any of those two signals on two QCustomPlots to make them replot synchronously, it won't cause an infinite recursion.
If a layer is in mode QCPLayer::lmBuffered (QCPLayer::setMode), it is also possible to replot only that specific layer via QCPLayer::replot. See the documentation there for details.

See also

replotTime

17.674.4.58 replotTime()

```
double QCustomPlot::replotTime (
            bool average = false ) const
```

Returns the time in milliseconds that the last replot took. If *average* is set to true, an exponential moving average over the last couple of replots is returned.

See also

replot

17.674.4.59 rescaleAxes()

```
void QCustomPlot::rescaleAxes (
            bool onlyVisiblePlottables = false )
```

Rescales the axes such that all plottables (like graphs) in the plot are fully visible.
if *onlyVisiblePlottables* is set to true, only the plottables that have their visibility set to true (QCPLayerable::setVisible), will be used to rescale the axes.

See also

QCPAbstractPlottable::rescaleAxes, QCPAxis::rescale

17.674.4.60 saveBmp()

```
bool QCustomPlot::saveBmp (
            const QString & fileName,
            int width = 0,
            int height = 0,
            double scale = 1.0,
            int resolution = 96,
            QCP::ResolutionUnit resolutionUnit = QCP::ruDotsPerInch )
```

Saves a BMP image file to *fileName* on disc. The output plot will have the dimensions *width* and *height* in pixels, multiplied by *scale*. If either *width* or *height* is zero, the current width and height of the QCustomPlot widget is used instead. Line widths and texts etc. are not scaled up when larger widths/heights are used. If you want that effect, use the *scale* parameter.
For example, if you set both *width* and *height* to 100 and *scale* to 2, you will end up with an image file of size 200∗200 in which all graphical elements are scaled up by factor 2 (line widths, texts, etc.). This scaling is not done by stretching a 100∗100 image, the result will have full 200∗200 pixel resolution.

If you use a high scaling factor, it is recommended to enable antialiasing for all elements by temporarily setting QCustomPlot::setAntialiasedElements to QCP::aeAll as this allows QCustomPlot to place objects with sub-pixel accuracy.
The *resolution* will be written to the image file header and has no direct consequence for the quality or the pixel size. However, if opening the image with a tool which respects the metadata, it will be able to scale the image to match either a given size in real units of length (inch, centimeters, etc.), or the target display DPI. You can specify in which units *resolution* is given, by setting *resolutionUnit*. The *resolution* is converted to the format's expected resolution unit internally.
Returns true on success. If this function fails, most likely the BMP format isn't supported by the system, see Qt docs about QImageWriter::supportedImageFormats().
The objects of the plot will appear in the current selection state. If you don't want any selected objects to be painted in their selected look, deselect everything with deselectAll before calling this function.

Warning

> If calling this function inside the constructor of the parent of the QCustomPlot widget (i.e. the MainWindow constructor, if QCustomPlot is inside the MainWindow), always provide explicit non-zero widths and heights. If you leave *width* or *height* as 0 (default), this function uses the current width and height of the QCustomPlot widget. However, in Qt, these aren't defined yet inside the constructor, so you would get an image that has strange widths/heights.

See also

savePdf, savePng, saveJpg, saveRastered

17.674.4.61 saveJpg()

```
bool QCustomPlot::saveJpg (
              const QString & fileName,
              int width = 0,
              int height = 0,
              double scale = 1.0,
              int quality = -1,
              int resolution = 96,
              QCP::ResolutionUnit resolutionUnit = QCP::ruDotsPerInch )
```

Saves a JPEG image file to *fileName* on disc. The output plot will have the dimensions *width* and *height* in pixels, multiplied by *scale*. If either *width* or *height* is zero, the current width and height of the QCustomPlot widget is used instead. Line widths and texts etc. are not scaled up when larger widths/heights are used. If you want that effect, use the *scale* parameter.
For example, if you set both *width* and *height* to 100 and *scale* to 2, you will end up with an image file of size 200∗200 in which all graphical elements are scaled up by factor 2 (line widths, texts, etc.). This scaling is not done by stretching a 100∗100 image, the result will have full 200∗200 pixel resolution.
If you use a high scaling factor, it is recommended to enable antialiasing for all elements by temporarily setting QCustomPlot::setAntialiasedElements to QCP::aeAll as this allows QCustomPlot to place objects with sub-pixel accuracy.
image compression can be controlled with the *quality* parameter which must be between 0 and 100 or -1 to use the default setting.
The *resolution* will be written to the image file header and has no direct consequence for the quality or the pixel size. However, if opening the image with a tool which respects the metadata, it will be able to scale the image to match either a given size in real units of length (inch, centimeters, etc.), or the target display DPI. You can specify in which units *resolution* is given, by setting *resolutionUnit*. The *resolution* is converted to the format's expected resolution unit internally.
Returns true on success. If this function fails, most likely the JPEG format isn't supported by the system, see Qt docs about QImageWriter::supportedImageFormats().
The objects of the plot will appear in the current selection state. If you don't want any selected objects to be painted in their selected look, deselect everything with deselectAll before calling this function.

Warning

If calling this function inside the constructor of the parent of the QCustomPlot widget (i.e. the MainWindow constructor, if QCustomPlot is inside the MainWindow), always provide explicit non-zero widths and heights. If you leave *width* or *height* as 0 (default), this function uses the current width and height of the QCustomPlot widget. However, in Qt, these aren't defined yet inside the constructor, so you would get an image that has strange widths/heights.

See also

savePdf, savePng, saveBmp, saveRastered

17.674.4.62 savePdf()

```
bool QCustomPlot::savePdf (
            const QString & fileName,
            int width = 0,
            int height = 0,
            QCP::ExportPen exportPen = QCP::epAllowCosmetic,
            const QString & pdfCreator = QString(),
            const QString & pdfTitle = QString() )
```

Saves a PDF with the vectorized plot to the file *fileName*. The axis ratio as well as the scale of texts and lines will be derived from the specified *width* and *height*. This means, the output will look like the normal on-screen output of a QCustomPlot widget with the corresponding pixel width and height. If either *width* or *height* is zero, the exported image will have the same dimensions as the QCustomPlot widget currently has.
Setting *exportPen* to QCP::epNoCosmetic allows to disable the use of cosmetic pens when drawing to the PDF file. Cosmetic pens are pens with numerical width 0, which are always drawn as a one pixel wide line, no matter what zoom factor is set in the PDF-Viewer. For more information about cosmetic pens, see the QPainter and QPen documentation.
The objects of the plot will appear in the current selection state. If you don't want any selected objects to be painted in their selected look, deselect everything with deselectAll before calling this function.
Returns true on success.

Warning

- If you plan on editing the exported PDF file with a vector graphics editor like Inkscape, it is advised to set *exportPen* to QCP::epNoCosmetic to avoid losing those cosmetic lines (which might be quite many, because cosmetic pens are the default for e.g. axes and tick marks).
- If calling this function inside the constructor of the parent of the QCustomPlot widget (i.e. the MainWindow constructor, if QCustomPlot is inside the MainWindow), always provide explicit non-zero widths and heights. If you leave *width* or *height* as 0 (default), this function uses the current width and height of the QCustomPlot widget. However, in Qt, these aren't defined yet inside the constructor, so you would get an image that has strange widths/heights.

pdfCreator and *pdfTitle* may be used to set the according metadata fields in the resulting PDF file.

Note

On Android systems, this method does nothing and issues an according qDebug warning message. This is also the case if for other reasons the define flag `QT_NO_PRINTER` is set.

See also

savePng, saveBmp, saveJpg, saveRastered

17.674.4.63 savePng()

```
bool QCustomPlot::savePng (
            const QString & fileName,
```

```
int width = 0,
int height = 0,
double scale = 1.0,
int quality = -1,
int resolution = 96,
QCP::ResolutionUnit resolutionUnit = QCP::ruDotsPerInch )
```

Saves a PNG image file to *fileName* on disc. The output plot will have the dimensions *width* and *height* in pixels, multiplied by *scale*. If either *width* or *height* is zero, the current width and height of the QCustomPlot widget is used instead. Line widths and texts etc. are not scaled up when larger widths/heights are used. If you want that effect, use the *scale* parameter.
For example, if you set both *width* and *height* to 100 and *scale* to 2, you will end up with an image file of size 200∗200 in which all graphical elements are scaled up by factor 2 (line widths, texts, etc.). This scaling is not done by stretching a 100∗100 image, the result will have full 200∗200 pixel resolution.
If you use a high scaling factor, it is recommended to enable antialiasing for all elements by temporarily setting QCustomPlot::setAntialiasedElements to QCP::aeAll as this allows QCustomPlot to place objects with sub-pixel accuracy.
image compression can be controlled with the *quality* parameter which must be between 0 and 100 or -1 to use the default setting.
The *resolution* will be written to the image file header and has no direct consequence for the quality or the pixel size. However, if opening the image with a tool which respects the metadata, it will be able to scale the image to match either a given size in real units of length (inch, centimeters, etc.), or the target display DPI. You can specify in which units *resolution* is given, by setting *resolutionUnit*. The *resolution* is converted to the format's expected resolution unit internally.
Returns true on success. If this function fails, most likely the PNG format isn't supported by the system, see Qt docs about QImageWriter::supportedImageFormats().
The objects of the plot will appear in the current selection state. If you don't want any selected objects to be painted in their selected look, deselect everything with deselectAll before calling this function.
If you want the PNG to have a transparent background, call setBackground(const QBrush &brush) with no brush (Qt::NoBrush) or a transparent color (Qt::transparent), before saving.

Warning

> If calling this function inside the constructor of the parent of the QCustomPlot widget (i.e. the MainWindow constructor, if QCustomPlot is inside the MainWindow), always provide explicit non-zero widths and heights. If you leave *width* or *height* as 0 (default), this function uses the current width and height of the QCustomPlot widget. However, in Qt, these aren't defined yet inside the constructor, so you would get an image that has strange widths/heights.

See also

savePdf, saveBmp, saveJpg, saveRastered

17.674.4.64 saveRastered()

```
bool QCustomPlot::saveRastered (
const QString & fileName,
int width,
int height,
double scale,
const char * format,
int quality = -1,
int resolution = 96,
QCP::ResolutionUnit resolutionUnit = QCP::ruDotsPerInch )
```

Saves the plot to a rastered image file *fileName* in the image format *format*. The plot is sized to *width* and *height* in pixels and scaled with *scale*. (width 100 and scale 2.0 lead to a full resolution file with width 200.) If the *format* supports compression, *quality* may be between 0 and 100 to control it.
Returns true on success. If this function fails, most likely the given *format* isn't supported by the system, see Qt docs about QImageWriter::supportedImageFormats().

The *resolution* will be written to the image file header (if the file format supports this) and has no direct consequence for the quality or the pixel size. However, if opening the image with a tool which respects the metadata, it will be able to scale the image to match either a given size in real units of length (inch, centimeters, etc.), or the target display DPI. You can specify in which units *resolution* is given, by setting *resolutionUnit*. The *resolution* is converted to the format's expected resolution unit internally.

saveBmp, saveJpg, savePng, savePdf

17.674.4.65 selectedAxes()

`QList< QCPAxis * > QCustomPlot::selectedAxes ( ) const`
Returns the axes that currently have selected parts, i.e. whose selection state is not QCPAxis::spNone.

See also

selectedPlottables, selectedLegends, setInteractions, QCPAxis::setSelectedParts, QCPAxis::setSelectableParts

17.674.4.66 selectedGraphs()

`QList< QCPGraph * > QCustomPlot::selectedGraphs ( ) const`
Returns a list of the selected graphs. If no graphs are currently selected, the list is empty.
If you are not only interested in selected graphs but other plottables like QCPCurve, QCPBars, etc., use selectedPlottables.

See also

setInteractions, selectedPlottables, QCPAbstractPlottable::setSelectable, QCPAbstractPlottable::setSelection

17.674.4.67 selectedItems()

`QList< QCPAbstractItem * > QCustomPlot::selectedItems ( ) const`
Returns a list of the selected items. If no items are currently selected, the list is empty.

See also

setInteractions, QCPAbstractItem::setSelectable, QCPAbstractItem::setSelected

17.674.4.68 selectedLegends()

`QList< QCPLegend * > QCustomPlot::selectedLegends ( ) const`
Returns the legends that currently have selected parts, i.e. whose selection state is not QCPLegend::spNone.

See also

selectedPlottables, selectedAxes, setInteractions, QCPLegend::setSelectedParts, QCPLegend::setSelectableParts, QCPLegend::selectedItems

17.674.4.69 selectedPlottables()

`QList< QCPAbstractPlottable * > QCustomPlot::selectedPlottables ( ) const`
Returns a list of the selected plottables. If no plottables are currently selected, the list is empty.
There is a convenience function if you're only interested in selected graphs, see selectedGraphs.

See also

setInteractions, QCPAbstractPlottable::setSelectable, QCPAbstractPlottable::setSelection

17.674.4.70 selectionChangedByUser

```
void QCustomPlot::selectionChangedByUser ( )  [signal]
```

This signal is emitted after the user has changed the selection in the QCustomPlot, e.g. by clicking. It is not emitted when the selection state of an object has changed programmatically by a direct call to `setSelected()`/`setSelection()` on an object or by calling deselectAll.

In addition to this signal, selectable objects also provide individual signals, for example QCPAxis::selectionChanged or QCPAbstractPlottable::selectionChanged. Note that those signals are emitted even if the selection state is changed programmatically.

See the documentation of setInteractions for details about the selection mechanism.

See also

selectedPlottables, selectedGraphs, selectedItems, selectedAxes, selectedLegends

17.674.4.71 selectionRect()

```
QCPSelectionRect * QCustomPlot::selectionRect ( ) const  [inline]
```

Allows access to the currently used QCPSelectionRect instance (or subclass thereof), that is used to handle and draw selection rect interactions (see setSelectionRectMode).

See also

setSelectionRect

17.674.4.72 setAntialiasedElement()

```
void QCustomPlot::setAntialiasedElement (
            QCP::AntialiasedElement antialiasedElement,
            bool enabled = true )
```

Sets whether the specified *antialiasedElement* is forcibly drawn antialiased.

See setAntialiasedElements for details.

See also

setNotAntialiasedElement

17.674.4.73 setAntialiasedElements()

```
void QCustomPlot::setAntialiasedElements (
            const QCP::AntialiasedElements & antialiasedElements )
```

Sets which elements are forcibly drawn antialiased as an *or* combination of QCP::AntialiasedElement.

This overrides the antialiasing settings for whole element groups, normally controlled with the *setAntialiasing* function on the individual elements. If an element is neither specified in setAntialiasedElements nor in setNotAntialiasedElements, the antialiasing setting on each individual element instance is used.

For example, if *antialiasedElements* contains QCP::aePlottables, all plottables will be drawn antialiased, no matter what the specific QCPAbstractPlottable::setAntialiased value was set to.

if an element in *antialiasedElements* is already set in setNotAntialiasedElements, it is removed from there.

See also

setNotAntialiasedElements

17.674.4.74 setAutoAddPlottableToLegend()

```
void QCustomPlot::setAutoAddPlottableToLegend (
            bool on )
```

If set to true, adding a plottable (e.g. a graph) to the QCustomPlot automatically also adds the plottable to the legend (QCustomPlot::legend).

See also

addGraph, QCPLegend::addItem

17.674.4.75 setBackground() [1/3]

```
void QCustomPlot::setBackground (
            const QBrush & brush )
```

Sets the background brush of the viewport (see setViewport).
Before drawing everything else, the background is filled with *brush*. If a background pixmap was set with setBackground(const QPixmap &pm), this brush will be used to fill the viewport before the background pixmap is drawn. This can be useful for background pixmaps with translucent areas.
Set *brush* to Qt::NoBrush or Qt::Transparent to leave background transparent. This can be useful for exporting to image formats which support transparency, e.g. savePng.

See also

setBackgroundScaled, setBackgroundScaledMode

17.674.4.76 setBackground() [2/3]

```
void QCustomPlot::setBackground (
            const QPixmap & pm )
```

Sets *pm* as the viewport background pixmap (see setViewport). The pixmap is always drawn below all other objects in the plot.
For cases where the provided pixmap doesn't have the same size as the viewport, scaling can be enabled with setBackgroundScaled and the scaling mode (whether and how the aspect ratio is preserved) can be set with setBackgroundScaledMode. To set all these options in one call, consider using the overloaded version of this function.
If a background brush was set with setBackground(const QBrush &brush), the viewport will first be filled with that brush, before drawing the background pixmap. This can be useful for background pixmaps with translucent areas.

See also

setBackgroundScaled, setBackgroundScaledMode

17.674.4.77 setBackground() [3/3]

```
void QCustomPlot::setBackground (
            const QPixmap & pm,
            bool scaled,
            Qt::AspectRatioMode mode = Qt::KeepAspectRatioByExpanding )
```

This is an overloaded member function, provided for convenience. It differs from the above function only in what argument(s) it accepts.
Allows setting the background pixmap of the viewport, whether it shall be scaled and how it shall be scaled in one call.

See also

setBackground(const QPixmap &pm), setBackgroundScaled, setBackgroundScaledMode

17.674.4.78 setBackgroundScaled()

```
void QCustomPlot::setBackgroundScaled (
            bool scaled )
```

Sets whether the viewport background pixmap shall be scaled to fit the viewport. If *scaled* is set to true, control whether and how the aspect ratio of the original pixmap is preserved with setBackgroundScaledMode.
Note that the scaled version of the original pixmap is buffered, so there is no performance penalty on replots. (Except when the viewport dimensions are changed continuously.)

See also

setBackground, setBackgroundScaledMode

17.674.4.79 setBackgroundScaledMode()

```
void QCustomPlot::setBackgroundScaledMode (
            Qt::AspectRatioMode mode )
```

If scaling of the viewport background pixmap is enabled (setBackgroundScaled), use this function to define whether and how the aspect ratio of the original pixmap is preserved.

See also

setBackground, setBackgroundScaled

17.674.4.80 setBufferDevicePixelRatio()

```
void QCustomPlot::setBufferDevicePixelRatio (
            double ratio )
```

Sets the device pixel ratio used by the paint buffers of this QCustomPlot instance.
Normally, this doesn't need to be set manually, because it is initialized with the regular *QWidget::devicePixelRatio* which is configured by Qt to fit the display device (e.g. 1 for normal displays, 2 for High-DPI displays).
Device pixel ratios are supported by Qt only for Qt versions since 5.4. If this method is called when QCustomPlot is being used with older Qt versions, outputs an according qDebug message and leaves the internal buffer device pixel ratio at 1.0.

17.674.4.81 setCurrentLayer() [1/2]

```
bool QCustomPlot::setCurrentLayer (
            const QString & name )
```

Sets the layer with the specified *name* to be the current layer. All layerables (QCPLayerable), e.g. plottables and items, are created on the current layer.
Returns true on success, i.e. if there is a layer with the specified *name* in the QCustomPlot.
Layer names are case-sensitive.

See also

addLayer, moveLayer, removeLayer, QCPLayerable::setLayer

17.674.4.82 setCurrentLayer() [2/2]

```
bool QCustomPlot::setCurrentLayer (
            QCPLayer * layer )
```

This is an overloaded member function, provided for convenience. It differs from the above function only in what argument(s) it accepts.
Sets the provided *layer* to be the current layer.
Returns true on success, i.e. when *layer* is a valid layer in the QCustomPlot.

See also

addLayer, moveLayer, removeLayer

17.674.4.83 setInteraction()

```
void QCustomPlot::setInteraction (
            const QCP::Interaction & interaction,
            bool enabled = true )
```

Sets the single *interaction* of this QCustomPlot to *enabled*.
For details about the interaction system, see setInteractions.

See also

setInteractions

17.674.4.84 setInteractions()

```
void QCustomPlot::setInteractions (
            const QCP::Interactions & interactions )
```

Sets the possible interactions of this QCustomPlot as an or-combination of QCP::Interaction enums. There are the following types of interactions:

Axis range manipulation is controlled via QCP::iRangeDrag and QCP::iRangeZoom. When the respective interaction is enabled, the user may drag axes ranges and zoom with the mouse wheel. For details how to control which axes the user may drag/zoom and in what orientations, see QCPAxisRect::setRangeDrag, QCPAxisRect::setRangeZoom, QCPAxisRect::setRangeDragAxes, QCPAxisRect::setRangeZoomAxes.

Plottable data selection is controlled by QCP::iSelectPlottables. If QCP::iSelectPlottables is set, the user may select plottables (graphs, curves, bars,...) and their data by clicking on them or in their vicinity (setSelectionTolerance). Whether the user can actually select a plottable and its data can further be restricted with the QCPAbstractPlottable::setSelectable method on the specific plottable. For details, see the special page about the data selection mechanism. To retrieve a list of all currently selected plottables, call selectedPlottables. If you're only interested in QCPGraphs, you may use the convenience function selectedGraphs.

Item selection is controlled by QCP::iSelectItems. If QCP::iSelectItems is set, the user may select items (QCPItemLine, QCPItemText,...) by clicking on them or in their vicinity. To find out whether a specific item is selected, call QCPAbstractItem::selected(). To retrieve a list of all currently selected items, call selectedItems.

Axis selection is controlled with QCP::iSelectAxes. If QCP::iSelectAxes is set, the user may select parts of the axes by clicking on them. What parts exactly (e.g. Axis base line, tick labels, axis label) are selectable can be controlled via QCPAxis::setSelectableParts for each axis. To retrieve a list of all axes that currently contain selected parts, call selectedAxes. Which parts of an axis are selected, can be retrieved with QCPAxis::selectedParts().

Legend selection is controlled with QCP::iSelectLegend. If this is set, the user may select the legend itself or individual items by clicking on them. What parts exactly are selectable can be controlled via QCPLegend::setSelectableParts. To find out whether the legend or any of its child items are selected, check the value of QCPLegend::selectedParts. To find out which child items are selected, call QCPLegend::selectedItems.

All other selectable elements The selection of all other selectable objects (e.g. QCPTextElement, or your own layerable subclasses) is controlled with QCP::iSelectOther. If set, the user may select those objects by clicking on them. To find out which are currently selected, you need to check their selected state explicitly.

If the selection state has changed by user interaction, the selectionChangedByUser signal is emitted. Each selectable object additionally emits an individual selectionChanged signal whenever their selection state has changed, i.e. not only by user interaction.

To allow multiple objects to be selected by holding the selection modifier (setMultiSelectModifier), set the flag QCP::iMultiSelect.

Note

In addition to the selection mechanism presented here, QCustomPlot always emits corresponding signals, when an object is clicked or double clicked. see plottableClick and plottableDoubleClick for example.

See also

setInteraction, setSelectionTolerance

17.674.4.85 setMultiSelectModifier()

```
void QCustomPlot::setMultiSelectModifier (
            Qt::KeyboardModifier modifier )
```

Sets the keyboard modifier that will be recognized as multi-select-modifier.

If QCP::iMultiSelect is specified in setInteractions, the user may select multiple objects (or data points) by clicking on them one after the other while holding down *modifier*.

By default the multi-select-modifier is set to Qt::ControlModifier.

See also

setInteractions

17.674.4.86 setNoAntialiasingOnDrag()

```
void QCustomPlot::setNoAntialiasingOnDrag (
            bool enabled )
```

Sets whether antialiasing is disabled for this QCustomPlot while the user is dragging axes ranges. If many objects, especially plottables, are drawn antialiased, this greatly improves performance during dragging. Thus it creates a more responsive user experience. As soon as the user stops dragging, the last replot is done with normal antialiasing, to restore high image quality.

See also

setAntialiasedElements, setNotAntialiasedElements

17.674.4.87 setNotAntialiasedElement()

```
void QCustomPlot::setNotAntialiasedElement (
            QCP::AntialiasedElement notAntialiasedElement,
            bool enabled = true )
```

Sets whether the specified *notAntialiasedElement* is forcibly drawn not antialiased.
See setNotAntialiasedElements for details.

See also

setAntialiasedElement

17.674.4.88 setNotAntialiasedElements()

```
void QCustomPlot::setNotAntialiasedElements (
            const QCP::AntialiasedElements & notAntialiasedElements )
```

Sets which elements are forcibly drawn not antialiased as an *or* combination of QCP::AntialiasedElement.
This overrides the antialiasing settings for whole element groups, normally controlled with the *setAntialiasing* function on the individual elements. If an element is neither specified in setAntialiasedElements nor in setNotAntialiasedElements, the antialiasing setting on each individual element instance is used.
For example, if *notAntialiasedElements* contains QCP::aePlottables, no plottables will be drawn antialiased, no matter what the specific QCPAbstractPlottable::setAntialiased value was set to.
if an element in *notAntialiasedElements* is already set in setAntialiasedElements, it is removed from there.

See also

setAntialiasedElements

17.674.4.89 setOpenGl()

```
void QCustomPlot::setOpenGl (
            bool enabled,
            int multisampling = 16 )
```

Warning

This is still an experimental feature and its performance depends on the system that it runs on. Having multiple QCustomPlot widgets in one application with enabled OpenGL rendering might cause context conflicts on some systems.

This method allows to enable OpenGL plot rendering, for increased plotting performance of graphically demanding plots (thick lines, translucent fills, etc.).
If *enabled* is set to true, QCustomPlot will try to initialize OpenGL and, if successful, continue plotting with hardware acceleration. The parameter *multisampling* controls how many samples will be used per pixel, it essentially controls the antialiasing quality. If *multisampling* is set too high for the current graphics hardware, the maximum allowed value will be used.
You can test whether switching to OpenGL rendering was successful by checking whether the according getter *QCustomPlot::openGl()* returns true. If the OpenGL initialization fails, rendering continues with the regular software rasterizer, and an according qDebug output is generated.

If switching to OpenGL was successful, this method disables label caching (setPlottingHint(QCP::phCacheLabels, false)) and turns on QCustomPlot's antialiasing override for all elements (setAntialiasedElements(QCP::aeAll)), leading to a higher quality output. The antialiasing override allows for pixel-grid aligned drawing in the OpenGL paint device. As stated before, in OpenGL rendering the actual antialiasing of the plot is controlled with *multisampling*. If *enabled* is set to false, the antialiasing/label caching settings are restored to what they were before OpenGL was enabled, if they weren't altered in the meantime.

Note

OpenGL support is only enabled if QCustomPlot is compiled with the macro `QCUSTOMPLOT_USE_OPENGL` defined. This define must be set before including the QCustomPlot header both during compilation of the QCustomPlot library as well as when compiling your application. It is best to just include the line `DEFINES += QCUSTOMPLOT_USE_OPENGL` in the respective qmake project files.

If you are using a Qt version before 5.0, you must also add the module "opengl" to your `QT` variable in the qmake project files. For Qt versions 5.0 and higher, QCustomPlot switches to a newer OpenGL interface which is already in the "gui" module.

17.674.4.90 setPlottingHint()

```
void QCustomPlot::setPlottingHint (
            QCP::PlottingHint hint,
            bool enabled = true )
```

Sets the specified plotting *hint* to *enabled*.

See also

setPlottingHints

17.674.4.91 setPlottingHints()

```
void QCustomPlot::setPlottingHints (
            const QCP::PlottingHints & hints )
```

Sets the plotting hints for this QCustomPlot instance as an *or* combination of QCP::PlottingHint.

See also

setPlottingHint

17.674.4.92 setSelectionRect()

```
void QCustomPlot::setSelectionRect (
            QCPSelectionRect * selectionRect )
```

Sets the QCPSelectionRect instance that QCustomPlot will use if *mode* is not QCP::srmNone and the user performs a click-and-drag interaction. QCustomPlot takes ownership of the passed *selectionRect*. It can be accessed later via selectionRect.

This method is useful if you wish to replace the default QCPSelectionRect instance with an instance of a QCPSelectionRect subclass, to introduce custom behaviour of the selection rect.

See also

setSelectionRectMode

17.674.4.93 setSelectionRectMode()

```
void QCustomPlot::setSelectionRectMode (
            QCP::SelectionRectMode mode )
```

Sets how QCustomPlot processes mouse click-and-drag interactions by the user.

If *mode* is QCP::srmNone, the mouse drag is forwarded to the underlying objects. For example, QCPAxisRect may process a mouse drag by dragging axis ranges, see QCPAxisRect::setRangeDrag. If *mode* is not QCP::srmNone, the current selection rect (selectionRect) becomes activated and allows e.g. rect zooming and data point selection.

If you wish to provide your user both with axis range dragging and data selection/range zooming, use this method to switch between the modes just before the interaction is processed, e.g. in reaction to the mousePress or mouseMove signals. For example you could check whether the user is holding a certain keyboard modifier, and then decide which *mode* shall be set.
If a selection rect interaction is currently active, and *mode* is set to QCP::srmNone, the interaction is canceled (QCPSelectionRect::cancel). Switching between any of the other modes will keep the selection rect active. Upon completion of the interaction, the behaviour is as defined by the currently set *mode*, not the mode that was set when the interaction started.

See also

setInteractions, setSelectionRect, QCPSelectionRect

17.674.4.94 setSelectionTolerance()

```
void QCustomPlot::setSelectionTolerance (
            int pixels )
```

Sets the tolerance that is used to decide whether a click selects an object (e.g. a plottable) or not.
If the user clicks in the vicinity of the line of e.g. a QCPGraph, it's only regarded as a potential selection when the minimum distance between the click position and the graph line is smaller than *pixels*. Objects that are defined by an area (e.g. QCPBars) only react to clicks directly inside the area and ignore this selection tolerance. In other words, it only has meaning for parts of objects that are too thin to exactly hit with a click and thus need such a tolerance.

See also

setInteractions, QCPLayerable::selectTest

17.674.4.95 setViewport()

```
void QCustomPlot::setViewport (
            const QRect & rect )
```

Sets the viewport of this QCustomPlot. Usually users of QCustomPlot don't need to change the viewport manually.
The viewport is the area in which the plot is drawn. All mechanisms, e.g. margin calculation take the viewport to be the outer border of the plot. The viewport normally is the rect() of the QCustomPlot widget, i.e. a rect with top left (0, 0) and size of the QCustomPlot widget.
Don't confuse the viewport with the axis rect (QCustomPlot::axisRect). An axis rect is typically an area enclosed by four axes, where the graphs/plottables are drawn in. The viewport is larger and contains also the axes themselves, their tick numbers, their labels, or even additional axis rects, color scales and other layout elements.
This function is used to allow arbitrary size exports with toPixmap, savePng, savePdf, etc. by temporarily changing the viewport size.

17.674.4.96 toPainter()

```
void QCustomPlot::toPainter (
            QCPPainter * painter,
            int width = 0,
            int height = 0 )
```

Renders the plot using the passed *painter*.
The plot is sized to *width* and *height* in pixels. If the *painter's* scale is not 1.0, the resulting plot will appear scaled accordingly.

Note

If you are restricted to using a QPainter (instead of QCPPainter), create a temporary QPicture and open a QCPPainter on it. Then call toPainter with this QCPPainter. After ending the paint operation on the picture, draw it with the QPainter. This will reproduce the painter actions the QCPPainter took, with a QPainter.

See also

toPixmap

17.674.4.97 toPixmap()

```
QPixmap QCustomPlot::toPixmap (
            int width = 0,
            int height = 0,
            double scale = 1.0 )
```

Renders the plot to a pixmap and returns it.
The plot is sized to *width* and *height* in pixels and scaled with *scale*. (width 100 and scale 2.0 lead to a full resolution pixmap with width 200.)

See also

toPainter, saveRastered, saveBmp, savePng, saveJpg, savePdf

17.674.5 Member Data Documentation

17.674.5.1 legend

```
QCPLegend * QCustomPlot::legend
```

A pointer to the default legend of the main axis rect. The legend is invisible by default. Use QCPLegend::setVisible to change this.
QCustomPlot offers convenient pointers to the axes (xAxis, yAxis, xAxis2, yAxis2) and the legend. They make it very easy working with plots that only have a single axis rect and at most one axis at each axis rect side. If you use the layout system to add multiple legends to the plot, use the layout system interface to access the new legend. For example, legends can be placed inside an axis rect's inset layout, and must then also be accessed via the inset layout. If the default legend is removed due to manipulation of the layout system (e.g. by removing the main axis rect), the corresponding pointer becomes `nullptr`.
If an axis convenience pointer is currently `nullptr` and a new axis rect or a corresponding axis is added in the place of the main axis rect, QCustomPlot resets the convenience pointers to the according new axes. Similarly the legend convenience pointer will be reset if a legend is added after the main legend was removed before.

17.674.5.2 xAxis

```
QCPAxis * QCustomPlot::xAxis
```

A pointer to the primary x Axis (bottom) of the main axis rect of the plot.
QCustomPlot offers convenient pointers to the axes (xAxis, yAxis, xAxis2, yAxis2) and the legend. They make it very easy working with plots that only have a single axis rect and at most one axis at each axis rect side. If you use the layout system to add multiple axis rects or multiple axes to one side, use the QCPAxisRect::axis interface to access the new axes. If one of the four default axes or the default legend is removed due to manipulation of the layout system (e.g. by removing the main axis rect), the corresponding pointers become `nullptr`.
If an axis convenience pointer is currently `nullptr` and a new axis rect or a corresponding axis is added in the place of the main axis rect, QCustomPlot resets the convenience pointers to the according new axes. Similarly the legend convenience pointer will be reset if a legend is added after the main legend was removed before.

17.674.5.3 xAxis2

```
QCPAxis * QCustomPlot::xAxis2
```

A pointer to the secondary x Axis (top) of the main axis rect of the plot. Secondary axes are invisible by default. Use QCPAxis::setVisible to change this (or use QCPAxisRect::setupFullAxesBox).
QCustomPlot offers convenient pointers to the axes (xAxis, yAxis, xAxis2, yAxis2) and the legend. They make it very easy working with plots that only have a single axis rect and at most one axis at each axis rect side. If you use the layout system to add multiple axis rects or multiple axes to one side, use the QCPAxisRect::axis interface to access the new axes. If one of the four default axes or the default legend is removed due to manipulation of the layout system (e.g. by removing the main axis rect), the corresponding pointers become `nullptr`.
If an axis convenience pointer is currently `nullptr` and a new axis rect or a corresponding axis is added in the place of the main axis rect, QCustomPlot resets the convenience pointers to the according new axes. Similarly the legend convenience pointer will be reset if a legend is added after the main legend was removed before.

17.674.5.4 yAxis

```
QCPAxis * QCustomPlot::yAxis
```

A pointer to the primary y Axis (left) of the main axis rect of the plot.
QCustomPlot offers convenient pointers to the axes (xAxis, yAxis, xAxis2, yAxis2) and the legend. They make it very easy working with plots that only have a single axis rect and at most one axis at each axis rect side. If you use the layout system to add multiple axis rects or multiple axes to one side, use the QCPAxisRect::axis interface to access the new axes. If one of the four default axes or the default legend is removed due to manipulation of the layout system (e.g. by removing the main axis rect), the corresponding pointers become `nullptr`.
If an axis convenience pointer is currently `nullptr` and a new axis rect or a corresponding axis is added in the place of the main axis rect, QCustomPlot resets the convenience pointers to the according new axes. Similarly the legend convenience pointer will be reset if a legend is added after the main legend was removed before.

17.674.5.5 yAxis2

```
QCPAxis * QCustomPlot::yAxis2
```

A pointer to the secondary y Axis (right) of the main axis rect of the plot. Secondary axes are invisible by default. Use QCPAxis::setVisible to change this (or use QCPAxisRect::setupFullAxesBox).
QCustomPlot offers convenient pointers to the axes (xAxis, yAxis, xAxis2, yAxis2) and the legend. They make it very easy working with plots that only have a single axis rect and at most one axis at each axis rect side. If you use the layout system to add multiple axis rects or multiple axes to one side, use the QCPAxisRect::axis interface to access the new axes. If one of the four default axes or the default legend is removed due to manipulation of the layout system (e.g. by removing the main axis rect), the corresponding pointers become `nullptr`.
If an axis convenience pointer is currently `nullptr` and a new axis rect or a corresponding axis is added in the place of the main axis rect, QCustomPlot resets the convenience pointers to the according new axes. Similarly the legend convenience pointer will be reset if a legend is added after the main legend was removed before.

17.675.1 Constructor & Destructor Documentation

17.675.1.1 QtAbstractEditorFactory()

```
template<class PropertyManager >
QtAbstractEditorFactory< PropertyManager >::QtAbstractEditorFactory (
            QObject * parent = 0 )  [inline], [explicit]
```

Creates an editor factory with the given *parent*.

See also

addPropertyManager()

17.675.2 Member Function Documentation

17.675.2.1 addPropertyManager()

```
template<class PropertyManager >
void QtAbstractEditorFactory< PropertyManager >::addPropertyManager (
            PropertyManager * manager )  [inline]
```

Adds the given *manager* to this factory's set of managers, making this factory produce editing widgets for properties created by the given manager.

The PropertyManager type is a template argument class, and represents the chosen QtAbstractPropertyManager subclass.

See also

propertyManagers(), removePropertyManager()

17.675.2.2 connectPropertyManager()

```
template<class PropertyManager >
void QtAbstractEditorFactory< PropertyManager >::connectPropertyManager (
            PropertyManager * manager )  [protected], [pure virtual]
```

Connects this factory to the given *manager's* signals. The PropertyManager type is a template argument class, and represents the chosen QtAbstractPropertyManager subclass.

This function is used internally by the addPropertyManager() function, and makes it possible to update an editing widget when the associated property's data changes. This is typically done in custom slots responding to the signals emitted by the property's manager, e.g. QtIntPropertyManager::valueChanged() and QtIntPropertyManager::rangeChanged().

See also

propertyManagers(), disconnectPropertyManager()

17.675.2.3 createEditor() [1/2]

```
template<class PropertyManager >
QWidget * QtAbstractEditorFactory< PropertyManager >::createEditor (
            PropertyManager * manager,
            QtProperty * property,
            QWidget * parent )  [protected], [pure virtual]
```

Creates an editing widget with the given *parent* for the specified *property* created by the given *manager*. The PropertyManager type is a template argument class, and represents the chosen QtAbstractPropertyManager subclass.

This function must be implemented in derived classes: It is recommended to store a pointer to the widget and map it to the given *property*, since the widget must be updated whenever the associated property's data changes. This is typically done in custom slots responding to the signals emitted by the property's manager, e.g. QtIntPropertyManager::valueChanged() and QtIntPropertyManager::rangeChanged().

See also

connectPropertyManager()

17.675.2.4 createEditor() [2/2]

```
template<class PropertyManager >
QWidget * QtAbstractEditorFactory< PropertyManager >::createEditor (
            QtProperty * property,
            QWidget * parent )  [inline], [override], [virtual]
```

Creates an editing widget (with the given *parent*) for the given *property*.

Implements QtAbstractEditorFactoryBase.

17.675.2.5 disconnectPropertyManager()

```
template<class PropertyManager >
void QtAbstractEditorFactory< PropertyManager >::disconnectPropertyManager (
            PropertyManager * manager )  [protected], [pure virtual]
```

Disconnects this factory from the given *manager's* signals. The PropertyManager type is a template argument class, and represents the chosen QtAbstractPropertyManager subclass.
This function is used internally by the removePropertyManager() function.

See also

propertyManagers(), connectPropertyManager()

17.675.2.6 managerDestroyed()

```
template<class PropertyManager >
void QtAbstractEditorFactory< PropertyManager >::managerDestroyed (
            QObject * manager )  [inline], [override], [protected], [virtual]
```

Implements QtAbstractEditorFactoryBase.

17.675.2.7 propertyManager()

```
template<class PropertyManager >
PropertyManager * QtAbstractEditorFactory< PropertyManager >::propertyManager (
            QtProperty * property ) const  [inline]
```

Returns the property manager for the given *property*, or 0 if the given *property* doesn't belong to any of this factory's registered managers.
The PropertyManager type is a template argument class, and represents the chosen QtAbstractPropertyManager subclass.

See also

propertyManagers()

17.675.2.8 propertyManagers()

```
template<class PropertyManager >
QSet< PropertyManager * > QtAbstractEditorFactory< PropertyManager >::propertyManagers ( )
const  [inline]
```

Returns the factory's set of associated managers. The PropertyManager type is a template argument class, and represents the chosen QtAbstractPropertyManager subclass.

See also

addPropertyManager(), removePropertyManager()

17.675.2.9 removePropertyManager()

```
template<class PropertyManager >
void QtAbstractEditorFactory< PropertyManager >::removePropertyManager (
            PropertyManager * manager )  [inline]
```

Removes the given *manager* from this factory's set of managers. The PropertyManager type is a template argument class, and may be any QtAbstractPropertyManager subclass.

See also

propertyManagers(), addPropertyManager()

The documentation for this class was generated from the following files:

17.676.1 Constructor & Destructor Documentation

17.676.1.1 QtAbstractEditorFactoryBase()

```
QtAbstractEditorFactoryBase::QtAbstractEditorFactoryBase (
            QObject * parent = 0 )  [inline], [explicit], [protected]
```

Creates an abstract editor factory with the given *parent*.

17.676.2 Member Function Documentation

17.676.2.1 createEditor()

```
QWidget * QtAbstractEditorFactoryBase::createEditor (
            QtProperty * property,
            QWidget * parent )  [pure virtual]
```

Creates an editing widget (with the given *parent*) for the given *property*.
This function is reimplemented in QtAbstractEditorFactory template class which also provides a pure virtual convenience overload of this function enabling access to the property's manager.

See also

QtAbstractEditorFactory::createEditor()

Implemented in QtAbstractEditorFactory< PropertyManager >, QtAbstractEditorFactory< QtBoolPropertyManager >, QtAbstractEditorFactory< QtCharPropertyManager >, QtAbstractEditorFactory< QtColorPropertyManager >, QtAbstractEditorFactory< QtCursorPropertyManager >, QtAbstractEditorFactory< QtDatePropertyManager >, QtAbstractEditorFactory< QtDateTimePropertyManager >, QtAbstractEditorFactory< QtDoublePropertyManager >, QtAbstractEditorFactory< QtEnumPropertyManager >, QtAbstractEditorFactory< QtFontPropertyManager >, QtAbstractEditorFactory< QtIntPropertyManager >, QtAbstractEditorFactory< QtKeySequencePropertyManager >, QtAbstractEditorFactory< QtStringPropertyManager >, QtAbstractEditorFactory< QtTimePropertyManager >, and QtAbstractEditorFactory< QtVariantPropertyManager >.

17.677.1 Constructor & Destructor Documentation

17.677.1.1 QtAbstractPropertyBrowser()

```
QtAbstractPropertyBrowser::QtAbstractPropertyBrowser (
            QWidget * parent = 0 )  [explicit]
```

Creates an abstract property browser with the given *parent*.

17.677.1.2 ~QtAbstractPropertyBrowser()

```
QtAbstractPropertyBrowser::~QtAbstractPropertyBrowser ( )
```

Destroys the property browser, and destroys all the items that were created by this property browser.
Note that the properties that were displayed in the editor are not deleted since they still can be used in other editors. Neither does the destructor delete the property managers and editor factories that were used by this property browser widget unless this widget was their parent.

See also

QtAbstractPropertyManager::~QtAbstractPropertyManager()

17.677.2 Member Function Documentation

17.677.2.1 addProperty

```
QtBrowserItem * QtAbstractPropertyBrowser::addProperty (
            QtProperty * property )  [slot]
```

Appends the given *property* (and its subproperties) to the property browser's list of top level properties. Returns the item created by property browser which is associated with the *property*. In order to get all children items created by the property browser in this call, the returned item should be traversed.
If the specified *property* is already added, this function does nothing and returns 0.

See also

insertProperty(), QtProperty::addSubProperty(), properties()

17.677.2.2 clear()

```
void QtAbstractPropertyBrowser::clear ( )
```

Removes all the properties from the editor, but does not delete them since they can still be used in other editors.

See also

removeProperty(), QtAbstractPropertyManager::clear()

17.677.2.3 createEditor()

```
QWidget * QtAbstractPropertyBrowser::createEditor (
            QtProperty * property,
            QWidget * parent )  [protected], [virtual]
```

Creates an editing widget (with the given *parent*) for the given *property* according to the previously established associations between property managers and editor factories.
If the property is created by a property manager which was not associated with any of the existing factories in *this* property editor, the function returns 0.
To make a property editable in the property browser, the createEditor() function must be called to provide the property with a suitable editing widget.
Reimplement this function to provide additional decoration for the editing widgets created by the installed factories.

See also

setFactoryForManager()

17.677.2.4 currentItem()

```
QtBrowserItem * QtAbstractPropertyBrowser::currentItem ( ) const
```

Returns the current item in the property browser.

See also

setCurrentItem()

17.677.2.5 currentItemChanged

```
void QtAbstractPropertyBrowser::currentItemChanged (
            QtBrowserItem * current )  [signal]
```

This signal is emitted when the current item changes. The current item is specified by *current*.

See also

QtAbstractPropertyBrowser::setCurrentItem()

17.677.2.6 insertProperty

```
QtBrowserItem * QtAbstractPropertyBrowser::insertProperty (
            QtProperty * property,
            QtProperty * afterProperty )  [slot]
```

Inserts the given *property* (and its subproperties) after the specified *afterProperty* in the browser's list of top level properties. Returns item created by property browser which is associated with the *property*. In order to get all children items created by the property browser in this call returned item should be traversed.
If the specified *afterProperty* is 0, the given *property* is inserted at the beginning of the list. If *property* is already inserted, this function does nothing and returns 0.

See also

addProperty(), QtProperty::insertSubProperty(), properties()

17.677.2.7 itemChanged()

```
void QtAbstractPropertyBrowser::itemChanged (
            QtBrowserItem * item )  [protected], [pure virtual]
```

This function is called whenever a property's data changes, passing a pointer to the *item* of property as parameter.
This function must be reimplemented in derived classes in order to update the property browser widget whenever a property's name, tool tip, status tip, "what's this" text, value text or value icon changes.
Note that if the property browser contains several occurrences of the same property, this method will be called once for each occurrence (with a different item each time).

See also

QtProperty, items()

Implemented in QtButtonPropertyBrowser, QtGroupBoxPropertyBrowser, and QtTreePropertyBrowser.

17.677.2.8 itemInserted()

```
void QtAbstractPropertyBrowser::itemInserted (
            QtBrowserItem * insertedItem,
            QtBrowserItem * precedingItem )  [protected], [pure virtual]
```

This function is called to update the widget whenever a property is inserted or added to the property browser, passing pointers to the *insertedItem* of property and the specified *precedingItem* as parameters.
If *precedingItem* is 0, the *insertedItem* was put at the beginning of its parent item's list of subproperties. If the parent of *insertedItem* is 0, the *insertedItem* was added as a top level property of *this* property browser.
This function must be reimplemented in derived classes. Note that if the *insertedItem's* property has subproperties, this method will be called for those properties as soon as the current call is finished.

See also

insertProperty(), addProperty()

Implemented in QtButtonPropertyBrowser, QtGroupBoxPropertyBrowser, and QtTreePropertyBrowser.

17.677.2.9 itemRemoved()

```
void QtAbstractPropertyBrowser::itemRemoved (
            QtBrowserItem * item )  [protected], [pure virtual]
```

This function is called to update the widget whenever a property is removed from the property browser, passing the pointer to the *item* of the property as parameters. The passed *item* is deleted just after this call is finished.
If the the parent of *item* is 0, the removed *item* was a top level property in this editor.
This function must be reimplemented in derived classes. Note that if the removed *item's* property has subproperties, this method will be called for those properties just before the current call is started.

See also

removeProperty()

Implemented in QtButtonPropertyBrowser, QtGroupBoxPropertyBrowser, and QtTreePropertyBrowser.

17.677.2.10 items()

```
QList< QtBrowserItem * > QtAbstractPropertyBrowser::items (
            QtProperty * property ) const
```

Returns the property browser's list of all items associated with the given *property*.
There is one item per instance of the property in the browser.

See also

topLevelItem()

17.677.2.11 properties()

```
QList< QtProperty * > QtAbstractPropertyBrowser::properties ( ) const
```

Returns the property browser's list of top level properties.
To traverse the subproperties, use the QtProperty::subProperties() function.

See also

addProperty(), insertProperty(), removeProperty()

17.677.2.12 removeProperty

```
void QtAbstractPropertyBrowser::removeProperty (
            QtProperty * property )  [slot]
```

Removes the specified *property* (and its subproperties) from the property browser's list of top level properties. All items that were associated with the given *property* and its children are deleted.
Note that the properties are *not* deleted since they can still be used in other editors.

See also

clear(), QtProperty::removeSubProperty(), properties()

17.677.2.13 setCurrentItem()

```
void QtAbstractPropertyBrowser::setCurrentItem (
            QtBrowserItem * item )
```

Sets the current item in the property browser to *item*.

See also

currentItem(), currentItemChanged()

17.677.2.14 setFactoryForManager()

```
template<class PropertyManager >
void QtAbstractPropertyBrowser::setFactoryForManager (
            PropertyManager * manager,
            QtAbstractEditorFactory< PropertyManager > * factory )  [inline]
```

Connects the given *manager* to the given *factory*, ensuring that properties of the *manager's* type will be displayed with an editing widget suitable for their value.
For example:
In this example the `myInteger` property's value is displayed with a QSpinBox widget, while the `myDouble` property's value is displayed with a QDoubleSpinBox widget.
Note that a factory can be associated with many managers, but a manager can only be associated with one single factory. If the given *manager* already is associated with another factory, the old association is broken before the new one established.
This function ensures that the given *manager* and the given *factory* are compatible, and it automatically calls the QtAbstractEditorFactory::addPropertyManager() function if necessary.

See also

unsetFactoryForManager()

17.677.2.15 topLevelItem()

```
QtBrowserItem * QtAbstractPropertyBrowser::topLevelItem (
            QtProperty * property ) const
```

Returns the top-level items associated with the given *property*.
Returns 0 if *property* wasn't inserted into this property browser or isn't a top-level one.

See also

topLevelItems(), items()

17.677.2.16 topLevelItems()

```
QList< QtBrowserItem * > QtAbstractPropertyBrowser::topLevelItems ( ) const
```

Returns the list of top-level items.

See also

topLevelItem()

17.677.2.17 unsetFactoryForManager()

```
void QtAbstractPropertyBrowser::unsetFactoryForManager (
            QtAbstractPropertyManager * manager )
```

Removes the association between the given *manager* and the factory bound to it, automatically calling the QtAbstractEditorFactory::removePropertyManager() function if necessary.

See also

setFactoryForManager()

- virtual void uninitializeProperty (QtProperty *property)
- virtual QtProperty * createProperty ()

Friends

- class **QtProperty**

17.679.1 Constructor & Destructor Documentation

17.679.1.1 QtAbstractPropertyManager()

```
QtAbstractPropertyManager::QtAbstractPropertyManager (
            QObject * parent = 0 )  [explicit]
```

Creates an abstract property manager with the given *parent*.

17.679.1.2 ~QtAbstractPropertyManager()

```
QtAbstractPropertyManager::~QtAbstractPropertyManager ( )
```

Destroys the manager. All properties created by the manager are destroyed.

17.679.2 Member Function Documentation

17.679.2.1 addProperty()

```
QtProperty * QtAbstractPropertyManager::addProperty (
            const QString & name = QString() )
```

Creates a property with the given *name* which then is owned by this manager.
Internally, this function calls the createProperty() and initializeProperty() functions.

See also

initializeProperty(), properties()

17.679.2.2 clear()

```
void QtAbstractPropertyManager::clear ( ) const
```

Destroys all the properties that this manager has created.

See also

propertyDestroyed(), uninitializeProperty()

17.679.2.3 createProperty()

```
QtProperty * QtAbstractPropertyManager::createProperty ( )  [protected], [virtual]
```

Creates a property.
The base implementation produce QtProperty instances; Reimplement this function to make this manager produce objects of a QtProperty subclass.

See also

addProperty(), initializeProperty()

Reimplemented in QtVariantPropertyManager.

17.679.2.4 hasValue()

```
bool QtAbstractPropertyManager::hasValue (
            const QtProperty * property ) const  [protected], [virtual]
```

Returns whether the given *property* has a value.
The default implementation of this function returns true.

See also

QtProperty::hasValue()

Reimplemented in QtGroupPropertyManager, and QtVariantPropertyManager.

17.679.2.5 initializeProperty()

```
void QtAbstractPropertyManager::initializeProperty (
            QtProperty * property )  [protected], [pure virtual]
```

This function is called whenever a new valid property pointer has been created, passing the pointer as parameter.
The purpose is to let the manager know that the *property* has been created so that it can provide additional attributes for the new property, e.g. QtIntPropertyManager adds \l {QtIntPropertyManager::value()}{value}, \l {QtIntPropertyManager::minimum()}{minimum} and \l {QtIntPropertyManager::maximum()}{maximum} attributes.
Since each manager subclass adds type specific attributes, this function is pure virtual and must be reimplemented when deriving from the QtAbstractPropertyManager class.

See also

addProperty(), createProperty()

Implemented in QtGroupPropertyManager, QtIntPropertyManager, QtBoolPropertyManager, QtDoublePropertyManager, QtStringPropertyManager, QtDatePropertyManager, QtTimePropertyManager, QtDateTimePropertyManager, QtKeySequencePropertyManager, QtCharPropertyManager, QtLocalePropertyManager, QtPointPropertyManager, QtPointFPropertyManager, QtSizePropertyManager, QtSizeFPropertyManager, QtRectPropertyManager, QtRectFPropertyManager, QtEnumPropertyManager, QtFlagPropertyManager, QtSizePolicyPropertyManager, QtFontPropertyManager, QtColorPropertyManager, QtCursorPropertyManager, and QtVariantPropertyManager.

17.679.2.6 properties()

```
QSet< QtProperty * > QtAbstractPropertyManager::properties ( ) const
```

Returns the set of properties created by this manager.

See also

addProperty()

17.679.2.7 propertyChanged

```
void QtAbstractPropertyManager::propertyChanged (
            QtProperty * property )  [signal]
```

This signal is emitted whenever a property's data changes, passing a pointer to the *property* as parameter.
Note that signal is only emitted for properties that are created by this manager.

See also

QtAbstractPropertyBrowser::itemChanged()

17.679.2.8 propertyDestroyed

```
void QtAbstractPropertyManager::propertyDestroyed (
            QtProperty * property )  [signal]
```

This signal is emitted when the specified *property* is about to be destroyed.
Note that signal is only emitted for properties that are created by this manager.

See also

clear(), uninitializeProperty()

17.679.2.9 propertyInserted

```
void QtAbstractPropertyManager::propertyInserted (
            QtProperty * newProperty,
            QtProperty * parentProperty,
            QtProperty * precedingProperty )  [signal]
```

This signal is emitted when a new subproperty is inserted into an existing property, passing pointers to the *newProperty*, *parentProperty* and *precedingProperty* as parameters.
If *precedingProperty* is 0, the *newProperty* was inserted at the beginning of the *parentProperty's* subproperties list.
Note that signal is emitted only if the *parentProperty* is created by this manager.

See also

QtAbstractPropertyBrowser::itemInserted()

17.679.2.10 propertyRemoved

```
void QtAbstractPropertyManager::propertyRemoved (
            QtProperty * property,
            QtProperty * parent )  [signal]
```

This signal is emitted when a subproperty is removed, passing pointers to the removed *property* and the *parent* property as parameters.
Note that signal is emitted only when the *parent* property is created by this manager.

See also

QtAbstractPropertyBrowser::itemRemoved()

17.679.2.11 uninitializeProperty()

```
void QtAbstractPropertyManager::uninitializeProperty (
            QtProperty * property )  [protected], [virtual]
```

This function is called just before the specified *property* is destroyed.
The purpose is to let the property manager know that the *property* is being destroyed so that it can remove the property's additional attributes.

See also

clear(), propertyDestroyed()

Reimplemented in QtGroupPropertyManager, QtIntPropertyManager, QtBoolPropertyManager, QtDoublePropertyManager, QtStringPropertyManager, QtDatePropertyManager, QtTimePropertyManager, QtDateTimePropertyManager, QtKeySequencePropertyManager, QtCharPropertyManager, QtLocalePropertyManager, QtPointPropertyManager, QtPointFPropertyManager, QtSizePropertyManager, QtSizeFPropertyManager, QtRectPropertyManager, QtRectFPropertyManager, QtEnumPropertyManager, QtFlagPropertyManager, QtSizePolicyPropertyManager, QtFontPropertyManager, QtColorPropertyManager, QtCursorPropertyManager, and QtVariantPropertyManager.

17.679.2.12 valueIcon()

```
QIcon QtAbstractPropertyManager::valueIcon (
            const QtProperty * property ) const  [protected], [virtual]
```

Returns an icon representing the current state of the given *property*.
The default implementation of this function returns an invalid icon.

See also

QtProperty::valueIcon()

Reimplemented in QtBoolPropertyManager, QtEnumPropertyManager, QtFontPropertyManager, QtColorPropertyManager, QtCursorPropertyManager, and QtVariantPropertyManager.

17.679.2.13 valueText()

```
QString QtAbstractPropertyManager::valueText (
            const QtProperty * property ) const  [protected], [virtual]
```

Returns a string representing the current state of the given *property*.
The default implementation of this function returns an empty string.

See also

QtProperty::valueText()

Reimplemented in QtIntPropertyManager, QtBoolPropertyManager, QtDoublePropertyManager, QtStringPropertyManager, QtDatePropertyManager, QtTimePropertyManager, QtDateTimePropertyManager, QtKeySequencePropertyManager, QtCharPropertyManager, QtLocalePropertyManager, QtPointPropertyManager, QtPointFPropertyManager, QtSizePropertyManager, QtSizeFPropertyManager, QtRectPropertyManager, QtRectFPropertyManager, QtEnumPropertyManager, QtFlagPropertyManager, QtSizePolicyPropertyManager, QtFontPropertyManager, QtColorPropertyManager, QtCursorPropertyManager, and QtVariantPropertyManager.

17.682.1 Constructor & Destructor Documentation

17.682.1.1 QtBoolPropertyManager()

```
QtBoolPropertyManager::QtBoolPropertyManager (
            QObject * parent = 0 )
```

Creates a manager with the given *parent*.

17.682.1.2 ~QtBoolPropertyManager()

```
QtBoolPropertyManager::~QtBoolPropertyManager ( )
```

Destroys this manager, and all the properties it has created.

17.682.2 Member Function Documentation

17.682.2.1 initializeProperty()

```
void QtBoolPropertyManager::initializeProperty (
            QtProperty * property )  [override], [protected], [virtual]
```

\reimp
Implements QtAbstractPropertyManager.

17.682.2.2 setValue

```
void QtBoolPropertyManager::setValue (
            QtProperty * property,
            bool value )  [slot]
```

Sets the value of the given *property* to *value*.

See also

value()

17.682.2.3 uninitializeProperty()

```
void QtBoolPropertyManager::uninitializeProperty (
            QtProperty * property )  [override], [protected], [virtual]
```

\reimp
Reimplemented from QtAbstractPropertyManager.

17.682.2.4 value()

```
bool QtBoolPropertyManager::value (
            const QtProperty * property ) const
```

Returns the given *property's* value.
If the given *property* is not managed by *this* manager, this function returns false.

See also

setValue()

17.682.2.5 valueChanged

```
void QtBoolPropertyManager::valueChanged (
            QtProperty * property,
            bool value )  [signal]
```

This signal is emitted whenever a property created by this manager changes its value, passing a pointer to the *property* and the new *value* as parameters.

17.682.2.6 valueIcon()

```
QIcon QtBoolPropertyManager::valueIcon (
            const QtProperty * property ) const  [override], [protected], [virtual]
```

Friends

- class **QtAbstractPropertyBrowserPrivate**

17.684.1 Member Function Documentation

17.684.1.1 browser()

```
QtAbstractPropertyBrowser * QtBrowserItem::browser ( ) const
```

Returns the property browser which owns *this* item.

17.684.1.2 children()

```
QList< QtBrowserItem * > QtBrowserItem::children ( ) const
```

Returns the children items of *this* item. The properties reproduced from children items are always the same as reproduced from associated property' children, for example:
The *childrenItems* list represents the same list as *childrenProperties*.

17.684.1.3 parent()

```
QtBrowserItem * QtBrowserItem::parent ( ) const
```

Returns the parent item of *this* item. Returns 0 if *this* item is associated with top-level property in item's property browser.

See also

children()

17.684.1.4 property()

```
QtProperty * QtBrowserItem::property ( ) const
```

Returns the property which is accosiated with this item. Note that several items can be associated with the same property instance in the same property browser.

17.686.1 Constructor & Destructor Documentation

17.686.1.1 QtButtonPropertyBrowser()

```
QtButtonPropertyBrowser::QtButtonPropertyBrowser (
            QWidget * parent = 0 )
```

Creates a property browser with the given *parent*.

17.686.1.2 ~QtButtonPropertyBrowser()

```
QtButtonPropertyBrowser::~QtButtonPropertyBrowser ( )
```

Destroys this property browser.

Note that the properties that were inserted into this browser are *not* destroyed since they may still be used in other browsers. The properties are owned by the manager that created them.

See also

QtProperty, QtAbstractPropertyManager

17.686.2 Member Function Documentation

17.686.2.1 collapsed

```
void QtButtonPropertyBrowser::collapsed (
            QtBrowserItem * item )  [signal]
```

This signal is emitted when the *item* is collapsed.

See also

expanded(), setExpanded()

17.686.2.2 expanded

```
void QtButtonPropertyBrowser::expanded (
            QtBrowserItem * item )  [signal]
```

This signal is emitted when the *item* is expanded.

See also

collapsed(), setExpanded()

17.686.2.3 isExpanded()

```
bool QtButtonPropertyBrowser::isExpanded (
            QtBrowserItem * item ) const
```

Returns true if the *item* is expanded; otherwise returns false.

See also

setExpanded()

17.686.2.4 itemChanged()

```
void QtButtonPropertyBrowser::itemChanged (
            QtBrowserItem * item )  [override], [protected], [virtual]
```

\reimp
Implements QtAbstractPropertyBrowser.

17.686.2.5 itemInserted()

```
void QtButtonPropertyBrowser::itemInserted (
            QtBrowserItem * item,
            QtBrowserItem * afterItem )  [override], [protected], [virtual]
```

\reimp
Implements QtAbstractPropertyBrowser.

17.686.2.6 itemRemoved()

```
void QtButtonPropertyBrowser::itemRemoved (
            QtBrowserItem * item )  [override], [protected], [virtual]
```

\reimp
Implements QtAbstractPropertyBrowser.

17.686.2.7 setExpanded()

```
void QtButtonPropertyBrowser::setExpanded (
            QtBrowserItem * item,
            bool expanded )
```

Sets the *item* to either collapse or expanded, depending on the value of *expanded*.

See also

isExpanded(), expanded(), collapsed()

17.689.1 Constructor & Destructor Documentation

17.689.1.1 QtCharEditorFactory()

```
QtCharEditorFactory::QtCharEditorFactory (
            QObject * parent = 0 )
```

Creates a factory with the given *parent*.

17.689.1.2 ~QtCharEditorFactory()

```
QtCharEditorFactory::~QtCharEditorFactory ( )
```

Destroys this factory, and all the widgets it has created.

The documentation for this class was generated from the following files:

- applications/gui/genesys/propertyeditor/qtpropertybrowser/qteditorfactory.h
- applications/gui/genesys/propertyeditor/qtpropertybrowser/qteditorfactory.cpp

17.691.1 Constructor & Destructor Documentation

17.691.1.1 QtCharPropertyManager()

```
QtCharPropertyManager::QtCharPropertyManager (
            QObject * parent = 0 )
```

Creates a manager with the given *parent*.

17.691.1.2 ~QtCharPropertyManager()

```
QtCharPropertyManager::~QtCharPropertyManager ( )
```

Destroys this manager, and all the properties it has created.

17.691.2 Member Function Documentation

17.691.2.1 initializeProperty()

```
void QtCharPropertyManager::initializeProperty (
            QtProperty * property )  [override], [protected], [virtual]
```

\reimp
Implements QtAbstractPropertyManager.

17.691.2.2 setValue

```
void QtCharPropertyManager::setValue (
            QtProperty * property,
            const QChar & value )  [slot]
```

Sets the value of the given *property* to *value*.

See also

value(), valueChanged()

17.691.2.3 uninitializeProperty()

```
void QtCharPropertyManager::uninitializeProperty (
            QtProperty * property )  [override], [protected], [virtual]
```

\reimp
Reimplemented from QtAbstractPropertyManager.

17.691.2.4 value()

```
QChar QtCharPropertyManager::value (
            const QtProperty * property ) const
```

Returns the given *property's* value.
If the given *property* is not managed by this manager, this function returns an null QChar object.

See also

setValue()

17.691.2.5 valueChanged

```
void QtCharPropertyManager::valueChanged (
            QtProperty * property,
            const QChar & value )  [signal]
```

This signal is emitted whenever a property created by this manager changes its value, passing a pointer to the *property* and the new *value* as parameters.

17.691.2.6 valueText()

```
QString QtCharPropertyManager::valueText (
            const QtProperty * property ) const  [override], [protected], [virtual]
```

\reimp
Reimplemented from QtAbstractPropertyManager.

17.698.1 Constructor & Destructor Documentation

17.698.1.1 QtColorPropertyManager()

```
QtColorPropertyManager::QtColorPropertyManager (
            QObject * parent = 0 )
```

Creates a manager with the given *parent*.

17.698.1.2 ∼QtColorPropertyManager()

```
QtColorPropertyManager::~QtColorPropertyManager ( )
```

Destroys this manager, and all the properties it has created.

17.698.2 Member Function Documentation

17.698.2.1 initializeProperty()

```
void QtColorPropertyManager::initializeProperty (
            QtProperty * property )  [override], [protected], [virtual]
```

\reimp
Implements QtAbstractPropertyManager.

17.698.2.2 setValue

```
void QtColorPropertyManager::setValue (
            QtProperty * property,
            const QColor & value )  [slot]
```

Sets the value of the given *property* to *value*. Nested properties are updated automatically.

See also

value(), valueChanged()

17.698.2.3 subIntPropertyManager()

```
QtIntPropertyManager * QtColorPropertyManager::subIntPropertyManager ( ) const
```

Returns the manager that produces the nested *red*, *green* and *blue* subproperties.
In order to provide editing widgets for the subproperties in a property browser widget, this manager must be associated with an editor factory.

See also

QtAbstractPropertyBrowser::setFactoryForManager()

17.698.2.4 uninitializeProperty()

```
void QtColorPropertyManager::uninitializeProperty (
            QtProperty * property )  [override], [protected], [virtual]
```

\reimp
Reimplemented from QtAbstractPropertyManager.

17.698.2.5 value()

```
QColor QtColorPropertyManager::value (
            const QtProperty * property ) const
```

Returns the given *property's* value.
If the given *property* is not managed by *this* manager, this function returns an invalid color.

See also

setValue()

17.698.2.6 valueChanged

```
void QtColorPropertyManager::valueChanged (
            QtProperty * property,
            const QColor & value )  [signal]
```

This signal is emitted whenever a property created by this manager changes its value, passing a pointer to the *property* and the new *value* as parameters.

See also

setValue()

17.698.2.7 valueIcon()

```
QIcon QtColorPropertyManager::valueIcon (
            const QtProperty * property ) const  [override], [protected], [virtual]
```

\reimp
Reimplemented from QtAbstractPropertyManager.

17.698.2.8 valueText()

```
QString QtColorPropertyManager::valueText (
            const QtProperty * property ) const  [override], [protected], [virtual]
```

\reimp
Reimplemented from QtAbstractPropertyManager.

17.703.1 Constructor & Destructor Documentation

17.703.1.1 QtCursorPropertyManager()

```
QtCursorPropertyManager::QtCursorPropertyManager (
            QObject * parent = 0 )
```

Creates a manager with the given *parent*.

17.703.1.2 ~QtCursorPropertyManager()

```
QtCursorPropertyManager::~QtCursorPropertyManager ( )
```

Destroys this manager, and all the properties it has created.

17.703.2 Member Function Documentation

17.703.2.1 initializeProperty()

```
void QtCursorPropertyManager::initializeProperty (
            QtProperty * property )  [override], [protected], [virtual]
```

\reimp
Implements QtAbstractPropertyManager.

17.703.2.2 setValue

```
void QtCursorPropertyManager::setValue (
            QtProperty * property,
            const QCursor & value )  [slot]
```

Sets the value of the given *property* to *value*.

See also

value(), valueChanged()

17.703.2.3 uninitializeProperty()

```
void QtCursorPropertyManager::uninitializeProperty (
            QtProperty * property )  [override], [protected], [virtual]
```

\reimp
Reimplemented from QtAbstractPropertyManager.

17.703.2.4 value()

```
QCursor QtCursorPropertyManager::value (
            const QtProperty * property ) const
```

Returns the given *property's* value.
If the given *property* is not managed by this manager, this function returns a default QCursor object.

See also

setValue()

17.703.2.5 valueChanged

```
void QtCursorPropertyManager::valueChanged (
            QtProperty * property,
            const QCursor & value )  [signal]
```

This signal is emitted whenever a property created by this manager changes its value, passing a pointer to the *property* and the new *value* as parameters.

See also

setValue()

17.703.2.6 valueIcon()

17.708.1 Constructor & Destructor Documentation

17.708.1.1 QtDatePropertyManager()

```
QtDatePropertyManager::QtDatePropertyManager (
            QObject * parent = 0 )
```

Creates a manager with the given *parent*.

17.708.1.2 ∼QtDatePropertyManager()

```
QtDatePropertyManager::~QtDatePropertyManager ( )
```

Destroys this manager, and all the properties it has created.

17.708.2 Member Function Documentation

17.708.2.1 initializeProperty()

```
void QtDatePropertyManager::initializeProperty (
            QtProperty * property )  [override], [protected], [virtual]
```

\reimp

Implements QtAbstractPropertyManager.

17.708.2.2 maximum()

```
QDate QtDatePropertyManager::maximum (
            const QtProperty * property ) const
```

Returns the given *property's* maximum date.

See also

minimum(), setRange()

17.708.2.3 minimum()

```
QDate QtDatePropertyManager::minimum (
            const QtProperty * property ) const
```

Returns the given *property's* minimum date.

See also

maximum(), setRange()

17.708.2.4 rangeChanged

```
void QtDatePropertyManager::rangeChanged (
            QtProperty * property,
            QDate minimum,
            QDate maximum )  [signal]
```

This signal is emitted whenever a property created by this manager changes its range of valid dates, passing a pointer to the *property* and the new *minimum* and *maximum* dates.

See also

setRange()

17.708.2.5 setMaximum

```
void QtDatePropertyManager::setMaximum (
            QtProperty * property,
            QDate maxVal )  [slot]
```

Sets the maximum value for the given *property* to *maxVal*.
When setting the maximum value, the minimum and current values are adjusted if necessary (ensuring that the range remains valid and that the current value is within in the range).

See also

maximum(), setRange()

17.708.2.6 setMinimum

```
void QtDatePropertyManager::setMinimum (
            QtProperty * property,
            QDate minVal )  [slot]
```

Sets the minimum value for the given *property* to *minVal*.
When setting the minimum value, the maximum and current values are adjusted if necessary (ensuring that the range remains valid and that the current value is within in the range).

See also

minimum(), setRange()

17.708.2.7 setRange

```
void QtDatePropertyManager::setRange (
            QtProperty * property,
            QDate minimum,
            QDate maximum )  [slot]
```

Sets the range of valid dates.
This is a convenience function defining the range of valid dates in one go; setting the *minimum* and *maximum* values for the given *property* with a single function call.
When setting a new date range, the current value is adjusted if necessary (ensuring that the value remains in date range).

See also

setMinimum(), setMaximum(), rangeChanged()

17.708.2.8 setValue

```
void QtDatePropertyManager::setValue (
            QtProperty * property,
            QDate value )  [slot]
```

Sets the value of the given *property* to *value*.
If the specified *value* is not a valid date according to the given *property's* range, the value is adjusted to the nearest valid value within the range.

See also

value(), setRange(), valueChanged()

17.708.2.9 uninitializeProperty()

```
void QtDatePropertyManager::uninitializeProperty (
            QtProperty * property )  [override], [protected], [virtual]
```

\reimp
Reimplemented from QtAbstractPropertyManager.

17.708.2.10 value()

```
QDate QtDatePropertyManager::value (
            const QtProperty * property ) const
```

Returns the given *property's* value.
If the given *property* is not managed by *this* manager, this function returns an invalid date.

See also

setValue()

17.708.2.11 valueChanged

```
void QtDatePropertyManager::valueChanged (
            QtProperty * property,
            QDate value )  [signal]
```

This signal is emitted whenever a property created by this manager changes its value, passing a pointer to the *property* and the new *value* as parameters.

See also

setValue()

17.708.2.12 valueText()

```
QString QtDatePropertyManager::valueText (
            const QtProperty * property ) const  [override], [protected], [virtual]
```

\reimp
Reimplemented from QtAbstractPropertyManager.
The documentation for this class was generated from the following files:

17.713.1 Constructor & Destructor Documentation

17.713.1.1 QtDateTimePropertyManager()

```
QtDateTimePropertyManager::QtDateTimePropertyManager (
            QObject * parent = 0 )
```

Creates a manager with the given *parent*.

17.713.1.2 ~QtDateTimePropertyManager()

```
QtDateTimePropertyManager::~QtDateTimePropertyManager ( )
```

Destroys this manager, and all the properties it has created.

17.713.2 Member Function Documentation

17.713.2.1 initializeProperty()

```
void QtDateTimePropertyManager::initializeProperty (
            QtProperty * property )  [override], [protected], [virtual]
```

\reimp
Implements QtAbstractPropertyManager.

17.713.2.2 setValue

```
void QtDateTimePropertyManager::setValue (
            QtProperty * property,
            const QDateTime & value )  [slot]
```

Sets the value of the given *property* to *value*.

See also

value(), valueChanged()

17.713.2.3 uninitializeProperty()

```
void QtDateTimePropertyManager::uninitializeProperty (
            QtProperty * property )  [override], [protected], [virtual]
```

\reimp
Reimplemented from QtAbstractPropertyManager.

17.713.2.4 value()

```
QDateTime QtDateTimePropertyManager::value (
            const QtProperty * property ) const
```

Returns the given *property's* value.
If the given *property* is not managed by this manager, this function returns an invalid QDateTime object.

See also

setValue()

17.713.2.5 valueChanged

```
void QtDateTimePropertyManager::valueChanged (
            QtProperty * property,
            const QDateTime & value )  [signal]
```

This signal is emitted whenever a property created by this manager changes its value, passing a pointer to the *property* and the new *value* as parameters.

17.713.2.6 valueText()

```

17.716.1 Constructor & Destructor Documentation

17.716.1.1 QtDoublePropertyManager()

```
QtDoublePropertyManager::QtDoublePropertyManager (
            QObject * parent = 0 )
```

Creates a manager with the given *parent*.

17.716.1.2 ~QtDoublePropertyManager()

```
QtDoublePropertyManager::~QtDoublePropertyManager ( )
```

Destroys this manager, and all the properties it has created.

17.716.2 Member Function Documentation

17.716.2.1 decimals()

```
int QtDoublePropertyManager::decimals (
            const QtProperty * property ) const
```

Returns the given *property's* precision, in decimals.

See also

setDecimals()

17.716.2.2 decimalsChanged

```
void QtDoublePropertyManager::decimalsChanged (
            QtProperty * property,
            int prec )  [signal]
```

This signal is emitted whenever a property created by this manager changes its precision of value, passing a pointer to the *property* and the new *prec* value

See also

setDecimals()

17.716.2.3 initializeProperty()

```
void QtDoublePropertyManager::initializeProperty (
            QtProperty * property )  [override], [protected], [virtual]
```

\reimp
Implements QtAbstractPropertyManager.

17.716.2.4 maximum()

```
double QtDoublePropertyManager::maximum (
            const QtProperty * property ) const
```

Returns the given *property's* maximum value.

See also

minimum(), setRange()

17.716.2.5 minimum()

```
double QtDoublePropertyManager::minimum (
            const QtProperty * property ) const
```

Returns the given *property's* minimum value.

See also

maximum(), setRange()

17.716.2.6 rangeChanged

```
void QtDoublePropertyManager::rangeChanged (
            QtProperty * property,
            double minimum,
            double maximum )  [signal]
```

This signal is emitted whenever a property created by this manager changes its range of valid values, passing a pointer to the *property* and the new *minimum* and *maximum* values

See also

setRange()

17.716.2.7 setDecimals

```
void QtDoublePropertyManager::setDecimals (
            QtProperty * property,
            int prec )  [slot]
```

Sets the precision of the given *property* to *prec*.
The valid decimal range is 0-13. The default is 2.

See also

decimals()

17.716.2.8 setMaximum

```
void QtDoublePropertyManager::setMaximum (
            QtProperty * property,
            double maxVal )  [slot]
```

Sets the maximum value for the given *property* to *maxVal*.
When setting the maximum value, the minimum and current values are adjusted if necessary (ensuring that the range remains valid and that the current value is within in the range).

See also

maximum(), setRange(), rangeChanged()

17.716.2.9 setMinimum

```
void QtDoublePropertyManager::setMinimum (
            QtProperty * property,
            double minVal )  [slot]
```

Sets the minimum value for the given *property* to *minVal*.
When setting the minimum value, the maximum and current values are adjusted if necessary (ensuring that the range remains valid and that the current value is within in the range).

See also

minimum(), setRange(), rangeChanged()

17.716.2.10 setRange

```
void QtDoublePropertyManager::setRange (
            QtProperty * property,
            double minimum,
            double maximum )  [slot]
```

Sets the range of valid values.
This is a convenience function defining the range of valid values in one go; setting the *minimum* and *maximum* values for the given *property* with a single function call.
When setting a new range, the current value is adjusted if necessary (ensuring that the value remains within range).

See also

setMinimum(), setMaximum(), rangeChanged()

17.716.2.11 setSingleStep

```
void QtDoublePropertyManager::setSingleStep (
            QtProperty * property,
            double step )  [slot]
```

Sets the step value for the given *property* to *step*.
The step is typically used to increment or decrement a property value while pressing an arrow key.

See also

singleStep()

17.716.2.12 setValue

```
void QtDoublePropertyManager::setValue (
            QtProperty * property,
            double value )  [slot]
```

Sets the value of the given *property* to *value*.
If the specified *value* is not valid according to the given *property's* range, the *value* is adjusted to the nearest valid value within the range.

See also

value(), setRange(), valueChanged()

17.716.2.13 singleStep()

```
double QtDoublePropertyManager::singleStep (
            const QtProperty * property ) const
```

Returns the given *property's* step value.
The step is typically used to increment or decrement a property value while pressing an arrow key.

See also

setSingleStep()

17.716.2.14 singleStepChanged

```
void QtDoublePropertyManager::singleStepChanged (
            QtProperty * property,
            double step )  [signal]
```

This signal is emitted whenever a property created by this manager changes its single step property, passing a pointer to the *property* and the new *step* value

See also

setSingleStep()

17.716.2.15 uninitializeProperty()

```
void QtDoublePropertyManager::uninitializeProperty (
            QtProperty * property )  [override], [protected], [virtual]
```

\reimp
Reimplemented from QtAbstractPropertyManager.

17.716.2.16 value()

```
double QtDoublePropertyManager::value (
            const QtProperty * property ) const
```

Returns the given *property's* value.
If the given property is not managed by this manager, this function returns 0.

See also

setValue()

17.716.2.17 valueChanged

```
void QtDoublePropertyManager::valueChanged (
            QtProperty * property,
            double value )  [signal]
```

This signal is emitted whenever a property created by this manager changes its value, passing a pointer to the *property* and the new *value* as parameters.

See also

setValue()

17.716.2.18 valueText()

```
QString QtDoublePropertyManager::valueText (
            const QtProperty * property ) const  [override], [protected], [virtual]
```

\reimp
Reimplemented from QtAbstractPropertyManager.

17.722.1 Constructor & Destructor Documentation

17.722.1.1 QtEnumPropertyManager()

```
QtEnumPropertyManager::QtEnumPropertyManager (
            QObject * parent = 0 )
```

Creates a manager with the given *parent*.

17.722.1.2 ~QtEnumPropertyManager()

```
QtEnumPropertyManager::~QtEnumPropertyManager ( )
```

Destroys this manager, and all the properties it has created.

17.722.2 Member Function Documentation

17.722.2.1 enumIcons()

```
QMap< int, QIcon > QtEnumPropertyManager::enumIcons (
            const QtProperty * property ) const
```

Returns the given *property's* map of enum values to their icons.

See also

value(), setEnumIcons()

17.722.2.2 enumIconsChanged

```
void QtEnumPropertyManager::enumIconsChanged (
            QtProperty * property,
            const QMap< int, QIcon > & icons )  [signal]
```

This signal is emitted whenever a property created by this manager changes its enum icons, passing a pointer to the *property* and the new mapping of values to *icons* as parameters.

See also

setEnumIcons()

17.722.2.3 enumNames()

```
QStringList QtEnumPropertyManager::enumNames (
            const QtProperty * property ) const
```

Returns the given *property's* list of enum names.

See also

value(), setEnumNames()

17.722.2.4 enumNamesChanged

```
void QtEnumPropertyManager::enumNamesChanged (
            QtProperty * property,
            const QStringList & names )  [signal]
```

This signal is emitted whenever a property created by this manager changes its enum names, passing a pointer to the *property* and the new *names* as parameters.

See also

setEnumNames()

17.722.2.5 initializeProperty()

```
void QtEnumPropertyManager::initializeProperty (
            QtProperty * property )  [override], [protected], [virtual]
```

\reimp
Implements QtAbstractPropertyManager.

17.722.2.6 setEnumIcons

```
void QtEnumPropertyManager::setEnumIcons (
            QtProperty * property,
            const QMap< int, QIcon > & enumIcons )  [slot]
```

Sets the given *property's* map of enum values to their icons to *enumIcons*.
Each enum value can have associated icon. This association is represented with passed *enumIcons* map.

See also

enumNames(), enumNamesChanged()

17.722.2.7 setEnumNames

```
void QtEnumPropertyManager::setEnumNames (
            QtProperty * property,
            const QStringList & enumNames )  [slot]
```

Sets the given *property's* list of enum names to *enumNames*. The *property's* current value is reset to 0 indicating the first item of the list.
If the specified *enumNames* list is empty, the *property's* current value is set to -1.

See also

enumNames(), enumNamesChanged()

17.722.2.8 setValue

```
void QtEnumPropertyManager::setValue (
            QtProperty * property,
            int value )  [slot]
```

Sets the value of the given *property* to *value*.
The specified *value* must be less than the size of the given *property's* enumNames() list. Use -1 to leave the editor without a current selection.

See also

value(), valueChanged()

17.722.2.9 uninitializeProperty()

```
void QtEnumPropertyManager::uninitializeProperty (
            QtProperty * property )  [override], [protected], [virtual]
```

\reimp
Reimplemented from QtAbstractPropertyManager.

17.722.2.10 value()

```
int QtEnumPropertyManager::value (
            const QtProperty * property ) const
```

Returns the given *property's* value which is an index in the list returned by enumNames()
If the given property is not managed by this manager, this function returns -1.

See also

enumNames(), setValue()

17.722.2.11 valueChanged

```
void QtEnumPropertyManager::valueChanged (
            QtProperty * property,
            int value )  [signal]
```

This signal is emitted whenever a property created by this manager changes its value, passing a pointer to the *property* and the new *value* as parameters.

See also

setValue()

17.722.2.12 valueIcon()

```
QIcon QtEnumPropertyManager::valueIcon (
            const QtProperty * property ) const  [override], [protected], [virtual]
```

\reimp
Reimplemented from QtAbstractPropertyManager.

17.722.2.13 valueText()

```
QString QtEnumPropertyManager::valueText (
            const QtProperty * property ) const  [override], [protected], [virtual]
```

\reimp
Reimplemented from QtAbstractPropertyManager.

- virtual QIcon valueIcon (const QtProperty *property) const
- virtual QtProperty * createProperty ()

17.725.1 Constructor & Destructor Documentation

17.725.1.1 QtFlagPropertyManager()

```
QtFlagPropertyManager::QtFlagPropertyManager (
            QObject * parent = 0 )
```

Creates a manager with the given *parent*.

17.725.1.2 ~QtFlagPropertyManager()

```
QtFlagPropertyManager::~QtFlagPropertyManager ( )
```

Destroys this manager, and all the properties it has created.

17.725.2 Member Function Documentation

17.725.2.1 flagNames()

```
QStringList QtFlagPropertyManager::flagNames (
            const QtProperty * property ) const
```

Returns the given *property's* list of flag names.

See also

value(), setFlagNames()

17.725.2.2 flagNamesChanged

```
void QtFlagPropertyManager::flagNamesChanged (
            QtProperty * property,
            const QStringList & names )  [signal]
```

This signal is emitted whenever a property created by this manager changes its flag names, passing a pointer to the *property* and the new *names* as parameters.

See also

setFlagNames()

17.725.2.3 initializeProperty()

```
void QtFlagPropertyManager::initializeProperty (
            QtProperty * property )  [override], [protected], [virtual]
```

\reimp
Implements QtAbstractPropertyManager.

17.725.2.4 setFlagNames

```
void QtFlagPropertyManager::setFlagNames (
            QtProperty * property,
            const QStringList & flagNames )  [slot]
```

Sets the given *property's* list of flag names to *flagNames*. The property's current value is reset to 0 indicating the first item of the list.

See also

flagNames(), flagNamesChanged()

17.725.2.5 setValue

```
void QtFlagPropertyManager::setValue (
            QtProperty * property,
            int value )  [slot]
```

Sets the value of the given *property* to *value*. Nested properties are updated automatically.
The specified *value* must be less than the binary combination of the property's flagNames() list size (i.e. less than 2\sup n, where n is the size of the list) and larger than (or equal to) 0.

See also

value(), valueChanged()

17.725.2.6 subBoolPropertyManager()

```
QtBoolPropertyManager * QtFlagPropertyManager::subBoolPropertyManager ( ) const
```

Returns the manager that produces the nested boolean subproperties representing each flag.
In order to provide editing widgets for the subproperties in a property browser widget, this manager must be associated with an editor factory.

See also

QtAbstractPropertyBrowser::setFactoryForManager()

17.725.2.7 uninitializeProperty()

```
void QtFlagPropertyManager::uninitializeProperty (
            QtProperty * property )  [override], [protected], [virtual]
```

\reimp
Reimplemented from QtAbstractPropertyManager.

17.725.2.8 value()

```
int QtFlagPropertyManager::value (
            const QtProperty * property ) const
```

Returns the given *property's* value.
If the given property is not managed by this manager, this function returns 0.

See also

flagNames(), setValue()

17.725.2.9 valueChanged

```
void QtFlagPropertyManager::valueChanged (
            QtProperty * property,
            int value )  [signal]
```

This signal is emitted whenever a property created by this manager changes its value, passing a pointer to the *property* and the new *value* as parameters.

See also

setValue()

17.725.2.10 valueText()

```
QString QtFlagPropertyManager::valueText (
            const QtProperty * property ) const  [override], [protected], [virtual]
```

\reimp
Reimplemented from QtAbstractPropertyManager.

17.731.1.1 QtFontPropertyManager()

```
QtFontPropertyManager::QtFontPropertyManager (
            QObject * parent = 0 )
```

Creates a manager with the given *parent*.

17.731.1.2 ∼QtFontPropertyManager()

```
QtFontPropertyManager::~QtFontPropertyManager ( )
```

Destroys this manager, and all the properties it has created.

17.731.2 Member Function Documentation

17.731.2.1 initializeProperty()

```
void QtFontPropertyManager::initializeProperty (
            QtProperty * property )  [override], [protected], [virtual]
```

\reimp
Implements QtAbstractPropertyManager.

17.731.2.2 setValue

```
void QtFontPropertyManager::setValue (
            QtProperty * property,
            const QFont & value )  [slot]
```

Sets the value of the given *property* to *value*. Nested properties are updated automatically.

See also

value(), valueChanged()

17.731.2.3 subBoolPropertyManager()

```
QtBoolPropertyManager * QtFontPropertyManager::subBoolPropertyManager ( ) const
```

Returns the manager that creates the *bold*, *italic*, *underline*, *strikeOut* and *kerning* subproperties.
In order to provide editing widgets for the mentioned properties in a property browser widget, this manager must be associated with an editor factory.

See also

QtAbstractPropertyBrowser::setFactoryForManager()

17.731.2.4 subEnumPropertyManager()

```
QtEnumPropertyManager * QtFontPropertyManager::subEnumPropertyManager ( ) const
```

Returns the manager that create the *family* subproperty.
In order to provide editing widgets for the *family* property in a property browser widget, this manager must be associated with an editor factory.

See also

QtAbstractPropertyBrowser::setFactoryForManager()

17.731.2.5 subIntPropertyManager()

```
QtIntPropertyManager * QtFontPropertyManager::subIntPropertyManager ( ) const
```

Returns the manager that creates the *pointSize* subproperty.
In order to provide editing widgets for the *pointSize* property in a property browser widget, this manager must be associated with an editor factory.

See also

QtAbstractPropertyBrowser::setFactoryForManager()

17.731.2.6 uninitializeProperty()

```
void QtFontPropertyManager::uninitializeProperty (
            QtProperty * property )  [override], [protected], [virtual]
```

\reimp
Reimplemented from QtAbstractPropertyManager.

17.731.2.7 value()

```
QFont QtFontPropertyManager::value (
            const QtProperty * property ) const
```

Returns the given *property's* value.
If the given property is not managed by this manager, this function returns a font object that uses the application's default font.

See also

setValue()

17.731.2.8 valueChanged

```
void QtFontPropertyManager::valueChanged (
            QtProperty * property,
            const QFont & value )  [signal]
```

This signal is emitted whenever a property created by this manager changes its value, passing a pointer to the *property* and the new *value* as parameters.

See also

setValue()

17.731.2.9 valueIcon()

```
QIcon QtFontPropertyManager::valueIcon (
            const QtProperty * property ) const  [override], [protected], [virtual]
```

\reimp
Reimplemented from QtAbstractPropertyManager.

17.731.2.10 valueText()

```
QString QtFontPropertyManager::valueText (
            const QtProperty * property ) const  [override], [protected], [virtual]
```

\reimp
Reimplemented from QtAbstractPropertyManager.

17.733.1 Constructor & Destructor Documentation

17.733.1.1 QtGroupBoxPropertyBrowser()

```
QtGroupBoxPropertyBrowser::QtGroupBoxPropertyBrowser (
            QWidget * parent = 0 )
```

Creates a property browser with the given *parent*.

17.733.1.2 ~QtGroupBoxPropertyBrowser()

```
QtGroupBoxPropertyBrowser::~QtGroupBoxPropertyBrowser ( )
```

Destroys this property browser.
Note that the properties that were inserted into this browser are *not* destroyed since they may still be used in other browsers. The properties are owned by the manager that created them.

- virtual QtProperty * createProperty ()

17.738.1 Constructor & Destructor Documentation

17.738.1.1 QtIntPropertyManager()

```
QtIntPropertyManager::QtIntPropertyManager (
            QObject * parent = 0 )
```

Creates a manager with the given *parent*.

17.738.1.2 ~QtIntPropertyManager()

```
QtIntPropertyManager::~QtIntPropertyManager ( )
```

Destroys this manager, and all the properties it has created.

17.738.2 Member Function Documentation

17.738.2.1 initializeProperty()

```
void QtIntPropertyManager::initializeProperty (
            QtProperty * property )  [override], [protected], [virtual]
```

\reimp
Implements QtAbstractPropertyManager.

17.738.2.2 maximum()

```
int QtIntPropertyManager::maximum (
            const QtProperty * property ) const
```

Returns the given *property's* maximum value.

See also

setMaximum(), minimum(), setRange()

17.738.2.3 minimum()

```
int QtIntPropertyManager::minimum (
            const QtProperty * property ) const
```

Returns the given *property's* minimum value.

See also

setMinimum(), maximum(), setRange()

17.738.2.4 rangeChanged

```
void QtIntPropertyManager::rangeChanged (
            QtProperty * property,
            int minimum,
            int maximum )  [signal]
```

This signal is emitted whenever a property created by this manager changes its range of valid values, passing a pointer to the *property* and the new *minimum* and *maximum* values.

See also

setRange()

17.738.2.5 setMaximum

```
void QtIntPropertyManager::setMaximum (
            QtProperty * property,
            int maxVal )  [slot]
```

Sets the maximum value for the given *property* to *maxVal*.
When setting maximum value, the minimum and current values are adjusted if necessary (ensuring that the range remains valid and that the current value is within the range).

See also

maximum(), setRange(), rangeChanged()

17.738.2.6 setMinimum

```
void QtIntPropertyManager::setMinimum (
            QtProperty * property,
            int minVal )  [slot]
```

Sets the minimum value for the given *property* to *minVal*.
When setting the minimum value, the maximum and current values are adjusted if necessary (ensuring that the range remains valid and that the current value is within the range).

See also

minimum(), setRange(), rangeChanged()

17.738.2.7 setRange

```
void QtIntPropertyManager::setRange (
            QtProperty * property,
            int minimum,
            int maximum )  [slot]
```

Sets the range of valid values.
This is a convenience function defining the range of valid values in one go; setting the *minimum* and *maximum* values for the given *property* with a single function call.
When setting a new range, the current value is adjusted if necessary (ensuring that the value remains within range).

See also

setMinimum(), setMaximum(), rangeChanged()

17.738.2.8 setSingleStep

```
void QtIntPropertyManager::setSingleStep (
            QtProperty * property,
            int step )  [slot]
```

Sets the step value for the given *property* to *step*.
The step is typically used to increment or decrement a property value while pressing an arrow key.

See also

singleStep()

17.738.2.9 setValue

```
void QtIntPropertyManager::setValue (
            QtProperty * property,
            int value )  [slot]
```

Sets the value of the given *property* to *value*.
If the specified *value* is not valid according to the given *property's* range, the *value* is adjusted to the nearest valid value within the range.

See also

value(), setRange(), valueChanged()

17.738.2.10 singleStep()

```
int QtIntPropertyManager::singleStep (
            const QtProperty * property ) const
```

Returns the given *property's* step value.
The step is typically used to increment or decrement a property value while pressing an arrow key.

See also

setSingleStep()

17.738.2.11 singleStepChanged

```
void QtIntPropertyManager::singleStepChanged (
            QtProperty * property,
            int step )  [signal]
```

This signal is emitted whenever a property created by this manager changes its single step property, passing a pointer to the *property* and the new *step* value

See also

setSingleStep()

17.738.2.12 uninitializeProperty()

```
void QtIntPropertyManager::uninitializeProperty (
            QtProperty * property )  [override], [protected], [virtual]
```

\reimp
Reimplemented from QtAbstractPropertyManager.

17.738.2.13 value()

```
int QtIntPropertyManager::value (
            const QtProperty * property ) const
```

Returns the given *property's* value.
If the given property is not managed by this manager, this function returns 0.

See also

setValue()

17.738.2.14 valueChanged

```
void QtIntPropertyManager::valueChanged (
            QtProperty * property,
            int value )  [signal]
```

This signal is emitted whenever a property created by this manager changes its value, passing a pointer to the *property* and the new *value* as parameters.

See also

setValue()

17.738.2.15 valueText()

```
QString QtIntPropertyManager::valueText (
            const QtProperty * property ) const  [override], [protected], [virtual]
```

\reimp
Reimplemented from QtAbstractPropertyManager.

17.742.1 Constructor & Destructor Documentation

17.742.1.1 QtKeySequencePropertyManager()

```
QtKeySequencePropertyManager::QtKeySequencePropertyManager (
            QObject * parent = 0 )
```

Creates a manager with the given *parent*.

17.742.1.2 ∼QtKeySequencePropertyManager()

```
QtKeySequencePropertyManager::~QtKeySequencePropertyManager ( )
```

Destroys this manager, and all the properties it has created.

17.742.2 Member Function Documentation

17.742.2.1 initializeProperty()

```
void QtKeySequencePropertyManager::initializeProperty (
            QtProperty * property )  [override], [protected], [virtual]
```

\reimp
Implements QtAbstractPropertyManager.

17.742.2.2 setValue

```
void QtKeySequencePropertyManager::setValue (
            QtProperty * property,
            const QKeySequence & value )  [slot]
```

Sets the value of the given *property* to *value*.

See also

value(), valueChanged()

17.742.2.3 uninitializeProperty()

```
void QtKeySequencePropertyManager::uninitializeProperty (
            QtProperty * property )  [override], [protected], [virtual]
```

\reimp
Reimplemented from QtAbstractPropertyManager.

17.742.2.4 value()

```
QKeySequence QtKeySequencePropertyManager::value (
            const QtProperty * property ) const
```

Returns the given *property's* value.
If the given *property* is not managed by this manager, this function returns an empty QKeySequence object.

See also

setValue()

17.742.2.5 valueChanged

```
void QtKeySequencePropertyManager::valueChanged (
            QtProperty * property,
            const QKeySequence & value )  [signal]
```

This signal is emitted whenever a property created by this manager changes its value, passing a pointer to the *property* and the new *value* as parameters.

17.742.2.6 valueText()

```
QString QtKeySequencePropertyManager::valueText (
            const QtProperty * property ) const  [override], [protected], [virtual]
```

\reimp
Reimplemented from QtAbstractPropertyManager.

17.746.1 Constructor & Destructor Documentation

17.746.1.1 QtLocalePropertyManager()

```
QtLocalePropertyManager::QtLocalePropertyManager (
            QObject * parent = 0 )
```

Creates a manager with the given *parent*.

17.746.1.2 ~QtLocalePropertyManager()

```
QtLocalePropertyManager::~QtLocalePropertyManager ( )
```

Destroys this manager, and all the properties it has created.

17.746.2 Member Function Documentation

17.746.2.1 initializeProperty()

```
void QtLocalePropertyManager::initializeProperty (
            QtProperty * property )  [override], [protected], [virtual]
```

\reimp

Implements QtAbstractPropertyManager.

17.746.2.2 setValue

```
void QtLocalePropertyManager::setValue (
            QtProperty * property,
            const QLocale & value )  [slot]
```

Sets the value of the given *property* to *value*. Nested properties are updated automatically.

See also

value(), valueChanged()

17.746.2.3 subEnumPropertyManager()

```
QtEnumPropertyManager * QtLocalePropertyManager::subEnumPropertyManager ( ) const
```

Returns the manager that creates the nested *language* and *country* subproperties.
In order to provide editing widgets for the mentioned subproperties in a property browser widget, this manager must be associated with an editor factory.

See also

QtAbstractPropertyBrowser::setFactoryForManager()

17.746.2.4 uninitializeProperty()

```
void QtLocalePropertyManager::uninitializeProperty (
            QtProperty * property )  [override], [protected], [virtual]
```

\reimp
Reimplemented from QtAbstractPropertyManager.

17.746.2.5 value()

```
QLocale QtLocalePropertyManager::value (
            const QtProperty * property ) const
```

Returns the given *property's* value.
If the given property is not managed by this manager, this function returns the default locale.

See also

setValue()

17.746.2.6 valueChanged

```
void QtLocalePropertyManager::valueChanged (
            QtProperty * property,
            const QLocale & value )  [signal]
```

This signal is emitted whenever a property created by this manager changes its value, passing a pointer to the *property* and the new *value* as parameters.

See also

setValue()

17.746.2.7 valueText()

```
QString QtLocalePropertyManager::valueText (
            const QtProperty * property ) const  [override], [protected], [virtual]
```

\reimp
Reimplemented from QtAbstractPropertyManager.
The documentation for this class was generated from the following files:

- applications/gui/genesys/propertyeditor/qtpropertybrowser/qtpropertymanager.h
- applications/gui/genesys/propertyeditor/qtpropertybrowser/qtpropertymanager.cpp

- virtual QtProperty * createProperty ()

17.751.1 Constructor & Destructor Documentation

17.751.1.1 QtPointFPropertyManager()

```
QtPointFPropertyManager::QtPointFPropertyManager (
            QObject * parent = 0 )
```

Creates a manager with the given *parent*.

17.751.1.2 ~QtPointFPropertyManager()

```
QtPointFPropertyManager::~QtPointFPropertyManager ( )
```

Destroys this manager, and all the properties it has created.

17.751.2 Member Function Documentation

17.751.2.1 decimals()

```
int QtPointFPropertyManager::decimals (
            const QtProperty * property ) const
```

Returns the given *property's* precision, in decimals.

See also

setDecimals()

17.751.2.2 decimalsChanged

```
void QtPointFPropertyManager::decimalsChanged (
            QtProperty * property,
            int prec )  [signal]
```

This signal is emitted whenever a property created by this manager changes its precision of value, passing a pointer to the *property* and the new *prec* value

See also

setDecimals()

17.751.2.3 initializeProperty()

```
void QtPointFPropertyManager::initializeProperty (
            QtProperty * property )  [override], [protected], [virtual]
```

\reimp
Implements QtAbstractPropertyManager.

17.751.2.4 setDecimals

```
void QtPointFPropertyManager::setDecimals (
            QtProperty * property,
            int prec )  [slot]
```

Sets the precision of the given *property* to *prec*.
The valid decimal range is 0-13. The default is 2.

See also

decimals()

17.751.2.5 setValue

```
void QtPointFPropertyManager::setValue (
            QtProperty * property,
            const QPointF & value )  [slot]
```

Sets the value of the given *property* to *value*. Nested properties are updated automatically.

See also

value(), valueChanged()

17.751.2.6 subDoublePropertyManager()

```
QtDoublePropertyManager * QtPointFPropertyManager::subDoublePropertyManager ( ) const
```

Returns the manager that creates the nested *x* and *y* subproperties.
In order to provide editing widgets for the subproperties in a property browser widget, this manager must be associated with an editor factory.

See also

QtAbstractPropertyBrowser::setFactoryForManager()

17.751.2.7 uninitializeProperty()

```
void QtPointFPropertyManager::uninitializeProperty (
            QtProperty * property )  [override], [protected], [virtual]
```

\reimp
Reimplemented from QtAbstractPropertyManager.

17.751.2.8 value()

```
QPointF QtPointFPropertyManager::value (
            const QtProperty * property ) const
```

Returns the given *property's* value.
If the given *property* is not managed by this manager, this function returns a point with coordinates (0, 0).

See also

setValue()

17.751.2.9 valueChanged

```
void QtPointFPropertyManager::valueChanged (
            QtProperty * property,
            const QPointF & value )  [signal]
```

This signal is emitted whenever a property created by this manager changes its value, passing a pointer to the *property* and the new *value* as parameters.

See also

setValue()

17.751.2.10 valueText()

```
QString QtPointFPropertyManager::valueText (
            const QtProperty * property ) const  [override], [protected], [virtual]
```

\reimp
Reimplemented from QtAbstractPropertyManager.
The documentation for this class was generated from the following files:

- applications/gui/genesys/propertyeditor/qtpropertybrowser/qtpropertymanager.h
- applications/gui/genesys/propertyeditor/qtpropertybrowser/qtpropertymanager.cpp

Friends

- class **QtAbstractPropertyManager**

17.755.1 Constructor & Destructor Documentation

17.755.1.1 ~QtProperty()

```
QtProperty::~QtProperty ( )  [virtual]
```

Destroys this property.
Note that subproperties are detached but not destroyed, i.e. they can still be used in another context.

See also

QtAbstractPropertyManager::clear()

17.755.1.2 QtProperty()

```
QtProperty::QtProperty (
            QtAbstractPropertyManager * manager )  [explicit], [protected]
```

Creates a property with the given *manager*.
This constructor is only useful when creating a custom QtProperty subclass (e.g. QtVariantProperty). To create a regular QtProperty object, use the QtAbstractPropertyManager::addProperty() function instead.

See also

QtAbstractPropertyManager::addProperty()

17.755.2 Member Function Documentation

17.755.2.1 addSubProperty()

```
void QtProperty::addSubProperty (
            QtProperty * property )
```

Appends the given *property* to this property's subproperties.
If the given *property* already is added, this function does nothing.

See also

insertSubProperty(), removeSubProperty()

17.755.2.2 descriptionToolTip()

```
QString QtProperty::descriptionToolTip ( ) const
```

Returns the property description's tool tip.
This is suitable for tool tips over the description (label).

Since

5.6

See also

setDescriptionToolTip()

17.755.2.3 hasValue()

```
bool QtProperty::hasValue ( ) const
```

Returns whether the property has a value.

See also

QtAbstractPropertyManager::hasValue()

17.755.2.4 insertSubProperty()

```
void QtProperty::insertSubProperty (
            QtProperty * property,
            QtProperty * precedingProperty )
```

Inserts the given *property* after the specified *precedingProperty* into this property's list of subproperties. If *precedingProperty* is 0, the specified *property* is inserted at the beginning of the list.
If the given *property* already is inserted, this function does nothing.

See also

addSubProperty(), removeSubProperty()

17.755.2.5 isEnabled()

```
bool QtProperty::isEnabled ( ) const
```

Returns whether the property is enabled.

See also

setEnabled()

17.755.2.6 isModified()

```
bool QtProperty::isModified ( ) const
```

Returns whether the property is modified.

See also

setModified()

17.755.2.7 propertyManager()

```
QtAbstractPropertyManager * QtProperty::propertyManager ( ) const
```

Returns a pointer to the manager that owns this property.

17.755.2.8 propertyName()

```
QString QtProperty::propertyName ( ) const
```

Returns the property's name.

See also

setPropertyName()

17.755.2.9 removeSubProperty()

```
void QtProperty::removeSubProperty (
            QtProperty * property )
```

Removes the given *property* from the list of subproperties without deleting it.

See also

addSubProperty(), insertSubProperty()

17.755.2.10 setDescriptionToolTip()

```
void QtProperty::setDescriptionToolTip (
            const QString & text )
```

Sets the property description's tool tip to the given *text*.

Since

5.6

See also

descriptionToolTip()

17.755.2.11 setEnabled()

```
void QtProperty::setEnabled (
            bool enable )
```

Enables or disables the property according to the passed *enable* value.

See also

isEnabled()

17.755.2.12 setModified()

```
void QtProperty::setModified (
            bool modified )
```

Sets the property's modified state according to the passed *modified* value.

See also

isModified()

17.755.2.13 setPropertyName()

```
void QtProperty::setPropertyName (
            const QString & name )
```

Sets the property's name to the given *name*.

See also

propertyName()

17.755.2.14 setStatusTip()

```
void QtProperty::setStatusTip (
            const QString & text )
```

Sets the property's status tip to the given *text*.

See also

statusTip()

17.755.2.15 setValueToolTip()

```
void QtProperty::setValueToolTip (
            const QString & text )
```

Sets the property value's tool tip to the given *text*.

Since

5.6

See also

valueToolTip()

17.755.2.16 setWhatsThis()

```
void QtProperty::setWhatsThis (
            const QString & text )
```

Sets the property's "What's This" help text to the given *text*.

See also

whatsThis()

17.755.2.17 statusTip()

```
QString QtProperty::statusTip ( ) const
```

Returns the property's status tip.

See also

setStatusTip()

17.755.2.18 subProperties()

```
QList< QtProperty * > QtProperty::subProperties ( ) const
```

Returns the set of subproperties.
Note that subproperties are not owned by *this* property, but by the manager that created them.

See also

insertSubProperty(), removeSubProperty()

17.755.2.19 valueIcon()

```
QIcon QtProperty::valueIcon ( ) const
```

Returns an icon representing the current state of this property.
If the given property type can not generate such an icon, this function returns an invalid icon.

See also

QtAbstractPropertyManager::valueIcon()

17.755.2.20 valueText()

```
QString QtProperty::valueText ( ) const
```

Returns a string representing the current state of this property.
If the given property type can not generate such a string, this function returns an empty string.

See also

QtAbstractPropertyManager::valueText()

17.755.2.21 valueToolTip()

```
QString QtProperty::valueToolTip ( ) const
```

Returns the property value's tool tip.
This is suitable for tool tips over the value (item delegate).

Since

5.6

See also

setValueToolTip()

17.755.2.22 whatsThis()

```
QString QtProperty::whatsThis ( ) const
```

Returns the property's "What's This" help text.

See also

setWhatsThis()

17.760.1 Constructor & Destructor Documentation

17.760.1.1 QtRectFPropertyManager()

```
QtRectFPropertyManager::QtRectFPropertyManager (
            QObject * parent = 0 )
```

Creates a manager with the given *parent*.

17.760.1.2 ~QtRectFPropertyManager()

```
QtRectFPropertyManager::~QtRectFPropertyManager ( )
```

Destroys this manager, and all the properties it has created.

17.760.2 Member Function Documentation

17.760.2.1 constraint()

```
QRectF QtRectFPropertyManager::constraint (
            const QtProperty * property ) const
```

Returns the given *property's* constraining rectangle. If returned value is null QRectF it means there is no constraint applied.

See also

value(), setConstraint()

17.760.2.2 constraintChanged

```
void QtRectFPropertyManager::constraintChanged (
            QtProperty * property,
            const QRectF & constraint )  [signal]
```

This signal is emitted whenever property changes its constraint rectangle, passing a pointer to the *property* and the new *constraint* rectangle as parameters.

See also

setConstraint()

17.760.2.3 decimals()

```
int QtRectFPropertyManager::decimals (
            const QtProperty * property ) const
```

Returns the given *property's* precision, in decimals.

See also

setDecimals()

17.760.2.4 decimalsChanged

```
void QtRectFPropertyManager::decimalsChanged (
            QtProperty * property,
            int prec )  [signal]
```

This signal is emitted whenever a property created by this manager changes its precision of value, passing a pointer to the *property* and the new *prec* value

See also

setDecimals()

17.760.2.5 initializeProperty()

```
void QtRectFPropertyManager::initializeProperty (
            QtProperty * property )  [override], [protected], [virtual]
```

\reimp
Implements QtAbstractPropertyManager.

17.760.2.6 setConstraint

```
void QtRectFPropertyManager::setConstraint (
            QtProperty * property,
            const QRectF & constraint )  [slot]
```

Sets the given *property's* constraining rectangle to *constraint*.
When setting the constraint, the current value is adjusted if necessary (ensuring that the current rectangle value is inside the constraint). In order to reset the constraint pass a null QRectF value.

See also

setValue(), constraint(), constraintChanged()

17.760.2.7 setDecimals

```
void QtRectFPropertyManager::setDecimals (
            QtProperty * property,
            int prec )  [slot]
```

Sets the precision of the given *property* to *prec*.
The valid decimal range is 0-13. The default is 2.

See also

decimals()

17.760.2.8 setValue

```
void QtRectFPropertyManager::setValue (
            QtProperty * property,
            const QRectF & value )  [slot]
```

Sets the value of the given *property* to *value*. Nested properties are updated automatically.
If the specified *value* is not inside the given *property's* constraining rectangle, the value is adjusted accordingly to fit within the constraint.

See also

value(), setConstraint(), valueChanged()

17.760.2.9 subDoublePropertyManager()

```
QtDoublePropertyManager * QtRectFPropertyManager::subDoublePropertyManager ( ) const
```

Returns the manager that creates the nested *x*, *y*, *width* and *height* subproperties.
In order to provide editing widgets for the mentioned subproperties in a property browser widget, this manager must be associated with an editor factory.

See also

QtAbstractPropertyBrowser::setFactoryForManager()

17.760.2.10 uninitializeProperty()

```
void QtRectFPropertyManager::uninitializeProperty (
            QtProperty * property )  [override], [protected], [virtual]
```

\reimp
Reimplemented from QtAbstractPropertyManager.

17.760.2.11 value()

```
QRectF QtRectFPropertyManager::value (
            const QtProperty * property ) const
```

Returns the given *property's* value.
If the given *property* is not managed by this manager, this function returns an invalid rectangle.

See also

setValue(), constraint()

17.760.2.12 valueChanged

```
void QtRectFPropertyManager::valueChanged (
            QtProperty * property,
            const QRectF & value )  [signal]
```

This signal is emitted whenever a property created by this manager changes its value, passing a pointer to the *property* and the new *value* as parameters.

See also

setValue()

17.760.2.13 valueText()

```
QString QtRectFPropertyManager::valueText (
            const QtProperty * property ) const  [override], [protected], [virtual]
```

\reimp
Reimplemented from QtAbstractPropertyManager.
The documentation for this class was generated from the following files:

- applications/gui/genesys/propertyeditor/qtpropertybrowser/qtpropertymanager.h
- applications/gui/genesys/propertyeditor/qtpropertybrowser/qtpropertymanager.cpp

17.762.1 Constructor & Destructor Documentation

17.762.1.1 QtRectPropertyManager()

```
QtRectPropertyManager::QtRectPropertyManager (
            QObject * parent = 0 )
```

Creates a manager with the given *parent*.

17.762.1.2 ~QtRectPropertyManager()

```
QtRectPropertyManager::~QtRectPropertyManager ( )
```

Destroys this manager, and all the properties it has created.

17.762.2 Member Function Documentation

17.762.2.1 constraint()

```
QRect QtRectPropertyManager::constraint (
            const QtProperty * property ) const
```

Returns the given *property's* constraining rectangle. If returned value is null QRect it means there is no constraint applied.

See also

value(), setConstraint()

17.762.2.2 constraintChanged

```
void QtRectPropertyManager::constraintChanged (
            QtProperty * property,
            const QRect & constraint )  [signal]
```

This signal is emitted whenever property changes its constraint rectangle, passing a pointer to the *property* and the new *constraint* rectangle as parameters.

See also

setConstraint()

17.762.2.3 initializeProperty()

```
void QtRectPropertyManager::initializeProperty (
            QtProperty * property )  [override], [protected], [virtual]
```

\reimp
Implements QtAbstractPropertyManager.

17.762.2.4 setConstraint

```
void QtRectPropertyManager::setConstraint (
            QtProperty * property,
            const QRect & constraint )  [slot]
```

Sets the given *property's* constraining rectangle to *constraint*.
When setting the constraint, the current value is adjusted if necessary (ensuring that the current rectangle value is inside the constraint). In order to reset the constraint pass a null QRect value.

See also

setValue(), constraint(), constraintChanged()

17.762.2.5 setValue

```
void QtRectPropertyManager::setValue (
            QtProperty * property,
            const QRect & value )  [slot]
```

Sets the value of the given *property* to *value*. Nested properties are updated automatically.
If the specified *value* is not inside the given *property's* constraining rectangle, the value is adjusted accordingly to fit within the constraint.

See also

value(), setConstraint(), valueChanged()

17.762.2.6 subIntPropertyManager()

```
QtIntPropertyManager * QtRectPropertyManager::subIntPropertyManager ( ) const
```

Returns the manager that creates the nested *x*, *y*, *width* and *height* subproperties.
In order to provide editing widgets for the mentioned subproperties in a property browser widget, this manager must be associated with an editor factory.

See also

QtAbstractPropertyBrowser::setFactoryForManager()

17.762.2.7 uninitializeProperty()

```
void QtRectPropertyManager::uninitializeProperty (
            QtProperty * property )  [override], [protected], [virtual]
```

\reimp
Reimplemented from QtAbstractPropertyManager.

17.762.2.8 value()

```
QRect QtRectPropertyManager::value (
            const QtProperty * property ) const
```

Returns the given *property's* value.
If the given *property* is not managed by this manager, this function returns an invalid rectangle.

See also

setValue(), constraint()

17.762.2.9 valueChanged

```
void QtRectPropertyManager::valueChanged (
            QtProperty * property,
            const QRect & value )  [signal]
```

This signal is emitted whenever a property created by this manager changes its value, passing a pointer to the *property* and the new *value* as parameters.

See also

setValue()

17.762.2.10 valueText()

```
QString QtRectPropertyManager::valueText (
            const QtProperty * property ) const  [override], [protected], [virtual]
```

\reimp
Reimplemented from QtAbstractPropertyManager.
The documentation for this class was generated from the following files:

17.766.1 Constructor & Destructor Documentation

17.766.1.1 QtSizeFPropertyManager()

```
QtSizeFPropertyManager::QtSizeFPropertyManager (
            QObject * parent = 0 )
```

Creates a manager with the given *parent*.

17.766.1.2 ~QtSizeFPropertyManager()

```
QtSizeFPropertyManager::~QtSizeFPropertyManager ( )
```

Destroys this manager, and all the properties it has created.

17.766.2 Member Function Documentation

17.766.2.1 decimals()

```
int QtSizeFPropertyManager::decimals (
            const QtProperty * property ) const
```

Returns the given *property's* precision, in decimals.

See also

setDecimals()

17.766.2.2 decimalsChanged

```
void QtSizeFPropertyManager::decimalsChanged (
            QtProperty * property,
            int prec )  [signal]
```

This signal is emitted whenever a property created by this manager changes its precision of value, passing a pointer to the *property* and the new *prec* value

See also

setDecimals()

17.766.2.3 initializeProperty()

```
void QtSizeFPropertyManager::initializeProperty (
            QtProperty * property )  [override], [protected], [virtual]

\reimp
Implements QtAbstractPropertyManager.

17.766.2.4 maximum()

```
QSizeF QtSizeFPropertyManager::maximum (
            const QtProperty * property ) const
```

Returns the given *property's* maximum size value.

See also

setMaximum(), minimum(), setRange()

17.766.2.5 minimum()

```
QSizeF QtSizeFPropertyManager::minimum (
            const QtProperty * property ) const
```

Returns the given *property's* minimum size value.

See also

setMinimum(), maximum(), setRange()

17.766.2.6 rangeChanged

```
void QtSizeFPropertyManager::rangeChanged (
            QtProperty * property,
            const QSizeF & minimum,
            const QSizeF & maximum )  [signal]
```

This signal is emitted whenever a property created by this manager changes its range of valid sizes, passing a pointer to the *property* and the new *minimum* and *maximum* sizes.

See also

setRange()

17.766.2.7 setDecimals

```
void QtSizeFPropertyManager::setDecimals (
            QtProperty * property,
            int prec )  [slot]
```

Sets the precision of the given *property* to *prec*.
The valid decimal range is 0-13. The default is 2.

See also

decimals()

17.766.2.8 setMaximum

```
void QtSizeFPropertyManager::setMaximum (
            QtProperty * property,
            const QSizeF & maxVal )  [slot]
```

Sets the maximum size value for the given *property* to *maxVal*.
When setting the maximum size value, the minimum and current values are adjusted if necessary (ensuring that the size range remains valid and that the current value is within the range).

See also

maximum(), setRange(), rangeChanged()

17.766.2.9 setMinimum

```
void QtSizeFPropertyManager::setMinimum (
            QtProperty * property,
            const QSizeF & minVal )  [slot]
```

Sets the minimum size value for the given *property* to *minVal*.
When setting the minimum size value, the maximum and current values are adjusted if necessary (ensuring that the size range remains valid and that the current value is within the range).

See also

minimum(), setRange(), rangeChanged()

17.766.2.10 setRange

```
void QtSizeFPropertyManager::setRange (
            QtProperty * property,
            const QSizeF & minimum,
            const QSizeF & maximum )  [slot]
```

Sets the range of valid values.
This is a convenience function defining the range of valid values in one go; setting the *minimum* and *maximum* values for the given *property* with a single function call.
When setting a new range, the current value is adjusted if necessary (ensuring that the value remains within the range).

See also

setMinimum(), setMaximum(), rangeChanged()

17.766.2.11 setValue

```
void QtSizeFPropertyManager::setValue (
            QtProperty * property,
            const QSizeF & value )  [slot]
```

Sets the value of the given *property* to *value*.
If the specified *value* is not valid according to the given *property's* size range, the *value* is adjusted to the nearest valid value within the size range.

See also

value(), setRange(), valueChanged()

17.766.2.12 subDoublePropertyManager()

```
QtDoublePropertyManager * QtSizeFPropertyManager::subDoublePropertyManager ( ) const
```

Returns the manager that creates the nested *width* and *height* subproperties.
In order to provide editing widgets for the *width* and *height* properties in a property browser widget, this manager must be associated with an editor factory.

See also

QtAbstractPropertyBrowser::setFactoryForManager()

17.766.2.13 uninitializeProperty()

```
void QtSizeFPropertyManager::uninitializeProperty (
            QtProperty * property )  [override], [protected], [virtual]
```

\reimp
Reimplemented from QtAbstractPropertyManager.

17.766.2.14 value()

```
QSizeF QtSizeFPropertyManager::value (
            const QtProperty * property ) const
```

Returns the given *property's* value.
If the given *property* is not managed by this manager, this function returns an invalid size

See also

setValue()

17.766.2.15 valueChanged

```
void QtSizeFPropertyManager::valueChanged (
            QtProperty * property,
            const QSizeF & value )  [signal]
```

This signal is emitted whenever a property created by this manager changes its value, passing a pointer to the *property* and the new *value* as parameters.

See also

setValue()

17.766.2.16 valueText()

```
QString QtSizeFPropertyManager::valueText (
            const QtProperty * property ) const  [override], [protected], [virtual]
```

\reimp
Reimplemented from QtAbstractPropertyManager.

17.768.1 Constructor & Destructor Documentation

17.768.1.1 QtSizePolicyPropertyManager()

```
QtSizePolicyPropertyManager::QtSizePolicyPropertyManager (
            QObject * parent = 0 )
```

Creates a manager with the given *parent*.

17.768.1.2 ∼QtSizePolicyPropertyManager()

```
QtSizePolicyPropertyManager::~QtSizePolicyPropertyManager ( )
```

Destroys this manager, and all the properties it has created.

17.768.2 Member Function Documentation

17.768.2.1 initializeProperty()

```
void QtSizePolicyPropertyManager::initializeProperty (
            QtProperty * property )  [override], [protected], [virtual]
```

\reimp
Implements QtAbstractPropertyManager.

17.768.2.2 setValue

```
void QtSizePolicyPropertyManager::setValue (
            QtProperty * property,
            const QSizePolicy & value )  [slot]
```

Sets the value of the given *property* to *value*. Nested properties are updated automatically.

See also

value(), valueChanged()

17.768.2.3 subEnumPropertyManager()

```
QtEnumPropertyManager * QtSizePolicyPropertyManager::subEnumPropertyManager ( ) const
```

Returns the manager that creates the nested *horizontalPolicy* and *verticalPolicy* subproperties.
In order to provide editing widgets for the mentioned subproperties in a property browser widget, this manager must be associated with an editor factory.

See also

QtAbstractPropertyBrowser::setFactoryForManager()

17.768.2.4 subIntPropertyManager()

```
QtIntPropertyManager * QtSizePolicyPropertyManager::subIntPropertyManager ( ) const
```

Returns the manager that creates the nested *horizontalStretch* and *verticalStretch* subproperties.
In order to provide editing widgets for the mentioned subproperties in a property browser widget, this manager must be associated with an editor factory.

See also

QtAbstractPropertyBrowser::setFactoryForManager()

17.768.2.5 uninitializeProperty()

```
void QtSizePolicyPropertyManager::uninitializeProperty (
            QtProperty * property )  [override], [protected], [virtual]
```

\reimp
Reimplemented from QtAbstractPropertyManager.

17.768.2.6 value()

```
QSizePolicy QtSizePolicyPropertyManager::value (
            const QtProperty * property ) const
```

Returns the given *property's* value.
If the given property is not managed by this manager, this function returns the default size policy.

See also

setValue()

17.768.2.7 valueChanged

```
void QtSizePolicyPropertyManager::valueChanged (
            QtProperty * property,
            const QSizePolicy & value )  [signal]
```

This signal is emitted whenever a property created by this manager changes its value, passing a pointer to the *property* and the new *value* as parameters.

See also

setValue()

17.768.2.8 valueText()

```
QString QtSizePolicyPropertyManager::valueText (
            const QtProperty * property ) const  [override], [protected], [virtual]
```

\reimp Unknown size policy on reading invalid uic3 files

17.770.1 Constructor & Destructor Documentation

17.770.1.1 QtSizePropertyManager()

```
QtSizePropertyManager::QtSizePropertyManager (
            QObject * parent = 0 )
```

Creates a manager with the given *parent*.

17.770.1.2 ~QtSizePropertyManager()

```
QtSizePropertyManager::~QtSizePropertyManager ( )
```

Destroys this manager, and all the properties it has created.

17.770.2 Member Function Documentation

17.770.2.1 initializeProperty()

```
void QtSizePropertyManager::initializeProperty (
            QtProperty * property )  [override], [protected], [virtual]
```

\reimp

Implements QtAbstractPropertyManager.

17.770.2.2 maximum()

```
QSize QtSizePropertyManager::maximum (
            const QtProperty * property ) const
```

Returns the given *property's* maximum size value.

See also

setMaximum(), minimum(), setRange()

17.770.2.3 minimum()

```
QSize QtSizePropertyManager::minimum (
            const QtProperty * property ) const
```

Returns the given *property's* minimum size value.

See also

setMinimum(), maximum(), setRange()

17.770.2.4 rangeChanged

```
void QtSizePropertyManager::rangeChanged (
            QtProperty * property,
            const QSize & minimum,
            const QSize & maximum )  [signal]
```

This signal is emitted whenever a property created by this manager changes its range of valid sizes, passing a pointer to the *property* and the new *minimum* and *maximum* sizes.

See also

setRange()

17.770.2.5 setMaximum

```
void QtSizePropertyManager::setMaximum (
            QtProperty * property,
            const QSize & maxVal )  [slot]
```

Sets the maximum size value for the given *property* to *maxVal*.
When setting the maximum size value, the minimum and current values are adjusted if necessary (ensuring that the size range remains valid and that the current value is within the range).

See also

maximum(), setRange(), rangeChanged()

17.770.2.6 setMinimum

```
void QtSizePropertyManager::setMinimum (
            QtProperty * property,
            const QSize & minVal )  [slot]
```

Sets the minimum size value for the given *property* to *minVal*.
When setting the minimum size value, the maximum and current values are adjusted if necessary (ensuring that the size range remains valid and that the current value is within the range).

See also

minimum(), setRange(), rangeChanged()

17.770.2.7 setRange

```
void QtSizePropertyManager::setRange (
            QtProperty * property,
            const QSize & minimum,
            const QSize & maximum )  [slot]
```

Sets the range of valid values.
This is a convenience function defining the range of valid values in one go; setting the *minimum* and *maximum* values for the given *property* with a single function call.
When setting a new range, the current value is adjusted if necessary (ensuring that the value remains within the range).

See also

setMinimum(), setMaximum(), rangeChanged()

17.770.2.8 setValue

```
void QtSizePropertyManager::setValue (
            QtProperty * property,
            const QSize & value )  [slot]
```

Sets the value of the given *property* to *value*.
If the specified *value* is not valid according to the given *property's* size range, the *value* is adjusted to the nearest valid value within the size range.

See also

value(), setRange(), valueChanged()

17.770.2.9 subIntPropertyManager()

```
QtIntPropertyManager * QtSizePropertyManager::subIntPropertyManager ( ) const
```

Returns the manager that creates the nested *width* and *height* subproperties.
In order to provide editing widgets for the *width* and *height* properties in a property browser widget, this manager must be associated with an editor factory.

See also

QtAbstractPropertyBrowser::setFactoryForManager()

17.770.2.10 uninitializeProperty()

```
void QtSizePropertyManager::uninitializeProperty (
            QtProperty * property )  [override], [protected], [virtual]
```

\reimp
Reimplemented from QtAbstractPropertyManager.

17.770.2.11 value()

```
QSize QtSizePropertyManager::value (
            const QtProperty * property ) const
```

Returns the given *property's* value.
If the given *property* is not managed by this manager, this function returns an invalid size

See also

setValue()

17.770.2.12 valueChanged

```
void QtSizePropertyManager::valueChanged (
            QtProperty * property,
            const QSize & value )  [signal]
```

This signal is emitted whenever a property created by this manager changes its value, passing a pointer to the *property* and the new *value* as parameters.

See also

setValue()

17.770.2.13 valueText()

```
QString QtSizePropertyManager::valueText (

17.777.1 Constructor & Destructor Documentation

17.777.1.1 QtStringPropertyManager()

```
QtStringPropertyManager::QtStringPropertyManager (
            QObject * parent = 0 )
```

Creates a manager with the given *parent*.

17.777.1.2 ~QtStringPropertyManager()

```
QtStringPropertyManager::~QtStringPropertyManager ( )
```

Destroys this manager, and all the properties it has created.

17.777.2 Member Function Documentation

17.777.2.1 initializeProperty()

```
void QtStringPropertyManager::initializeProperty (
            QtProperty * property )  [override], [protected], [virtual]
```

\reimp
Implements QtAbstractPropertyManager.

17.777.2.2 regExp()

```
QRegularExpression QtStringPropertyManager::regExp (
            const QtProperty * property ) const
```

Returns the given *property's* currently set regular expression.
If the given *property* is not managed by this manager, this function returns an empty expression.

See also

setRegExp()

17.777.2.3 regExpChanged

```
void QtStringPropertyManager::regExpChanged (
            QtProperty * property,
            const QRegularExpression & regExp ) [signal]
```

This signal is emitted whenever a property created by this manager changes its currenlty set regular expression, passing a pointer to the *property* and the new *regExp* as parameters.

See also

setRegExp()

17.777.2.4 setRegExp

```
void QtStringPropertyManager::setRegExp (
            QtProperty * property,
            const QRegularExpression & regExp ) [slot]
```

Sets the regular expression of the given *property* to *regExp*.

See also

regExp(), setValue(), regExpChanged()

17.777.2.5 setValue

```
void QtStringPropertyManager::setValue (
            QtProperty * property,
            const QString & value ) [slot]
```

Sets the value of the given *property* to *value*.
If the specified *value* doesn't match the given *property's* regular expression, this function does nothing.

See also

value(), setRegExp(), valueChanged()

17.777.2.6 uninitializeProperty()

```
void QtStringPropertyManager::uninitializeProperty (
            QtProperty * property ) [override], [protected], [virtual]
```

\reimp
Reimplemented from QtAbstractPropertyManager.

17.777.2.7 value()

```
QString QtStringPropertyManager::value (
            const QtProperty * property ) const
```

Returns the given *property's* value.
If the given property is not managed by this manager, this function returns an empty string.

See also

setValue()

17.777.2.8 valueChanged

```
void QtStringPropertyManager::valueChanged (
            QtProperty * property,
            const QString & value )  [signal]
```

This signal is emitted whenever a property created by this manager changes its value, passing a pointer to the *property* and the new *value* as parameters.

See also

setValue()

17.777.2.9 valueText()

```
QString QtStringPropertyManager::valueText (
            const QtProperty * property ) const  [override], [protected], [virtual]
```

\reimp
Reimplemented from QtAbstractPropertyManager.

17.782.1 Constructor & Destructor Documentation

17.782.1.1 QtTimePropertyManager()

```
QtTimePropertyManager::QtTimePropertyManager (
            QObject * parent = 0 )
```

Creates a manager with the given *parent*.

17.782.1.2 ~QtTimePropertyManager()

```
QtTimePropertyManager::~QtTimePropertyManager ( )
```

Destroys this manager, and all the properties it has created.

17.782.2 Member Function Documentation

17.782.2.1 initializeProperty()

```
void QtTimePropertyManager::initializeProperty (
            QtProperty * property )  [override], [protected], [virtual]
```

\reimp
Implements QtAbstractPropertyManager.

17.782.2.2 setValue

```
void QtTimePropertyManager::setValue (
            QtProperty * property,
            QTime value )  [slot]
```

Sets the value of the given *property* to *value*.

See also

value(), valueChanged()

17.782.2.3 uninitializeProperty()

```
void QtTimePropertyManager::uninitializeProperty (
            QtProperty * property )  [override], [protected], [virtual]
```

\reimp
Reimplemented from QtAbstractPropertyManager.

17.782.2.4 value()

```
QTime QtTimePropertyManager::value (
            const QtProperty * property ) const
```

Returns the given *property's* value.
If the given property is not managed by this manager, this function returns an invalid time object.

See also

setValue()

17.782.2.5 valueChanged

```
void QtTimePropertyManager::valueChanged (
            QtProperty * property,
            QTime value )  [signal]
```

This signal is emitted whenever a property created by this manager changes its value, passing a pointer to the *property* and the new *value* as parameters.

17.784.1 Member Enumeration Documentation

17.784.1.1 ResizeMode

enum QtTreePropertyBrowser::ResizeMode
The resize mode specifies the behavior of the header sections.
\value Interactive The user can resize the sections. The sections can also be resized programmatically using setSplitterPosition().
\value Fixed The user cannot resize the section. The section can only be resized programmatically using setSplitterPosition().
\value Stretch QHeaderView will automatically resize the section to fill the available space. The size cannot be changed by the user or programmatically.
\value ResizeToContents QHeaderView will automatically resize the section to its optimal size based on the contents of the entire column. The size cannot be changed by the user or programmatically.

See also

setResizeMode()

17.784.2 Constructor & Destructor Documentation

17.784.2.1 QtTreePropertyBrowser()

```
QtTreePropertyBrowser::QtTreePropertyBrowser (
            QWidget * parent = 0 )
```

Creates a property browser with the given *parent*.

17.784.2.2 ~QtTreePropertyBrowser()

```
QtTreePropertyBrowser::~QtTreePropertyBrowser ( )
```

Destroys this property browser.
Note that the properties that were inserted into this browser are *not* destroyed since they may still be used in other browsers. The properties are owned by the manager that created them.

See also

QtProperty, QtAbstractPropertyManager

17.784.3 Member Function Documentation

17.784.3.1 backgroundColor()

```
QColor QtTreePropertyBrowser::backgroundColor (
            QtBrowserItem * item ) const
```

Returns the *item's* color. If there is no color set for item it returns invalid color.

See also

calculatedBackgroundColor(), setBackgroundColor()

17.784.3.2 calculatedBackgroundColor()

```
QColor QtTreePropertyBrowser::calculatedBackgroundColor (
            QtBrowserItem * item ) const
```

Returns the *item's* color. If there is no color set for item it returns parent *item's* color (if there is no color set for parent it returns grandparent's color and so on). In case the color is not set for *item* and it's top level item it returns invalid color.

See also

backgroundColor(), setBackgroundColor()

17.784.3.3 collapsed

```
void QtTreePropertyBrowser::collapsed (
            QtBrowserItem * item )  [signal]
```

This signal is emitted when the *item* is collapsed.

See also

expanded(), setExpanded()

17.784.3.4 editItem()

```
void QtTreePropertyBrowser::editItem (
            QtBrowserItem * item )
```

Sets the current item to *item* and opens the relevant editor for it.

17.784.3.5 expanded

```
void QtTreePropertyBrowser::expanded (
            QtBrowserItem * item )  [signal]
```

This signal is emitted when the *item* is expanded.

See also

collapsed(), setExpanded()

17.784.3.6 isExpanded()

```
bool QtTreePropertyBrowser::isExpanded (
            QtBrowserItem * item ) const
```

Returns true if the *item* is expanded; otherwise returns false.

See also

setExpanded()

17.784.3.7 isItemVisible()

```
bool QtTreePropertyBrowser::isItemVisible (
            QtBrowserItem * item ) const
```

Returns true if the *item* is visible; otherwise returns false.

See also

setItemVisible()

Since

4.5

17.784.3.8 itemChanged()

```
void QtTreePropertyBrowser::itemChanged (
            QtBrowserItem * item )  [override], [protected], [virtual]
```

\reimp
Implements QtAbstractPropertyBrowser.

17.784.3.9 itemInserted()

```
void QtTreePropertyBrowser::itemInserted (
            QtBrowserItem * item,
            QtBrowserItem * afterItem )  [override], [protected], [virtual]
```

\reimp
Implements QtAbstractPropertyBrowser.

17.784.3.10 itemRemoved()

```
void QtTreePropertyBrowser::itemRemoved (
            QtBrowserItem * item )  [override], [protected], [virtual]
```

\reimp
Implements QtAbstractPropertyBrowser.

17.784.3.11 setBackgroundColor()

```
void QtTreePropertyBrowser::setBackgroundColor (
            QtBrowserItem * item,
            const QColor & color )
```

Sets the *item's* background color to *color*. Note that while item's background is rendered every second row is being drawn with alternate color (which is a bit lighter than items *color*)

See also

backgroundColor(), calculatedBackgroundColor()

17.784.3.12 setExpanded()

```
void QtTreePropertyBrowser::setExpanded (
            QtBrowserItem * item,
            bool expanded )
```

Sets the *item* to either collapse or expanded, depending on the value of *expanded*.

See also

isExpanded(), expanded(), collapsed()

17.784.3.13 setItemVisible()

```
void QtTreePropertyBrowser::setItemVisible (
            QtBrowserItem * item,
            bool visible )
```

Sets the *item* to be visible, depending on the value of *visible*.

See also

isItemVisible()

Since

4.5

17.784.4 Property Documentation

17.784.4.1 propertiesWithoutValueMarked

```
QtTreePropertyBrowser::propertiesWithoutValueMarked  [read], [write]
```

whether to enable or disable marking properties without value.
When marking is enabled the item's background is rendered in dark color and item's foreground is rendered with light color.

See also

propertiesWithoutValueMarked()

QtProperty::~QtProperty()

17.788.1.2 QtVariantProperty()

```
QtVariantProperty::QtVariantProperty (
            QtVariantPropertyManager * manager )  [protected]
```

Creates a variant property using the given *manager*.

Do not use this constructor to create variant property instances; use the QtVariantPropertyManager::addProperty() function instead. This constructor is used internally by the QtVariantPropertyManager::createProperty() function.

See also

QtVariantPropertyManager

17.788.2 Member Function Documentation

17.788.2.1 attributeValue()

```
QVariant QtVariantProperty::attributeValue (
            const QString & attribute ) const
```

Returns this property's value for the specified *attribute*.

QtVariantPropertyManager provides a couple of related functions: \l{QtVariantPropertyManager::attributes()}{attributes()} and \l{QtVariantPropertyManager::attributeType()}{attributeType()}.

See also

setAttribute()

17.788.2.2 propertyType()

```
int QtVariantProperty::propertyType ( ) const
```

Returns this property's type.
QtVariantPropertyManager provides several related functions: \l{QtVariantPropertyManager::enumTypeId()}{enumTypeId()}, \l{QtVariantPropertyManager::flagTypeId()}{flagTypeId()} and \l{QtVariantPropertyManager::groupTypeId()}{groupTypeId()}.

See also

valueType()

17.788.2.3 setAttribute()

```
void QtVariantProperty::setAttribute (
            const QString & attribute,
            const QVariant & value )
```

Sets the *attribute* of property to *value*.
QtVariantPropertyManager provides the related \l{QtVariantPropertyManager::setAttribute()}{setAttribute()} function.

See also

attributeValue()

17.788.2.4 setValue()

```
void QtVariantProperty::setValue (
            const QVariant & value )
```

Sets the value of this property to *value*.
The specified *value* must be of the type returned by valueType(), or of a type that can be converted to valueType() using the QVariant::canConvert() function; otherwise this function does nothing.

See also

value()

17.788.2.5 value()

```
QVariant QtVariantProperty::value ( ) const
```

Returns the property's current value.

See also

valueType(), setValue()

17.788.2.6 valueType()

```
int QtVariantProperty::valueType ( ) const
```

Returns the type of this property's value.

See also

propertyType()

17.789.1 Constructor & Destructor Documentation

17.789.1.1 QtVariantPropertyManager()

```
QtVariantPropertyManager::QtVariantPropertyManager (
            QObject * parent = 0 )
```

Creates a manager with the given *parent*.

17.789.1.2 ~QtVariantPropertyManager()

```
QtVariantPropertyManager::~QtVariantPropertyManager ( )
```

Destroys this manager, and all the properties it has created.

17.789.2 Member Function Documentation

17.789.2.1 addProperty()

```
QtVariantProperty * QtVariantPropertyManager::addProperty (
            int propertyType,
            const QString & name = QString() )  [virtual]
```

Creates and returns a variant property of the given *propertyType* with the given *name*.
If the specified *propertyType* is not supported by this variant manager, this function returns 0.
Do not use the inherited QtAbstractPropertyManager::addProperty() function to create a variant property (that function will always return 0 since it will not be clear what type the property should have).

See also

isPropertyTypeSupported()

17.789.2.2 attributeChanged

```
void QtVariantPropertyManager::attributeChanged (
            QtProperty * property,
            const QString & attribute,
            const QVariant & value )  [signal]
```

This signal is emitted whenever an attribute of a property created by this manager changes its value, passing a pointer to the *property*, the *attribute* and the new *value* as parameters.

See also

setAttribute()

17.789.2.3 attributes()

```
QStringList QtVariantPropertyManager::attributes (
            int propertyType ) const  [virtual]
```

Returns a list of the given *propertyType* 's attributes.

See also

attributeValue(), attributeType()

17.789.2.4 attributeType()

```
int QtVariantPropertyManager::attributeType (
            int propertyType,
            const QString & attribute ) const  [virtual]
```

Returns the type of the specified *attribute* of the given *propertyType*.
If the given *propertyType* is not supported by *this* manager, or if the given *propertyType* does not possess the specified *attribute*, this function returns QMetaType::UnknownType.

See also

attributes(), valueType()

17.789.2.5 attributeValue()

```
QVariant QtVariantPropertyManager::attributeValue (
            const QtProperty * property,
            const QString & attribute ) const  [virtual]
```

Returns the given *property's* value for the specified *attribute*
If the given *property* was not created by *this* manager, or if the specified *attribute* does not exist, this function returns an invalid variant.

See also

attributes(), attributeType(), setAttribute()

17.789.2.6 createProperty()

```
QtProperty * QtVariantPropertyManager::createProperty ( )  [override], [protected], [virtual]
```

Creates a property.
The base implementation produce QtProperty instances; Reimplement this function to make this manager produce objects of a QtProperty subclass.

See also

addProperty(), initializeProperty()

Reimplemented from QtAbstractPropertyManager.

17.789.2.7 enumTypeId()

```
QT_END_NAMESPACE QT_BEGIN_NAMESPACE int QtVariantPropertyManager::enumTypeId ( )  [static]
```

Returns the type id for an enum property.
Note that the property's value type can be retrieved using the valueType() function (which is QMetaType::Int for the enum property type).

See also

propertyType(), valueType()

17.789.2.8 flagTypeId()

```
int QtVariantPropertyManager::flagTypeId ( )  [static]
```

Returns the type id for a flag property.
Note that the property's value type can be retrieved using the valueType() function (which is QMetaType::Int for the flag property type).

See also

propertyType(), valueType()

17.789.2.9 groupTypeId()

```
int QtVariantPropertyManager::groupTypeId ( )  [static]
```

Returns the type id for a group property.
Note that the property's value type can be retrieved using the valueType() function (which is QMetaType::Unknown↩ Type for the group property type, since it doesn't provide any value).

See also

propertyType(), valueType()

17.789.2.10 hasValue()

```
bool QtVariantPropertyManager::hasValue (
            const QtProperty * property ) const  [override], [protected], [virtual]
```

Returns whether the given *property* has a value.
The default implementation of this function returns true.

See also

QtProperty::hasValue()

Reimplemented from QtAbstractPropertyManager.

17.789.2.11 iconMapTypeId()

```
int QtVariantPropertyManager::iconMapTypeId ( )  [static]
```

Returns the type id for a icon map attribute.
Note that the property's attribute type can be retrieved using the attributeType() function.

See also

attributeType(), QtEnumPropertyManager::enumIcons()

17.789.2.12 initializeProperty()

```
void QtVariantPropertyManager::initializeProperty (
            QtProperty * property )  [override], [protected], [virtual]
```

This function is called whenever a new valid property pointer has been created, passing the pointer as parameter.
The purpose is to let the manager know that the *property* has been created so that it can provide additional attributes for the new property, e.g. QtIntPropertyManager adds \l {QtIntPropertyManager::value()}{value}, \l {QtIntPropertyManager::minimum()}{minimum} and \l {QtIntPropertyManager::maximum()}{maximum} attributes. Since each manager subclass adds type specific attributes, this function is pure virtual and must be reimplemented when deriving from the QtAbstractPropertyManager class.

See also

addProperty(), createProperty()

Implements QtAbstractPropertyManager.

17.789.2.13 isPropertyTypeSupported()

```
bool QtVariantPropertyManager::isPropertyTypeSupported (
            int propertyType ) const  [virtual]
```

Returns true if the given *propertyType* is supported by this variant manager; otherwise false.

See also

propertyType()

17.789.2.14 propertyType()

```
int QtVariantPropertyManager::propertyType (
            const QtProperty * property ) const
```

Returns the given *property's* type.

See also

valueType()

17.789.2.15 setAttribute

```
void QtVariantPropertyManager::setAttribute (
            QtProperty * property,
            const QString & attribute,
            const QVariant & value )  [virtual], [slot]
```

Sets the value of the specified *attribute* of the given *property*, to *value*.
The new *value's* type must be of the type returned by attributeType(), or of a type that can be converted to attributeType() using the QVariant::canConvert() function, otherwise this function does nothing.

See also

attributeValue(), QtVariantProperty::setAttribute(), attributeChanged()

17.789.2.16 setValue

```
void QtVariantPropertyManager::setValue (
            QtProperty * property,
            const QVariant & value )  [virtual], [slot]
```

Sets the value of the given *property* to *value*.
The specified *value* must be of a type returned by valueType(), or of type that can be converted to valueType() using the QVariant::canConvert() function, otherwise this function does nothing.

See also

value(), QtVariantProperty::setValue(), valueChanged()

17.789.2.17 uninitializeProperty()

```
void QtVariantPropertyManager::uninitializeProperty (
            QtProperty * property )  [override], [protected], [virtual]
```

This function is called just before the specified *property* is destroyed.
The purpose is to let the property manager know that the *property* is being destroyed so that it can remove the property's additional attributes.

See also

clear(), propertyDestroyed()

Reimplemented from QtAbstractPropertyManager.

17.789.2.18 value()

```
QVariant QtVariantPropertyManager::value (
            const QtProperty * property ) const  [virtual]
```

Returns the given *property's* value.
If the given *property* is not managed by this manager, this function returns an invalid variant.

See also

setValue()

17.789.2.19 valueChanged

```
void QtVariantPropertyManager::valueChanged (
            QtProperty * property,
            const QVariant & value )  [signal]
```

This signal is emitted whenever a property created by this manager changes its value, passing a pointer to the *property* and the new *value* as parameters.

See also

setValue()

17.789.2.20 valueIcon()

```
QIcon QtVariantPropertyManager::valueIcon (
            const QtProperty * property ) const  [override], [protected], [virtual]
```

Returns an icon representing the current state of the given *property*.
The default implementation of this function returns an invalid icon.

See also

QtProperty::valueIcon()

Reimplemented from QtAbstractPropertyManager.

17.789.2.21 valueText()

```
QString QtVariantPropertyManager::valueText (
            const QtProperty * property ) const  [override], [protected], [virtual]
```

Returns a string representing the current state of the given *property*.
The default implementation of this function returns an empty string.

See also

QtProperty::valueText()

Reimplemented from QtAbstractPropertyManager.

17.789.2.22 valueType() [1/2]

```
int QtVariantPropertyManager::valueType (
            const QtProperty * property ) const
```

Returns the given *property's* value type.

See also

propertyType()

17.789.2.23 valueType() [2/2]

```
int QtVariantPropertyManager::valueType (
            int propertyType ) const  [virtual]
```

This is an overloaded member function, provided for convenience. It differs from the above function only in what argument(s) it accepts.
Returns the value type associated with the given *propertyType*.

17.789.2.24 variantProperty()

```
QtVariantProperty * QtVariantPropertyManager::variantProperty (
            const QtProperty * property ) const
```

Returns the given *property* converted into a QtVariantProperty.
If the *property* was not created by this variant manager, the function returns 0.

See also

createProperty()

One-dimensional numerical quadrature abstraction.
`#include <tools/Continuous/Quadrature_if.h>`

Public Member Functions

- virtual double **integrate** (double min, double max, double(∗f)(double), double precision) const =0

17.792.1 Detailed Description

One-dimensional numerical quadrature abstraction.
Architectural role:

- Planned extraction of integration responsibility from Solver_if.

The documentation for this class was generated from the following file:

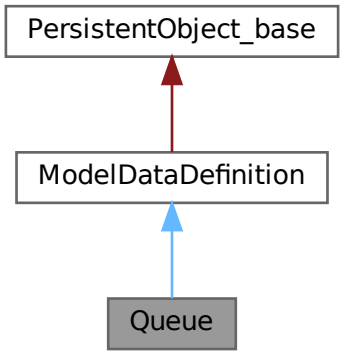
- tools/Continuous/Quadrature_if.h

17.793 Queue Class Reference

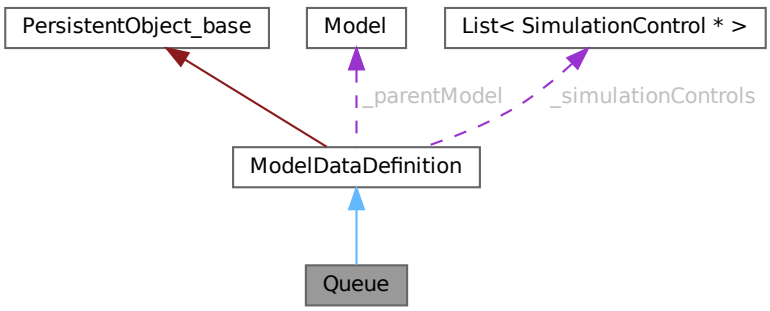
Data definition holding waiting entities for a component (a Seize-family component, Process, Batch, etc.) and defining their ranking rule.

`#include <plugins/data/DiscreteProcessing/Queue.h>`

Inheritance diagram for Queue:



Collaboration diagram for Queue:



Public Types

- enum class **OrderRule** : int {
  FIFO = 0 , **LIFO** = 1 , **HIGHESTVALUE** = 2 , **SMALLESTVALUE** = 3 ,
  num_elements = 4 }

Public Member Functions

- **Queue** (Model ∗model, std::string name="")
- virtual std::string show () override

  Returns a textual representation of this data definition.
- void **insertElement** (Waiting ∗modeldatum)
- void **removeElement** (Waiting ∗modeldatum)

- unsigned int **size** ()
- Waiting * **first** ()
- Waiting * **getAtRank** (unsigned int rank)

- int **getOrderRuleInt** () const
- double **sumAttributesFromWaiting** (Util::identification attributeID)
- double **getAttributeFromWaitingRank** (unsigned int rank, Util::identification attributeID)

Public Member Functions inherited from ModelDataDefinition

- ModelDataDefinition (Model *model, std::string datadefinitionTypename, std::string name="", bool insertIntoModel=true)

  Creates a model data definition and optionally inserts it into the model.
- virtual ~**ModelDataDefinition** ()

  Releases resources owned by this data definition.
- Util::identification getId () const

  Returns the unique identifier of this instance.
- void setName (const std::string &name)

  Updates the logical name of this instance.
- const std::string & getName () const

  Returns the logical name of this instance.
- void setLabel (const std::string &label)

  Updates the user-visible label of this instance.
- const std::string & getLabel () const

  Returns the user-visible label of this instance.
- const std::string & getClassname () const

  Returns the runtime class name used by the plugin system.
- Model * getParentModel () const

  Returns the parent model that owns this definition.
- bool isReportStatistics () const

  Indicates whether this data definition contributes report statistics.
- void setReportStatistics (bool reportStatistics)

  Enables or disables report-statistics generation for this definition.
- ModelDataDefinition * getInternalData (const std::string &name) const

  Looks up a named internal child data definition.
- std::map< std::string, ModelDataDefinition * > * getInternalData () const

  Returns the full map of internal child data definitions.
- std::map< std::string, ModelDataDefinition * > * getAttachedData () const

  Returns the full map of attached data definitions.
- bool hasChanged () const

  Indicates whether this instance has been modified since the last reset.
- void setHasChanged (bool hasChanged)

  Updates the changed flag for this data definition.
- unsigned int getLevel () const

  Returns the hierarchical editing context containing this element.
- void setModelLevel (unsigned int _modelLevel)

  Sets this element's hierarchical editing context.
- List< SimulationControl * > * getSimulationControls () const

Returns the simulation controls owned by this data definition.

- TraceManager::Level getTraceLevelSpecific () const

  Returns the trace level that applies specifically to this definition.

- void setTraceLevelSpecific (TraceManager::Level level)

  Updates the trace level used by this definition.

- void defineTraceLevelSpecific (TraceManager::Level traceLevelspecific, bool traceLevelSpecific↩ Enabled=true)

  Defines the specific trace level and optionally enables it immediately.

- bool isTraceLevelSpecificEnabled () const

  Indicates whether the specific trace level is enabled.

- void setTraceLevelSpecificEnabled (bool traceLevelSpecificEnabled)

  Enables or disables the specific trace level.

Static Public Member Functions

- static std::string **convertEnumToStr** (OrderRule rule)
- static PluginInformation * **GetPluginInformation** ()
- static ModelDataDefinition * **LoadInstance** (Model *model, PersistenceRecord *fields)
- static ModelDataDefinition * **NewInstance** (Model *model, std::string name="")

Static Public Member Functions inherited from ModelDataDefinition

- static ModelDataDefinition * LoadInstance (Model *model, PersistenceRecord *fields, bool insertIntoModel)

  Loads a model data definition instance from serialized fields.

- static ModelDataDefinition * NewInstance (Model *model, std::string name="")

  Creates a new instance of a data definition using the plugin registry.

- static void SaveInstance (PersistenceRecord *fields, ModelDataDefinition *modeldatum)

  Serializes a data definition instance into a persistence record.

- static bool Check (ModelDataDefinition *modeldatum, std::string &errorMessage)

  Validates a data definition instance.

- static void InitBetweenReplications (ModelDataDefinition *modeldatum)

  Resets simulation-time state between replications.

- static void CreateInternalData (ModelDataDefinition *modeldatum)

  Creates internal and attached data required by this instance.

- static bool CreateRelatedDataElements (ModelDataDefinition *modeldatum, std::string &errorMessage)

  Creates related data and validates the instance in a single call.

Protected Member Functions

- virtual bool _loadInstance (PersistenceRecord *fields) override

  must be overriden by derived classes

- virtual void _saveInstance (PersistenceRecord *fields, bool saveDefaultValues) override

  Saves object fields into a serialization structure.

- virtual bool _check (std::string &errorMessage) override

  could be overriden by derived classes

17.793.1 Detailed Description

Data definition holding waiting entities for a component (a Seize-family component, Process, Batch, etc.) and defining their ranking rule.
Arena correspondence: the "Queue module" (Rockwell Automation, *Getting Started with Arena*, "The Basic Process Panel", pp. 45-46). `OrderRule` mirrors Arena's four ranking rules (First In First Out, Last In First Out, lowest/highest attribute value first); `_attributeName` is the evaluated attribute for the two attribute-based rules. Known difference from Arena: this class has no explicit "Shared" flag. In GenESyS a Queue is simply a referenceable ModelDataDefinition, so any number of components may already reference the same instance; Arena needs an explicit opt-in because its queues are otherwise private to the module that created them.
`isReportStatistics()`/`setReportStatistics`() (inherited from ModelDataDefinition) correspond to Arena's per-module "Report Statistics" checkbox and gate the internal `StatisticsCollector` instances created by `_createInternalStatisticReporters()`.

17.793.2 Member Function Documentation

17.793.2.1 _check()

```
bool Queue::_check (
            std::string & errorMessage )  [override], [protected], [virtual]
```

could be overriden by derived classes
Reimplemented from ModelDataDefinition.

17.793.2.2 _createInternalStatisticReporters()

```
void Queue::_createInternalStatisticReporters ( )  [override], [protected], [virtual]
```

Reimplemented from ModelDataDefinition.

17.793.2.3 _getParserChangesInformation()

```
ParserChangesInformation * Queue::_getParserChangesInformation ( )  [override], [protected],
[virtual]
```

This method returns all changes in the parser that are needed by plugins of this ModelDatas. When connecting a new plugin, ParserChangesInformation are used to change parser source code, whch is after compiled and dinamically linked to to simulator kernel to reflect the changes
Reimplemented from ModelDataDefinition.

17.793.2.4 _initBetweenReplications()

```
void Queue::_initBetweenReplications ( )  [override], [protected], [virtual]
```

Reimplemented from ModelDataDefinition.

17.793.2.5 _loadInstance()

```
bool Queue::_loadInstance (
            PersistenceRecord * fields )  [override], [protected], [virtual]
```

must be overriden by derived classes
Reimplemented from ModelDataDefinition.

17.793.2.6 _saveInstance()

```
void Queue::_saveInstance (
            PersistenceRecord * fields,
            bool saveDefaultValues )  [override], [protected], [virtual]
```

Saves object fields into a serialization structure.

Parameters

fields	a table-like structure used for serialization.
saveDefaultValues	indicates whether or not to save fields which are set to their default value.

Reimplemented from ModelDataDefinition.

17.793.2.7 show()

```
std::string Queue::show ( )  [override], [virtual]
```

Returns a textual representation of this data definition.
Returns the keys of internal ModelDataDefinitions such as counters, statistics collectors and other children needed before model checking.

Returns

Human-readable summary used by traces and debug output.

Reimplemented from ModelDataDefinition.
The documentation for this class was generated from the following files:

- plugins/data/DiscreteProcessing/Queue.h
- plugins/data/DiscreteProcessing/Queue.cpp

  virtual public methods

Public Member Functions inherited from ModelComponent

- ModelComponent (Model *model, std::string componentTypename, std::string name="")

  constructors
- virtual ~**ModelComponent** ()

  Releases component-owned resources and unregisters it from the model.
- ConnectionManager * getConnectionManager () const

  new public user methods for this component
- void connectTo (ModelComponent *component, unsigned int inputPortNumber=0)

  Connects this component to another component.
- bool hasBreakpointAt ()

  Indicates whether a simulation breakpoint is set on this component.
- void setDescription (std::string _description)

  Updates the free-form description shown by the GUI.
- std::string getDescription () const

  Returns the free-form description associated with this component.
- void remove (ModelComponent *comp)

  Removes a connected component from this component.

Public Member Functions inherited from ModelDataDefinition

- ModelDataDefinition (Model *model, std::string datadefinitionTypename, std::string name="", bool insert↩ IntoModel=true)

  Creates a model data definition and optionally inserts it into the model.
- virtual ~**ModelDataDefinition** ()

  Releases resources owned by this data definition.
- Util::identification getId () const

  Returns the unique identifier of this instance.
- void setName (const std::string &name)

  Updates the logical name of this instance.
- const std::string & getName () const

  Returns the logical name of this instance.
- void setLabel (const std::string &label)

  Updates the user-visible label of this instance.
- const std::string & getLabel () const

Returns the user-visible label of this instance.

- const std::string & getClassname () const

  Returns the runtime class name used by the plugin system.

- Model * getParentModel () const

  Returns the parent model that owns this definition.

- bool isReportStatistics () const

  Indicates whether this data definition contributes report statistics.

- void setReportStatistics (bool reportStatistics)

  Enables or disables report-statistics generation for this definition.

- ModelDataDefinition * getInternalData (const std::string &name) const

  Looks up a named internal child data definition.

- std::map< std::string, ModelDataDefinition * > * getInternalData () const

  Returns the full map of internal child data definitions.

- std::map< std::string, ModelDataDefinition * > * getAttachedData () const

  Returns the full map of attached data definitions.

- bool hasChanged () const

  Indicates whether this instance has been modified since the last reset.

- void setHasChanged (bool hasChanged)

  Updates the changed flag for this data definition.

- unsigned int getLevel () const

  Returns the hierarchical editing context containing this element.

- void setModelLevel (unsigned int _modelLevel)

  Sets this element's hierarchical editing context.

- List< SimulationControl * > * getSimulationControls () const

  Returns the simulation controls owned by this data definition.

- TraceManager::Level getTraceLevelSpecific () const

  Returns the trace level that applies specifically to this definition.

- void setTraceLevelSpecific (TraceManager::Level level)

  Updates the trace level used by this definition.

- void defineTraceLevelSpecific (TraceManager::Level traceLevelspecific, bool traceLevelSpecific↩ Enabled=true)

  Defines the specific trace level and optionally enables it immediately.

- bool isTraceLevelSpecificEnabled () const

  Indicates whether the specific trace level is enabled.

- void setTraceLevelSpecificEnabled (bool traceLevelSpecificEnabled)

  Enables or disables the specific trace level.

Static Public Member Functions

- static PluginInformation * **GetPluginInformation** ()
- static ModelComponent * **LoadInstance** (Model *model, PersistenceRecord *fields)
- static ModelDataDefinition * **NewInstance** (Model *model, std::string name="")

Static Public Member Functions inherited from ModelComponent

- static ModelComponent * LoadInstance (Model *model, PersistenceRecord *fields)

  static public methods that must have implementations (Load and New just the same. GetInformation must provide specific infos for the new component

- static bool Check (ModelComponent *component)

  Validates a component instance.

- static void CreateInternalData (ModelComponent *component)

  Creates internal data required by a component instance.

- static void SaveInstance (PersistenceRecord *fields, ModelComponent *component)

  Serializes a component instance into a persistence record.
- static void DispatchEvent (Event *event)

  Dispatches a simulation event to the target component.

Static Public Member Functions inherited from ModelDataDefinition

- static ModelDataDefinition * LoadInstance (Model *model, PersistenceRecord *fields, bool insertIntoModel)

  Loads a model data definition instance from serialized fields.
- static ModelDataDefinition * NewInstance (Model *model, std::string name="")

  Creates a new instance of a data definition using the plugin registry.
- static void SaveInstance (PersistenceRecord *fields, ModelDataDefinition *modeldatum)

  Serializes a data definition instance into a persistence record.
- static bool Check (ModelDataDefinition *modeldatum, std::string &errorMessage)

  Validates a data definition instance.
- static void InitBetweenReplications (ModelDataDefinition *modeldatum)

  Resets simulation-time state between replications.
- static void CreateInternalData (ModelDataDefinition *modeldatum)

  Creates internal and attached data required by this instance.
- static bool CreateRelatedDataElements (ModelDataDefinition *modeldatum, std::string &errorMessage)

  Creates related data and validates the instance in a single call.

Protected Member Functions

- virtual void _onDispatchEvent (Entity *entity, unsigned int inputPortNumber) override

  Handles a dispatched event for this component type.
- virtual bool _loadInstance (PersistenceRecord *fields) override

  virtual protected method that must be overriden
- virtual void _saveInstance (PersistenceRecord *fields, bool saveDefaultValues) override

  Saves object fields into a serialization structure.
- virtual void _initBetweenReplications () override
- virtual bool _check (std::string &errorMessage) override

  could be overriden by derived classes
- virtual void _createInternalStatisticReporters () override

17.802.1 Detailed Description

Evaluates a parser expression each time an entity passes through and records the value into a StatisticsCollector and/or an external file.
Arena correspondence: the "Record module" (Rockwell Automation, *Getting Started with Arena*, "The Basic Process Panel", pp. 41-42), which offers five Types: Count, Entity Statistics, Time Interval, Time Between, and Expression, plus optional Tally/Counter Sets.
Only the Expression Type is implemented — there is no `Type` field at all. GenESyS extends this single mode with dataset-export metadata that has no Arena counterpart (`_datasetName`, `_randomVariableName`, `_variableType`, `_description`) and direct file recording (`_filename`, `_timeDependent`) intended for external tooling such as the Data Analyser.
Known differences from Arena: Count, Entity Statistics, Time Interval and Time Between have no equivalent Type here, and there is no Tally/Counter Set support ("Record into Set"). This does not mean statistics collection itself is unavailable in GenESyS — `Counter` and `StatisticsCollector` are used directly by several other components/data definitions — only that this specific component only reaches the Expression case.

17.802.2 Member Function Documentation

17.802.2.1 _check()

```
bool Record::_check (
            std::string & errorMessage )  [override], [protected], [virtual]
```

could be overriden by derived classes
Reimplemented from ModelDataDefinition.

17.802.2.2 _createInternalStatisticReporters()

```
void Record::_createInternalStatisticReporters ( )  [override], [protected], [virtual]
```

Reimplemented from ModelDataDefinition.

17.802.2.3 _initBetweenReplications()

```
void Record::_initBetweenReplications ( )  [override], [protected], [virtual]
```

Reimplemented from ModelDataDefinition.

17.802.2.4 _loadInstance()

```
bool Record::_loadInstance (
            PersistenceRecord * fields )  [override], [protected], [virtual]
```

virtual protected method that must be overriden
Reimplemented from ModelComponent.

17.802.2.5 _onDispatchEvent()

```
void Record::_onDispatchEvent (
            Entity * entity,
            unsigned int inputPortNumber )  [override], [protected], [virtual]
```

Handles a dispatched event for this component type.
This method is only for ModelComponents, not for ModelDataElements.

Parameters

entity	Entity being processed.
inputPortNumber	Input port where the entity arrived.

Implements ModelComponent.

17.802.2.6 _saveInstance()

```
void Record::_saveInstance (
```

```
            PersistenceRecord * fields,
            bool saveDefaultValues )  [override], [protected], [virtual]
```

Saves object fields into a serialization structure.

Parameters

fields	a table-like structure used for serialization.
saveDefaultValues	indicates whether or not to save fields which are set to their default value.

Reimplemented from ModelComponent.

17.802.2.7 setDatasetDescription()

```
void Record::setDatasetDescription (
            std::string description )
```

Sets the free-text dataset description emitted in enriched Record file headers.

17.802.2.8 setDatasetName()

```
void Record::setDatasetName (
            std::string datasetName )
```

Sets the analytical dataset name emitted in enriched Record file headers.

17.802.2.9 setExpressionName()

```
void Record::setExpressionName (
            std::string expressionName )
```

Sets the legacy expression-name metadata kept for old Record datasets.

17.802.2.10 setRandomVariableName()

```
void Record::setRandomVariableName (
            std::string randomVariableName )
```

Sets the random variable name emitted in enriched Record file headers.

17.802.2.11 setVariableType()

```
void Record::setVariableType (
            std::string variableType )
```

Sets the canonical random variable type for enriched Record file headers.

17.802.2.12 show()

```
std::string Record::show ( )  [override], [virtual]
```

virtual public methods
Returns a textual representation of this component.

Returns

Human-readable description used for tracing and debugging.

Reimplemented from ModelComponent.
The documentation for this class was generated from the following files:

- plugins/components/InputOutput/Record.h
- plugins/components/InputOutput/Record.cpp

- virtual std::string show () override

  virtual public methods
- void **setOdeSolver** (ODESolver ∗solver)
- ODESolver ∗ **getOdeSolver** () const
- void **setOdeSolverName** (std::string name)
- std::string **getOdeSolverName** () const

Public Member Functions inherited from ModelComponent

- ModelComponent (Model ∗model, std::string componentTypename, std::string name="")

  constructors
- virtual ∼**ModelComponent** ()

  Releases component-owned resources and unregisters it from the model.
- ConnectionManager ∗ getConnectionManager () const

  new public user methods for this component
- void connectTo (ModelComponent ∗component, unsigned int inputPortNumber=0)

  Connects this component to another component.
- bool hasBreakpointAt ()

  Indicates whether a simulation breakpoint is set on this component.

- void setDescription (std::string _description)

  Updates the free-form description shown by the GUI.
- std::string getDescription () const

  Returns the free-form description associated with this component.
- void remove (ModelComponent *comp)

  Removes a connected component from this component.

Public Member Functions inherited from ModelDataDefinition

- ModelDataDefinition (Model *model, std::string datadefinitionTypename, std::string name="", bool insertIntoModel=true)

  Creates a model data definition and optionally inserts it into the model.
- virtual ~**ModelDataDefinition** ()

  Releases resources owned by this data definition.
- Util::identification getId () const

  Returns the unique identifier of this instance.
- void setName (const std::string &name)

  Updates the logical name of this instance.
- const std::string & getName () const

  Returns the logical name of this instance.
- void setLabel (const std::string &label)

  Updates the user-visible label of this instance.
- const std::string & getLabel () const

  Returns the user-visible label of this instance.
- const std::string & getClassname () const

  Returns the runtime class name used by the plugin system.
- Model * getParentModel () const

  Returns the parent model that owns this definition.
- bool isReportStatistics () const

  Indicates whether this data definition contributes report statistics.
- void setReportStatistics (bool reportStatistics)

  Enables or disables report-statistics generation for this definition.
- ModelDataDefinition * getInternalData (const std::string &name) const

  Looks up a named internal child data definition.
- std::map< std::string, ModelDataDefinition * > * getInternalData () const

  Returns the full map of internal child data definitions.
- std::map< std::string, ModelDataDefinition * > * getAttachedData () const

  Returns the full map of attached data definitions.
- bool hasChanged () const

  Indicates whether this instance has been modified since the last reset.
- void setHasChanged (bool hasChanged)

  Updates the changed flag for this data definition.
- unsigned int getLevel () const

  Returns the hierarchical editing context containing this element.
- void setModelLevel (unsigned int _modelLevel)

  Sets this element's hierarchical editing context.
- List< SimulationControl * > * getSimulationControls () const

  Returns the simulation controls owned by this data definition.
- TraceManager::Level getTraceLevelSpecific () const

  Returns the trace level that applies specifically to this definition.
- void setTraceLevelSpecific (TraceManager::Level level)

Updates the trace level used by this definition.

- void defineTraceLevelSpecific (TraceManager::Level traceLevelspecific, bool traceLevelSpecific↩ Enabled=true)

  Defines the specific trace level and optionally enables it immediately.
- bool isTraceLevelSpecificEnabled () const

  Indicates whether the specific trace level is enabled.
- void setTraceLevelSpecificEnabled (bool traceLevelSpecificEnabled)

  Enables or disables the specific trace level.

Protected Member Functions

- void _onDispatchEvent (Entity *entity, unsigned int inputPortNumber) override

  Handles a dispatched event for this component type.
- void _onDispatchEvent (Entity *entity, unsigned int inputPortNumber) override

  Handles a dispatched event for this component type.

Protected Member Functions inherited from ContinuousSystemComponent

- virtual bool _loadInstance (PersistenceRecord *fields) override

  virtual protected method that must be overriden
- virtual void _saveInstance (PersistenceRecord *fields, bool saveDefaultValues) override

  Saves object fields into a serialization structure.
- virtual bool _check (std::string &errorMessage) override

  could be overriden by derived classes
- virtual void _createEditableDataDefinitions () override

Protected Member Functions inherited from ModelDataDefinition

17.803.1 Member Function Documentation

17.803.1.1 _onDispatchEvent() [1/2]

```
void RecordingContinuousSystemComponent::_onDispatchEvent (
            Entity * entity,
            unsigned int inputPortNumber )  [inline], [override], [protected], [virtual]
```

Handles a dispatched event for this component type.
This method is only for ModelComponents, not for ModelDataElements.

Parameters

entity	Entity being processed.
inputPortNumber	Input port where the entity arrived.

Reimplemented from ContinuousSystemComponent.

17.803.1.2 _onDispatchEvent() [2/2]

```
void RecordingContinuousSystemComponent::_onDispatchEvent (
            Entity * entity,
            unsigned int inputPortNumber )  [inline], [override], [protected], [virtual]
```

Handles a dispatched event for this component type.
This method is only for ModelComponents, not for ModelDataElements.

Parameters

entity	Entity being processed.
inputPortNumber	Input port where the entity arrived.

Reimplemented from ContinuousSystemComponent.
The documentation for this class was generated from the following files:

- tests/demo_continuous_trace.cpp
- tests/test_continuous_system.cpp

Public Member Functions inherited from ModelComponent

- ModelComponent (Model *model, std::string componentTypename, std::string name="")

  constructors
- virtual ~**ModelComponent** ()

  Releases component-owned resources and unregisters it from the model.
- ConnectionManager * getConnectionManager () const

  new public user methods for this component

- void connectTo (ModelComponent *component, unsigned int inputPortNumber=0)

  Connects this component to another component.
- bool hasBreakpointAt ()

  Indicates whether a simulation breakpoint is set on this component.
- void setDescription (std::string _description)

  Updates the free-form description shown by the GUI.
- std::string getDescription () const

  Returns the free-form description associated with this component.
- void remove (ModelComponent *comp)

  Removes a connected component from this component.

Public Member Functions inherited from ModelDataDefinition

- ModelDataDefinition (Model *model, std::string datadefinitionTypename, std::string name="", bool insert↩ IntoModel=true)

  Creates a model data definition and optionally inserts it into the model.
- virtual ~**ModelDataDefinition** ()

  Releases resources owned by this data definition.
- Util::identification getId () const

  Returns the unique identifier of this instance.
- void setName (const std::string &name)

  Updates the logical name of this instance.
- const std::string & getName () const

  Returns the logical name of this instance.
- void setLabel (const std::string &label)

  Updates the user-visible label of this instance.
- const std::string & getLabel () const

  Returns the user-visible label of this instance.
- const std::string & getClassname () const

  Returns the runtime class name used by the plugin system.
- Model * getParentModel () const

  Returns the parent model that owns this definition.
- bool isReportStatistics () const

  Indicates whether this data definition contributes report statistics.
- void setReportStatistics (bool reportStatistics)

  Enables or disables report-statistics generation for this definition.
- ModelDataDefinition * getInternalData (const std::string &name) const

  Looks up a named internal child data definition.
- std::map< std::string, ModelDataDefinition * > * getInternalData () const

  Returns the full map of internal child data definitions.
- std::map< std::string, ModelDataDefinition * > * getAttachedData () const

  Returns the full map of attached data definitions.
- bool hasChanged () const

  Indicates whether this instance has been modified since the last reset.
- void setHasChanged (bool hasChanged)

  Updates the changed flag for this data definition.
- unsigned int getLevel () const

  Returns the hierarchical editing context containing this element.
- void setModelLevel (unsigned int _modelLevel)

  Sets this element's hierarchical editing context.
- List< SimulationControl * > * getSimulationControls () const

Returns the simulation controls owned by this data definition.

- TraceManager::Level getTraceLevelSpecific () const

  Returns the trace level that applies specifically to this definition.

- void setTraceLevelSpecific (TraceManager::Level level)

  Updates the trace level used by this definition.

- void defineTraceLevelSpecific (TraceManager::Level traceLevelspecific, bool traceLevelSpecific↩ Enabled=true)

  Defines the specific trace level and optionally enables it immediately.

- bool isTraceLevelSpecificEnabled () const

  Indicates whether the specific trace level is enabled.

- void setTraceLevelSpecificEnabled (bool traceLevelSpecificEnabled)

  Enables or disables the specific trace level.

Protected Member Functions

17.804.1 Member Function Documentation

17.804.1.1 _onDispatchEvent()

```
void RecordingLSODE::_onDispatchEvent (
            Entity * entity,
            unsigned int inputPortNumber )  [inline], [override], [protected], [virtual]
```

Handles a dispatched event for this component type.
This method is only for ModelComponents, not for ModelDataElements.

Parameters

entity	Entity being processed.
inputPortNumber	Input port where the entity arrived.

Reimplemented from LSODE.
The documentation for this class was generated from the following file:

- tests/test_lsode.cpp

17.805 Rectifier Class Reference

Static Public Member Functions inherited from ModelComponent

- static ModelComponent * LoadInstance (Model *model, PersistenceRecord *fields)

  static public methods that must have implementations (Load and New just the same. GetInformation must provide specific infos for the new component
- static bool Check (ModelComponent *component)

  Validates a component instance.
- static void CreateInternalData (ModelComponent *component)

  Creates internal data required by a component instance.
- static void SaveInstance (PersistenceRecord *fields, ModelComponent *component)

  Serializes a component instance into a persistence record.
- static void DispatchEvent (Event *event)

  Dispatches a simulation event to the target component.

Static Public Member Functions inherited from ModelDataDefinition

- static ModelDataDefinition * LoadInstance (Model *model, PersistenceRecord *fields, bool insertIntoModel)

  Loads a model data definition instance from serialized fields.
- static ModelDataDefinition * NewInstance (Model *model, std::string name="")

  Creates a new instance of a data definition using the plugin registry.
- static void SaveInstance (PersistenceRecord *fields, ModelDataDefinition *modeldatum)

  Serializes a data definition instance into a persistence record.
- static bool Check (ModelDataDefinition *modeldatum, std::string &errorMessage)

  Validates a data definition instance.
- static void InitBetweenReplications (ModelDataDefinition *modeldatum)

  Resets simulation-time state between replications.
- static void CreateInternalData (ModelDataDefinition *modeldatum)

Creates internal and attached data required by this instance.

- static bool CreateRelatedDataElements (ModelDataDefinition *modeldatum, std::string &errorMessage)

  Creates related data and validates the instance in a single call.

Protected Member Functions

- virtual void _onDispatchEvent (Entity *entity, unsigned int inputPortNumber) override

  Handles a dispatched event for this component type.
- virtual bool _loadInstance (PersistenceRecord *fields) override

  virtual protected method that must be overriden
- virtual void _initBetweenReplications () override
- virtual void _saveInstance (PersistenceRecord *fields, bool saveDefaultValues) override

  Saves object fields into a serialization structure.
- virtual bool _check (std::string &errorMessage) override

  could be overriden by derived classes
- virtual void _createEditableDataDefinitions () override

Protected Member Functions inherited from ModelDataDefinition

17.808.1 Detailed Description

Gives up control of one or more previously seized resources, immediately unblocking any entity waiting for them. Arena correspondence: the "Release module" (Rockwell Automation, *Getting Started with Arena*, "The Advanced Process Panel", p. 60). `_releaseRequests` (a list of `SeizableItem`, reused from Seize) matches Arena's Type/Resource Name/Set Name/Quantity/Release Rule fields.
Confirmed behavior: reads back `Entity.Allocation.<ResourceName>` (set by Seize) and credits the resource's held time (`resource->getLastTimeSeized()`) to that category, both into a `<EntityType>.<Category>Time` StatisticsCollector and a running `Entity.Total<Category>Time` attribute — see `docs/ai_assistants/reference/ARENA_GENESYS_COMPATIBILITY.md` §6.10.

17.808.2 Member Function Documentation

17.808.2.1 _check()

```
bool Release::_check (
            std::string & errorMessage )  [override], [protected], [virtual]
```

could be overriden by derived classes
Reimplemented from ModelDataDefinition.

17.808.2.2 _createEditableDataDefinitions()

```
void Release::_createEditableDataDefinitions ( )  [override], [protected], [virtual]
```

Reimplemented from ModelDataDefinition.

17.808.2.3 _initBetweenReplications()

```
void Release::_initBetweenReplications ( )  [override], [protected], [virtual]
```

Reimplemented from ModelDataDefinition.

17.808.2.4 _loadInstance()

```
bool Release::_loadInstance (
            PersistenceRecord * fields )  [override], [protected], [virtual]
```

virtual protected method that must be overriden
Reimplemented from ModelComponent.

17.808.2.5 _onDispatchEvent()

```
void Release::_onDispatchEvent (
            Entity * entity,
            unsigned int inputPortNumber )  [override], [protected], [virtual]
```

Handles a dispatched event for this component type.
This method is only for ModelComponents, not for ModelDataElements.

Parameters

entity	Entity being processed.
inputPortNumber	Input port where the entity arrived.

Implements ModelComponent.

17.808.2.6 _saveInstance()

```
void Release::_saveInstance (
            PersistenceRecord * fields,
            bool saveDefaultValues )  [override], [protected], [virtual]
```

Saves object fields into a serialization structure.

Parameters

fields	a table-like structure used for serialization.
saveDefaultValues	indicates whether or not to save fields which are set to their default value.

Reimplemented from ModelComponent.

17.808.2.7 show()

```
std::string Release::show ( )  [override], [virtual]
```

virtual public methods
Returns a textual representation of this component.

Returns

Human-readable description used for tracing and debugging.

Reimplemented from ModelComponent.
The documentation for this class was generated from the following files:

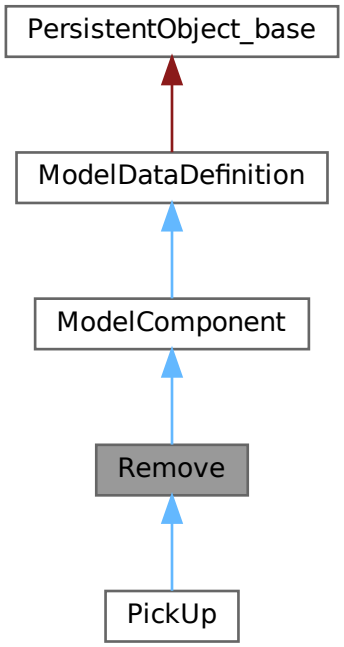
- plugins/components/DiscreteProcessing/Release.h
- plugins/components/DiscreteProcessing/Release.cpp

17.809 Remove Class Reference

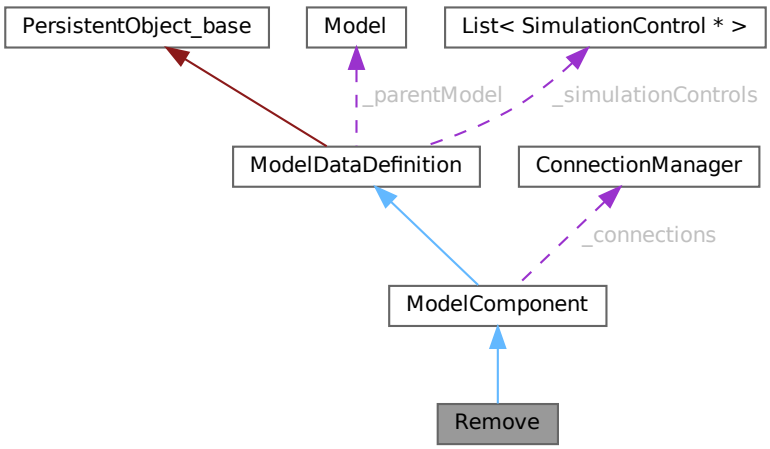
Removes one or more entities at a given rank (or rank range) from a Queue or an EntityGroup and forwards them.

`#include <plugins/components/Decisions/Remove.h>`

Inheritance diagram for Remove:



Collaboration diagram for Remove:



Public Types

- enum class **RemoveFromType** : int { **QUEUE** = 0 , **ENTITYGROUP** = 1 , **num_elements** = 2 }

Public Member Functions

- **Remove** (Model *model, std::string name="")
- virtual std::string show () override

  virtual public methods
- void **setRemoveStartRank** (std::string _removeFromRank)
- std::string **getRemoveStartRank** () const
- void **setRemoveEndRank** (std::string _removeEndRank)
- std::string **getRemoveEndRank** () const
- void **setRemoveFromType** (Remove::RemoveFromType _removeFromType)
- Remove::RemoveFromType **getRemoveFromType** () const
- void **setRemoveFrom** (ModelDataDefinition *_removeFrom)
- ModelDataDefinition * **getRemoveFrom** () const

Public Member Functions inherited from ModelComponent

- ModelComponent (Model *model, std::string componentTypename, std::string name="")

  constructors
- virtual ~**ModelComponent** ()

  Releases component-owned resources and unregisters it from the model.
- ConnectionManager * getConnectionManager () const

  new public user methods for this component
- void connectTo (ModelComponent *component, unsigned int inputPortNumber=0)

  Connects this component to another component.
- bool hasBreakpointAt ()

  Indicates whether a simulation breakpoint is set on this component.
- void setDescription (std::string _description)

  Updates the free-form description shown by the GUI.
- std::string getDescription () const

  Returns the free-form description associated with this component.
- void remove (ModelComponent *comp)

  Removes a connected component from this component.

Public Member Functions inherited from ModelDataDefinition

- ModelDataDefinition (Model *model, std::string datadefinitionTypename, std::string name="", bool insert↩ IntoModel=true)

  Creates a model data definition and optionally inserts it into the model.
- virtual ~**ModelDataDefinition** ()

  Releases resources owned by this data definition.
- Util::identification getId () const

  Returns the unique identifier of this instance.
- void setName (const std::string &name)

  Updates the logical name of this instance.
- const std::string & getName () const

  Returns the logical name of this instance.
- void setLabel (const std::string &label)

  Updates the user-visible label of this instance.
- const std::string & getLabel () const

Returns the user-visible label of this instance.

- const std::string & getClassname () const

  Returns the runtime class name used by the plugin system.
- Model * getParentModel () const

  Returns the parent model that owns this definition.
- bool isReportStatistics () const

  Indicates whether this data definition contributes report statistics.
- void setReportStatistics (bool reportStatistics)

  Enables or disables report-statistics generation for this definition.
- ModelDataDefinition * getInternalData (const std::string &name) const

  Looks up a named internal child data definition.
- std::map< std::string, ModelDataDefinition * > * getInternalData () const

  Returns the full map of internal child data definitions.
- std::map< std::string, ModelDataDefinition * > * getAttachedData () const

  Returns the full map of attached data definitions.
- bool hasChanged () const

  Indicates whether this instance has been modified since the last reset.
- void setHasChanged (bool hasChanged)

  Updates the changed flag for this data definition.
- unsigned int getLevel () const

  Returns the hierarchical editing context containing this element.
- void setModelLevel (unsigned int _modelLevel)

  Sets this element's hierarchical editing context.
- List< SimulationControl * > * getSimulationControls () const

  Returns the simulation controls owned by this data definition.
- TraceManager::Level getTraceLevelSpecific () const

  Returns the trace level that applies specifically to this definition.
- void setTraceLevelSpecific (TraceManager::Level level)

  Updates the trace level used by this definition.
- void defineTraceLevelSpecific (TraceManager::Level traceLevelspecific, bool traceLevelSpecific↩ Enabled=true)

  Defines the specific trace level and optionally enables it immediately.
- bool isTraceLevelSpecificEnabled () const

  Indicates whether the specific trace level is enabled.
- void setTraceLevelSpecificEnabled (bool traceLevelSpecificEnabled)

  Enables or disables the specific trace level.

Static Public Member Functions

17.809.1 Detailed Description

Removes one or more entities at a given rank (or rank range) from a Queue or an EntityGroup and forwards them. Arena correspondence: the "Remove module" (Rockwell Automation, *Getting Started with Arena*, "The Advanced Process Panel", p. 61), which removes a single entity at one rank from a queue.
Known difference from Arena (broader, not narrower): `RemoveFromType` (`QUEUE/ENTITYGROUP`) also supports removing from an EntityGroup, and `_removeStartRank`/`_removeEndRank` support a rank *range* rather than Arena's single-rank-only removal. PickUp (in this same directory) reuses this class for Arena's "Pickup module".

17.809.2 Member Function Documentation

17.809.2.1 _check()

```
bool Remove::_check (
            std::string & errorMessage )  [override], [protected], [virtual]
```

could be overriden by derived classes
Reimplemented from ModelDataDefinition.

17.809.2.2 _createEditableDataDefinitions()

```
void Remove::_createEditableDataDefinitions ( )  [override], [protected], [virtual]
```

This method returns all changes in the parser that are needed by plugins of this ModelDatas. When connecting a new plugin, ParserChangesInformation are used to change parser source code, whch is after compiled and dinamically linked to to simulator kernel to reflect the changes
Reimplemented from ModelDataDefinition.

17.809.2.3 _loadInstance()

```
bool Remove::_loadInstance (
            PersistenceRecord * fields )  [override], [protected], [virtual]
```

virtual protected method that must be overriden
Reimplemented from ModelComponent.

17.809.2.4 _onDispatchEvent()

```
void Remove::_onDispatchEvent (
            Entity * entity,
            unsigned int inputPortNumber )  [override], [protected], [virtual]
```

Handles a dispatched event for this component type.
This method is only for ModelComponents, not for ModelDataElements.

Parameters

entity	Entity being processed.
inputPortNumber	Input port where the entity arrived.

Implements ModelComponent.

17.809.2.5 _saveInstance()

```
void Remove::_saveInstance (
            PersistenceRecord * fields,
            bool saveDefaultValues )  [override], [protected], [virtual]
```

Saves object fields into a serialization structure.

Parameters

fields	a table-like structure used for serialization.
saveDefaultValues	indicates whether or not to save fields which are set to their default value.

Reimplemented from ModelComponent.

17.809.2.6 show()

```
std::string Remove::show ( )  [override], [virtual]
```

virtual public methods
Returns a textual representation of this component.

Returns

Human-readable description used for tracing and debugging.

Reimplemented from ModelComponent.
The documentation for this class was generated from the following files:

- plugins/components/Decisions/Remove.h
- plugins/components/Decisions/Remove.cpp

- void **setRunner** (SPICERunner *runner)

  new public user methods for this components
- SPICERunner * **getRunner** ()
- virtual std::string show () override

  virtual public methods

Public Member Functions inherited from ModelComponent

- ModelComponent (Model *model, std::string componentTypename, std::string name="")

  constructors
- virtual ~**ModelComponent** ()

  Releases component-owned resources and unregisters it from the model.
- ConnectionManager * getConnectionManager () const

  new public user methods for this component
- void connectTo (ModelComponent *component, unsigned int inputPortNumber=0)

  Connects this component to another component.
- bool hasBreakpointAt ()

  Indicates whether a simulation breakpoint is set on this component.
- void setDescription (std::string _description)

Updates the free-form description shown by the GUI.

- std::string getDescription () const

  Returns the free-form description associated with this component.

- void remove (ModelComponent *comp)

  Removes a connected component from this component.

Public Member Functions inherited from ModelDataDefinition

- ModelDataDefinition (Model *model, std::string datadefinitionTypename, std::string name="", bool insert↩ IntoModel=true)

  Creates a model data definition and optionally inserts it into the model.

- virtual ~**ModelDataDefinition** ()

  Releases resources owned by this data definition.

- Util::identification getId () const

  Returns the unique identifier of this instance.

- void setName (const std::string &name)

  Updates the logical name of this instance.

- const std::string & getName () const

  Returns the logical name of this instance.

- void setLabel (const std::string &label)

  Updates the user-visible label of this instance.

- const std::string & getLabel () const

  Returns the user-visible label of this instance.

- const std::string & getClassname () const

  Returns the runtime class name used by the plugin system.

- Model * getParentModel () const

  Returns the parent model that owns this definition.

- bool isReportStatistics () const

  Indicates whether this data definition contributes report statistics.

- void setReportStatistics (bool reportStatistics)

  Enables or disables report-statistics generation for this definition.

- ModelDataDefinition * getInternalData (const std::string &name) const

  Looks up a named internal child data definition.

- std::map< std::string, ModelDataDefinition * > * getInternalData () const

  Returns the full map of internal child data definitions.

- std::map< std::string, ModelDataDefinition * > * getAttachedData () const

  Returns the full map of attached data definitions.

- bool hasChanged () const

  Indicates whether this instance has been modified since the last reset.

- void setHasChanged (bool hasChanged)

  Updates the changed flag for this data definition.

- unsigned int getLevel () const

  Returns the hierarchical editing context containing this element.

- void setModelLevel (unsigned int _modelLevel)

  Sets this element's hierarchical editing context.

- List< SimulationControl * > * getSimulationControls () const

  Returns the simulation controls owned by this data definition.

- TraceManager::Level getTraceLevelSpecific () const

  Returns the trace level that applies specifically to this definition.

- void setTraceLevelSpecific (TraceManager::Level level)

  Updates the trace level used by this definition.

- void defineTraceLevelSpecific (TraceManager::Level traceLevelspecific, bool traceLevelSpecific↩ Enabled=true)

  Defines the specific trace level and optionally enables it immediately.
- bool isTraceLevelSpecificEnabled () const

  Indicates whether the specific trace level is enabled.
- void setTraceLevelSpecificEnabled (bool traceLevelSpecificEnabled)

  Enables or disables the specific trace level.

Static Public Member Functions

- static PluginInformation * **GetPluginInformation** ()

- static ModelDataDefinition * **NewInstance** (Model *model, std::string name="")

Static Public Member Functions inherited from SPICECircuit

- static PluginInformation * **GetPluginInformation** ()

  static public methods that must have implementations (Load and New just the same. GetInformation must provide specific infos for the new component
- static ModelComponent * **LoadInstance** (Model *model, PersistenceRecord *fields)
- static ModelDataDefinition * **NewInstance** (Model *model, std::string name="")
- static std::vector< std::string > **split** (std::string word, char split_char)

  Externalize function GetPluginInformation to be accessible throught dynamic linked library.

Static Public Member Functions inherited from ModelComponent

- static ModelComponent * LoadInstance (Model *model, PersistenceRecord *fields)

  static public methods that must have implementations (Load and New just the same. GetInformation must provide specific infos for the new component
- static bool Check (ModelComponent *component)

  Validates a component instance.
- static void CreateInternalData (ModelComponent *component)

  Creates internal data required by a component instance.
- static void SaveInstance (PersistenceRecord *fields, ModelComponent *component)

  Serializes a component instance into a persistence record.
- static void DispatchEvent (Event *event)

  Dispatches a simulation event to the target component.

Static Public Member Functions inherited from ModelDataDefinition

- static ModelDataDefinition * LoadInstance (Model *model, PersistenceRecord *fields, bool insertIntoModel)

  Loads a model data definition instance from serialized fields.
- static ModelDataDefinition * NewInstance (Model *model, std::string name="")

  Creates a new instance of a data definition using the plugin registry.
- static void SaveInstance (PersistenceRecord *fields, ModelDataDefinition *modeldatum)

  Serializes a data definition instance into a persistence record.
- static bool Check (ModelDataDefinition *modeldatum, std::string &errorMessage)

  Validates a data definition instance.
- static void InitBetweenReplications (ModelDataDefinition *modeldatum)

  Resets simulation-time state between replications.
- static void CreateInternalData (ModelDataDefinition *modeldatum)

  Creates internal and attached data required by this instance.
- static bool CreateRelatedDataElements (ModelDataDefinition *modeldatum, std::string &errorMessage)

  Creates related data and validates the instance in a single call.

Protected Member Functions

- virtual bool _loadInstance (PersistenceRecord *fields) override

  virtual protected method that must be overriden
- virtual void _saveInstance (PersistenceRecord *fields, bool saveDefaultValues) override

  Saves object fields into a serialization structure.

Protected Member Functions inherited from SPICECircuit

17.810.1 Member Function Documentation

17.810.1.1 _loadInstance()

```
bool Resistor::_loadInstance (
            PersistenceRecord * fields ) [override], [protected], [virtual]
```

virtual protected method that must be overriden
Reimplemented from SPICECircuit.

17.810.1.2 _saveInstance()

```
void Resistor::_saveInstance (
            PersistenceRecord * fields,
            bool saveDefaultValues )  [override], [protected], [virtual]
```

Saves object fields into a serialization structure.

Parameters

fields	a table-like structure used for serialization.
saveDefaultValues	indicates whether or not to save fields which are set to their default value.

Reimplemented from SPICECircuit.

17.810.1.3 Build()

```
void Resistor::Build ( )  [override], [virtual]
```

Reimplemented from SPICECircuit.
The documentation for this class was generated from the following files:

- plugins/components/ElectronicsSimulation/SPICECircuit.h
- plugins/components/ElectronicsSimulation/SPICECircuit.cpp

17.811 Resource Class Reference

Data definition representing a seizable capacity pool (equipment, staff, etc.), its costing, its optional capacity schedule, and its associated Failure definitions.

Public Member Functions inherited from ModelDataDefinition

- ModelDataDefinition (Model *model, std::string datadefinitionTypename, std::string name="", bool insertIntoModel=true)

  Creates a model data definition and optionally inserts it into the model.
- virtual ~**ModelDataDefinition** ()

  Releases resources owned by this data definition.
- Util::identification getId () const

  Returns the unique identifier of this instance.
- void setName (const std::string &name)

  Updates the logical name of this instance.
- const std::string & getName () const

  Returns the logical name of this instance.
- void setLabel (const std::string &label)

  Updates the user-visible label of this instance.
- const std::string & getLabel () const

  Returns the user-visible label of this instance.
- const std::string & getClassname () const

  Returns the runtime class name used by the plugin system.
- Model * getParentModel () const

  Returns the parent model that owns this definition.
- bool isReportStatistics () const

  Indicates whether this data definition contributes report statistics.
- void setReportStatistics (bool reportStatistics)

  Enables or disables report-statistics generation for this definition.
- ModelDataDefinition * getInternalData (const std::string &name) const

  Looks up a named internal child data definition.
- std::map< std::string, ModelDataDefinition * > * getInternalData () const

  Returns the full map of internal child data definitions.
- std::map< std::string, ModelDataDefinition * > * getAttachedData () const

  Returns the full map of attached data definitions.
- bool hasChanged () const

  Indicates whether this instance has been modified since the last reset.
- void setHasChanged (bool hasChanged)

  Updates the changed flag for this data definition.
- unsigned int getLevel () const

  Returns the hierarchical editing context containing this element.
- void setModelLevel (unsigned int _modelLevel)

  Sets this element's hierarchical editing context.
- List< SimulationControl * > * getSimulationControls () const

  Returns the simulation controls owned by this data definition.
- TraceManager::Level getTraceLevelSpecific () const

  Returns the trace level that applies specifically to this definition.
- void setTraceLevelSpecific (TraceManager::Level level)

  Updates the trace level used by this definition.
- void defineTraceLevelSpecific (TraceManager::Level traceLevelspecific, bool traceLevelSpecificEnabled=true)

  Defines the specific trace level and optionally enables it immediately.
- bool isTraceLevelSpecificEnabled () const

  Indicates whether the specific trace level is enabled.
- void setTraceLevelSpecificEnabled (bool traceLevelSpecificEnabled)

  Enables or disables the specific trace level.

17.811.1 Detailed Description

Data definition representing a seizable capacity pool (equipment, staff, etc.), its costing, its optional capacity schedule, and its associated Failure definitions.
Arena correspondence: the "Resource module" (Rockwell Automation, *Getting Started with Arena*, "The Basic Process Panel", pp. 46-48). `_capacity` is Arena's fixed "Capacity"; `_capacitySchedule` (a Schedule*) is Arena's "Based on Schedule" type; `_costBusyTimeUnit`, `_costIdleTimeUnit` and `_costPerUse` are Arena's Busy/Idle-per-time-unit and Per Use costs (GenESyS generalizes Arena's "per hour" to the model's base time unit); `_failures` is Arena's Failures list (see Failure).
`ResourceState` (IDLE/BUSY/FAILED/INACTIVE/OTHER) is the closest correspondence to Arena's resource states, but it is a fixed enumeration.
Known differences from Arena, to validate against `Resource.cpp` and `Schedule.cpp` before treating them as closed:

- Arena's "StateSet" data module lets a modeler define arbitrary named states mapped onto autostates or failures; this class only exposes the fixed `ResourceState` enumeration, so a fully custom named-state catalog has no GenESyS equivalent;
- Arena's per-resource "Schedule Rule" (how a capacity decrease behaves against a busy unit: ignore/preempt/wait) has no field on this class; the closest candidate is the per-item `Schedulable↩ Item::Rule` on Schedule, which is a different granularity and needs confirmation.

17.811.2 Constructor & Destructor Documentation

17.811.2.1 Resource()

```
Resource::Resource (
            Model * model,
            std::string name = "" )
```

Handlers are sorted by priority

17.811.3 Member Function Documentation

17.811.3.1 _check()

```
bool Resource::_check (
            std::string & errorMessage )  [override], [protected], [virtual]
```

could be overriden by derived classes
Validate resource basic semantic constraints.
Reimplemented from ModelDataDefinition.

17.811.3.2 _createAttachedAttributes()

```
void Resource::_createAttachedAttributes ( )  [override], [protected], [virtual]
```

Reimplemented from ModelDataDefinition.

17.811.3.3 _initBetweenReplications()

```
void Resource::_initBetweenReplications ( )  [override], [protected], [virtual]
```

Reimplemented from ModelDataDefinition.

17.811.3.4 _loadInstance()

```
bool Resource::_loadInstance (
            PersistenceRecord * fields )  [override], [protected], [virtual]
```

must be overriden by derived classes
Reimplemented from ModelDataDefinition.

17.811.3.5 _saveInstance()

```
void Resource::_saveInstance (
            PersistenceRecord * fields,
            bool saveDefaultValues )  [override], [protected], [virtual]
```

Saves object fields into a serialization structure.

Parameters

fields	a table-like structure used for serialization.
saveDefaultValues	indicates whether or not to save fields which are set to their default value.

Reimplemented from ModelDataDefinition.

17.811.3.6 show()

```
std::string Resource::show ( )  [override], [virtual]
```

Returns a textual representation of this data definition.
Returns the keys of internal ModelDataDefinitions such as counters, statistics collectors and other children needed before model checking.

Returns

Human-readable summary used by traces and debug output.

Reimplemented from ModelDataDefinition.
The documentation for this class was generated from the following files:

- plugins/data/DiscreteProcessing/Resource.h
- plugins/data/DiscreteProcessing/Resource.cpp

17.812 ResourceAllocationComponent Class Reference

```
#include <plugins/components/WholeCellModeling/ResourceAllocationComponent.↩
h>
```

  virtual public methods

Public Member Functions inherited from ModelComponent

- ModelComponent (Model *model, std::string componentTypename, std::string name="")

  constructors
- virtual ~**ModelComponent** ()

  Releases component-owned resources and unregisters it from the model.
- ConnectionManager * getConnectionManager () const

  new public user methods for this component
- void connectTo (ModelComponent *component, unsigned int inputPortNumber=0)

  Connects this component to another component.
- bool hasBreakpointAt ()

  Indicates whether a simulation breakpoint is set on this component.
- void setDescription (std::string _description)

  Updates the free-form description shown by the GUI.
- std::string getDescription () const

  Returns the free-form description associated with this component.
- void remove (ModelComponent *comp)

  Removes a connected component from this component.

Public Member Functions inherited from ModelDataDefinition

- ModelDataDefinition (Model *model, std::string datadefinitionTypename, std::string name="", bool insertIntoModel=true)

  Creates a model data definition and optionally inserts it into the model.
- virtual ~**ModelDataDefinition** ()

  Releases resources owned by this data definition.
- Util::identification getId () const

  Returns the unique identifier of this instance.
- void setName (const std::string &name)

  Updates the logical name of this instance.
- const std::string & getName () const

  Returns the logical name of this instance.
- void setLabel (const std::string &label)

  Updates the user-visible label of this instance.
- const std::string & getLabel () const

  Returns the user-visible label of this instance.
- const std::string & getClassname () const

  Returns the runtime class name used by the plugin system.
- Model * getParentModel () const

  Returns the parent model that owns this definition.
- bool isReportStatistics () const

  Indicates whether this data definition contributes report statistics.
- void setReportStatistics (bool reportStatistics)

  Enables or disables report-statistics generation for this definition.
- ModelDataDefinition * getInternalData (const std::string &name) const

  Looks up a named internal child data definition.
- std::map< std::string, ModelDataDefinition * > * getInternalData () const

  Returns the full map of internal child data definitions.
- std::map< std::string, ModelDataDefinition * > * getAttachedData () const

  Returns the full map of attached data definitions.
- bool hasChanged () const

  Indicates whether this instance has been modified since the last reset.
- void setHasChanged (bool hasChanged)

  Updates the changed flag for this data definition.
- unsigned int getLevel () const

  Returns the hierarchical editing context containing this element.
- void setModelLevel (unsigned int _modelLevel)

  Sets this element's hierarchical editing context.
- List< SimulationControl * > * getSimulationControls () const

  Returns the simulation controls owned by this data definition.
- TraceManager::Level getTraceLevelSpecific () const

  Returns the trace level that applies specifically to this definition.
- void setTraceLevelSpecific (TraceManager::Level level)

  Updates the trace level used by this definition.
- void defineTraceLevelSpecific (TraceManager::Level traceLevelspecific, bool traceLevelSpecificEnabled=true)

  Defines the specific trace level and optionally enables it immediately.
- bool isTraceLevelSpecificEnabled () const

  Indicates whether the specific trace level is enabled.
- void setTraceLevelSpecificEnabled (bool traceLevelSpecificEnabled)

  Enables or disables the specific trace level.

Static Public Member Functions

- static PluginInformation * **GetPluginInformation** ()
- static ModelComponent * **LoadInstance** (Model *model, PersistenceRecord *fields)
- static ModelDataDefinition * **NewInstance** (Model *model, std::string name="")

Static Public Member Functions inherited from ModelComponent

- static ModelComponent * LoadInstance (Model *model, PersistenceRecord *fields)

  static public methods that must have implementations (Load and New just the same. GetInformation must provide specific infos for the new component
- static bool Check (ModelComponent *component)

  Validates a component instance.
- static void CreateInternalData (ModelComponent *component)

  Creates internal data required by a component instance.
- static void SaveInstance (PersistenceRecord *fields, ModelComponent *component)

  Serializes a component instance into a persistence record.
- static void DispatchEvent (Event *event)

  Dispatches a simulation event to the target component.

Static Public Member Functions inherited from ModelDataDefinition

- static ModelDataDefinition * LoadInstance (Model *model, PersistenceRecord *fields, bool insertIntoModel)

  Loads a model data definition instance from serialized fields.
- static ModelDataDefinition * NewInstance (Model *model, std::string name="")

  Creates a new instance of a data definition using the plugin registry.
- static void SaveInstance (PersistenceRecord *fields, ModelDataDefinition *modeldatum)

  Serializes a data definition instance into a persistence record.
- static bool Check (ModelDataDefinition *modeldatum, std::string &errorMessage)

  Validates a data definition instance.
- static void InitBetweenReplications (ModelDataDefinition *modeldatum)

  Resets simulation-time state between replications.
- static void CreateInternalData (ModelDataDefinition *modeldatum)

  Creates internal and attached data required by this instance.
- static bool CreateRelatedDataElements (ModelDataDefinition *modeldatum, std::string &errorMessage)

  Creates related data and validates the instance in a single call.

Protected Member Functions

- virtual bool _loadInstance (PersistenceRecord *fields) override

  virtual protected method that must be overriden
- virtual void _saveInstance (PersistenceRecord *fields, bool saveDefaultValues) override

  Saves object fields into a serialization structure.

- bool **_traceLevelSpecificEnabled** = false

17.812.1 Detailed Description

Fair allocation of molecular machines (RNAP, ribosomes) before each SSA step.
Implements the "ResourceAllocation" contract from Karr et al. (2012): available RNAP and ribosome counts are divided proportionally across active molecular species, then written to WholeCellState::setResourceBudget() so StochasticTranscription and StochasticTranslation can honour the budget.
Allocation logic:

- Count N_mRNA = number of keys in WholeCellState molecule counts whose name starts with m↩ RNASpeciesPrefix (default "mRNA_").
- Count N_protein = number of keys starting with proteinSpeciesPrefix (default "protein_").
- RNAP budget per mRNA gene = floor(RNAP_free / max(N_mRNA, 1))
- Ribosome budget per protein = floor(ribosome_free / max(N_mRNA, 1)) (per active mRNA transcript, not per protein species)
- Write per-species budget to WholeCellState::setResourceBudget().

This component must fire BEFORE StochasticTranscription and StochasticTranslation in the simulation pipeline.

17.812.2 Member Function Documentation

17.812.2.1 _check()

```
bool ResourceAllocationComponent::_check (
            std::string & errorMessage )  [override], [protected], [virtual]
```

could be overriden by derived classes
Reimplemented from ModelDataDefinition.

17.812.2.2 _createEditableDataDefinitions()

```
void ResourceAllocationComponent::_createEditableDataDefinitions ( )  [override], [protected],
[virtual]
```

Reimplemented from ModelDataDefinition.

17.812.2.3 _initBetweenReplications()

```
void ResourceAllocationComponent::_initBetweenReplications ( )  [override], [protected], [virtual]
```

Reimplemented from ModelDataDefinition.

17.812.2.4 _loadInstance()

```
bool ResourceAllocationComponent::_loadInstance (
            PersistenceRecord * fields )  [override], [protected], [virtual]
```

virtual protected method that must be overriden
Reimplemented from ModelComponent.

17.812.2.5 _onDispatchEvent()

```
void ResourceAllocationComponent::_onDispatchEvent (
            Entity * entity,
            unsigned int inputPortNumber )  [override], [protected], [virtual]
```

Handles a dispatched event for this component type.
This method is only for ModelComponents, not for ModelDataElements.

Parameters

entity	Entity being processed.
inputPortNumber	Input port where the entity arrived.

Implements ModelComponent.

17.812.2.6 _saveInstance()

```
void ResourceAllocationComponent::_saveInstance (
            PersistenceRecord * fields,
            bool saveDefaultValues )  [override], [protected], [virtual]
```

Saves object fields into a serialization structure.

Parameters

fields	a table-like structure used for serialization.
saveDefaultValues	indicates whether or not to save fields which are set to their default value.

Reimplemented from ModelComponent.

17.812.2.7 show()

```
std::string ResourceAllocationComponent::show ( )  [override], [virtual]
```

virtual public methods
Returns a textual representation of this component.

Returns

Human-readable description used for tracing and debugging.

Reimplemented from ModelComponent.
The documentation for this class was generated from the following files:

- plugins/components/WholeCellModeling/ResourceAllocationComponent.h
- plugins/components/WholeCellModeling/ResourceAllocationComponent.cpp

17.813 ResourceTestProbe Class Reference

Static Public Member Functions

- static bool **HasStatisticsInternals** (const Resource &resource)

- void **setLabel** (Label *_label)
- Label * **getLabel** () const

Public Member Functions inherited from ModelComponent

- ModelComponent (Model *model, std::string componentTypename, std::string name="")

  constructors
- virtual ~**ModelComponent** ()

  Releases component-owned resources and unregisters it from the model.
- ConnectionManager * getConnectionManager () const

  new public user methods for this component
- void connectTo (ModelComponent *component, unsigned int inputPortNumber=0)

Connects this component to another component.

- bool hasBreakpointAt ()

  Indicates whether a simulation breakpoint is set on this component.

- void setDescription (std::string _description)

  Updates the free-form description shown by the GUI.

- std::string getDescription () const

  Returns the free-form description associated with this component.

- void remove (ModelComponent *comp)

  Removes a connected component from this component.

Public Member Functions inherited from ModelDataDefinition

- ModelDataDefinition (Model *model, std::string datadefinitionTypename, std::string name="", bool insert↩ IntoModel=true)

  Creates a model data definition and optionally inserts it into the model.

- virtual ~**ModelDataDefinition** ()

  Releases resources owned by this data definition.

- Util::identification getId () const

  Returns the unique identifier of this instance.

- void setName (const std::string &name)

  Updates the logical name of this instance.

- const std::string & getName () const

  Returns the logical name of this instance.

- void setLabel (const std::string &label)

  Updates the user-visible label of this instance.

- const std::string & getLabel () const

  Returns the user-visible label of this instance.

- const std::string & getClassname () const

  Returns the runtime class name used by the plugin system.

- Model * getParentModel () const

  Returns the parent model that owns this definition.

- bool isReportStatistics () const

  Indicates whether this data definition contributes report statistics.

- void setReportStatistics (bool reportStatistics)

  Enables or disables report-statistics generation for this definition.

- ModelDataDefinition * getInternalData (const std::string &name) const

  Looks up a named internal child data definition.

- std::map< std::string, ModelDataDefinition * > * getInternalData () const

  Returns the full map of internal child data definitions.

- std::map< std::string, ModelDataDefinition * > * getAttachedData () const

  Returns the full map of attached data definitions.

- bool hasChanged () const

  Indicates whether this instance has been modified since the last reset.

- void setHasChanged (bool hasChanged)

  Updates the changed flag for this data definition.

- unsigned int getLevel () const

  Returns the hierarchical editing context containing this element.

- void setModelLevel (unsigned int _modelLevel)

  Sets this element's hierarchical editing context.

- List< SimulationControl * > * getSimulationControls () const

  Returns the simulation controls owned by this data definition.

- TraceManager::Level getTraceLevelSpecific () const

  Returns the trace level that applies specifically to this definition.
- void setTraceLevelSpecific (TraceManager::Level level)

  Updates the trace level used by this definition.
- void defineTraceLevelSpecific (TraceManager::Level traceLevelspecific, bool traceLevelSpecific↩ Enabled=true)

  Defines the specific trace level and optionally enables it immediately.
- bool isTraceLevelSpecificEnabled () const

  Indicates whether the specific trace level is enabled.
- void setTraceLevelSpecificEnabled (bool traceLevelSpecificEnabled)

  Enables or disables the specific trace level.

Static Public Member Functions

- static std::string **convertEnumToStr** (DestinationType type)
- static PluginInformation * **GetPluginInformation** ()
- static ModelComponent * **LoadInstance** (Model *model, PersistenceRecord *fields)
- static ModelDataDefinition * **NewInstance** (Model *model, std::string name="")

Static Public Member Functions inherited from ModelComponent

- static ModelComponent * LoadInstance (Model *model, PersistenceRecord *fields)

  static public methods that must have implementations (Load and New just the same. GetInformation must provide specific infos for the new component
- static bool Check (ModelComponent *component)

  Validates a component instance.
- static void CreateInternalData (ModelComponent *component)

  Creates internal data required by a component instance.
- static void SaveInstance (PersistenceRecord *fields, ModelComponent *component)

  Serializes a component instance into a persistence record.
- static void DispatchEvent (Event *event)

  Dispatches a simulation event to the target component.

Static Public Member Functions inherited from ModelDataDefinition

- static ModelDataDefinition * LoadInstance (Model *model, PersistenceRecord *fields, bool insertIntoModel)

  Loads a model data definition instance from serialized fields.
- static ModelDataDefinition * NewInstance (Model *model, std::string name="")

  Creates a new instance of a data definition using the plugin registry.
- static void SaveInstance (PersistenceRecord *fields, ModelDataDefinition *modeldatum)

  Serializes a data definition instance into a persistence record.
- static bool Check (ModelDataDefinition *modeldatum, std::string &errorMessage)

  Validates a data definition instance.
- static void InitBetweenReplications (ModelDataDefinition *modeldatum)

  Resets simulation-time state between replications.
- static void CreateInternalData (ModelDataDefinition *modeldatum)

  Creates internal and attached data required by this instance.
- static bool CreateRelatedDataElements (ModelDataDefinition *modeldatum, std::string &errorMessage)

  Creates related data and validates the instance in a single call.

Protected Member Functions

- virtual void _onDispatchEvent (Entity *entity, unsigned int inputPortNumber) override

  Handles a dispatched event for this component type.
- virtual bool _loadInstance (PersistenceRecord *fields) override

  virtual protected method that must be overriden
- virtual void _saveInstance (PersistenceRecord *fields, bool saveDefaultValues) override

  Saves object fields into a serialization structure.

17.817.1 Detailed Description

Route module DESCRIPTION The Route module transfers an entity to a specified station or the next station in the station visitation sequence defined for the entity. A delay time to transfer to the next station may be defined. When an entity enters the Route module, its Station attribute (Entity.Station) is set to the destination station. The entity is then sent to the destination station, using the route time specified. If the station destination is entered as By Sequence, the next station is determined by the entity's sequence and step within the set (defined by special-purpose attributes Entity.Sequence and Entity.Jobstep, respectively). TYPICAL USES Send a part to its next processing station based on its routing slip Send an account balance call to an account agent Send restaurant customers to a specific table PROMPTS Prompt Description Name Unique name of the module that will be displayed in the flowchart. Route Time Travel time from the entity's current location to the destination station. Units Time units for route-time parameters. Destination Type Method for determining the entity destination location. Selection of By Sequence requires that the entity has been assigned a sequence name and that the sequence itself has been defined. Station Name Name of the individual destination station. Attribute Name Name of the attribute that stores the station name to which entities will route. Expression Expression that is evaluated to the station name where entities will route.

17.817.2 Member Function Documentation

17.817.2.1 _check()

```
bool Route::_check (
            std::string & errorMessage )  [override], [protected], [virtual]
```

could be overriden by derived classes
Reimplemented from ModelDataDefinition.

17.817.2.2 _createAttachedAttributes()

```
void Route::_createAttachedAttributes ( )  [override], [protected], [virtual]
```
Reimplemented from ModelDataDefinition.

17.817.2.3 _createEditableDataDefinitions()

```
void Route::_createEditableDataDefinitions ( )  [override], [protected], [virtual]
```
Reimplemented from ModelDataDefinition.

17.817.2.4 _createInternalStatisticReporters()

```
void Route::_createInternalStatisticReporters ( )  [override], [protected], [virtual]
```
Reimplemented from ModelDataDefinition.

17.817.2.5 _loadInstance()

```
bool Route::_loadInstance (
            PersistenceRecord * fields )  [override], [protected], [virtual]
```
virtual protected method that must be overriden
Reimplemented from ModelComponent.

17.817.2.6 _onDispatchEvent()

```
void Route::_onDispatchEvent (
            Entity * entity,
            unsigned int inputPortNumber )  [override], [protected], [virtual]
```
Handles a dispatched event for this component type.
This method is only for ModelComponents, not for ModelDataElements.

Parameters

entity	Entity being processed.
inputPortNumber	Input port where the entity arrived.

Implements ModelComponent.

17.817.2.7 _saveInstance()

```
void Route::_saveInstance (
            PersistenceRecord * fields,
            bool saveDefaultValues )  [override], [protected], [virtual]
```
Saves object fields into a serialization structure.

Parameters

fields	a table-like structure used for serialization.
saveDefaultValues	indicates whether or not to save fields which are set to their default value.

Reimplemented from ModelComponent.

17.817.2.8 show()

```
std::string Route::show ( )  [override], [virtual]
```
virtual public methods
Returns a textual representation of this component.

Returns

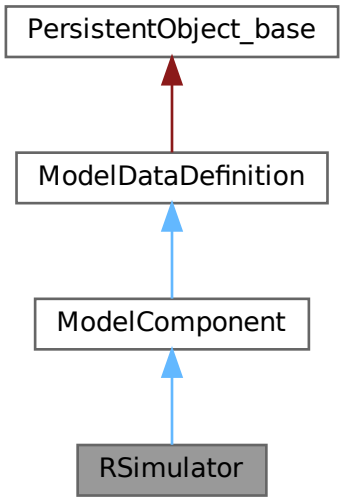
Human-readable description used for tracing and debugging.

Reimplemented from ModelComponent.
The documentation for this class was generated from the following files:

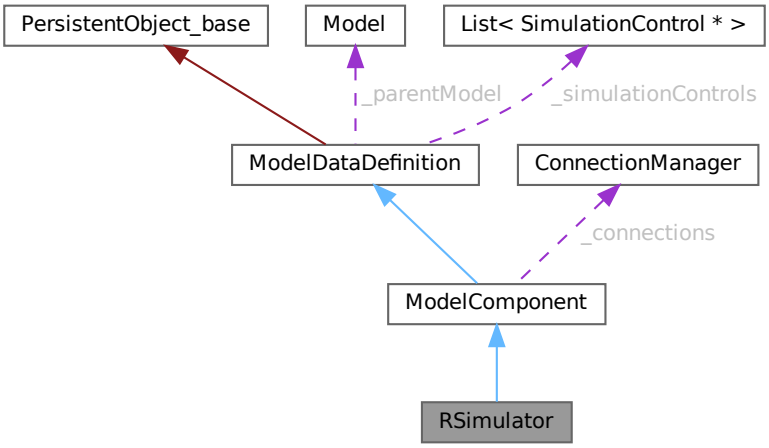
- plugins/components/MaterialHandling/Route.h
- plugins/components/MaterialHandling/Route.cpp

17.818 RSimulator Class Reference

Component that sends configured R commands to an internal RSimulatorRunner.
`#include <plugins/components/ExternalIntegration/RSimulator.h>`
Inheritance diagram for RSimulator:



Collaboration diagram for RSimulator:



Public Member Functions

- **RSimulator** (Model *model, std::string name="")

  Creates an RSimulator component attached to a model.
- virtual ~**RSimulator** ()=default

  Destroys the RSimulator component.
- void **setRExecutable** (std::string rExecutable)

  Sets the Rscript executable name or path used by the internal runner.
- std::string **getRExecutable** () const

  Returns the Rscript executable name or path used by the internal runner.
- void **setWorkingDirectory** (std::string workingDirectory)

  Sets the working directory used by generated R scripts.
- std::string **getWorkingDirectory** () const

  Returns the working directory used by generated R scripts.
- void **setPreludeScript** (std::string preludeScript)

  Sets optional R code prepended to every command.
- std::string **getPreludeScript** () const

  Returns optional R code prepended to every command.
- void **insertCommand** (std::string command)

  Appends one R command to the execution list.
- void **setCommands** (std::list< std::string > commands)

  Replaces the command list with the provided commands.
- List< std::string > * **getCommands** () const

  Returns the command list used when entities arrive.
- void **setCommandList** (std::string commandList)

  Replaces the command list using one command per non-empty line.
- std::string **getCommandList** () const

  Returns commands serialized as one command per line for GUI editing.
- RSimulatorRunner * **getRunner** ()

  Returns the internal runner, creating it first if necessary.
- virtual std::string show () override

  Returns a compact human-readable description of the component.

Public Member Functions inherited from ModelComponent

- ModelComponent (Model *model, std::string componentTypename, std::string name="")

  constructors
- virtual ~**ModelComponent** ()

  Releases component-owned resources and unregisters it from the model.
- ConnectionManager * getConnectionManager () const

  new public user methods for this component
- void connectTo (ModelComponent *component, unsigned int inputPortNumber=0)

  Connects this component to another component.
- bool hasBreakpointAt ()

  Indicates whether a simulation breakpoint is set on this component.
- void setDescription (std::string _description)

  Updates the free-form description shown by the GUI.
- std::string getDescription () const

  Returns the free-form description associated with this component.
- void remove (ModelComponent *comp)

  Removes a connected component from this component.

Public Member Functions inherited from ModelDataDefinition

- ModelDataDefinition (Model *model, std::string datadefinitionTypename, std::string name="", bool insert↩ IntoModel=true)

  Creates a model data definition and optionally inserts it into the model.
- virtual ~**ModelDataDefinition** ()

  Releases resources owned by this data definition.
- Util::identification getId () const

  Returns the unique identifier of this instance.
- void setName (const std::string &name)

  Updates the logical name of this instance.
- const std::string & getName () const

  Returns the logical name of this instance.
- void setLabel (const std::string &label)

  Updates the user-visible label of this instance.
- const std::string & getLabel () const

  Returns the user-visible label of this instance.
- const std::string & getClassname () const

  Returns the runtime class name used by the plugin system.
- Model * getParentModel () const

  Returns the parent model that owns this definition.
- bool isReportStatistics () const

  Indicates whether this data definition contributes report statistics.
- void setReportStatistics (bool reportStatistics)

  Enables or disables report-statistics generation for this definition.
- ModelDataDefinition * getInternalData (const std::string &name) const

  Looks up a named internal child data definition.
- std::map< std::string, ModelDataDefinition * > * getInternalData () const

  Returns the full map of internal child data definitions.
- std::map< std::string, ModelDataDefinition * > * getAttachedData () const

  Returns the full map of attached data definitions.
- bool hasChanged () const

  Indicates whether this instance has been modified since the last reset.

- void setHasChanged (bool hasChanged)

  Updates the changed flag for this data definition.
- unsigned int getLevel () const

  Returns the hierarchical editing context containing this element.
- void setModelLevel (unsigned int _modelLevel)

  Sets this element's hierarchical editing context.
- List< SimulationControl * > * getSimulationControls () const

  Returns the simulation controls owned by this data definition.
- TraceManager::Level getTraceLevelSpecific () const

  Returns the trace level that applies specifically to this definition.
- void setTraceLevelSpecific (TraceManager::Level level)

  Updates the trace level used by this definition.
- void defineTraceLevelSpecific (TraceManager::Level traceLevelspecific, bool traceLevelSpecific↩ Enabled=true)

  Defines the specific trace level and optionally enables it immediately.
- bool isTraceLevelSpecificEnabled () const

  Indicates whether the specific trace level is enabled.
- void setTraceLevelSpecificEnabled (bool traceLevelSpecificEnabled)

  Enables or disables the specific trace level.

Static Public Member Functions

- static PluginInformation * **GetPluginInformation** ()

  Returns plugin metadata for the RSimulator component.
- static ModelComponent * **LoadInstance** (Model *model, PersistenceRecord *fields)

  Loads an RSimulator component from persistence.
- static ModelDataDefinition * **NewInstance** (Model *model, std::string name="")

  Creates a new RSimulator component instance.

Static Public Member Functions inherited from ModelComponent

- static ModelComponent * LoadInstance (Model *model, PersistenceRecord *fields)

  static public methods that must have implementations (Load and New just the same. GetInformation must provide specific infos for the new component
- static bool Check (ModelComponent *component)

  Validates a component instance.
- static void CreateInternalData (ModelComponent *component)

  Creates internal data required by a component instance.
- static void SaveInstance (PersistenceRecord *fields, ModelComponent *component)

  Serializes a component instance into a persistence record.
- static void DispatchEvent (Event *event)

  Dispatches a simulation event to the target component.

Static Public Member Functions inherited from ModelDataDefinition

- static ModelDataDefinition * LoadInstance (Model *model, PersistenceRecord *fields, bool insertIntoModel)

  Loads a model data definition instance from serialized fields.
- static ModelDataDefinition * NewInstance (Model *model, std::string name="")

  Creates a new instance of a data definition using the plugin registry.
- static void SaveInstance (PersistenceRecord *fields, ModelDataDefinition *modeldatum)

  Serializes a data definition instance into a persistence record.
- static bool Check (ModelDataDefinition *modeldatum, std::string &errorMessage)

Validates a data definition instance.

- static void InitBetweenReplications (ModelDataDefinition *modeldatum)

  Resets simulation-time state between replications.
- static void CreateInternalData (ModelDataDefinition *modeldatum)

  Creates internal and attached data required by this instance.
- static bool CreateRelatedDataElements (ModelDataDefinition *modeldatum, std::string &errorMessage)

  Creates related data and validates the instance in a single call.

Protected Member Functions

- virtual void _onDispatchEvent (Entity *entity, unsigned int inputPortNumber) override

  Executes R commands for the arriving entity and forwards it.
- virtual bool _loadInstance (PersistenceRecord *fields) override

  Loads persisted RSimulator configuration.
- virtual void _saveInstance (PersistenceRecord *fields, bool saveDefaultValues) override

  Saves RSimulator configuration.
- virtual bool _check (std::string &errorMessage) override

  Validates the executable, working directory and command list.
- virtual void _createEditableDataDefinitions () override

  Creates or updates the internal RSimulatorRunner.

Protected Member Functions inherited from ModelDataDefinition

- bool _getSaveDefaultsOption ()

- void **_optionalNonEditableDataDefinitionRemove** (const std::string &key)
- void **_optionalNonEditableDataDefinitionsClear** ()
- void **_checkCreateAttachedReferencedDataDefinition** (const std::string &expression)

  method to be called to insert attached dataelements that are referenced by string expressions (detected by the parser), to avoid orphaned data definitions
- void **trace** (const std::string &text, TraceManager::Level level=TraceManager::Level::L8_detailed)

  not just an easy access to trace manager, but wrappers to check if specific trace level applies
- void **traceError** (const std::string &text, const std::exception &e)
- void **traceError** (const std::string &text, TraceManager::Level level=TraceManager::Level::L1_errorFatal)
- void **traceReport** (const std::string &text, TraceManager::Level level=TraceManager::Level::L2_results)
- void **traceSimulation** (void *thisobject, double time, Entity *entity, ModelComponent *component, const std::string &text, TraceManager::Level level=TraceManager::Level::L8_detailed)
- void traceSimulation (void *thisobject, const std::string &text, TraceManager::Level level=TraceManager::↩ Level::L8_detailed)

  Traces text to the simulation output.
- void **traceSimulation** (void *thisobject, TraceManager::Level level, const std::string &text)

Additional Inherited Members

Protected Attributes inherited from ModelComponent

- ConnectionManager * _connections = new ConnectionManager()

  virtual protected methods that could be overriden by derived classes, if needed

Protected Attributes inherited from ModelDataDefinition

- Util::identification **_id**

17.818.1 Detailed Description

Component that sends configured R commands to an internal RSimulatorRunner.
Each arriving entity triggers the configured command list. Commands are executed sequentially by the internal RSimulatorRunner, and the first version exposes results through simulation trace messages before forwarding the entity.

17.818.2 Member Function Documentation

17.818.2.1 _check()

```
bool RSimulator::_check (
            std::string & errorMessage )  [override], [protected], [virtual]
```

Validates the executable, working directory and command list.
Reimplemented from ModelDataDefinition.

17.818.2.2 _createEditableDataDefinitions()

```
void RSimulator::_createEditableDataDefinitions ( )  [override], [protected], [virtual]
```

Creates or updates the internal RSimulatorRunner.
Reimplemented from ModelDataDefinition.

17.818.2.3 _loadInstance()

```
bool RSimulator::_loadInstance (
            PersistenceRecord * fields )  [override], [protected], [virtual]
```

Loads persisted RSimulator configuration.
Reimplemented from ModelComponent.

17.818.2.4 _onDispatchEvent()

```
void RSimulator::_onDispatchEvent (
            Entity * entity,
            unsigned int inputPortNumber )  [override], [protected], [virtual]
```

Executes R commands for the arriving entity and forwards it.
Implements ModelComponent.

17.818.2.5 _saveInstance()

```
void RSimulator::_saveInstance (
            PersistenceRecord * fields,
            bool saveDefaultValues )  [override], [protected], [virtual]
```

Saves RSimulator configuration.
Reimplemented from ModelComponent.

17.818.2.6 show()

```
std::string RSimulator::show ( )  [override], [virtual]
```

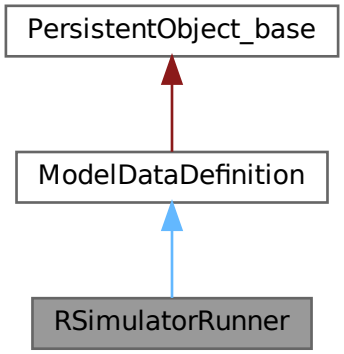
Returns a compact human-readable description of the component.
Reimplemented from ModelComponent.
The documentation for this class was generated from the following files:

- plugins/components/ExternalIntegration/RSimulator.h
- plugins/components/ExternalIntegration/RSimulator.cpp

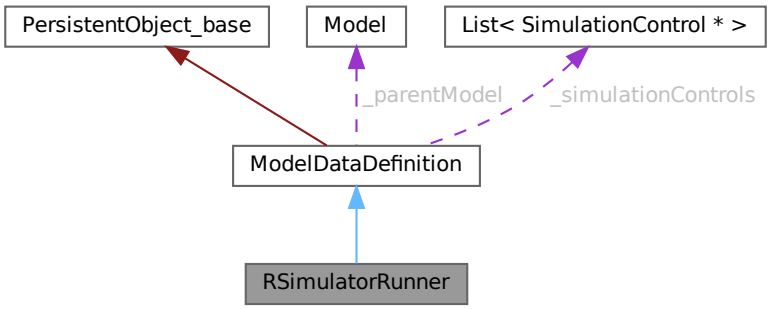
17.819 RSimulatorRunner Class Reference

Model data definition that executes R code through Rscript.
`#include <plugins/data/ExternalIntegration/RSimulatorRunner.h>`

Inheritance diagram for RSimulatorRunner:



Collaboration diagram for RSimulatorRunner:



Public Member Functions

- **RSimulatorRunner** (Model *model, std::string name="")

  Creates an R runner bound to a model.
- virtual ~**RSimulatorRunner** ()=default

  Destroys the R runner.
- void **setRExecutable** (std::string rExecutable)

  Sets the Rscript executable name or path.
- std::string **getRExecutable** () const

  Returns the Rscript executable name or path.
- void **setWorkingDirectory** (std::string workingDirectory)

  Sets the working directory used for generated scripts and command execution.
- std::string **getWorkingDirectory** () const

  Returns the working directory used for generated scripts and command execution.
- void **setPreludeScript** (std::string preludeScript)

  Sets optional R code prepended before the command block.

- std::string **getPreludeScript** () const

  Returns optional R code prepended before the command block.
- void **setCommand** (std::string command)

  Sets the R command/script body to execute.
- std::string **getCommand** () const

  Returns the R command/script body to execute.
- void **setLastStatus** (std::string lastStatus)

  Sets the last execution status.
- std::string **getLastStatus** () const

  Returns the last execution status.
- void **setLastExitCode** (int lastExitCode)

  Sets the last process exit code.
- int **getLastExitCode** () const

  Returns the last process exit code.
- void **setLastStdout** (std::string lastStdout)

  Sets stdout captured from the last R execution.
- std::string **getLastStdout** () const

  Returns stdout captured from the last R execution.
- void **setLastStderr** (std::string lastStderr)

  Sets stderr captured from the last R execution.
- std::string **getLastStderr** () const

  Returns stderr captured from the last R execution.
- void **setLastResponsePayload** (std::string lastResponsePayload)

  Sets the response payload exposed to other tools.
- std::string **getLastResponsePayload** () const

  Returns the response payload exposed to other tools.
- void **setLastScriptFilename** (std::string lastScriptFilename)

  Sets the generated R script filename from the last execution.
- std::string **getLastScriptFilename** () const

  Returns the generated R script filename from the last execution.
- void **setLastResponseFilename** (std::string lastResponseFilename)

  Sets the stdout file path from the last execution.
- std::string **getLastResponseFilename** () const

  Returns the stdout file path from the last execution.
- bool **executeCommand** (std::string &errorMessage)

  Executes the configured R code and updates last-execution fields atomically.
- virtual std::string show () override

  Returns a compact human-readable description of the runner.

Public Member Functions inherited from ModelDataDefinition

- ModelDataDefinition (Model *model, std::string datadefinitionTypename, std::string name="", bool insert↩ IntoModel=true)

  Creates a model data definition and optionally inserts it into the model.
- virtual ~**ModelDataDefinition** ()

  Releases resources owned by this data definition.
- Util::identification getId () const

  Returns the unique identifier of this instance.
- void setName (const std::string &name)

  Updates the logical name of this instance.
- const std::string & getName () const

Returns the logical name of this instance.

- void setLabel (const std::string &label)

  Updates the user-visible label of this instance.
- const std::string & getLabel () const

  Returns the user-visible label of this instance.
- const std::string & getClassname () const

  Returns the runtime class name used by the plugin system.
- Model * getParentModel () const

  Returns the parent model that owns this definition.
- bool isReportStatistics () const

  Indicates whether this data definition contributes report statistics.
- void setReportStatistics (bool reportStatistics)

  Enables or disables report-statistics generation for this definition.
- ModelDataDefinition * getInternalData (const std::string &name) const

  Looks up a named internal child data definition.
- std::map< std::string, ModelDataDefinition * > * getInternalData () const

  Returns the full map of internal child data definitions.
- std::map< std::string, ModelDataDefinition * > * getAttachedData () const

  Returns the full map of attached data definitions.
- bool hasChanged () const

  Indicates whether this instance has been modified since the last reset.
- void setHasChanged (bool hasChanged)

  Updates the changed flag for this data definition.
- unsigned int getLevel () const

  Returns the hierarchical editing context containing this element.
- void setModelLevel (unsigned int _modelLevel)

  Sets this element's hierarchical editing context.
- List< SimulationControl * > * getSimulationControls () const

  Returns the simulation controls owned by this data definition.
- TraceManager::Level getTraceLevelSpecific () const

  Returns the trace level that applies specifically to this definition.
- void setTraceLevelSpecific (TraceManager::Level level)

  Updates the trace level used by this definition.
- void defineTraceLevelSpecific (TraceManager::Level traceLevelspecific, bool traceLevelSpecific↩ Enabled=true)

  Defines the specific trace level and optionally enables it immediately.
- bool isTraceLevelSpecificEnabled () const

  Indicates whether the specific trace level is enabled.
- void setTraceLevelSpecificEnabled (bool traceLevelSpecificEnabled)

  Enables or disables the specific trace level.

Static Public Member Functions

- static ModelDataDefinition * **LoadInstance** (Model *model, PersistenceRecord *fields)

  Loads an R runner from a persistence record.
- static PluginInformation * **GetPluginInformation** ()

  Returns plugin metadata and system dependency declarations.
- static ModelDataDefinition * **NewInstance** (Model *model, std::string name="")

  Creates a new R runner instance for plugin construction.

Static Public Member Functions inherited from ModelDataDefinition

- static ModelDataDefinition * LoadInstance (Model *model, PersistenceRecord *fields, bool insertIntoModel)

  Loads a model data definition instance from serialized fields.
- static ModelDataDefinition * NewInstance (Model *model, std::string name="")

  Creates a new instance of a data definition using the plugin registry.
- static void SaveInstance (PersistenceRecord *fields, ModelDataDefinition *modeldatum)

  Serializes a data definition instance into a persistence record.
- static bool Check (ModelDataDefinition *modeldatum, std::string &errorMessage)

  Validates a data definition instance.
- static void InitBetweenReplications (ModelDataDefinition *modeldatum)

  Resets simulation-time state between replications.
- static void CreateInternalData (ModelDataDefinition *modeldatum)

  Creates internal and attached data required by this instance.
- static bool CreateRelatedDataElements (ModelDataDefinition *modeldatum, std::string &errorMessage)

  Creates related data and validates the instance in a single call.

Protected Member Functions

- virtual bool _loadInstance (PersistenceRecord *fields) override

  Loads persisted R runner configuration and last-execution state.
- virtual void _saveInstance (PersistenceRecord *fields, bool saveDefaultValues) override

  Saves R runner configuration and last-execution state.
- virtual bool _check (std::string &errorMessage) override

  Validates the runner configuration without executing R.

Protected Member Functions inherited from ModelDataDefinition

- bool _getSaveDefaultsOption ()
- virtual ParserChangesInformation * _getParserChangesInformation ()
- virtual void _initBetweenReplications ()
- virtual void _addSimulationControl (SimulationControl *control)

17.819.1 Detailed Description

Model data definition that executes R code through Rscript.
The runner stores a compact R execution configuration, writes a temporary script, executes it with Rscript, and keeps status, exit code, stdout, stderr and response payload inside the model data definition for later inspection.

17.819.2 Member Function Documentation

17.819.2.1 _check()

```
bool RSimulatorRunner::_check (
            std::string & errorMessage )  [override], [protected], [virtual]
```

Validates the runner configuration without executing R.
Reimplemented from ModelDataDefinition.

17.819.2.2 _loadInstance()

```
bool RSimulatorRunner::_loadInstance (
            PersistenceRecord * fields )  [override], [protected], [virtual]
```

Loads persisted R runner configuration and last-execution state.
Reimplemented from ModelDataDefinition.

17.819.2.3 _saveInstance()

```
void RSimulatorRunner::_saveInstance (
            PersistenceRecord * fields,
            bool saveDefaultValues )  [override], [protected], [virtual]
```

Saves R runner configuration and last-execution state.
Reimplemented from ModelDataDefinition.

17.819.2.4 show()

```
std::string RSimulatorRunner::show ( )  [override], [virtual]
```

Returns a compact human-readable description of the runner.
Reimplemented from ModelDataDefinition.

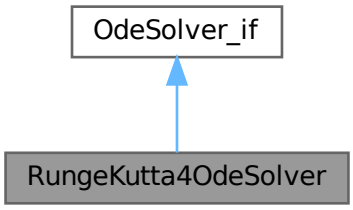
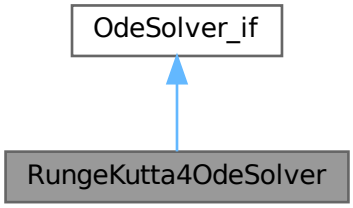
17.820 RungeKutta4OdeSolver Class Reference

Fixed-step fourth-order Runge-Kutta solver for first-order ODE systems.
`#include <tools/Continuous/RungeKutta4OdeSolver.h>`
Inheritance diagram for RungeKutta4OdeSolver:



Collaboration diagram for RungeKutta4OdeSolver:



Public Member Functions

- bool advance (const OdeSystem_if &system, double t0, double dt, const double *y0, double *y1) const override

17.820.1 Detailed Description

Fixed-step fourth-order Runge-Kutta solver for first-order ODE systems.

17.820.2 Member Function Documentation

17.820.2.1 advance()

```
bool RungeKutta4OdeSolver::advance (
            const OdeSystem_if & system,
            double t0,
            double dt,
            const double * y0,
            double * y1 ) const  [inline], [override], [virtual]
```

Implements OdeSolver_if.

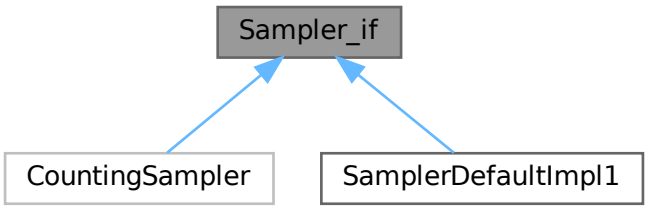
17.826 Sampler_if Class Reference

Abstraction for random-number generation and probability-distribution sampling.
`#include <kernel/statistics/Sampler_if.h>`
Inheritance diagram for Sampler_if:



Classes

- struct RNG_Parameters

  Encapsulates generator-specific configuration/state parameters.

Public Member Functions

- virtual double random ()=0

  Generates a pseudo-random value uniformly distributed in the range [0,1).
- virtual double sampleBeta (double alpha, double beta, double infLimit, double supLimit)=0

  Samples a Beta-distributed value scaled to an arbitrary output interval.
- virtual double sampleBeta (double alpha, double beta)=0

  Samples a standard Beta-distributed value in [0,1].
- virtual double sampleErlang (double mean, int M, double offset=0.0)=0

  Samples from an Erlang distribution using the provided mean and number of phases.
- virtual double sampleExponential (double mean, double offset=0.0)=0

  Samples from an Exponential distribution with the provided mean.
- virtual double sampleGamma (double alpha, double beta, double offset=0.0)=0

  Samples from a Gamma distribution using the provided shape/scale parameters.
- virtual double sampleGumbell (double mode, double scale)=0

  Samples from a Gumbel distribution using mode and scale.

- virtual double sampleLogNormal (double mean, double stddev, double offset=0.0)=0

  Samples from a Lognormal distribution parameterized by mean and standard deviation.
- virtual double sampleNormal (double mean, double stddev)=0

  Samples from a Normal distribution.
- virtual double sampleTriangular (double min, double mode, double max)=0

  Samples from a Triangular distribution.
- virtual double sampleUniform (double min, double max)=0

  Samples from a continuous Uniform distribution in [min, max].
- virtual double sampleWeibull (double alpha, double scale)=0

  Samples from a Weibull distribution.
- virtual double sampleBinomial (int trials, double p)=0

  Samples from a Binomial distribution with `trials` and success probability `p`.
- virtual double sampleBernoulli (double p)=0

  Samples from a Bernoulli distribution (0/1).
- virtual double sampleDiscrete (double prob, double value,...)=0

  Samples from a discrete distribution using a variadic list of probability/value pairs.
- virtual double sampleDiscrete (double *prob, double *value, int size)=0

  Samples from a discrete distribution using probability/value arrays.
- virtual double sampleGeometric (double p)=0

  Samples from a Geometric distribution with success probability `p`.
- virtual void setRNGparameters (RNG_Parameters *param)=0

  Updates the pseudo-random generator internal parameters.
- virtual RNG_Parameters * getRNGparameters () const =0

  Returns the current pseudo-random generator parameters.

17.826.1 Detailed Description

Abstraction for random-number generation and probability-distribution sampling.
Concrete implementations provide a base uniform pseudo-random generator and helper methods to sample supported continuous and discrete probability distributions used across the simulation kernel (e.g., parser functions and stochastic model logic).

17.826.2 Member Function Documentation

17.826.2.1 getRNGparameters()

```
virtual RNG_Parameters * Sampler_if::getRNGparameters ( ) const  [pure virtual]
```

Returns the current pseudo-random generator parameters.
Implemented in SamplerDefaultImpl1, and CountingSampler.

17.826.2.2 random()

```
virtual double Sampler_if::random ( )  [pure virtual]
```

Generates a pseudo-random value uniformly distributed in the range [0,1).

Returns

Base pseudo-random value used by the other distribution samplers.

Implemented in SamplerDefaultImpl1, and CountingSampler.

17.826.2.3 sampleBernoulli()

```
virtual double Sampler_if::sampleBernoulli (
            double p )  [pure virtual]
```

Samples from a Bernoulli distribution (0/1).
Implemented in SamplerDefaultImpl1, and CountingSampler.

17.826.2.4 sampleBeta() [1/2]

```
virtual double Sampler_if::sampleBeta (
            double alpha,
            double beta )  [pure virtual]
```

Samples a standard Beta-distributed value in [0,1].
Implemented in SamplerDefaultImpl1, and CountingSampler.

17.826.2.5 sampleBeta() [2/2]

```
virtual double Sampler_if::sampleBeta (
            double alpha,
            double beta,
            double infLimit,
            double supLimit )  [pure virtual]
```

Samples a Beta-distributed value scaled to an arbitrary output interval.

Parameters

alpha	Alpha shape parameter (>0).
beta	Beta shape parameter (>0).
infLimit	Lower bound of the output interval.
supLimit	Upper bound of the output interval.

Returns

Sampled value within [infLimit, supLimit].

Implemented in SamplerDefaultImpl1, and CountingSampler.

17.826.2.6 sampleBinomial()

```
virtual double Sampler_if::sampleBinomial (
            int trials,
            double p )  [pure virtual]
```

Samples from a Binomial distribution with `trials` and success probability `p`.
Implemented in SamplerDefaultImpl1, and CountingSampler.

17.826.2.7 sampleDiscrete() [1/2]

```
virtual double Sampler_if::sampleDiscrete (
            double * prob,
            double * value,
            int size )  [pure virtual]
```

Samples from a discrete distribution using probability/value arrays.
Implemented in CountingSampler, and SamplerDefaultImpl1.

17.826.2.8 sampleDiscrete() [2/2]

```
virtual double Sampler_if::sampleDiscrete (
            double prob,
            double value,
             ...  )  [pure virtual]
```

Samples from a discrete distribution using a variadic list of probability/value pairs.
Implemented in SamplerDefaultImpl1, and CountingSampler.

17.826.2.9 sampleErlang()

```
virtual double Sampler_if::sampleErlang (
            double mean,
```

```
            int M,
            double offset = 0.0 )  [pure virtual]
```

Samples from an Erlang distribution using the provided mean and number of phases.
Implemented in SamplerDefaultImpl1, and CountingSampler.

17.826.2.10 sampleExponential()

```
virtual double Sampler_if::sampleExponential (
            double mean,
            double offset = 0.0 )  [pure virtual]
```

Samples from an Exponential distribution with the provided mean.
Implemented in SamplerDefaultImpl1, and CountingSampler.

17.826.2.11 sampleGamma()

```
virtual double Sampler_if::sampleGamma (
            double alpha,
            double beta,
            double offset = 0.0 )  [pure virtual]
```

Samples from a Gamma distribution using the provided shape/scale parameters.
Implemented in SamplerDefaultImpl1, and CountingSampler.

17.826.2.12 sampleGeometric()

```
virtual double Sampler_if::sampleGeometric (
            double p )  [pure virtual]
```

Samples from a Geometric distribution with success probability p.
Implemented in SamplerDefaultImpl1, and CountingSampler.

17.826.2.13 sampleGumbell()

```
virtual double Sampler_if::sampleGumbell (
            double mode,
            double scale )  [pure virtual]
```

Samples from a Gumbel distribution using mode and scale.
Implemented in SamplerDefaultImpl1, and CountingSampler.

17.826.2.14 sampleLogNormal()

```
virtual double Sampler_if::sampleLogNormal (
            double mean,
            double stddev,
            double offset = 0.0 )  [pure virtual]
```

Samples from a Lognormal distribution parameterized by mean and standard deviation.
Implemented in SamplerDefaultImpl1, and CountingSampler.

17.826.2.15 sampleNormal()

```
virtual double Sampler_if::sampleNormal (
            double mean,
            double stddev )  [pure virtual]
```

Samples from a Normal distribution.
Implemented in SamplerDefaultImpl1, and CountingSampler.

17.826.2.16 sampleTriangular()

```
virtual double Sampler_if::sampleTriangular (
            double min,
```

```
            double mode,
            double max )  [pure virtual]
```

Samples from a Triangular distribution.
Implemented in SamplerDefaultImpl1, and CountingSampler.

17.826.2.17 sampleUniform()

```
virtual double Sampler_if::sampleUniform (
            double min,
            double max )  [pure virtual]
```

Samples from a continuous Uniform distribution in [min, max].
Implemented in SamplerDefaultImpl1, and CountingSampler.

17.826.2.18 sampleWeibull()

```
virtual double Sampler_if::sampleWeibull (
            double alpha,
            double scale )  [pure virtual]
```

Samples from a Weibull distribution.
Implemented in SamplerDefaultImpl1, and CountingSampler.

17.826.2.19 setRNGparameters()

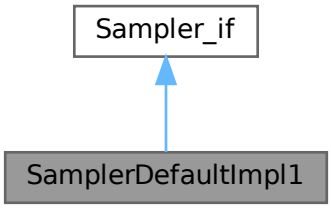
```
virtual void Sampler_if::setRNGparameters (
            RNG_Parameters * param )  [pure virtual]
```

Updates the pseudo-random generator internal parameters.
Implemented in CountingSampler, and SamplerDefaultImpl1.
The documentation for this class was generated from the following file:

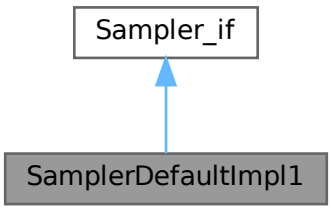
- kernel/statistics/Sampler_if.h

17.827 SamplerDefaultImpl1 Class Reference

Default pseudo-random sampler implementation used by the kernel.
`#include <kernel/statistics/SamplerDefaultImpl1.h>`
Inheritance diagram for SamplerDefaultImpl1:



Collaboration diagram for SamplerDefaultImpl1:



Classes

- struct DefaultImpl1RNG_Parameters

  Parameter bundle for the default RNG algorithm.

Public Member Functions

- **SamplerDefaultImpl1** ()

  Creates the sampler with default RNG parameters.
- virtual ~**SamplerDefaultImpl1** ()

  Destroys sampler and owned parameter objects when applicable.
- virtual double random () override

  Generates one base uniform pseudo-random number in [0,1).
- virtual double sampleBeta (double alpha, double beta, double infLimit, double supLimit) override

  Samples Beta in arbitrary interval [infLimit, supLimit].
- virtual double sampleBeta (double alpha, double beta) override

  Samples standard Beta in [0,1].
- virtual double sampleErlang (double mean, int M, double offset=0.0) override

  Samples Erlang distribution.
- virtual double sampleExponential (double mean, double offset=0.0) override

  Samples Exponential distribution.
- virtual double sampleGamma (double alpha, double beta, double offset=0.0) override

  Samples Gamma distribution.
- virtual double sampleGumbell (double mode, double scale) override

  Samples Gumbel distribution.
- virtual double sampleLogNormal (double mean, double stddev, double offset=0.0) override

  Samples Lognormal distribution.
- virtual double sampleNormal (double mean, double stddev) override

  Samples Normal distribution.
- virtual double sampleTriangular (double min, double mode, double max) override

  Samples Triangular distribution.
- virtual double sampleUniform (double min, double max) override

  Samples Uniform distribution in [min,max].
- virtual double sampleWeibull (double alpha, double scale) override

  Samples Weibull distribution.
- virtual double sampleBinomial (int trials, double p) override

  Samples Binomial distribution.

- virtual double sampleBernoulli (double p) override

  Samples Bernoulli distribution.
- virtual double sampleDiscrete (double prob, double value,...) override

  Samples arbitrary discrete distribution (variadic interface).
- virtual double sampleDiscrete (double *prob, double *value, int size) override

  Samples arbitrary discrete distribution (array interface).
- virtual double sampleGeometric (double p) override

  Samples Geometric distribution.
- void **reset** ()

  Reinitializes RNG state so the pseudo-random sequence restarts.
- virtual void setRNGparameters (RNG_Parameters *param) override

  Updates the pseudo-random generator internal parameters.
- virtual RNG_Parameters * getRNGparameters () const override

  Returns the current pseudo-random generator parameters.

17.827.1 Detailed Description

Default pseudo-random sampler implementation used by the kernel.
Implements a base RNG and multiple continuous/discrete distributions commonly used by simulation components and expression parser stochastic functions.

17.827.2 Member Function Documentation

17.827.2.1 getRNGparameters()

```
Sampler_if::RNG_Parameters * SamplerDefaultImpl1::getRNGparameters ( ) const  [override], [virtual]
```

Returns the current pseudo-random generator parameters.
Implements Sampler_if.

17.827.2.2 random()

```
double SamplerDefaultImpl1::random ( )  [override], [virtual]
```

Generates one base uniform pseudo-random number in [0,1).
Implements Sampler_if.

17.827.2.3 sampleBernoulli()

```
double SamplerDefaultImpl1::sampleBernoulli (
            double p )  [override], [virtual]
```

Samples Bernoulli distribution.
Implements Sampler_if.

17.827.2.4 sampleBeta() [1/2]

```
double SamplerDefaultImpl1::sampleBeta (
            double alpha,
            double beta )  [override], [virtual]
```

Samples standard Beta in [0,1].
Implements Sampler_if.

17.827.2.5 sampleBeta() [2/2]

```
double SamplerDefaultImpl1::sampleBeta (
            double alpha,
            double beta,
            double infLimit,
            double supLimit )  [override], [virtual]
```

Samples Beta in arbitrary interval [infLimit, supLimit].
Implements Sampler_if.

17.827.2.6 sampleBinomial()

```
double SamplerDefaultImpl1::sampleBinomial (
            int trials,
            double p )  [override], [virtual]
```

Samples Binomial distribution.
Implements Sampler_if.

17.827.2.7 sampleDiscrete() [1/2]

```
double SamplerDefaultImpl1::sampleDiscrete (
            double * prob,
            double * value,
            int size )  [override], [virtual]
```

Samples arbitrary discrete distribution (array interface).
Implements Sampler_if.

17.827.2.8 sampleDiscrete() [2/2]

```
double SamplerDefaultImpl1::sampleDiscrete (
            double prob,
            double value,
             ...  )  [override], [virtual]
```

Samples arbitrary discrete distribution (variadic interface).
Implements Sampler_if.

17.827.2.9 sampleErlang()

```
double SamplerDefaultImpl1::sampleErlang (
            double mean,
            int M,
            double offset = 0.0 )  [override], [virtual]
```

Samples Erlang distribution.
Implements Sampler_if.

17.827.2.10 sampleExponential()

```
double SamplerDefaultImpl1::sampleExponential (
            double mean,
            double offset = 0.0 )  [override], [virtual]
```

Samples Exponential distribution.
Implements Sampler_if.

17.827.2.11 sampleGamma()

```
double SamplerDefaultImpl1::sampleGamma (
            double alpha,
            double beta,
            double offset = 0.0 )  [override], [virtual]
```

Samples Gamma distribution.
Implements Sampler_if.

17.827.2.12 sampleGeometric()

```
double SamplerDefaultImpl1::sampleGeometric (
            double p )  [override], [virtual]
```

Samples Geometric distribution.
Implements Sampler_if.

17.827.2.13 sampleGumbell()

```
double SamplerDefaultImpl1::sampleGumbell (
            double mode,
            double scale )  [override], [virtual]
```

Samples Gumbel distribution.
Implements Sampler_if.

17.827.2.14 sampleLogNormal()

```
double SamplerDefaultImpl1::sampleLogNormal (
            double mean,
            double stddev,
            double offset = 0.0 )  [override], [virtual]
```

Samples Lognormal distribution.
Implements Sampler_if.

17.827.2.15 sampleNormal()

```
double SamplerDefaultImpl1::sampleNormal (
            double mean,
            double stddev )  [override], [virtual]
```

Samples Normal distribution.
Implements Sampler_if.

17.827.2.16 sampleTriangular()

```
double SamplerDefaultImpl1::sampleTriangular (
            double min,
            double mode,
            double max )  [override], [virtual]
```

Samples Triangular distribution.
Implements Sampler_if.

17.827.2.17 sampleUniform()

```
double SamplerDefaultImpl1::sampleUniform (
            double min,
            double max )  [override], [virtual]
```

Samples Uniform distribution in [min,max].
Implements Sampler_if.

17.827.2.18 sampleWeibull()

```
double SamplerDefaultImpl1::sampleWeibull (
            double alpha,
            double scale )  [override], [virtual]
```

Samples Weibull distribution.
Implements Sampler_if.

17.827.2.19 setRNGparameters()

```
void SamplerDefaultImpl1::setRNGparameters (
            RNG_Parameters * param )  [override], [virtual]
```

Updates the pseudo-random generator internal parameters.
Implements Sampler_if.
The documentation for this class was generated from the following files:

- kernel/statistics/SamplerDefaultImpl1.h
- kernel/statistics/SamplerDefaultImpl1.cpp

17.828 ScenarioExperiment_if Class Reference

The documentation for this class was generated from the following file:

- kernel/simulator/ScenarioExperiment_if.h

17.829 SceneToolController Class Reference

Controller for scene visualization, drawing tools, alignment, and zoom orchestration.
`#include <applications/gui/genesys/controllers/SceneToolController.h>`

Public Member Functions

- SceneToolController (ModelGraphicsView *graphicsView, Ui::MainWindow *ui, std::function< ModelGraphicsScene *()> currentScene, std::function< bool()> createModelImage, std::function< void()> unselectDrawIcons, std::function< bool()> checkSelectedDrawIcons, std::function< void(double)> gentleZoom, std::function< void()> actualizeActions, std::function< void()> actualizeTabPanes, int &zoomValue, bool &firstClickShow↩ Connection)

  Builds the scene-tool delegated controller used by MainWindow compatibility slots.
- void onActionShowGridTriggered ()

  Toggles grid visibility and requests scene redraw updates.
- void **onActionShowRuleTriggered** ()

  Toggles ruler visibility through the delegated scene callback path.
- void **onActionShowGuidesTriggered** ()

  Toggles guide visibility and keeps tab/action synchronization.
- void **onActionShowSnapTriggered** ()

  Toggles snap behavior on the current scene without changing tool wiring.
- void **onActionZoomInTriggered** ()

  Applies incremental zoom-in and updates shared zoom state.
- void **onActionZoomOutTriggered** ()

  Applies incremental zoom-out and updates shared zoom state.
- void onActionZoomAllTriggered ()

  Fits the current graphical model in view and re-synchronizes zoom widgets.
- void onActionZoomActualSizeTriggered ()

  Restores the graphical view to its default 1:1 zoom.
- void **syncZoomWidgetsForCurrentScale** ()

  Synchronizes the zoom slider and label with the current view scale.
- void onHorizontalSliderZoomGraphicalValueChanged (int value)

  Synchronizes slider-originated zoom changes with scene/view scale.
- void onActionDrawLineTriggered ()

  Activates line drawing mode as a compatibility façade wrapper.
- void **onActionDrawRectangleTriggered** ()

  Activates rectangle drawing mode as a compatibility façade wrapper.
- void **onActionDrawEllipseTriggered** ()

  Activates ellipse drawing mode as a compatibility façade wrapper.
- void **onActionDrawTextTriggered** ()

  Activates text drawing mode as a compatibility façade wrapper.
- void **onActionDrawPoligonTriggered** ()

  Activates polygon drawing mode as a compatibility façade wrapper.

- void **onActionAnimateSimulatedTimeTriggered** ()

  Toggles simulated-time animation overlays in the current scene.
- void **onActionAnimateVariableTriggered** ()

  Toggles variable animation overlays in the current scene.
- void **onActionAnimateCounterTriggered** ()

  Toggles counter animation overlays in the current scene.
- void **onActionAnimateAttributeTriggered** ()

  Activates attribute animation placeholder drawing.
- void **onActionAnimateEntityTriggered** ()

  Activates entity animation placeholder drawing.
- void **onActionAnimateEventTriggered** ()

  Activates event animation placeholder drawing.
- void **onActionAnimateExpressionTriggered** ()

  Activates expression animation placeholder drawing.
- void **onActionAnimatePlotTriggered** ()

  Activates plot animation placeholder drawing.
- void **onActionAnimateQueueTriggered** ()

  Activates queue animation placeholder drawing.
- void **onActionAnimateResourceTriggered** ()

  Activates resource animation placeholder drawing.
- void **onActionAnimateStationTriggered** ()

  Activates station animation placeholder drawing.
- void **onActionAnimateStatisticsTriggered** ()

  Activates statistics animation placeholder drawing.
- void **onActionConnectTriggered** ()

  Activates connection-creation mode and resets first-click compatibility state.
- void **onActionArranjeLeftTriggered** ()

  Aligns selected graphical items to the left boundary.
- void **onActionArranjeRightTriggered** ()

  Aligns selected graphical items to the right boundary.
- void **onActionArranjeTopTriggered** ()

  Aligns selected graphical items to the top boundary.
- void **onActionArranjeBototmTriggered** ()

  Aligns selected graphical items to the bottom boundary.
- void **onActionArranjeCenterTriggered** ()

  Aligns selected graphical items to horizontal center.
- void **onActionArranjeMiddleTriggered** ()

  Aligns selected graphical items to vertical middle.
- void **onActionActivateGraphicalSimulationTriggered** ()

  Toggles graphical simulation visualization mode and action state.
- void **onHorizontalSliderAnimationSpeedValueChanged** (int value)

  Applies animation-speed slider values to scene animation pacing.
- void **onActionSelectAllTriggered** ()

  Selects all graphical items in the active scene context.
- void **onActionShowInternalElementsTriggered** ()

  Toggles rendering of statistics data definitions and triggers representation refresh.
- void **onActionShowEditableElementsTriggered** ()

  Toggles rendering of editable data definitions and triggers representation refresh.
- void **onActionShowAttachedElementsTriggered** ()

  Toggles rendering of shared data definitions and triggers representation refresh.
- void **onCheckBoxShowElementsStateChanged** (int arg1)

Bridges checkbox state changes to the show-elements action wrapper.

- void **onCheckBoxShowInternalsStateChanged** (int arg1)

  Bridges checkbox state changes to the show-internals action wrapper.
- void **onCheckBoxShowEditableElementsStateChanged** (int arg1)

  Bridges checkbox state changes to the show-editable-elements action wrapper.
- void **onActionShowRecursiveElementsTriggered** ()

  Toggles recursive data-definition expansion and triggers representation refresh.
- void **onCheckBoxShowRecursiveStateChanged** (int arg1)

  Bridges recursive-render checkbox changes to model-image refresh workflow.
- void **onCheckBoxShowLevelsStateChanged** (int arg1)

  Bridges level-annotation checkbox changes to model-image refresh workflow.
- void **onActionGModelShowConnectTriggered** ()

  Toggles interactive connection-hint visibility in scene callback wiring.

17.829.1 Detailed Description

Controller for scene visualization, drawing tools, alignment, and zoom orchestration.
MainWindow delegates many menu/toolbar wrappers to this Phase-10 controller to keep the compatibility façade thin while concentrating scene-tool behavior in a dedicated component.
Responsibilities:

- handle grid/ruler/guides/snap toggles and zoom commands;
- orchestrate drawing/connection modes and alignment actions;
- coordinate animation toggles and scene-display filters through injected callbacks.

Boundaries:

- it does not own MainWindow or scene/view lifetime;
- it does not perform model persistence/export/simulation lifecycle work;
- it relies on injected references for shared UI state (zoom, first-click connection state).

17.829.2 Constructor & Destructor Documentation

17.829.2.1 SceneToolController()

```
SceneToolController::SceneToolController (
            ModelGraphicsView * graphicsView,
            Ui::MainWindow * ui,
            std::function< ModelGraphicsScene *()> currentScene,
            std::function< bool()> createModelImage,
            std::function< void()> unselectDrawIcons,
            std::function< bool()> checkSelectedDrawIcons,
            std::function< void(double)> gentleZoom,
            std::function< void()> actualizeActions,
            std::function< void()> actualizeTabPanes,
            int & zoomValue,
            bool & firstClickShowConnection )
```

Builds the scene-tool delegated controller used by MainWindow compatibility slots.
Stores only the narrow collaborators needed for scene-tool orchestration.

17.829.3 Member Function Documentation

17.829.3.1 onActionDrawLineTriggered()

```
void SceneToolController::onActionDrawLineTriggered ( )
```

Activates line drawing mode as a compatibility façade wrapper.
Activates the line drawing tool while preserving cursor semantics.

17.829.3.2 onActionShowGridTriggered()

```
void SceneToolController::onActionShowGridTriggered ( )
```

Toggles grid visibility and requests scene redraw updates.
Synchronizes the grid action with the current scene state.

17.829.3.3 onActionZoomActualSizeTriggered()

```
void SceneToolController::onActionZoomActualSizeTriggered ( )
```

Restores the graphical view to its default 1:1 zoom.
Restores the graphics view to the 1:1 zoom level and re-synchronizes the slider.

17.829.3.4 onActionZoomAllTriggered()

```
void SceneToolController::onActionZoomAllTriggered ( )
```

Fits the current graphical model in view and re-synchronizes zoom widgets.
Fits the scene to view and resets the zoom slider baseline.

17.829.3.5 onHorizontalSliderZoomGraphicalValueChanged()

```
void SceneToolController::onHorizontalSliderZoomGraphicalValueChanged (
            int value )
```

Synchronizes slider-originated zoom changes with scene/view scale.
Applies the zoom slider value to the graphics view transform.
The documentation for this class was generated from the following files:

- applications/gui/genesys/controllers/SceneToolController.h
- applications/gui/genesys/controllers/SceneToolController.cpp

17.830 SchedulableItem Class Reference

One (expression, duration, rule) triple inside a Schedule.
`#include <plugins/data/DiscreteProcessing/Schedule.h>`

Public Types

- enum class **Rule** : int { **IGNORE** = 1 , **PREEMPT** = 2 , **WAIT** = 3 }

Public Member Functions

- **SchedulableItem** (std::string expression, double duration, SchedulableItem::Rule rule=SchedulableItem::↩ Rule::IGNORE)
- void **setDuration** (double duration)
- double **getDuration** () const
- void **setExpression** (std::string expression)
- std::string **getExpression** () const
- void **setRule** (SchedulableItem::Rule rule)
- SchedulableItem::Rule **getRule** () const

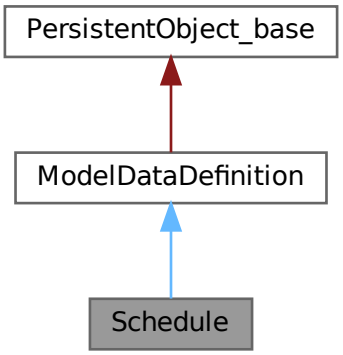
17.830.1 Detailed Description

One (expression, duration, rule) triple inside a Schedule.
`expression` is evaluated to produce the value that applies for `duration` time units before moving to the next item; this is the closest correspondence to one row of Arena's Schedule module "Durations" repeat group (Value/↩ Duration pairs), generalized from a static value to a parsed expression. `rule` mirrors Arena's per-resource "↩ Schedule Rule" (ignore/preempt/wait a busy unit on a capacity decrease), attached here per schedule item rather than per Resource; see Resource for the open question of how/whether the two map onto each other.
The documentation for this class was generated from the following file:

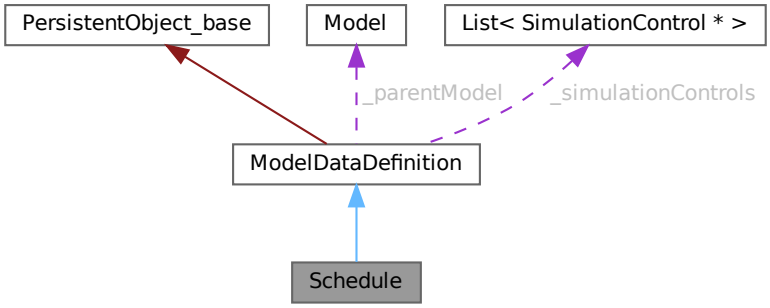
- plugins/data/DiscreteProcessing/Schedule.h

17.831 Schedule Class Reference

Inheritance diagram for Schedule:



Collaboration diagram for Schedule:



Public Member Functions

- **Schedule** (Model *model, std::string name="")
- virtual std::string show () override

  Returns a textual representation of this data definition.
- std::string **getExpression** ()
- List< SchedulableItem * > * **getSchedulableItems** () const
- void **setRepeatAfterLast** (bool _repeatAfterLast)
- bool **isRepeatAfterLast** () const

Public Member Functions inherited from ModelDataDefinition

- ModelDataDefinition (Model *model, std::string datadefinitionTypename, std::string name="", bool insert↩ IntoModel=true)

  Creates a model data definition and optionally inserts it into the model.
- virtual ~**ModelDataDefinition** ()

Releases resources owned by this data definition.

- Util::identification getId () const

  Returns the unique identifier of this instance.
- void setName (const std::string &name)

  Updates the logical name of this instance.
- const std::string & getName () const

  Returns the logical name of this instance.
- void setLabel (const std::string &label)

  Updates the user-visible label of this instance.
- const std::string & getLabel () const

  Returns the user-visible label of this instance.
- const std::string & getClassname () const

  Returns the runtime class name used by the plugin system.
- Model * getParentModel () const

  Returns the parent model that owns this definition.
- bool isReportStatistics () const

  Indicates whether this data definition contributes report statistics.
- void setReportStatistics (bool reportStatistics)

  Enables or disables report-statistics generation for this definition.
- ModelDataDefinition * getInternalData (const std::string &name) const

  Looks up a named internal child data definition.
- std::map< std::string, ModelDataDefinition * > * getInternalData () const

  Returns the full map of internal child data definitions.
- std::map< std::string, ModelDataDefinition * > * getAttachedData () const

  Returns the full map of attached data definitions.
- bool hasChanged () const

  Indicates whether this instance has been modified since the last reset.
- void setHasChanged (bool hasChanged)

  Updates the changed flag for this data definition.
- unsigned int getLevel () const

  Returns the hierarchical editing context containing this element.
- void setModelLevel (unsigned int _modelLevel)

  Sets this element's hierarchical editing context.
- List< SimulationControl * > * getSimulationControls () const

  Returns the simulation controls owned by this data definition.
- TraceManager::Level getTraceLevelSpecific () const

  Returns the trace level that applies specifically to this definition.
- void setTraceLevelSpecific (TraceManager::Level level)

  Updates the trace level used by this definition.
- void defineTraceLevelSpecific (TraceManager::Level traceLevelspecific, bool traceLevelSpecific↩ Enabled=true)

  Defines the specific trace level and optionally enables it immediately.
- bool isTraceLevelSpecificEnabled () const

  Indicates whether the specific trace level is enabled.
- void setTraceLevelSpecificEnabled (bool traceLevelSpecificEnabled)

  Enables or disables the specific trace level.

Static Public Member Functions

- static ModelDataDefinition * **LoadInstance** (Model *model, PersistenceRecord *fields)
- static PluginInformation * **GetPluginInformation** ()
- static ModelDataDefinition * **NewInstance** (Model *model, std::string name="")

Static Public Member Functions inherited from ModelDataDefinition

- static ModelDataDefinition * LoadInstance (Model *model, PersistenceRecord *fields, bool insertIntoModel)

  Loads a model data definition instance from serialized fields.
- static ModelDataDefinition * NewInstance (Model *model, std::string name="")

  Creates a new instance of a data definition using the plugin registry.
- static void SaveInstance (PersistenceRecord *fields, ModelDataDefinition *modeldatum)

  Serializes a data definition instance into a persistence record.
- static bool Check (ModelDataDefinition *modeldatum, std::string &errorMessage)

  Validates a data definition instance.
- static void InitBetweenReplications (ModelDataDefinition *modeldatum)

  Resets simulation-time state between replications.
- static void CreateInternalData (ModelDataDefinition *modeldatum)

  Creates internal and attached data required by this instance.
- static bool CreateRelatedDataElements (ModelDataDefinition *modeldatum, std::string &errorMessage)

  Creates related data and validates the instance in a single call.

Protected Member Functions

- virtual bool _loadInstance (PersistenceRecord *fields) override

  must be overriden by derived classes
- virtual void _saveInstance (PersistenceRecord *fields, bool saveDefaultValues) override

  Saves object fields into a serialization structure.
- virtual bool _check (std::string &errorMessage) override

  could be overriden by derived classes
- virtual ParserChangesInformation * _getParserChangesInformation () override
- virtual void _initBetweenReplications () override
- virtual void _addSimulationControl (SimulationControl *property) override

17.831.1 Member Function Documentation

17.831.1.1 _addSimulationControl()

```
void Schedule::_addSimulationControl (
            SimulationControl * property )  [override], [protected], [virtual]
```

Keep local control registration aligned with the base model-data contract.
Reimplemented from ModelDataDefinition.

17.831.1.2 _check()

```
bool Schedule::_check (
            std::string & errorMessage )  [override], [protected], [virtual]
```

could be overriden by derived classes
Validate that schedule has items and non-negative durations.
Reimplemented from ModelDataDefinition.

17.831.1.3 _getParserChangesInformation()

```
ParserChangesInformation * Schedule::_getParserChangesInformation ( )  [override], [protected],
[virtual]
```

This method returns all changes in the parser that are needed by plugins of this ModelDatas. When connecting a new plugin, ParserChangesInformation are used to change parser source code, whch is after compiled and dinamically linked to to simulator kernel to reflect the changes Return parser changes required by Schedule.
No parser customization is currently necessary.
Reimplemented from ModelDataDefinition.

17.831.1.4 _initBetweenReplications()

```
void Schedule::_initBetweenReplications ( )  [override], [protected], [virtual]
```

Reimplemented from ModelDataDefinition.

17.831.1.5 _loadInstance()

```
bool Schedule::_loadInstance (
            PersistenceRecord * fields )  [override], [protected], [virtual]
```

must be overriden by derived classes
Load schedulable items and repeat behavior.
Reimplemented from ModelDataDefinition.

17.831.1.6 _saveInstance()

```
void Schedule::_saveInstance (
            PersistenceRecord * fields,
            bool saveDefaultValues )  [override], [protected], [virtual]
```

Saves object fields into a serialization structure.

Parameters

fields	a table-like structure used for serialization.
saveDefaultValues	indicates whether or not to save fields which are set to their default value.

Persist schedule items and repeat behavior.
Reimplemented from ModelDataDefinition.

17.831.1.7 show()

```
std::string Schedule::show ( )  [override], [virtual]
```

Returns a textual representation of this data definition.
Returns the keys of internal ModelDataDefinitions such as counters, statistics collectors and other children needed before model checking.

Returns

Human-readable summary used by traces and debug output.

Reimplemented from ModelDataDefinition.
The documentation for this class was generated from the following files:

- plugins/data/DiscreteProcessing/Schedule.h
- plugins/data/DiscreteProcessing/Schedule.cpp

17.832 testing::ScopedTrace Class Reference

Public Member Functions

- template<typename T >
  ScopedTrace (const char *file, int line, const T &message)
- **ScopedTrace** (const char *file, int line, const char *message)
- **ScopedTrace** (const char *file, int line, const std::string &message)

The documentation for this class was generated from the following files:

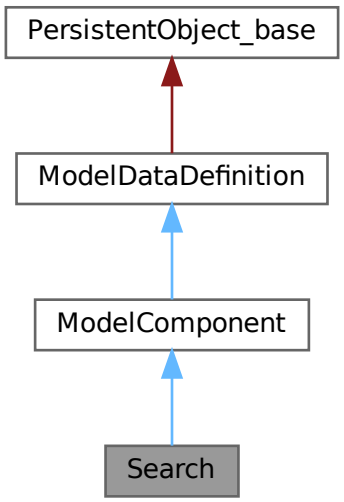
- gtest/gtest/gtest.h
- gtest/src/gtest.cc

17.833 Search Class Reference

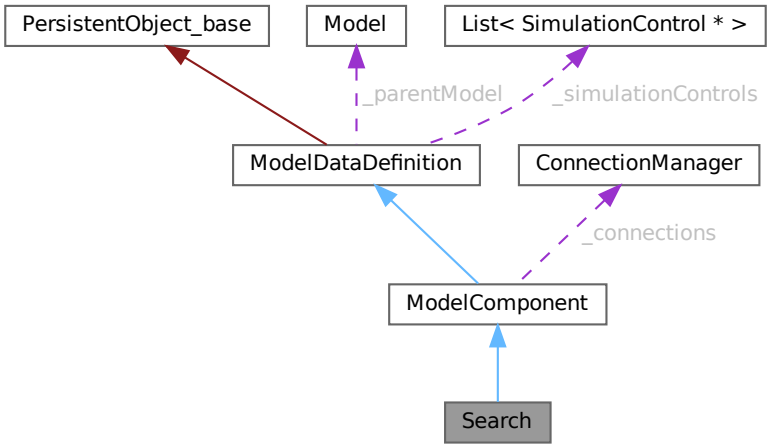
Scans a Queue or an EntityGroup rank range for the first entity satisfying a condition, saving the found rank (or 0) to an attribute.

`#include <plugins/components/Decisions/Search.h>`

Inheritance diagram for Search:



Collaboration diagram for Search:



Public Types

- enum class **SearchInType** : int { **QUEUE** = 0 , **ENTITYGROUP** = 1 , **num_elements** = 2 }

Public Member Functions

- **Search** (Model *model, std::string name="")
- virtual std::string show () override

  virtual public methods

- ModelDataDefinition * **getSearchIn** () const
- void **setSearchInType** (Search::SearchInType _searchInType)
- Search::SearchInType **getSearchInType** () const

Public Member Functions inherited from ModelComponent

- ModelComponent (Model *model, std::string componentTypename, std::string name="")

  constructors
- virtual ~**ModelComponent** ()

  Releases component-owned resources and unregisters it from the model.
- ConnectionManager * getConnectionManager () const

  new public user methods for this component
- void connectTo (ModelComponent *component, unsigned int inputPortNumber=0)

Connects this component to another component.

- bool hasBreakpointAt ()

  Indicates whether a simulation breakpoint is set on this component.

- void setDescription (std::string _description)

  Updates the free-form description shown by the GUI.

- std::string getDescription () const

  Returns the free-form description associated with this component.

- void remove (ModelComponent *comp)

  Removes a connected component from this component.

Public Member Functions inherited from ModelDataDefinition

- ModelDataDefinition (Model *model, std::string datadefinitionTypename, std::string name="", bool insert↩ IntoModel=true)

  Creates a model data definition and optionally inserts it into the model.

- virtual ~**ModelDataDefinition** ()

  Releases resources owned by this data definition.

- Util::identification getId () const

  Returns the unique identifier of this instance.

- void setName (const std::string &name)

  Updates the logical name of this instance.

- const std::string & getName () const

  Returns the logical name of this instance.

- void setLabel (const std::string &label)

  Updates the user-visible label of this instance.

- const std::string & getLabel () const

  Returns the user-visible label of this instance.

- const std::string & getClassname () const

  Returns the runtime class name used by the plugin system.

- Model * getParentModel () const

  Returns the parent model that owns this definition.

- bool isReportStatistics () const

  Indicates whether this data definition contributes report statistics.

- void setReportStatistics (bool reportStatistics)

  Enables or disables report-statistics generation for this definition.

- ModelDataDefinition * getInternalData (const std::string &name) const

  Looks up a named internal child data definition.

- std::map< std::string, ModelDataDefinition * > * getInternalData () const

  Returns the full map of internal child data definitions.

- std::map< std::string, ModelDataDefinition * > * getAttachedData () const

  Returns the full map of attached data definitions.

- bool hasChanged () const

  Indicates whether this instance has been modified since the last reset.

- void setHasChanged (bool hasChanged)

  Updates the changed flag for this data definition.

- unsigned int getLevel () const

  Returns the hierarchical editing context containing this element.

- void setModelLevel (unsigned int _modelLevel)

  Sets this element's hierarchical editing context.

- List< SimulationControl * > * getSimulationControls () const

  Returns the simulation controls owned by this data definition.

- TraceManager::Level getTraceLevelSpecific () const

  Returns the trace level that applies specifically to this definition.
- void setTraceLevelSpecific (TraceManager::Level level)

  Updates the trace level used by this definition.
- void defineTraceLevelSpecific (TraceManager::Level traceLevelspecific, bool traceLevelSpecific↩ Enabled=true)

  Defines the specific trace level and optionally enables it immediately.
- bool isTraceLevelSpecificEnabled () const

  Indicates whether the specific trace level is enabled.
- void setTraceLevelSpecificEnabled (bool traceLevelSpecificEnabled)

  Enables or disables the specific trace level.

Static Public Member Functions

- static std::string **convertEnumToStr** (SearchInType type)

- static ModelComponent * **LoadInstance** (Model *model, PersistenceRecord *fields)
- static ModelDataDefinition * **NewInstance** (Model *model, std::string name="")

Static Public Member Functions inherited from ModelComponent

- static ModelComponent * LoadInstance (Model *model, PersistenceRecord *fields)

  static public methods that must have implementations (Load and New just the same. GetInformation must provide specific infos for the new component
- static bool Check (ModelComponent *component)

  Validates a component instance.
- static void CreateInternalData (ModelComponent *component)

  Creates internal data required by a component instance.
- static void SaveInstance (PersistenceRecord *fields, ModelComponent *component)

  Serializes a component instance into a persistence record.
- static void DispatchEvent (Event *event)

  Dispatches a simulation event to the target component.

Static Public Member Functions inherited from ModelDataDefinition

- static ModelDataDefinition * LoadInstance (Model *model, PersistenceRecord *fields, bool insertIntoModel)

  Loads a model data definition instance from serialized fields.
- static ModelDataDefinition * NewInstance (Model *model, std::string name="")

  Creates a new instance of a data definition using the plugin registry.
- static void SaveInstance (PersistenceRecord *fields, ModelDataDefinition *modeldatum)

  Serializes a data definition instance into a persistence record.
- static bool Check (ModelDataDefinition *modeldatum, std::string &errorMessage)

  Validates a data definition instance.
- static void InitBetweenReplications (ModelDataDefinition *modeldatum)

  Resets simulation-time state between replications.
- static void CreateInternalData (ModelDataDefinition *modeldatum)

  Creates internal and attached data required by this instance.
- static bool CreateRelatedDataElements (ModelDataDefinition *modeldatum, std::string &errorMessage)

  Creates related data and validates the instance in a single call.

Protected Member Functions

- virtual bool _loadInstance (PersistenceRecord *fields) override

  virtual protected method that must be overriden
- virtual void _saveInstance (PersistenceRecord *fields, bool saveDefaultValues) override

  Saves object fields into a serialization structure.
- virtual void _onDispatchEvent (Entity *entity, unsigned int inputPortNumber) override

  Handles a dispatched event for this component type.
- virtual bool _check (std::string &errorMessage) override

  could be overriden by derived classes

17.833.1 Detailed Description

Scans a Queue or an EntityGroup rank range for the first entity satisfying a condition, saving the found rank (or 0) to an attribute.
Arena correspondence: the "Search module" (Rockwell Automation, *Getting Started with Arena*, "The Advanced Process Panel", p. 64), which also supports a third Type: searching a free-standing index range via an expression (setting the global system variable `J`), with no queue or group involved at all.
`SearchInType` (`QUEUE/ENTITYGROUP`) matches two of Arena's three Types; `_startRank/_endRank/_searchCondition/_saveFounRankAttribute` match Starting/Ending Value and Search Condition.
Known difference from Arena: the free-standing expression-only search Type has no corresponding `SearchInType` enumerator.

17.833.2 Member Function Documentation

17.833.2.1 _check()

```
bool Search::_check (
            std::string & errorMessage )  [override], [protected], [virtual]
```

could be overriden by derived classes
Reimplemented from ModelDataDefinition.

17.833.2.2 _createEditableDataDefinitions()

```
void Search::_createEditableDataDefinitions ( )  [override], [protected], [virtual]
```

This method returns all changes in the parser that are needed by plugins of this ModelDatas. When connecting a new plugin, ParserChangesInformation are used to change parser source code, whch is after compiled and dinamically linked to to simulator kernel to reflect the changes
Reimplemented from ModelDataDefinition.

17.833.2.3 _loadInstance()

```
bool Search::_loadInstance (
            PersistenceRecord * fields )  [override], [protected], [virtual]
```

virtual protected method that must be overriden
Reimplemented from ModelComponent.

17.833.2.4 _onDispatchEvent()

```
void Search::_onDispatchEvent (
            Entity * entity,
            unsigned int inputPortNumber )  [override], [protected], [virtual]
```

Handles a dispatched event for this component type.
This method is only for ModelComponents, not for ModelDataElements.

Parameters

entity	Entity being processed.
inputPortNumber	Input port where the entity arrived.

Implements ModelComponent.

17.833.2.5 _saveInstance()

```
void Search::_saveInstance (
            PersistenceRecord * fields,
            bool saveDefaultValues )  [override], [protected], [virtual]
```

Saves object fields into a serialization structure.

Parameters

fields	a table-like structure used for serialization.
saveDefaultValues	indicates whether or not to save fields which are set to their default value.

Reimplemented from ModelComponent.

17.833.2.6 show()

```
std::string Search::show ( )  [override], [virtual]
```

virtual public methods
Returns a textual representation of this component.

Returns

Human-readable description used for tracing and debugging.

Reimplemented from ModelComponent.
The documentation for this class was generated from the following files:

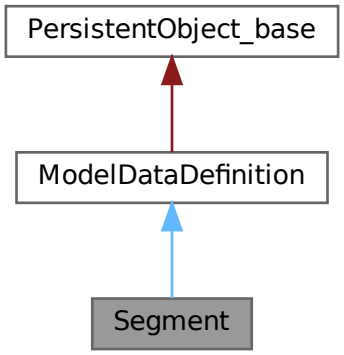
- plugins/components/Decisions/Search.h
- plugins/components/Decisions/Search.cpp

17.834 Segment Class Reference

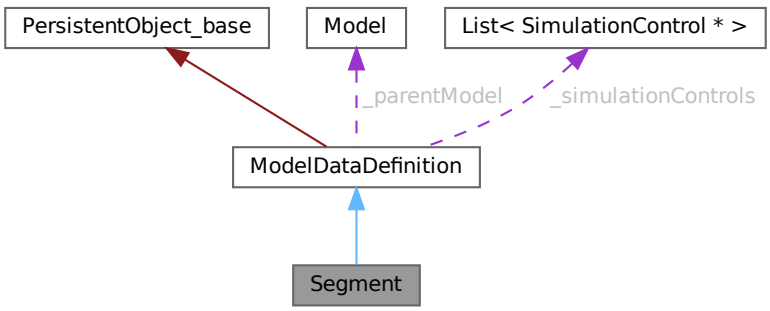
Data definition holding the ordered sequence of stations (and the length between consecutive stations) that make up one Conveyor's physical path.

`#include <plugins/data/MaterialHandling/Segment.h>`

Inheritance diagram for Segment:



Collaboration diagram for Segment:



Public Member Functions

- **Segment** (Model *model, std::string name="")
- virtual std::string show () override

  Returns a textual representation of this data definition.
- List< SegmentStep * > * **getSteps** () const
- void **insertStep** (SegmentStep *step)
- double **getDistanceBetween** (const std::string &fromStationName, const std::string &toStationName) const

  Sums lengthToNext from fromStationName up to (not including) toStationName; returns -1 when either station is absent or out of order.

Public Member Functions inherited from ModelDataDefinition

- ModelDataDefinition (Model *model, std::string datadefinitionTypename, std::string name="", bool insertIntoModel=true)

  Creates a model data definition and optionally inserts it into the model.
- virtual ~**ModelDataDefinition** ()

  Releases resources owned by this data definition.
- Util::identification getId () const

  Returns the unique identifier of this instance.
- void setName (const std::string &name)

  Updates the logical name of this instance.
- const std::string & getName () const

  Returns the logical name of this instance.
- void setLabel (const std::string &label)

  Updates the user-visible label of this instance.
- const std::string & getLabel () const

  Returns the user-visible label of this instance.
- const std::string & getClassname () const

  Returns the runtime class name used by the plugin system.
- Model * getParentModel () const

  Returns the parent model that owns this definition.
- bool isReportStatistics () const

  Indicates whether this data definition contributes report statistics.
- void setReportStatistics (bool reportStatistics)

  Enables or disables report-statistics generation for this definition.
- ModelDataDefinition * getInternalData (const std::string &name) const

  Looks up a named internal child data definition.
- std::map< std::string, ModelDataDefinition * > * getInternalData () const

  Returns the full map of internal child data definitions.
- std::map< std::string, ModelDataDefinition * > * getAttachedData () const

  Returns the full map of attached data definitions.
- bool hasChanged () const

  Indicates whether this instance has been modified since the last reset.
- void setHasChanged (bool hasChanged)

  Updates the changed flag for this data definition.
- unsigned int getLevel () const

  Returns the hierarchical editing context containing this element.
- void setModelLevel (unsigned int _modelLevel)

  Sets this element's hierarchical editing context.
- List< SimulationControl * > * getSimulationControls () const

  Returns the simulation controls owned by this data definition.
- TraceManager::Level getTraceLevelSpecific () const

  Returns the trace level that applies specifically to this definition.
- void setTraceLevelSpecific (TraceManager::Level level)

  Updates the trace level used by this definition.
- void defineTraceLevelSpecific (TraceManager::Level traceLevelspecific, bool traceLevelSpecificEnabled=true)

  Defines the specific trace level and optionally enables it immediately.
- bool isTraceLevelSpecificEnabled () const

  Indicates whether the specific trace level is enabled.
- void setTraceLevelSpecificEnabled (bool traceLevelSpecificEnabled)

  Enables or disables the specific trace level.

17.834.1 Detailed Description

Data definition holding the ordered sequence of stations (and the length between consecutive stations) that make up one Conveyor's physical path.
Arena correspondence: the "Segment module" (Rockwell Automation, *Getting Started with Arena*, "The Advanced Transfer Panel", p. 103), which defines a Segment Set (an ordered list of stations along a conveyor with the length of each segment).
Known limitation of this initial implementation: distance lookup only walks the path forward in declaration order (`getDistanceBetween()` sums `lengthToNext` from the "from" station up to the "to" station); there is no support for a conveyor whose stations are not visited in a single consistent order.

17.834.2 Member Function Documentation

17.834.2.1 _check()

```
bool Segment::_check (
            std::string & errorMessage )  [override], [protected], [virtual]
```

could be overriden by derived classes
Reimplemented from ModelDataDefinition.

17.834.2.2 _loadInstance()

```
bool Segment::_loadInstance (
            PersistenceRecord * fields )  [override], [protected], [virtual]
```

must be overriden by derived classes
Reimplemented from ModelDataDefinition.

17.834.2.3 _saveInstance()

```
void Segment::_saveInstance (
            PersistenceRecord * fields,
            bool saveDefaultValues )  [override], [protected], [virtual]
```

Saves object fields into a serialization structure.

Parameters

fields	a table-like structure used for serialization.
saveDefaultValues	indicates whether or not to save fields which are set to their default value.

Reimplemented from ModelDataDefinition.

17.834.2.4 show()

```
std::string Segment::show ( )  [override], [virtual]
```

Returns a textual representation of this data definition.
Returns the keys of internal ModelDataDefinitions such as counters, statistics collectors and other children needed before model checking.

Returns

Human-readable summary used by traces and debug output.

Reimplemented from ModelDataDefinition.
The documentation for this class was generated from the following files:

- plugins/data/MaterialHandling/Segment.h
- plugins/data/MaterialHandling/Segment.cpp

17.835 SegmentStep Class Reference

One (station, length-to-next-station) step of a Segment's ordered conveyor path.

`#include <plugins/data/MaterialHandling/Segment.h>`

Public Member Functions

- **SegmentStep** (std::string stationName, double lengthToNext)

Public Attributes

- std::string **stationName**
- double **lengthToNext**

17.835.1 Detailed Description

One (station, length-to-next-station) step of a Segment's ordered conveyor path.
The documentation for this class was generated from the following file:

- std::string **getPriorityExpression** () const

Public Member Functions inherited from ModelComponent

- ModelComponent (Model *model, std::string componentTypename, std::string name="")

  constructors
- virtual ~**ModelComponent** ()

  Releases component-owned resources and unregisters it from the model.
- ConnectionManager * getConnectionManager () const

  new public user methods for this component
- void connectTo (ModelComponent *component, unsigned int inputPortNumber=0)

  Connects this component to another component.
- bool hasBreakpointAt ()

  Indicates whether a simulation breakpoint is set on this component.

- void setDescription (std::string _description)

  Updates the free-form description shown by the GUI.
- std::string getDescription () const

  Returns the free-form description associated with this component.
- void remove (ModelComponent *comp)

  Removes a connected component from this component.

Public Member Functions inherited from ModelDataDefinition

- ModelDataDefinition (Model *model, std::string datadefinitionTypename, std::string name="", bool insert↩ IntoModel=true)

  Creates a model data definition and optionally inserts it into the model.
- virtual ~**ModelDataDefinition** ()

  Releases resources owned by this data definition.
- Util::identification getId () const

  Returns the unique identifier of this instance.
- void setName (const std::string &name)

  Updates the logical name of this instance.
- const std::string & getName () const

  Returns the logical name of this instance.
- void setLabel (const std::string &label)

  Updates the user-visible label of this instance.
- const std::string & getLabel () const

  Returns the user-visible label of this instance.
- const std::string & getClassname () const

  Returns the runtime class name used by the plugin system.
- Model * getParentModel () const

  Returns the parent model that owns this definition.
- bool isReportStatistics () const

  Indicates whether this data definition contributes report statistics.
- void setReportStatistics (bool reportStatistics)

  Enables or disables report-statistics generation for this definition.
- ModelDataDefinition * getInternalData (const std::string &name) const

  Looks up a named internal child data definition.
- std::map< std::string, ModelDataDefinition * > * getInternalData () const

  Returns the full map of internal child data definitions.
- std::map< std::string, ModelDataDefinition * > * getAttachedData () const

  Returns the full map of attached data definitions.
- bool hasChanged () const

  Indicates whether this instance has been modified since the last reset.
- void setHasChanged (bool hasChanged)

  Updates the changed flag for this data definition.
- unsigned int getLevel () const

  Returns the hierarchical editing context containing this element.
- void setModelLevel (unsigned int _modelLevel)

  Sets this element's hierarchical editing context.
- List< SimulationControl * > * getSimulationControls () const

  Returns the simulation controls owned by this data definition.
- TraceManager::Level getTraceLevelSpecific () const

  Returns the trace level that applies specifically to this definition.
- void setTraceLevelSpecific (TraceManager::Level level)

Updates the trace level used by this definition.

- void defineTraceLevelSpecific (TraceManager::Level traceLevelspecific, bool traceLevelSpecific↩ Enabled=true)

  Defines the specific trace level and optionally enables it immediately.
- bool isTraceLevelSpecificEnabled () const

  Indicates whether the specific trace level is enabled.
- void setTraceLevelSpecificEnabled (bool traceLevelSpecificEnabled)

  Enables or disables the specific trace level.

Static Public Member Functions

- static PluginInformation * **GetPluginInformation** ()
- static ModelComponent * **LoadInstance** (Model *model, PersistenceRecord *fields)
- static ModelDataDefinition * **NewInstance** (Model *model, std::string name="")

Static Public Member Functions inherited from ModelComponent

- static ModelComponent * LoadInstance (Model *model, PersistenceRecord *fields)

  static public methods that must have implementations (Load and New just the same. GetInformation must provide specific infos for the new component
- static bool Check (ModelComponent *component)

  Validates a component instance.
- static void CreateInternalData (ModelComponent *component)

  Creates internal data required by a component instance.
- static void SaveInstance (PersistenceRecord *fields, ModelComponent *component)

  Serializes a component instance into a persistence record.
- static void DispatchEvent (Event *event)

  Dispatches a simulation event to the target component.

Static Public Member Functions inherited from ModelDataDefinition

- static ModelDataDefinition * LoadInstance (Model *model, PersistenceRecord *fields, bool insertIntoModel)

  Loads a model data definition instance from serialized fields.
- static ModelDataDefinition * NewInstance (Model *model, std::string name="")

  Creates a new instance of a data definition using the plugin registry.
- static void SaveInstance (PersistenceRecord *fields, ModelDataDefinition *modeldatum)

  Serializes a data definition instance into a persistence record.
- static bool Check (ModelDataDefinition *modeldatum, std::string &errorMessage)

  Validates a data definition instance.
- static void InitBetweenReplications (ModelDataDefinition *modeldatum)

  Resets simulation-time state between replications.
- static void CreateInternalData (ModelDataDefinition *modeldatum)

  Creates internal and attached data required by this instance.
- static bool CreateRelatedDataElements (ModelDataDefinition *modeldatum, std::string &errorMessage)

  Creates related data and validates the instance in a single call.

Public Attributes

- const struct Seize::DEFAULT_VALUES **DEFAULT**

Protected Member Functions

- virtual void _onDispatchEvent (Entity *entity, unsigned int inputPortNumber) override

  Handles a dispatched event for this component type.
- virtual bool _loadInstance (PersistenceRecord *fields) override

  virtual protected method that must be overriden
- virtual void _initBetweenReplications () override
- virtual void _saveInstance (PersistenceRecord *fields, bool saveDefaultValues) override

  Saves object fields into a serialization structure.
- virtual bool _check (std::string &errorMessage) override

  could be overriden by derived classes
- virtual void _createEditableDataDefinitions () override

Protected Member Functions inherited from ModelDataDefinition

- bool _getSaveDefaultsOption ()

17.837.1 Detailed Description

Allocates one or more resources (or resource-set members) to an entity, queueing it if they are not simultaneously available.
Arena correspondence: the "Seize module" (Rockwell Automation, *Getting Started with Arena*, "The Advanced Process Panel", pp. 62-63). `_seizeRequests` (a list of `SeizableItem`) matches Arena's Type/Resource Name/Set Name/Quantity/Selection Rule/Save Attribute fields; `_queueableItem` matches Queue Type; `_priority`/`_priorityExpression` match Priority; `_allocationType` matches Allocation.
Confirmed behavior: on a successful seize, stamps `Entity.Allocation.<ResourceName>` with `_allocationType` — this is read back by Release, which credits the resource's held time to that category (see `docs/ai_assistants/reference/ARENA_GENESYS_COMPATIBILITY.md` §6.10 and §6.3 for the full category-time-allocation mechanism shared with Delay).
Known difference from Arena: no "Resource State" field (post-seize state assignment) — GenESyS's `ResourceState` is a fixed enum, not a user-defined StateSet (see Resource, §5.4).

17.837.2 Member Function Documentation

17.837.2.1 _check()

```
bool Seize::_check (
            std::string & errorMessage )  [override], [protected], [virtual]
```

could be overriden by derived classes
Reimplemented from ModelDataDefinition.

17.837.2.2 _createEditableDataDefinitions()

```
void Seize::_createEditableDataDefinitions ( )  [override], [protected], [virtual]
```
Reimplemented from ModelDataDefinition.

17.837.2.3 _initBetweenReplications()

```
void Seize::_initBetweenReplications ( )  [override], [protected], [virtual]
```
Reimplemented from ModelDataDefinition.

17.837.2.4 _loadInstance()

```
bool Seize::_loadInstance (
            PersistenceRecord * fields )  [override], [protected], [virtual]
```
virtual protected method that must be overriden
Reimplemented from ModelComponent.

17.837.2.5 _onDispatchEvent()

```
void Seize::_onDispatchEvent (
            Entity * entity,
            unsigned int inputPortNumber )  [override], [protected], [virtual]
```
Handles a dispatched event for this component type.
This method is only for ModelComponents, not for ModelDataElements.

Parameters

entity	Entity being processed.
inputPortNumber	Input port where the entity arrived.

Implements ModelComponent.

17.837.2.6 _saveInstance()

```
void Seize::_saveInstance (
            PersistenceRecord * fields,
            bool saveDefaultValues )  [override], [protected], [virtual]
```
Saves object fields into a serialization structure.

Parameters

fields	a table-like structure used for serialization.
saveDefaultValues	indicates whether or not to save fields which are set to their default value.

Reimplemented from ModelComponent.

17.837.2.7 show()

```
std::string Seize::show ( )  [override], [virtual]
```
virtual public methods
Returns a textual representation of this component.

Returns

Human-readable description used for tracing and debugging.

Reimplemented from ModelComponent.
The documentation for this class was generated from the following files:

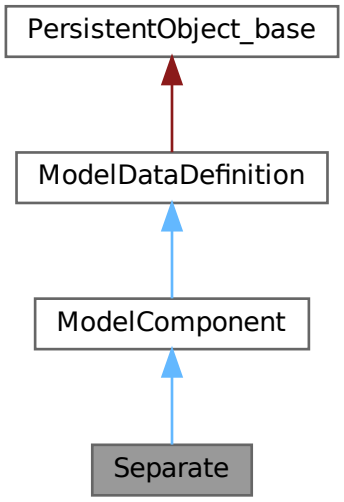
- plugins/components/DiscreteProcessing/Seize.h
- plugins/components/DiscreteProcessing/Seize.cpp

17.838 Separate Class Reference

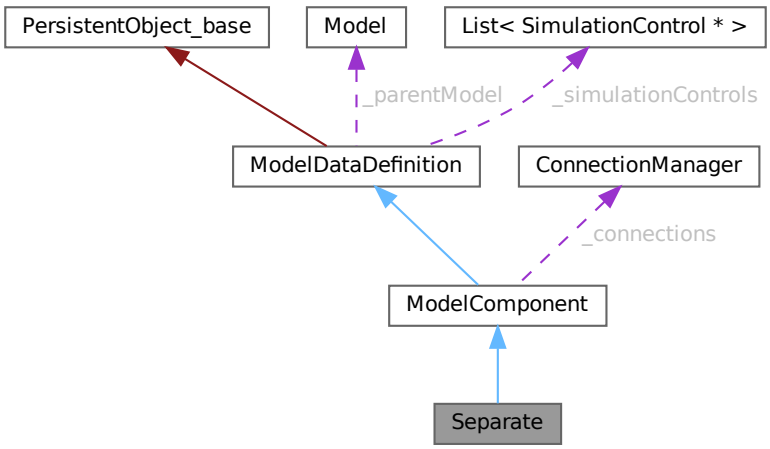
Releases the original member entities of a temporary Batch group back into the model.

`#include <plugins/components/Grouping/Separate.h>`

Inheritance diagram for Separate:



Collaboration diagram for Separate:



Public Member Functions

- **Separate** (Model *model, std::string name="")

  constructors
- virtual ~**ModelComponent** ()

  Releases component-owned resources and unregisters it from the model.
- ConnectionManager * getConnectionManager () const

  new public user methods for this component
- void connectTo (ModelComponent *component, unsigned int inputPortNumber=0)

  Connects this component to another component.
- bool hasBreakpointAt ()

  Indicates whether a simulation breakpoint is set on this component.
- void setDescription (std::string _description)

  Updates the free-form description shown by the GUI.
- std::string getDescription () const

  Returns the free-form description associated with this component.
- void remove (ModelComponent *comp)

  Removes a connected component from this component.

Public Member Functions inherited from ModelDataDefinition

- ModelDataDefinition (Model *model, std::string datadefinitionTypename, std::string name="", bool insert↩ IntoModel=true)

  Creates a model data definition and optionally inserts it into the model.
- virtual ~**ModelDataDefinition** ()

  Releases resources owned by this data definition.
- Util::identification getId () const

  Returns the unique identifier of this instance.
- void setName (const std::string &name)

  Updates the logical name of this instance.
- const std::string & getName () const

  Returns the logical name of this instance.
- void setLabel (const std::string &label)

  Updates the user-visible label of this instance.
- const std::string & getLabel () const

  Returns the user-visible label of this instance.
- const std::string & getClassname () const

  Returns the runtime class name used by the plugin system.
- Model * getParentModel () const

  Returns the parent model that owns this definition.
- bool isReportStatistics () const

  Indicates whether this data definition contributes report statistics.
- void setReportStatistics (bool reportStatistics)

  Enables or disables report-statistics generation for this definition.
- ModelDataDefinition * getInternalData (const std::string &name) const

  Looks up a named internal child data definition.
- std::map< std::string, ModelDataDefinition * > * getInternalData () const

  Returns the full map of internal child data definitions.
- std::map< std::string, ModelDataDefinition * > * getAttachedData () const

  Returns the full map of attached data definitions.
- bool hasChanged () const

  Indicates whether this instance has been modified since the last reset.

- void setHasChanged (bool hasChanged)

  Updates the changed flag for this data definition.
- unsigned int getLevel () const

  Returns the hierarchical editing context containing this element.
- void setModelLevel (unsigned int _modelLevel)

  Sets this element's hierarchical editing context.
- List< SimulationControl * > * getSimulationControls () const

  Returns the simulation controls owned by this data definition.
- TraceManager::Level getTraceLevelSpecific () const

  Returns the trace level that applies specifically to this definition.
- void setTraceLevelSpecific (TraceManager::Level level)

  Updates the trace level used by this definition.
- void defineTraceLevelSpecific (TraceManager::Level traceLevelspecific, bool traceLevelSpecific↩ Enabled=true)

  Defines the specific trace level and optionally enables it immediately.
- bool isTraceLevelSpecificEnabled () const

  Indicates whether the specific trace level is enabled.
- void setTraceLevelSpecificEnabled (bool traceLevelSpecificEnabled)

  Enables or disables the specific trace level.

17.838.1 Detailed Description

Releases the original member entities of a temporary Batch group back into the model.
Arena correspondence: the "Separate module" (Rockwell Automation, *Getting Started with Arena*, "The Basic Process Panel", p. 39), which has two Types: Duplicate Original (clone the incoming entity N times, optionally splitting VA/NVA/wait/transfer/other cost and time between the copies) and Split Existing Batch (recover the original entities grouped by Batch).
Only Split Existing Batch is implemented here: `_onDispatchEvent()` reads the `Entity.Group` marker attribute, looks up the matching EntityGroup (created by Batch), and releases every original member with its group marker cleared before removing the temporary representative entity.
Known difference from Arena: there is no Duplicate Original mode — no entity-cloning code path exists in this component at all. See `docs/ai_assistants/reference/ARENA_GENESYS_COMPATIBILITY.md` §6.8; Clone (`plugins/components/DiscreteProcessing/Clone.h`) may be the intended substitute but has not been audited yet.

17.838.2 Member Function Documentation

17.838.2.1 _check()

```
bool Separate::_check (
            std::string & errorMessage )  [override], [protected], [virtual]
```

could be overriden by derived classes
Reimplemented from ModelDataDefinition.

17.838.2.2 _loadInstance()

```
bool Separate::_loadInstance (
            PersistenceRecord * fields )  [override], [protected], [virtual]
```

virtual protected method that must be overriden
Reimplemented from ModelComponent.

17.838.2.3 _onDispatchEvent()

```
void Separate::_onDispatchEvent (
            Entity * entity,
            unsigned int inputPortNumber )  [override], [protected], [virtual]
```

Handles a dispatched event for this component type.
This method is only for ModelComponents, not for ModelDataElements.

Parameters

entity	Entity being processed.
inputPortNumber	Input port where the entity arrived.

Implements ModelComponent.

17.838.2.4 _saveInstance()

```
void Separate::_saveInstance (
            PersistenceRecord * fields,
            bool saveDefaultValues )  [override], [protected], [virtual]
```

Saves object fields into a serialization structure.

Parameters

fields	a table-like structure used for serialization.
saveDefaultValues	indicates whether or not to save fields which are set to their default value.

Reimplemented from ModelComponent.

17.838.2.5 show()

```
std::string Separate::show ( )  [override], [virtual]
```

virtual public methods
Returns a textual representation of this component.

Returns

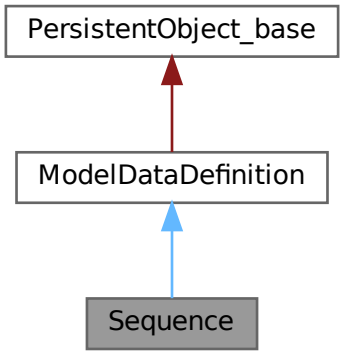
Human-readable description used for tracing and debugging.

Reimplemented from ModelComponent.
The documentation for this class was generated from the following files:

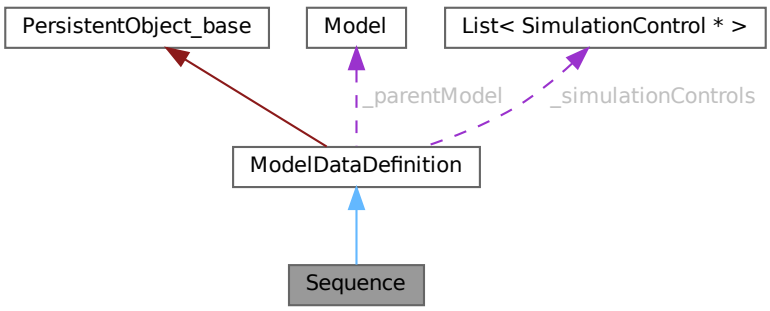
- plugins/components/Grouping/Separate.h
- plugins/components/Grouping/Separate.cpp

17.839 Sequence Class Reference

Data definition holding an ordered list of visitation steps (SequenceStep), each naming a Station or Label an entity should reach next, with optional attribute/variable assignments per step.
`#include <plugins/data/MaterialHandling/Sequence.h>`
Inheritance diagram for Sequence:



Collaboration diagram for Sequence:



Public Member Functions

- **Sequence** (Model *model, std::string name="")
- virtual std::string show () override

  Returns a textual representation of this data definition.
- List< SequenceStep * > * **getSteps** () const

Public Member Functions inherited from ModelDataDefinition

- ModelDataDefinition (Model *model, std::string datadefinitionTypename, std::string name="", bool insert↩ IntoModel=true)

  Creates a model data definition and optionally inserts it into the model.
- virtual ~**ModelDataDefinition** ()

Releases resources owned by this data definition.

- Util::identification getId () const

  Returns the unique identifier of this instance.
- void setName (const std::string &name)

  Updates the logical name of this instance.
- const std::string & getName () const

  Returns the logical name of this instance.
- void setLabel (const std::string &label)

  Updates the user-visible label of this instance.
- const std::string & getLabel () const

  Returns the user-visible label of this instance.
- const std::string & getClassname () const

  Returns the runtime class name used by the plugin system.
- Model * getParentModel () const

  Returns the parent model that owns this definition.
- bool isReportStatistics () const

  Indicates whether this data definition contributes report statistics.
- void setReportStatistics (bool reportStatistics)

  Enables or disables report-statistics generation for this definition.
- ModelDataDefinition * getInternalData (const std::string &name) const

  Looks up a named internal child data definition.
- std::map< std::string, ModelDataDefinition * > * getInternalData () const

  Returns the full map of internal child data definitions.
- std::map< std::string, ModelDataDefinition * > * getAttachedData () const

  Returns the full map of attached data definitions.
- bool hasChanged () const

  Indicates whether this instance has been modified since the last reset.
- void setHasChanged (bool hasChanged)

  Updates the changed flag for this data definition.
- unsigned int getLevel () const

  Returns the hierarchical editing context containing this element.
- void setModelLevel (unsigned int _modelLevel)

  Sets this element's hierarchical editing context.
- List< SimulationControl * > * getSimulationControls () const

  Returns the simulation controls owned by this data definition.
- TraceManager::Level getTraceLevelSpecific () const

  Returns the trace level that applies specifically to this definition.
- void setTraceLevelSpecific (TraceManager::Level level)

  Updates the trace level used by this definition.
- void defineTraceLevelSpecific (TraceManager::Level traceLevelspecific, bool traceLevelSpecific↩ Enabled=true)

  Defines the specific trace level and optionally enables it immediately.
- bool isTraceLevelSpecificEnabled () const

  Indicates whether the specific trace level is enabled.
- void setTraceLevelSpecificEnabled (bool traceLevelSpecificEnabled)

  Enables or disables the specific trace level.

Static Public Member Functions

- static PluginInformation * **GetPluginInformation** ()

17.839.1 Detailed Description

Data definition holding an ordered list of visitation steps (`SequenceStep`), each naming a Station or Label an entity should reach next, with optional attribute/variable assignments per step.
Arena correspondence: the "Sequence module" (Rockwell Automation, *Getting Started with Arena*, "The Advanced Transfer Panel", pp. 100-101), which defines an ordered visitation list of stations (jobsteps) plus per-step attribute/variable/picture assignments, tracked at runtime through the special-purpose Entity.Sequence/↩ Entity.Jobstep/ Entity.PlannedStation attributes.
GenESyS extends the concept by letting a SequenceStep target a Label instead of a Station (useful outside pure station-to-station material handling flows).
Known difference from Arena, to confirm in `Sequence.cpp`: steps are stored as a plain ordered `List`, so Arena's named, out-of-order "Step Name"/"Next Step" jump targets have no obvious equivalent here.

17.839.2 Member Function Documentation

17.839.2.1 _check()

```
bool Sequence::_check (
            std::string & errorMessage )  [override], [protected], [virtual]
```

could be overriden by derived classes
Reimplemented from ModelDataDefinition.

17.839.2.2 _createAttachedAttributes()

```
void Sequence::_createAttachedAttributes ( )  [override], [protected], [virtual]
```

Reimplemented from ModelDataDefinition.

17.839.2.3 _loadInstance()

```
bool Sequence::_loadInstance (
            PersistenceRecord * fields )  [override], [protected], [virtual]
```

must be overriden by derived classes
Reimplemented from ModelDataDefinition.

17.839.2.4 _saveInstance()

```
void Sequence::_saveInstance (
            PersistenceRecord * fields,
            bool saveDefaultValues )  [override], [protected], [virtual]
```

Saves object fields into a serialization structure.

Parameters

fields	a table-like structure used for serialization.
saveDefaultValues	indicates whether or not to save fields which are set to their default value.

Reimplemented from ModelDataDefinition.

17.839.2.5 show()

```
std::string Sequence::show ( )  [override], [virtual]
```

Returns a textual representation of this data definition.
Returns the keys of internal ModelDataDefinitions such as counters, statistics collectors and other children needed before model checking.

Returns

Human-readable summary used by traces and debug output.

Reimplemented from ModelDataDefinition.
The documentation for this class was generated from the following files:

- plugins/data/MaterialHandling/Sequence.h
- plugins/data/MaterialHandling/Sequence.cpp

17.840 SequenceStep Class Reference

Inheritance diagram for SequenceStep:

17.840.1 Member Function Documentation

17.840.1.1 _loadInstance()

```
bool SequenceStep::_loadInstance (
            PersistenceRecord * fields )  [override], [virtual]
```

Loads object fields from a deserialization structure.

Parameters

fields	a table-like structure which can be queried for parsed fields.

Returns

a boolean which is true iff the load operation was successful.

Implements PersistentObject_base.

17.840.1.2 _saveInstance()

```
void SequenceStep::_saveInstance (
            PersistenceRecord * fields,
            bool saveDefaultValues )  [override], [virtual]
```

Saves object fields into a serialization structure.

Parameters

fields	a table-like structure used for serialization.
saveDefaultValues	indicates whether or not to save fields which are set to their default value.

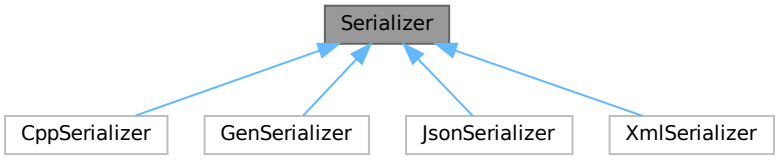
Implements PersistentObject_base.
The documentation for this class was generated from the following files:

- plugins/data/MaterialHandling/Sequence.h
- plugins/data/MaterialHandling/Sequence.cpp

17.841 Serializer Class Reference

Serialization/Deserialization interface for simulation models.
`#include <kernel/simulator/persistence/Serializer.h>`

Inheritance diagram for Serializer:



Public Member Functions

- virtual PersistenceRecord * newPersistenceRecord ()=0

  Creates an empty persistence record.
- virtual bool dump (std::ostream &output)=0

  Writes formatted contents to a given output stream.
- virtual bool load (std::istream &input)=0

  Attempts to load contents from a given input stream.
- virtual bool get (const std::string &name, PersistenceRecord *entry)=0

  Tries to fetch an entry with the given label as a key.
- virtual bool put (const std::string name, const std::string type, const Util::identification id, PersistenceRecord *fields)=0

  Upserts an entry into this structure.
- virtual int for_each (std::function< int(const std::string &) > delegate)=0

  Iterates over this structure's entries, ordered by ID.

17.841.1 Detailed Description

Serialization/Deserialization interface for simulation models.
This can be seen as an associative array which knows how to ser/deserialize itself. The "contents" of a serializer are the set of entries it contains.
Its entries are identified by strings, which correspond to unique component/datadef names. Each entry has its own name, a type, an id, and an associated set of fields. All of these are contained within a `PersistenceRecord` instance.
Serializers also act as factories for `PersistenceRecord`s, which can then only be used with the serializer which originated them.

17.841.2 Member Function Documentation

17.841.2.1 dump()

```
virtual bool Serializer::dump (
            std::ostream & output )  [pure virtual]
```

Writes formatted contents to a given output stream.

Parameters

output	output stream to write to.

Returns

whether the current state of this structure's contents was deemed valid for serialization.

Implemented in CppSerializer, GenSerializer, JsonSerializer, and XmlSerializer.

17.841.2.2 for_each()

```
virtual int Serializer::for_each (
            std::function< int(const std::string &) > delegate )  [pure virtual]
```

Iterates over this structure's entries, ordered by ID.

Parameters

delegate	delegate which is applied to every entry-identifying key, until it returns a non-zero value.

Returns

either zero, or the first non-zero value returned by the delegate.

Implemented in CppSerializer, GenSerializer, JsonSerializer, and XmlSerializer.

17.841.2.3 get()

```
virtual bool Serializer::get (
            const std::string & name,
            PersistenceRecord * entry )  [pure virtual]
```

Tries to fetch an entry with the given label as a key.

Parameters

name	a label which uniquely identifies an entry.
entry	(out-param) a pointer to a caller-owned entry, which is filled on success.

Returns

whether the entry was found and the out-param was actually written to.

Implemented in CppSerializer, GenSerializer, JsonSerializer, and XmlSerializer.

17.841.2.4 load()

```
virtual bool Serializer::load (
            std::istream & input )  [pure virtual]
```

Attempts to load contents from a given input stream.

Returns

whether the input was well-formatted and loading was successful.

Implemented in CppSerializer, GenSerializer, JsonSerializer, and XmlSerializer.

17.841.2.5 newPersistenceRecord()

```
virtual PersistenceRecord * Serializer::newPersistenceRecord ( )  [pure virtual]
```

Creates an empty persistence record.
Although the returned record can be freed normally with `delete`, care must be taken to only use records which come from a implementation, when configuring that implementation's contents.
Implemented in CppSerializer, GenSerializer, JsonSerializer, and XmlSerializer.

17.841.2.6 put()

```
virtual bool Serializer::put (
            const std::string name,
            const std::string type,
            const Util::identification id,
            PersistenceRecord * fields )  [pure virtual]
```

Upserts an entry into this structure.

Parameters

name	a label which uniquely identifies the entry.
type	a type name.
id	a component/datadef ID number.
fields	a persistence record for the entry, whose contents will be copied if valid.

Returns

whether the entry was valid and was actually copied into this structure.

Implemented in CppSerializer, GenSerializer, JsonSerializer, and XmlSerializer.
The documentation for this class was generated from the following files:

- kernel/simulator/persistence/Serializer.h
- kernel/simulator/persistence/Serializer.cpp

17.842 SessionContext Struct Reference

Owns the state that belongs to one authenticated web session.
`#include <applications/worker/session/SessionContext.h>`

Public Attributes

- std::string **sessionId**

  Stable session identifier returned to the client.
- std::string **accessToken**

  Bearer token used to authenticate API calls.
- std::filesystem::path **workspacePath**

  Filesystem workspace reserved for the session.
- std::unique_ptr< Simulator > **simulator**

  Simulator instance scoped to this session.
- std::mutex **mutex**

  Guards session-local mutable state.

17.842.1 Detailed Description

Owns the state that belongs to one authenticated web session.
Each session binds one access token to one workspace directory and one simulator instance. The mutex protects session-local state during API calls and background job execution.
The documentation for this struct was generated from the following file:

- applications/worker/session/SessionContext.h

17.843 SessionManager Class Reference

Creates, stores and resolves authenticated web sessions.
`#include <applications/worker/session/SessionManager.h>`

Public Types

- using **SimulatorFactory** = std::function< std::unique_ptr< Simulator >() >

  Factory used to build one simulator per session.

Public Member Functions

- SessionManager (TokenService &tokenService, SimulatorFactory simulatorFactory)

  Builds a manager with the token service and simulator factory to use.
- SessionContext * createSession ()

  Creates a new session, workspace and simulator instance.
- SessionContext * getSessionByToken (const std::string &token)

  Resolves the session associated with a bearer token.

17.843.1 Detailed Description

Creates, stores and resolves authenticated web sessions.
SessionManager owns the token-to-session map used by the web API. It also creates per-session simulator instances and assigns each session an isolated workspace directory.

17.843.2 Constructor & Destructor Documentation

17.843.2.1 SessionManager()

```
SessionManager::SessionManager (
            TokenService & tokenService,
            SimulatorFactory simulatorFactory )
```

Builds a manager with the token service and simulator factory to use.
Builds the session registry and session workspace root.

Parameters

tokenService	Service responsible for generating and validating tokens.
simulatorFactory	Factory used to create a fresh simulator per session.

17.843.3 Member Function Documentation

17.843.3.1 createSession()

```
SessionContext * SessionManager::createSession ( )
```

Creates a new session, workspace and simulator instance.
Creates a session, allocates token, simulator instance and workspace.

Returns

Pointer to the stored session context.

17.843.3.2 getSessionByToken()

```
SessionContext * SessionManager::getSessionByToken (
            const std::string & token )
```

Resolves the session associated with a bearer token.
Resolves a session by bearer token.

Parameters

token	Bearer token presented by the client.

Returns

Pointer to the matching session or nullptr when not found.

The documentation for this class was generated from the following files:

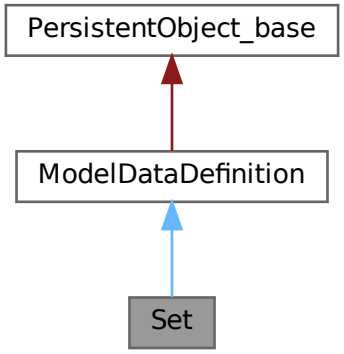
- applications/worker/session/SessionManager.h
- applications/worker/session/SessionManager.cpp

17.844 Set Class Reference

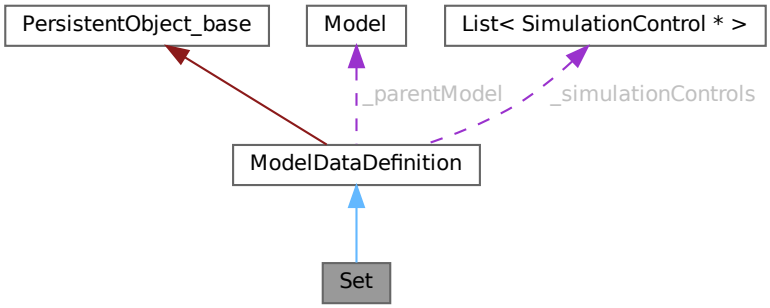
Data definition grouping an ordered list of ModelDataDefinition members of one concrete type, used by selection-rule-based components (e.g. Resource sets consumed by Seize-family components).

`#include <plugins/data/Logic/Set.h>`

Inheritance diagram for Set:



Collaboration diagram for Set:



Public Member Functions

- **Set** (Model *model, std::string name="", std::vector< std::string > allowedElementTypes={})
- virtual std::string show () override

  Returns a textual representation of this data definition.
- std::string **getSetOfType** () const
- bool setSetOfType (const std::string &setOfType)

  Sets the concrete member type for this Set while it is still structurally compatible.
- bool **canChangeSetOfType** () const

Returns true while the selected concrete member type can still be changed.

- void setAllowedElementTypes (const std::vector< std::string > &allowedElementTypes)

  Restricts which ModelDataDefinition subclasses may be created through this Set.
- void **addAllowedElementType** (const std::string &allowedElementType)

  Adds one accepted ModelDataDefinition subclass name to this Set creation contract.
- std::vector< std::string > **getAllowedElementTypes** () const

  Returns the currently accepted concrete member types for GUI and tooling contracts.
- List< ModelDataDefinition * > * **getElementSet** () const
- void **addElementSet** (ModelDataDefinition *newElement)
- void **removeElementSet** (ModelDataDefinition *element)
- ModelDataDefinition * createElementSetOfType (const std::string &typeName, const std::string &name="")

  Creates a new model data definition of the selected Set member type.

Public Member Functions inherited from ModelDataDefinition

- ModelDataDefinition (Model *model, std::string datadefinitionTypename, std::string name="", bool insert↩ IntoModel=true)

  Creates a model data definition and optionally inserts it into the model.
- virtual ~**ModelDataDefinition** ()

  Releases resources owned by this data definition.
- Util::identification getId () const

  Returns the unique identifier of this instance.
- void setName (const std::string &name)

  Updates the logical name of this instance.
- const std::string & getName () const

  Returns the logical name of this instance.
- void setLabel (const std::string &label)

  Updates the user-visible label of this instance.
- const std::string & getLabel () const

  Returns the user-visible label of this instance.
- const std::string & getClassname () const

  Returns the runtime class name used by the plugin system.
- Model * getParentModel () const

  Returns the parent model that owns this definition.
- bool isReportStatistics () const

  Indicates whether this data definition contributes report statistics.
- void setReportStatistics (bool reportStatistics)

  Enables or disables report-statistics generation for this definition.
- ModelDataDefinition * getInternalData (const std::string &name) const

  Looks up a named internal child data definition.
- std::map< std::string, ModelDataDefinition * > * getInternalData () const

  Returns the full map of internal child data definitions.
- std::map< std::string, ModelDataDefinition * > * getAttachedData () const

  Returns the full map of attached data definitions.
- bool hasChanged () const

  Indicates whether this instance has been modified since the last reset.
- void setHasChanged (bool hasChanged)

  Updates the changed flag for this data definition.
- unsigned int getLevel () const

  Returns the hierarchical editing context containing this element.
- void setModelLevel (unsigned int _modelLevel)

Sets this element's hierarchical editing context.

- List< SimulationControl * > * getSimulationControls () const

  Returns the simulation controls owned by this data definition.
- TraceManager::Level getTraceLevelSpecific () const

  Returns the trace level that applies specifically to this definition.
- void setTraceLevelSpecific (TraceManager::Level level)

  Updates the trace level used by this definition.
- void defineTraceLevelSpecific (TraceManager::Level traceLevelspecific, bool traceLevelSpecific↩ Enabled=true)

  Defines the specific trace level and optionally enables it immediately.
- bool isTraceLevelSpecificEnabled () const

  Indicates whether the specific trace level is enabled.
- void setTraceLevelSpecificEnabled (bool traceLevelSpecificEnabled)

  Enables or disables the specific trace level.

Static Public Member Functions

- static ModelDataDefinition * **LoadInstance** (Model *model, PersistenceRecord *fields)
- static PluginInformation * **GetPluginInformation** ()
- static ModelDataDefinition * **NewInstance** (Model *model, std::string name="")

Static Public Member Functions inherited from ModelDataDefinition

- static ModelDataDefinition * LoadInstance (Model *model, PersistenceRecord *fields, bool insertIntoModel)

  Loads a model data definition instance from serialized fields.
- static ModelDataDefinition * NewInstance (Model *model, std::string name="")

  Creates a new instance of a data definition using the plugin registry.
- static void SaveInstance (PersistenceRecord *fields, ModelDataDefinition *modeldatum)

  Serializes a data definition instance into a persistence record.
- static bool Check (ModelDataDefinition *modeldatum, std::string &errorMessage)

  Validates a data definition instance.
- static void InitBetweenReplications (ModelDataDefinition *modeldatum)

  Resets simulation-time state between replications.
- static void CreateInternalData (ModelDataDefinition *modeldatum)

  Creates internal and attached data required by this instance.
- static bool CreateRelatedDataElements (ModelDataDefinition *modeldatum, std::string &errorMessage)

  Creates related data and validates the instance in a single call.

Protected Member Functions

- virtual bool _loadInstance (PersistenceRecord *fields) override

  must be overriden by derived classes

17.844.1 Detailed Description

Data definition grouping an ordered list of ModelDataDefinition members of one concrete type, used by selection-rule-based components (e.g. Resource sets consumed by Seize-family components).
Arena correspondence: Arena's "Set module"/"Advanced Set module" (Rockwell Automation, *Getting Started with Arena*, "The Basic Process Panel" p. 51 and "The Advanced Process Panel" p. 69), which define closed, named set kinds: Resource, Counter, Tally, Entity (type), Entity Picture, Queue, Storage and Other.
Known difference from Arena (broader, not narrower, than the Arena concept): this class is polymorphic rather than a fixed enumeration of kinds. `setSetOfType()`/`getSetOfType()` record the concrete ModelDataDefinition subclass name of the first inserted member, and `setAllowedElementTypes()`/`addAllowedElement↩Type()` let a component owner (e.g. SeizableItem, QueueableItem) restrict a Set instance to one or more accepted subclasses. This means a GenESyS Set can, in principle, hold any registered ModelDataDefinition plugin type, not only the five kinds Arena hard-codes. There is no dedicated "picture" data definition, so Arena's Entity Picture sets have no GenESyS equivalent.

17.844.2 Member Function Documentation

17.844.2.1 _check()

```
bool Set::_check (
            std::string & errorMessage )  [override], [protected], [virtual]
```

could be overriden by derived classes
Reimplemented from ModelDataDefinition.

17.844.2.2 _createAttachedAttributes()

```
void Set::_createAttachedAttributes ( )  [override], [protected], [virtual]
```

Reimplemented from ModelDataDefinition.

17.844.2.3 _getParserChangesInformation()

```
ParserChangesInformation * Set::_getParserChangesInformation ( )  [override], [protected],
[virtual]
```

This method returns all changes in the parser that are needed by plugins of this ModelDatas. When connecting a new plugin, ParserChangesInformation are used to change parser source code, whch is after compiled and dinamically linked to to simulator kernel to reflect the changes
Reimplemented from ModelDataDefinition.

17.844.2.4 _loadInstance()

```
bool Set::_loadInstance (
            PersistenceRecord * fields )  [override], [protected], [virtual]
```

must be overriden by derived classes
Reimplemented from ModelDataDefinition.

17.844.2.5 _saveInstance()

```
void Set::_saveInstance (
            PersistenceRecord * fields,
            bool saveDefaultValues )  [override], [protected], [virtual]
```

Saves object fields into a serialization structure.

Parameters

fields	a table-like structure used for serialization.
saveDefaultValues	indicates whether or not to save fields which are set to their default value.

Reimplemented from ModelDataDefinition.

17.844.2.6 createElementSetOfType()

```
ModelDataDefinition * Set::createElementSetOfType (
            const std::string & typeName,
            const std::string & name = "" )
```

Creates a new model data definition of the selected Set member type.
This method is the kernel-side factory used by generic property editors. The editor provides the intended type; Set validates the current type/allowed-type contract and delegates actual object construction to PluginManager so plugin registration rules stay centralized.

17.844.2.7 setAllowedElementTypes()

```
void Set::setAllowedElementTypes (
            const std::vector< std::string > & allowedElementTypes )
```

Restricts which ModelDataDefinition subclasses may be created through this Set.
Empty means "use every creatable ModelDataDefinition plugin known by the simulator". Context owners such as SeizableItem and QueueableItem use this to expose Resource-only or Queue-only Set editing in the GUI without hard-coding those rules in the editor.

17.844.2.8 setSetOfType()

```
bool Set::setSetOfType (
            const std::string & setOfType )
```

Sets the concrete member type for this Set while it is still structurally compatible.
A Set is polymorphic only before its first member is inserted. Once members exist, all subsequent members must match this selected ModelDataDefinition subclass name.

17.844.2.9 show()

```
std::string Set::show ( )  [override], [virtual]
```

Returns a textual representation of this data definition.
Returns the keys of internal ModelDataDefinitions such as counters, statistics collectors and other children needed before model checking.

Returns

Human-readable summary used by traces and debug output.

Reimplemented from ModelDataDefinition.
The documentation for this class was generated from the following files:

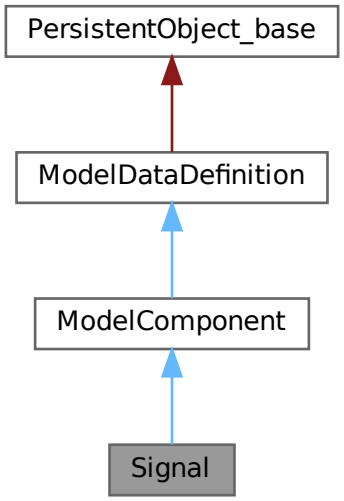
- plugins/data/Logic/Set.h
- plugins/data/Logic/Set.cpp

17.845 Signal Class Reference

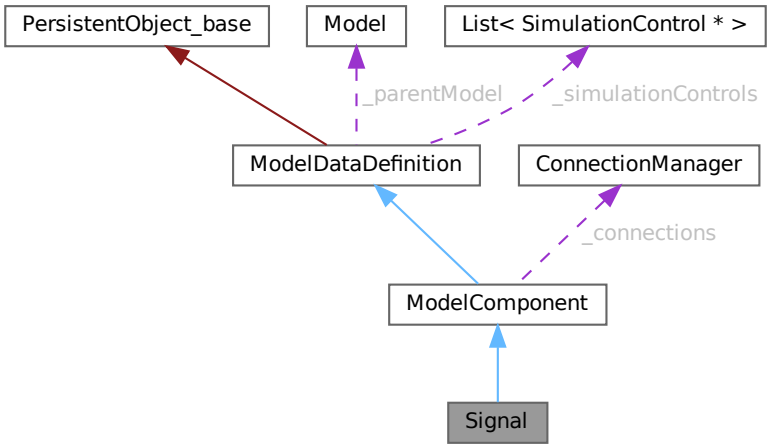
Broadcasts a signal value, releasing up to `_limitExpression` entities waiting at any `Wait` (Arena Hold) component in `WaitForSignal` mode with a matching signal.

`#include <plugins/components/Synchronization/Signal.h>`

Inheritance diagram for Signal:



Collaboration diagram for Signal:



Public Member Functions

- **Signal** (Model *model, std::string name="")
- virtual std::string show () override

virtual public methods

- void **setSignalData** (SignalData *signal)
- const std::string & **limitExpression** () const
- void **setLimitExpression** (const std::string &newLimitExpression)

Public Member Functions inherited from ModelComponent

- ModelComponent (Model *model, std::string componentTypename, std::string name="")

  constructors
- virtual ~**ModelComponent** ()

  Releases component-owned resources and unregisters it from the model.
- ConnectionManager * getConnectionManager () const

  new public user methods for this component
- void connectTo (ModelComponent *component, unsigned int inputPortNumber=0)

  Connects this component to another component.
- bool hasBreakpointAt ()

  Indicates whether a simulation breakpoint is set on this component.
- void setDescription (std::string _description)

  Updates the free-form description shown by the GUI.
- std::string getDescription () const

  Returns the free-form description associated with this component.
- void remove (ModelComponent *comp)

  Removes a connected component from this component.

Public Member Functions inherited from ModelDataDefinition

- ModelDataDefinition (Model *model, std::string datadefinitionTypename, std::string name="", bool insert↩ IntoModel=true)

  Creates a model data definition and optionally inserts it into the model.
- virtual ~**ModelDataDefinition** ()

  Releases resources owned by this data definition.
- Util::identification getId () const

  Returns the unique identifier of this instance.
- void setName (const std::string &name)

  Updates the logical name of this instance.
- const std::string & getName () const

  Returns the logical name of this instance.
- void setLabel (const std::string &label)

  Updates the user-visible label of this instance.
- const std::string & getLabel () const

  Returns the user-visible label of this instance.
- const std::string & getClassname () const

  Returns the runtime class name used by the plugin system.
- Model * getParentModel () const

  Returns the parent model that owns this definition.
- bool isReportStatistics () const

  Indicates whether this data definition contributes report statistics.
- void setReportStatistics (bool reportStatistics)

  Enables or disables report-statistics generation for this definition.
- ModelDataDefinition * getInternalData (const std::string &name) const

  Looks up a named internal child data definition.
- std::map< std::string, ModelDataDefinition * > * getInternalData () const

Returns the full map of internal child data definitions.

- std::map< std::string, ModelDataDefinition * > * getAttachedData () const

  Returns the full map of attached data definitions.

- bool hasChanged () const

  Indicates whether this instance has been modified since the last reset.

- void setHasChanged (bool hasChanged)

  Updates the changed flag for this data definition.

- unsigned int getLevel () const

  Returns the hierarchical editing context containing this element.

- void setModelLevel (unsigned int _modelLevel)

  Sets this element's hierarchical editing context.

- List< SimulationControl * > * getSimulationControls () const

  Returns the simulation controls owned by this data definition.

- TraceManager::Level getTraceLevelSpecific () const

  Returns the trace level that applies specifically to this definition.

- void setTraceLevelSpecific (TraceManager::Level level)

  Updates the trace level used by this definition.

- void defineTraceLevelSpecific (TraceManager::Level traceLevelspecific, bool traceLevelSpecific↩ Enabled=true)

  Defines the specific trace level and optionally enables it immediately.

- bool isTraceLevelSpecificEnabled () const

  Indicates whether the specific trace level is enabled.

- void setTraceLevelSpecificEnabled (bool traceLevelSpecificEnabled)

  Enables or disables the specific trace level.

Static Public Member Functions

- static PluginInformation * **GetPluginInformation** ()
- static ModelComponent * **LoadInstance** (Model *model, PersistenceRecord *fields)
- static ModelDataDefinition * **NewInstance** (Model *model, std::string name="")

Static Public Member Functions inherited from ModelComponent

- static ModelComponent * LoadInstance (Model *model, PersistenceRecord *fields)

  static public methods that must have implementations (Load and New just the same. GetInformation must provide specific infos for the new component

- static bool Check (ModelComponent *component)

  Validates a component instance.

- static void CreateInternalData (ModelComponent *component)

  Creates internal data required by a component instance.

- static void SaveInstance (PersistenceRecord *fields, ModelComponent *component)

  Serializes a component instance into a persistence record.

- static void DispatchEvent (Event *event)

  Dispatches a simulation event to the target component.

Static Public Member Functions inherited from ModelDataDefinition

- static ModelDataDefinition * LoadInstance (Model *model, PersistenceRecord *fields, bool insertIntoModel)

  Loads a model data definition instance from serialized fields.

- static ModelDataDefinition * NewInstance (Model *model, std::string name="")

  Creates a new instance of a data definition using the plugin registry.

- static void SaveInstance (PersistenceRecord *fields, ModelDataDefinition *modeldatum)

  Serializes a data definition instance into a persistence record.

- static bool Check (ModelDataDefinition *modeldatum, std::string &errorMessage)

  Validates a data definition instance.
- static void InitBetweenReplications (ModelDataDefinition *modeldatum)

  Resets simulation-time state between replications.
- static void CreateInternalData (ModelDataDefinition *modeldatum)

  Creates internal and attached data required by this instance.
- static bool CreateRelatedDataElements (ModelDataDefinition *modeldatum, std::string &errorMessage)

  Creates related data and validates the instance in a single call.

Protected Member Functions

- virtual bool _loadInstance (PersistenceRecord *fields) override

  virtual protected method that must be overriden
- virtual void _saveInstance (PersistenceRecord *fields, bool saveDefaultValues) override

  Saves object fields into a serialization structure.
- virtual void _onDispatchEvent (Entity *entity, unsigned int inputPortNumber) override

  Handles a dispatched event for this component type.
- virtual bool _check (std::string &errorMessage) override

  could be overriden by derived classes
- virtual void _initBetweenReplications () override
- virtual void _createEditableDataDefinitions () override

Protected Member Functions inherited from ModelDataDefinition

- bool _getSaveDefaultsOption ()

- bool **_traceLevelSpecificEnabled** = false

17.845.1 Detailed Description

Broadcasts a signal value, releasing up to `_limitExpression` entities waiting at any `Wait` (Arena Hold) component in `WaitForSignal` mode with a matching signal.
Arena correspondence: the "Signal module" (Rockwell Automation, *Getting Started with Arena*, "The Advanced Process Panel", p. 65). The attached `SignalData` matches Signal Value; `_limitExpression` matches Limit.

17.845.2 Member Function Documentation

17.845.2.1 _check()

```
bool Signal::_check (
            std::string & errorMessage )  [override], [protected], [virtual]
```

could be overriden by derived classes
Reimplemented from ModelDataDefinition.

17.845.2.2 _createEditableDataDefinitions()

```
void Signal::_createEditableDataDefinitions ( )  [override], [protected], [virtual]
```
Reimplemented from ModelDataDefinition.

17.845.2.3 _initBetweenReplications()

```
void Signal::_initBetweenReplications ( )  [override], [protected], [virtual]
```
Reimplemented from ModelDataDefinition.

17.845.2.4 _loadInstance()

```
bool Signal::_loadInstance (
            PersistenceRecord * fields )  [override], [protected], [virtual]
```
virtual protected method that must be overriden
Reimplemented from ModelComponent.

17.845.2.5 _onDispatchEvent()

```
void Signal::_onDispatchEvent (
            Entity * entity,
            unsigned int inputPortNumber )  [override], [protected], [virtual]
```
Handles a dispatched event for this component type.
This method is only for ModelComponents, not for ModelDataElements.

Parameters

entity	Entity being processed.
inputPortNumber	Input port where the entity arrived.

Implements ModelComponent.

17.845.2.6 _saveInstance()

```
void Signal::_saveInstance (
            PersistenceRecord * fields,
            bool saveDefaultValues )  [override], [protected], [virtual]
```
Saves object fields into a serialization structure.

Parameters

fields	a table-like structure used for serialization.
saveDefaultValues	indicates whether or not to save fields which are set to their default value.

Reimplemented from ModelComponent.

17.845.2.7 show()

```
std::string Signal::show ( )  [override], [virtual]
```
virtual public methods
Returns a textual representation of this component.

Returns

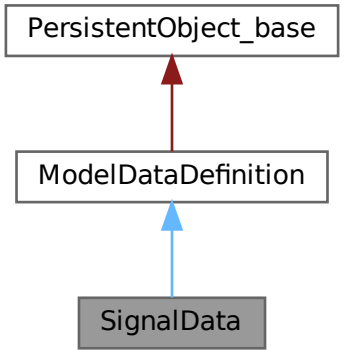
Human-readable description used for tracing and debugging.

Reimplemented from ModelComponent.
The documentation for this class was generated from the following files:

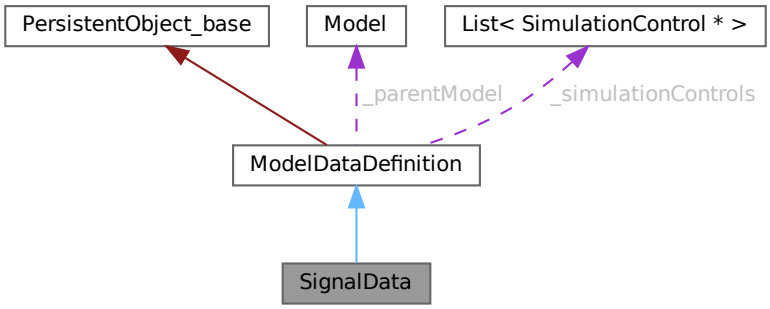
- plugins/components/Synchronization/Signal.h
- plugins/components/Synchronization/Signal.cpp

17.846 SignalData Class Reference

Inheritance diagram for SignalData:



Collaboration diagram for SignalData:



Public Types

- typedef std::function< unsigned int(SignalData *) > **SignalDataEventHandler**
- typedef std::pair< SignalDataEventHandler, ModelComponent * > **PairSignalDataEventHandler**

Public Member Functions

- **SignalData** (Model *model, std::string name="")
- virtual std::string show () override

  Returns a textual representation of this data definition.
- unsigned int **generateSignal** (double signalValue, unsigned int limit)
- void **addSignalDataEventHandler** (SignalDataEventHandler eventHandler, ModelComponent *component)
- void **removeSignalDataEventHandler** (ModelComponent *component)
- bool **hasSignalDataEventHandler** (ModelComponent *component) const
- unsigned int **remainsToLimit** () const
- void **decreaseRemainLimit** ()

Public Member Functions inherited from ModelDataDefinition

- ModelDataDefinition (Model *model, std::string datadefinitionTypename, std::string name="", bool insertIntoModel=true)

  Creates a model data definition and optionally inserts it into the model.
- virtual ~**ModelDataDefinition** ()

  Releases resources owned by this data definition.
- Util::identification getId () const

  Returns the unique identifier of this instance.
- void setName (const std::string &name)

  Updates the logical name of this instance.
- const std::string & getName () const

  Returns the logical name of this instance.
- void setLabel (const std::string &label)

  Updates the user-visible label of this instance.
- const std::string & getLabel () const

  Returns the user-visible label of this instance.
- const std::string & getClassname () const

  Returns the runtime class name used by the plugin system.
- Model * getParentModel () const

  Returns the parent model that owns this definition.
- bool isReportStatistics () const

  Indicates whether this data definition contributes report statistics.
- void setReportStatistics (bool reportStatistics)

  Enables or disables report-statistics generation for this definition.
- ModelDataDefinition * getInternalData (const std::string &name) const

  Looks up a named internal child data definition.
- std::map< std::string, ModelDataDefinition * > * getInternalData () const

  Returns the full map of internal child data definitions.
- std::map< std::string, ModelDataDefinition * > * getAttachedData () const

  Returns the full map of attached data definitions.
- bool hasChanged () const

  Indicates whether this instance has been modified since the last reset.
- void setHasChanged (bool hasChanged)

  Updates the changed flag for this data definition.
- unsigned int getLevel () const

  Returns the hierarchical editing context containing this element.
- void setModelLevel (unsigned int _modelLevel)

  Sets this element's hierarchical editing context.
- List< SimulationControl * > * getSimulationControls () const

  Returns the simulation controls owned by this data definition.
- TraceManager::Level getTraceLevelSpecific () const

  Returns the trace level that applies specifically to this definition.
- void setTraceLevelSpecific (TraceManager::Level level)

  Updates the trace level used by this definition.
- void defineTraceLevelSpecific (TraceManager::Level traceLevelspecific, bool traceLevelSpecificEnabled=true)

  Defines the specific trace level and optionally enables it immediately.
- bool isTraceLevelSpecificEnabled () const

  Indicates whether the specific trace level is enabled.
- void setTraceLevelSpecificEnabled (bool traceLevelSpecificEnabled)

  Enables or disables the specific trace level.

17.846.1 Member Function Documentation

17.846.1.1 _check()

```
bool SignalData::_check (
            std::string & errorMessage )  [override], [protected], [virtual]
```

could be overriden by derived classes
Reimplemented from ModelDataDefinition.

17.846.1.2 _initBetweenReplications()

```
void SignalData::_initBetweenReplications ( )  [override], [protected], [virtual]
```

Reimplemented from ModelDataDefinition.

17.846.1.3 _loadInstance()

```
bool SignalData::_loadInstance (
            PersistenceRecord * fields )  [override], [protected], [virtual]
```

must be overriden by derived classes
Reimplemented from ModelDataDefinition.

17.846.1.4 _saveInstance()

```
void SignalData::_saveInstance (
            PersistenceRecord * fields,
            bool saveDefaultValues )  [override], [protected], [virtual]
```

Saves object fields into a serialization structure.

Parameters

fields	a table-like structure used for serialization.
saveDefaultValues	indicates whether or not to save fields which are set to their default value.

Reimplemented from ModelDataDefinition.

17.846.1.5 show()

```
std::string SignalData::show ( )  [override], [virtual]
```

Returns a textual representation of this data definition.
Returns the keys of internal ModelDataDefinitions such as counters, statistics collectors and other children needed before model checking.

Returns

Human-readable summary used by traces and debug output.

Reimplemented from ModelDataDefinition.
The documentation for this class was generated from the following files:

- plugins/data/Synchronization/SignalData.h
- plugins/data/Synchronization/SignalData.cpp

17.847 GroProgramRuntime::SignalMutation Struct Reference

Public Attributes

- SignalMutationType **type** = SignalMutationType::Emit
- double **value** = 0.0
- unsigned int **channel** = 0

The documentation for this struct was generated from the following file:

- plugins/data/BiochemicalSimulation/GroProgramRuntime.h

17.848 SimpleHttpServer Class Reference

Minimal blocking HTTP/1.1 server for single-request-per-connection handling.
`#include <applications/worker/http/SimpleHttpServer.h>`

Public Types

- using **RequestHandler** = std::function< HttpResponse(const HttpRequest &)>

Public Member Functions

- SimpleHttpServer (unsigned short port)

  Construct a server bound to a TCP port.
- bool serve (const RequestHandler &handler, unsigned long maxRequests=0)

  Serve HTTP requests until the optional request limit is reached.
- void **requestStop** ()

  Requests the serving loop to stop as soon as it reaches a safe point.

17.848.1 Detailed Description

Minimal blocking HTTP/1.1 server for single-request-per-connection handling.
This server intentionally keeps the transport model simple (no keep-alive, no chunked transfer decoding) and delegates application routing to a request handler callback.

17.848.2 Constructor & Destructor Documentation

17.848.2.1 SimpleHttpServer()

```
SimpleHttpServer::SimpleHttpServer (
            unsigned short port )  [explicit]
```

Construct a server bound to a TCP port.

Parameters

port	TCP port that the server will bind/listen on.

17.848.3 Member Function Documentation

17.848.3.1 serve()

```
bool SimpleHttpServer::serve (
            const RequestHandler & handler,
            unsigned long maxRequests = 0 )
```

Serve HTTP requests until the optional request limit is reached.
Serves one request at a time over a blocking TCP listener.

Parameters

handler	Callback used to transform a parsed request into a response.
maxRequests	Maximum number of client requests to process (0 means unlimited).

Returns

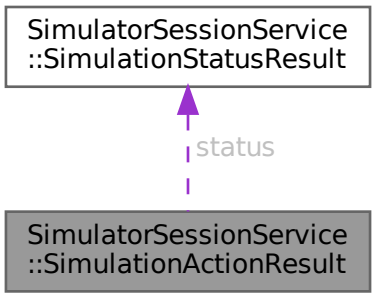
true when the serving loop ends normally; false on socket setup/runtime failure.

The loop accepts a connection, reads a bounded HTTP/1.1 request, delegates to the provided handler, serializes the response and closes the connection.
The documentation for this class was generated from the following files:

- applications/worker/http/SimpleHttpServer.h
- applications/worker/http/SimpleHttpServer.cpp

17.849 SimulatorSessionService::SimulationActionResult Struct Reference

Contains the result of a simulation action such as run or step.
`#include <applications/worker/service/SimulatorSessionService.h>`
Collaboration diagram for SimulatorSessionService::SimulationActionResult:



Public Attributes

- bool **success** = false
- bool **invalidToken** = false
- bool **missingCurrentModel** = false
- SimulationStatusResult **status**

17.849.1 Detailed Description

Contains the result of a simulation action such as run or step.
The documentation for this struct was generated from the following file:

- applications/worker/service/SimulatorSessionService.h

17.850 SimulationCommandController Class Reference

Controller that orchestrates UI simulation commands over SimulationController guards.
`#include <applications/gui/genesys/controllers/SimulationCommandController.h>`

Public Member Functions

- **SimulationCommandController** (SimulationController *simulationController, const std::function< void(const std::string &)> &insertCommandInConsole, const std::function< void()> &actualizeActions, const std::function< bool()> &checkModel, const std::function< bool()> &setSimulationModelBasedOnText, const std::function< void()> &prepareNewSimulationOutputs)

  Creates a command controller with narrow callbacks from MainWindow.
- void **onActionSimulationStartTriggered** (bool modelChecked) const

  Delegates the start simulation command flow.

- void **onActionSimulationStepTriggered** (bool modelChecked) const

  Delegates the step simulation command flow.
- void **onActionSimulationPauseTriggered** () const

  Delegates the pause simulation command flow.
- void **onActionSimulationResumeTriggered** (bool modelChecked) const

  Delegates the resume simulation command flow.
- void **onActionSimulationStopTriggered** () const

  Delegates the stop simulation command flow.

17.850.1 Detailed Description

Controller that orchestrates UI simulation commands over SimulationController guards.
This class sits between MainWindow compatibility slots and the low-level simulation readiness controller. It coordinates command intent (start/step/pause/resume/stop), command logging, and action refresh callbacks while preserving the existing UI trigger surface.
Responsibilities:

- execute simulation command flows delegated from MainWindow;
- use SimulationController precondition checks before unsafe commands;
- invoke injected callbacks for console command logging and action-state refresh.

Boundaries:

- it does not own simulation state or kernel event wiring;
- it does not render trace/event widgets;
- it is a controller/orchestration layer, not a persistence or synchronization service.

The documentation for this class was generated from the following files:

- applications/gui/genesys/controllers/SimulationCommandController.h
- applications/gui/genesys/controllers/SimulationCommandController.cpp

17.851 SimulatorSessionService::SimulationConfigInput Struct Reference

Defines user-provided simulation parameters to apply to the current model.
`#include <applications/worker/service/SimulatorSessionService.h>`

Public Attributes

- unsigned int **numberOfReplications** = 0
- double **replicationLength** = 0.0
- double **warmUpPeriod** = 0.0
- bool **pauseOnEvent** = false
- bool **pauseOnReplication** = false
- bool **initializeStatistics** = false
- bool **initializeSystem** = false

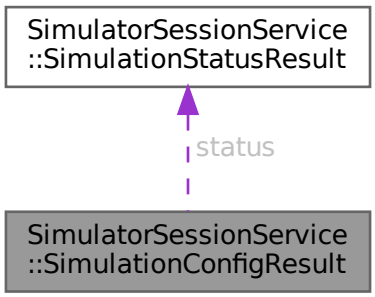
17.851.1 Detailed Description

Defines user-provided simulation parameters to apply to the current model.
The documentation for this struct was generated from the following file:

- applications/worker/service/SimulatorSessionService.h

17.852 SimulatorSessionService::SimulationConfigResult Struct Reference

Contains the result of applying simulation configuration.
`#include <applications/worker/service/SimulatorSessionService.h>`
Collaboration diagram for SimulatorSessionService::SimulationConfigResult:



Public Attributes

- bool **success** = false
- bool **invalidToken** = false
- bool **missingCurrentModel** = false
- SimulationStatusResult **status**

17.852.1 Detailed Description

Contains the result of applying simulation configuration.
The documentation for this struct was generated from the following file:

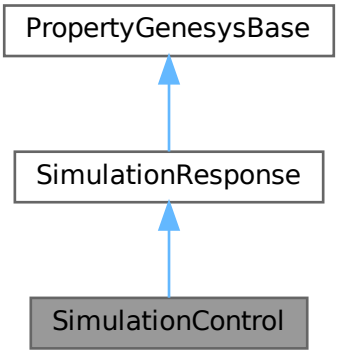
- applications/worker/service/SimulatorSessionService.h

17.853 SimulationControl Class Reference

Read/write kernel-side simulation control abstraction.
`#include <kernel/simulator/SimulationControlAndResponse.h>`

Inheritance diagram for SimulationControl:

Collaboration diagram for SimulationControl:



Public Member Functions

- **SimulationControl** (std::string className, std::string elementName, std::string propertyName, std::string whatsThis="", bool isList=false, bool isClass=false, bool isEnum=false)

- bool **_isEnum**

17.853.1 Detailed Description

Read/write kernel-side simulation control abstraction.
SimulationControl extends SimulationResponse with setter-based mutation and therefore represents writable kernel-side experiment controls.

17.853.2 Member Function Documentation

17.853.2.1 getChildSimulationControls()

```
virtual List< SimulationControl * > * SimulationControl::getChildSimulationControls (
            int index = 0 )  [inline], [virtual]
```

Returns nested SimulationControls exposed by this control.
This is the kernel-facing API for traversing child controls belonging to inline objects, references, or list elements represented by a control.
Reimplemented in SimulationControlGenericClass< T, M, C >, SimulationControlGenericClassNotDC< T, M, C >, and SimulationControlGenericListPointer< T, M, C >.
The documentation for this class was generated from the following file:

- kernel/simulator/SimulationControlAndResponse.h

17.857.1 Member Function Documentation

17.857.1.1 createObjectInstance()

```
template<typename T , typename M , typename C >
virtual bool SimulationControlGenericClass< T, M, C >::createObjectInstance (
            const std::string & value = "" )  [inline], [override], [virtual]
```

Reimplemented from SimulationControl.

17.857.1.2 ensureObjectInstance()

```
template<typename T , typename M , typename C >
virtual bool SimulationControlGenericClass< T, M, C >::ensureObjectInstance ( )  [inline],
[override], [virtual]
```

Reimplemented from SimulationControl.

17.857.1.3 getChildSimulationControls()

```
template<typename T , typename M , typename C >
virtual List< SimulationControl * > * SimulationControlGenericClass< T, M, C >::getChild↩
SimulationControls (
            int index = 0 )  [inline], [override], [virtual]
```

Returns nested SimulationControls exposed by this control.
This is the kernel-facing API for traversing child controls belonging to inline objects, references, or list elements represented by a control.
Reimplemented from SimulationControl.

17.857.1.4 getReferencedModelDataDefinition()

```
template<typename T , typename M , typename C >
virtual ModelDataDefinition * SimulationControlGenericClass< T, M, C >::getReferencedModel↩
DataDefinition ( ) const  [inline], [override], [virtual]
```

Reimplemented from SimulationControl.

17.857.1.5 getStrValues()

```
template<typename T , typename M , typename C >
virtual List< std::string > * SimulationControlGenericClass< T, M, C >::getStrValues ( )
[inline], [override], [virtual]
```

Reimplemented from SimulationResponse.

17.857.1.6 getValue()

```
template<typename T , typename M , typename C >
virtual std::string SimulationControlGenericClass< T, M, C >::getValue ( ) const  [inline],
[override], [virtual]
```

Implements SimulationResponse.

17.857.1.7 hasObjectInstance()

```
template<typename T , typename M , typename C >
virtual bool SimulationControlGenericClass< T, M, C >::hasObjectInstance ( ) const  [inline],
[override], [virtual]
```

Reimplemented from SimulationControl.

17.857.1.8 isInlineObjectProperty()

```
template<typename T , typename M , typename C >
virtual bool SimulationControlGenericClass< T, M, C >::isInlineObjectProperty ( ) const  [inline],
[override], [virtual]
```

Reimplemented from SimulationControl.

17.857.1.9 isModelDataDefinitionReference()

```
template<typename T , typename M , typename C >
virtual bool SimulationControlGenericClass< T, M, C >::isModelDataDefinitionReference ( )
const  [inline], [override], [virtual]
```

Reimplemented from SimulationControl.

17.857.1.10 setValue()

```
template<typename T , typename M , typename C >
virtual void SimulationControlGenericClass< T, M, C >::setValue (
            std::string value,
            bool remove = false )  [inline], [override], [virtual]
```

Implements SimulationControl.

17.857.1.11 supportsExistingObjectSelection()

```
template<typename T , typename M , typename C >
virtual bool SimulationControlGenericClass< T, M, C >::supportsExistingObjectSelection ( )
const  [inline], [override], [virtual]
```

Reimplemented from SimulationControl.

17.857.1.12 supportsInlineExpansion()

```
template<typename T , typename M , typename C >
virtual bool SimulationControlGenericClass< T, M, C >::supportsInlineExpansion ( ) const
[inline], [override], [virtual]
```

Reimplemented from SimulationControl.

17.857.1.13 supportsObjectCreation()

```
template<typename T , typename M , typename C >
virtual bool SimulationControlGenericClass< T, M, C >::supportsObjectCreation ( ) const  [inline],
[override], [virtual]
```

Reimplemented from SimulationControl.

17.858.1 Member Function Documentation

17.858.1.1 createObjectInstance()

```
template<typename T , typename M , typename C >
virtual bool SimulationControlGenericClassNotDC< T, M, C >::createObjectInstance (
            const std::string & value = "" )  [inline], [override], [virtual]
```

Reimplemented from SimulationControl.

17.858.1.2 ensureObjectInstance()

```
template<typename T , typename M , typename C >
virtual bool SimulationControlGenericClassNotDC< T, M, C >::ensureObjectInstance ( )  [inline],
[override], [virtual]
```

Reimplemented from SimulationControl.

17.858.1.3 getChildSimulationControls()

```
template<typename T , typename M , typename C >
virtual List< SimulationControl * > * SimulationControlGenericClassNotDC< T, M, C >::get↩
ChildSimulationControls (
            int index = 0 )  [inline], [override], [virtual]
```

Returns nested SimulationControls exposed by this control.
This is the kernel-facing API for traversing child controls belonging to inline objects, references, or list elements represented by a control.
Reimplemented from SimulationControl.

17.858.1.4 getValue()

```
template<typename T , typename M , typename C >
virtual std::string SimulationControlGenericClassNotDC< T, M, C >::getValue ( ) const  [inline],
[override], [virtual]
```

Implements SimulationResponse.

17.858.1.5 hasObjectInstance()

```
template<typename T , typename M , typename C >
virtual bool SimulationControlGenericClassNotDC< T, M, C >::hasObjectInstance ( ) const  [inline],
[override], [virtual]
```

Reimplemented from SimulationControl.

17.858.1.6 isInlineObjectProperty()

```
template<typename T , typename M , typename C >
virtual bool SimulationControlGenericClassNotDC< T, M, C >::isInlineObjectProperty ( ) const
[inline], [override], [virtual]
```

Reimplemented from SimulationControl.

17.858.1.7 setValue()

```
template<typename T , typename M , typename C >
virtual void SimulationControlGenericClassNotDC< T, M, C >::setValue (
            std::string value,
            bool remove = false )  [inline], [override], [virtual]
```

Implements SimulationControl.

17.858.1.8 supportsInlineExpansion()

```
template<typename T , typename M , typename C >
virtual bool SimulationControlGenericClassNotDC< T, M, C >::supportsInlineExpansion ( ) const
[inline], [override], [virtual]
```

Reimplemented from SimulationControl.

17.858.1.9 supportsObjectCreation()

```
template<typename T , typename M , typename C >
virtual bool SimulationControlGenericClassNotDC< T, M, C >::supportsObjectCreation ( ) const
[inline], [override], [virtual]
```

Reimplemented from SimulationControl.

The documentation for this class was generated from the following file:

- kernel/simulator/SimulationControlAndResponse.h

17.861.1 Member Function Documentation

17.861.1.1 createNewListElement()

```
template<typename T , typename M , typename C >
virtual bool SimulationControlGenericListPointer< T, M, C >::createNewListElement (
            const std::string & value = "" )  [inline], [override], [virtual]
```

Reimplemented from SimulationControl.

17.861.1.2 createNewListElementOfType()

```
template<typename T , typename M , typename C >
virtual bool SimulationControlGenericListPointer< T, M, C >::createNewListElementOfType (
            const std::string & typeName,
            const std::string & value = "" )  [inline], [override], [virtual]
```

Reimplemented from SimulationControl.

17.861.1.3 getChildSimulationControls()

```
template<typename T , typename M , typename C >
virtual List< SimulationControl * > * SimulationControlGenericListPointer< T, M, C >::get↩
ChildSimulationControls (
            int index = 0 )  [inline], [override], [virtual]
```

Returns nested SimulationControls exposed by this control.
This is the kernel-facing API for traversing child controls belonging to inline objects, references, or list elements represented by a control.
Reimplemented from SimulationControl.

17.861.1.4 getCreatableListElementTypes()

```
template<typename T , typename M , typename C >
virtual List< std::string > * SimulationControlGenericListPointer< T, M, C >::getCreatable↩
ListElementTypes ( )  [inline], [override], [virtual]
```

Reimplemented from SimulationControl.

17.861.1.5 getCurrentListElementType()

```
template<typename T , typename M , typename C >
virtual std::string SimulationControlGenericListPointer< T, M, C >::getCurrentListElementType
( ) const  [inline], [override], [virtual]
```

Reimplemented from SimulationControl.

17.861.1.6 getListElementModelDataDefinition()

```
template<typename T , typename M , typename C >
virtual ModelDataDefinition * SimulationControlGenericListPointer< T, M, C >::getListElement↩
ModelDataDefinition (
            int index ) const  [inline], [override], [virtual]
```

Reimplemented from SimulationControl.

17.861.1.7 getStrValues()

```
template<typename T , typename M , typename C >
virtual List< std::string > * SimulationControlGenericListPointer< T, M, C >::getStrValues (
)  [inline], [override], [virtual]
```

Reimplemented from SimulationResponse.

17.861.1.8 getValue()

```
template<typename T , typename M , typename C >
virtual std::string SimulationControlGenericListPointer< T, M, C >::getValue ( ) const  [inline],
[override], [virtual]
```

Implements SimulationResponse.

17.861.1.9 setCurrentListElementType()

```
template<typename T , typename M , typename C >
virtual bool SimulationControlGenericListPointer< T, M, C >::setCurrentListElementType (
            const std::string & typeName )  [inline], [override], [virtual]
```

Reimplemented from SimulationControl.

17.861.1.10 setValue()

```
template<typename T , typename M , typename C >
virtual void SimulationControlGenericListPointer< T, M, C >::setValue (
            std::string value,
            bool remove = false )  [inline], [override], [virtual]
```

Implements SimulationControl.

17.861.1.11 supportsListEditor()

```
template<typename T , typename M , typename C >
virtual bool SimulationControlGenericListPointer< T, M, C >::supportsListEditor ( ) const
[inline], [override], [virtual]
```

Reimplemented from SimulationControl.

17.861.1.12 supportsNewListElementCreation()

```
template<typename T , typename M , typename C >
virtual bool SimulationControlGenericListPointer< T, M, C >::supportsNewListElementCreation (
) const  [inline], [override], [virtual]
```

Reimplemented from SimulationControl.

17.862.1 Member Function Documentation

17.862.1.1 getValue()

```
virtual std::string SimulationControlInt::getValue ( ) const  [inline], [override], [virtual]
```

Implements SimulationResponse.

17.862.1.2 setValue()

```
virtual void SimulationControlInt::setValue (
            std::string value,
            bool remove = false )  [inline], [override], [virtual]
```

Implements SimulationControl.

The documentation for this class was generated from the following file:

- kernel/simulator/SimulationControlAndResponse.h

17.863 SimulationController Class Reference

Controller that validates simulation command readiness for MainWindow wrappers.

`#include <applications/gui/genesys/controllers/SimulationController.h>`

Public Member Functions

- SimulationController (QWidget *ownerWidget, Simulator *simulator)

  Creates a controller bound to GUI owner and simulator.
- bool hasCurrentModelSimulation () const

  Checks whether there is a valid current model with simulation object.
- ModelSimulation * currentSimulation () const

  Returns current simulation object when available.
- bool ensureReady (bool checkModel, bool modelChecked, const std::function< bool()> &runModelCheck, const std::function< bool()> &syncModelFromText) const

  Validates whether GUI can execute a simulation command now.

17.863.1 Detailed Description

Controller that validates simulation command readiness for MainWindow wrappers.

This controller is part of the incremental extraction that keeps MainWindow as a compatibility façade while moving simulation-command orchestration behind smaller collaborators. It centralizes precondition checks shared by start/step/pause/resume/stop flows, including model availability and model-text synchronization guards.

Responsibilities:

- verify that the current model and its ModelSimulation are available;
- execute callback-based readiness checks delegated by MainWindow;
- return a single command-ready decision used by higher-level command controllers.

Boundaries:

- it does not own simulation state or lifecycle (owned by Simulator);
- it does not execute GUI commands directly (handled by SimulationCommandController);
- it does not update widgets, tabs, or trace outputs.

Dependencies are injected narrowly (owner widget + simulator + callbacks) to preserve existing ownership and enable incremental compatibility without changing slot signatures.

17.863.2 Constructor & Destructor Documentation

17.863.2.1 SimulationController()

```
SimulationController::SimulationController (
            QWidget * ownerWidget,
            Simulator * simulator )
```

Creates a controller bound to GUI owner and simulator.

Parameters

ownerWidget	Widget used to show warning dialogs.
simulator	Simulator facade used by GUI.

17.863.3 Member Function Documentation

17.863.3.1 currentSimulation()

```
ModelSimulation * SimulationController::currentSimulation ( ) const
```

Returns current simulation object when available.

Returns

Pointer to current ModelSimulation or nullptr when unavailable.

17.863.3.2 ensureReady()

```
bool SimulationController::ensureReady (
            bool checkModel,
            bool modelChecked,
            const std::function< bool()> & runModelCheck,
            const std::function< bool()> & syncModelFromText ) const
```

Validates whether GUI can execute a simulation command now.

Validation pipeline: 1) Ensure current model/simulation exists; 2) Optionally execute model check callback when model is not checked yet; 3) Execute model synchronization callback (text -> model) and ensure simulation still exists.

Parameters

checkModel	If true, model-check callback may be executed.
modelChecked	Indicates current model check state from MainWindow.
runModelCheck	Callback that executes model check when needed.
syncModelFromText	Callback that synchronizes textual model representation.

Returns

true if command can proceed safely.

Todo Replace callback-based contract by dedicated interfaces to improve testability.

17.863.3.3 hasCurrentModelSimulation()

```
bool SimulationController::hasCurrentModelSimulation ( ) const
```

Checks whether there is a valid current model with simulation object.

Returns

true when simulation commands can access `current()->getSimulation()` safely.

Friends

- class **ModelSimulation**

17.869.1 Detailed Description

Stores an event that happened on a specific replication

The documentation for this class was generated from the following file:

- kernel/simulator/OnEventManager.h

17.870 SimulationEventController Class Reference

Controller for simulation event callbacks, UI updates, and handler wiring.
`#include <applications/gui/genesys/controllers/SimulationEventController.h>`

Classes

- struct Callbacks

Public Member Functions

- **SimulationEventController** (Simulator *simulator, ModelGraphicsScene *scene, ModelGraphicsView *graphicsView, QLabel *replicationLabel, QProgressBar *simulationProgressBar, QTableWidget *simulationEventsTable, QTableWidget *entitiesTable, QTableWidget *variablesTable, QTextEdit *simulationText, QTextEdit *reportsText, QTabWidget *centralTabWidget, QAction *activateGraphicalSimulation, QAction *animationEnabledAction, bool *modelChecked, int tabCentralReportsIndex, Callbacks callbacks)

  Creates the simulation-event bridge used by MainWindow compatibility handlers.
- void **onModelCheckSuccessHandler** (ModelEvent *re) const

  Handles model-check success and updates delegated GUI state.
- void **onReplicationStartHandler** (SimulationEvent *re) const

  Handles replication-start event and updates simulation/report panes.
- void **onSimulationStartHandler** (SimulationEvent *re) const

  Handles simulation-start event and resets run-scoped UI state.
- void **onSimulationPausedHandler** (SimulationEvent *re) const

  Handles simulation pause event and refreshes action availability.
- void **onSimulationResumeHandler** (SimulationEvent *re) const

  Handles simulation resume event and resumes graphical simulation synchronization.
- void **onSimulationEndHandler** (SimulationEvent *re) const

  Handles simulation end event and performs delegated cleanup/refresh.
- void **onReplicationEndHandler** (SimulationEvent *re) const

  Handles replication end event and forces progress display completion.
- void **onProcessEventHandler** (SimulationEvent *re) const

  Handles process-event updates for progress tables and scene refresh hooks.
- void **onEntityCreateHandler** (SimulationEvent *re) const

  Handles entity-create events for compatibility callback wiring.
- void **onEntityRemoveHandler** (SimulationEvent *re) const

  Handles entity-remove events for compatibility callback wiring.
- void **onMoveEntityEvent** (SimulationEvent *re) const

  Handles entity-move event updates used by graphical simulation animation.
- void **onAfterProcessEvent** (SimulationEvent *re) const

  Handles after-process event updates used by animation/frame synchronization.
- void **setOnEventHandlers** (MainWindow *owner) const

  Registers kernel on-event callbacks through MainWindow compatibility façade wrappers.

17.870.1 Detailed Description

Controller for simulation event callbacks, UI updates, and handler wiring.
This controller concentrates event-reaction logic previously embedded in MainWindow and keeps compatibility by exposing methods invoked from MainWindow wrappers. It also provides the event-registration entry point used to wire kernel OnEventManager callbacks to those wrappers without changing the existing signal/slot surface.
Responsibilities:

- react to model-check, replication, simulation, process, and entity events;
- update progress/status widgets and debug tables through injected UI dependencies;

- trigger delegated refresh callbacks for actions, debug panes, and scene synchronization;
- register handlers through MainWindow compatibility façade ownership.

Boundaries:

- it does not own MainWindow or widget lifetime;
- it does not execute simulation commands (handled by command controllers);
- it does not perform persistence/export/model-language synchronization.

The documentation for this class was generated from the following files:

- applications/gui/genesys/controllers/SimulationEventController.h
- applications/gui/genesys/controllers/SimulationEventController.cpp

17.871 SimulationExperiment Class Reference

Represents a higher-level simulation experiment definition.
`#include <kernel/simulator/SimulationExperiment.h>`

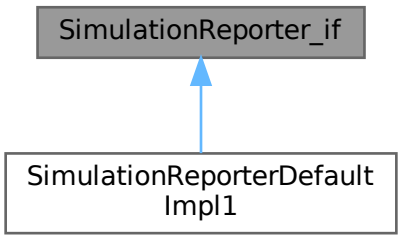
17.871.1 Detailed Description

Represents a higher-level simulation experiment definition.
Historically, GenESyS started with experiment control concentrated in ModelSimulation, mainly through replication count and replication length.
SimulationExperiment was introduced later as part of an unfinished effort to move richer experiment-design concepts into the simulation kernel, including experiment sets, scenarios and Process Analyzer-like workflows.
This class is still under development and should currently be treated as a placeholder for future experiment-layer behavior.
The documentation for this class was generated from the following files:

- kernel/simulator/SimulationExperiment.h
- kernel/simulator/SimulationExperiment.cpp

17.872 SimulationReporter_if Class Reference

Interface for reporting simulation results and experiment-facing outputs.
`#include <kernel/simulator/SimulationReporter_if.h>`
Inheritance diagram for SimulationReporter_if:



Public Member Functions

- virtual void showReplicationStatistics ()=0

  showReplicationStatistics
- virtual void showSimulationStatistics ()=0

  showSimulationStatistics
- virtual void showSimulationResponses ()=0

  showSimulationResponses
- virtual void showSimulationControls ()=0

  showSimulationControls

17.872.1 Detailed Description

Interface for reporting simulation results and experiment-facing outputs.
Reporter implementations define how replication/simulation summaries, responses and controls are presented to users or external consumers.

17.872.2 Member Function Documentation

17.872.2.1 showReplicationStatistics()

```
virtual void SimulationReporter_if::showReplicationStatistics ( )  [pure virtual]
```

showReplicationStatistics
Shows detailed statistics for the current/finished replication.
Implemented in SimulationReporterDefaultImpl1.

17.872.2.2 showSimulationControls()

```
virtual void SimulationReporter_if::showSimulationControls ( )  [pure virtual]
```

showSimulationControls
Shows monitored/configurable simulation controls (inputs).
Implemented in SimulationReporterDefaultImpl1.

17.872.2.3 showSimulationResponses()

```
virtual void SimulationReporter_if::showSimulationResponses ( )  [pure virtual]
```

showSimulationResponses
Shows configured simulation responses (outputs) for experimental analysis.
Implemented in SimulationReporterDefaultImpl1.

17.872.2.4 showSimulationStatistics()

```
virtual void SimulationReporter_if::showSimulationStatistics ( )  [pure virtual]
```

showSimulationStatistics
Shows aggregated statistics for the full simulation.
Implemented in SimulationReporterDefaultImpl1.
The documentation for this class was generated from the following file:

- kernel/simulator/SimulationReporter_if.h

17.873 SimulationReporterDefaultImpl1 Class Reference

```
#include <kernel/simulator/SimulationReporterDefaultImpl1.h>
```

17.873.1 Detailed Description

Class that implements SimulationReporter_if interface and is responsible for building and showing replication and simulation reports

17.873.2 Member Function Documentation

17.873.2.1 showReplicationStatistics()

```
void SimulationReporterDefaultImpl1::showReplicationStatistics ( )  [override], [virtual]
```

showReplicationStatistics
Shows detailed statistics for the current/finished replication.
Implements SimulationReporter_if.

17.873.2.2 showSimulationControls()

```
void SimulationReporterDefaultImpl1::showSimulationControls ( )  [override], [virtual]
```

showSimulationControls
Shows monitored/configurable simulation controls (inputs).
Implements SimulationReporter_if.

17.873.2.3 showSimulationResponses()

```
void SimulationReporterDefaultImpl1::showSimulationResponses ( )  [override], [virtual]
```

showSimulationResponses
Shows configured simulation responses (outputs) for experimental analysis.
Implements SimulationReporter_if.

17.873.2.4 showSimulationStatistics()

```
void SimulationReporterDefaultImpl1::showSimulationStatistics ( )  [override], [virtual]
```

showSimulationStatistics
Shows aggregated statistics for the full simulation.
Implements SimulationReporter_if.
The documentation for this class was generated from the following files:

- kernel/simulator/SimulationReporterDefaultImpl1.h
- kernel/simulator/SimulationReporterDefaultImpl1.cpp

17.874 SimulationResponse Class Reference

Read-only kernel-side simulation response abstraction.
`#include <kernel/simulator/SimulationControlAndResponse.h>`

17.875.1 Member Function Documentation

17.875.1.1 getValue()

```
virtual std::string SimulationResponseDouble::getValue ( ) const  [inline], [override], [virtual]
```

Implements SimulationResponse.

The documentation for this class was generated from the following file:

- kernel/simulator/SimulationControlAndResponse.h

17.876 SimulationResultsDataset Struct Reference

Public Member Functions

- std::string formatKindName () const
- bool isRecordFormat () const
- std::vector< double > values () const
- std::vector< unsigned int > replications () const
- std::vector< double > valuesForReplication (unsigned int replication) const

Public Attributes

- std::string **datasetName**
- std::string **randomVariableName**
- std::string **description**
- std::string **variableType** = "Continuous numeric"
- std::string **source**
- std::string **sourceDescription**
- std::string **expression**
- std::string **expressionName**
- std::string **formatVersion**
- SimulationResultsDatasetFormat **formatKind** = SimulationResultsDatasetFormat::Unknown
- bool **recordFile** = false
- bool **timeDependent** = false
- std::vector< SimulationResultsObservation > **observations**
- std::vector< std::string > **previewLines**

17.876.1 Member Function Documentation

17.876.1.1 formatKindName()

```
std::string SimulationResultsDataset::formatKindName ( ) const
```

Returns the display name for the detected dataset format.

17.876.1.2 isRecordFormat()

```
bool SimulationResultsDataset::isRecordFormat ( ) const
```

Returns true when this dataset was imported from a Genesys Record file.

17.876.1.3 replications()

```
std::vector< unsigned int > SimulationResultsDataset::replications ( ) const
```

Returns the distinct replication identifiers present in the observations.

17.876.1.4 values()

```
std::vector< double > SimulationResultsDataset::values ( ) const
```

Returns the observation values without replication or time metadata.

17.876.1.5 valuesForReplication()

```
std::vector< double > SimulationResultsDataset::valuesForReplication (
            unsigned int replication ) const
```

Returns all observation values for a single replication.
The documentation for this struct was generated from the following files:

- tools/Statistics/SimulationResultsDataset.h
- tools/Statistics/SimulationResultsDataset.cpp

17.877 SimulationResultsDatasetParser Class Reference

Static Public Member Functions

- static bool loadFromTextFile (const std::string &fileName, SimulationResultsDataset *dataset, std::string *errorMessage=nullptr)

17.877.1 Member Function Documentation

17.877.1.1 loadFromTextFile()

```
bool SimulationResultsDatasetParser::loadFromTextFile (
            const std::string & fileName,
            SimulationResultsDataset * dataset,
            std::string * errorMessage = nullptr )  [static]
```

Loads a simulation-results dataset from a text file.
The parser intentionally detects formats in this order: GUI tabular, Genesys Record, then raw numeric. Once a format is detected, no residual heuristic reinterprets the same file as another format.
The documentation for this class was generated from the following files:

- tools/Statistics/SimulationResultsDataset.h
- tools/Statistics/SimulationResultsDataset.cpp

17.878 SimulationResultsObservation Struct Reference

Public Attributes

- unsigned int **replication** = 1
- double **time** = 0.0
- bool **hasTime** = false
- double **value** = 0.0
- unsigned int **sourceLine** = 0

The documentation for this struct was generated from the following file:

- tools/Statistics/SimulationResultsDataset.h

17.879 SimulationScenario Class Reference

Represents a candidate simulation scenario within the unfinished experiment layer.
`#include <kernel/simulator/SimulationScenario.h>`

Public Member Functions

- bool **startSimulation** (Simulator *sim, std::string &errorMessage)
- std::list< std::pair< std::string, double > * > * getResponseValues () const
- std::list< std::pair< std::string, double > * > * **getControlValues** () const
- double **getResponseValue** (const std::string &responseName)
- void **setModelFilename** (std::string _modelFilename)
- std::string **getModelFilename** () const
- void **setScenarioName** (std::string _name)
- std::string **getScenarioName** () const
- void **setScenarioDescription** (std::string _scenarioDescription)
- std::string **getScenarioDescription** () const
- std::list< std::string > * **getSelectedControls** () const
- double **getControlValue** (const std::string &controlName)
- std::list< std::string > * **getSelectedResponses** () const
- void **setSelectedControls** (std::list< std::string > *selectedControls)
- void **setControl** (std::string name, double value) const

17.879.1 Detailed Description

Represents a candidate simulation scenario within the unfinished experiment layer.
Represents a scenario where a specific model (defined my ModelFilename) will be simulated. To each scenario will be associated a set of SimulationControl and SimulationResponse, and their values are set to the scenario by the ProcessAnalyser.
The original GenESyS execution flow relied on ModelSimulation for the basic experimental controls already supported by the kernel.
SimulationScenario was introduced later to support richer scenario-based experimentation, potentially including alternative models, modified controls and future Process Analyzer-like workflows.
This class is still under development and should currently be treated as an evolving kernel-side abstraction for experiment scenarios.

17.879.2 Member Function Documentation

17.879.2.1 getResponseValues()

```
std::list< std::pair< std::string, double > * > * SimulationScenario::getResponseValues ( )
const
```

The final result of the simulationScenario
The documentation for this class was generated from the following files:

- kernel/simulator/SimulationScenario.h
- kernel/simulator/SimulationScenario.cpp

17.880 SimulatorSessionService::SimulationStatusResult Struct Reference

Captures the current simulation execution state.
`#include <applications/worker/service/SimulatorSessionService.h>`

Public Attributes

Static Public Member Functions

- static std::string **traceConvertEnumToStr** (TraceManager::Level level)

17.882.1 Detailed Description

High-level non-owning facade over Simulator and its main composed services.
Construct with a non-owning pointer to an existing Simulator instance. All public methods delegate through the private helpers; none of those helpers are exposed publicly.
The documentation for this class was generated from the following file:

- kernel/simulator/SimulatorFacade.h

17.883 SimulatorSessionService::SimulatorInfoResult Struct Reference

Describes simulator identity metadata for a token-scoped session.
`#include <applications/worker/service/SimulatorSessionService.h>`

Public Attributes

- std::string **name**
- std::string **versionName**
- unsigned int **versionNumber**

17.883.1 Detailed Description

Describes simulator identity metadata for a token-scoped session.
The documentation for this struct was generated from the following file:

- applications/worker/service/SimulatorSessionService.h

17.884 SimulatorSessionService Class Reference

Encapsulates session-scoped simulator operations exposed by the Web API.
`#include <applications/worker/service/SimulatorSessionService.h>`

Classes

- struct CreateSessionResult

  Contains session creation identifiers returned to API clients.
- struct ModelImportResult

  Contains model import output and error state.
- struct ModelInfoResult

  Describes the currently active model information for a session.
- struct ModelPersistenceResult

  Contains save/load model operation output and error state.

- struct SimulationActionResult

  Contains the result of a simulation action such as run or step.
- struct SimulationConfigInput

  Defines user-provided simulation parameters to apply to the current model.
- struct SimulationConfigResult

  Contains the result of applying simulation configuration.
- struct SimulationStatusResult

  Captures the current simulation execution state.
- struct SimulatorInfoResult

  Describes simulator identity metadata for a token-scoped session.
- struct WorkerCapabilitiesResult

  Describes currently supported worker features.
- struct WorkerInfoResult

  Describes worker identity metadata for distributed discovery.
- struct WorkerJobCreationResult

  Contains worker job creation output and error state.
- struct WorkerJobInfoResult

  Describes worker job metadata exposed by worker stage 3 endpoints.
- struct WorkerJobQueryResult

  Contains worker job lookup output and error state.
- struct WorkerJobResultInfo

  Describes terminal worker job result data exposed by worker stage 5 endpoint.
- struct WorkerJobResultQueryResult

  Contains worker job terminal result lookup output and error state.
- struct WorkerJobRunResult

  Contains worker job run output and error state.

Public Types

- enum class PersistenceError {
  None , **InvalidToken** , **InvalidFilename** , **MissingCurrentModel** ,
  FileNotFound , **OperationFailed** }

  Enumerates persistence-specific errors for save/load model operations.
- enum class ModelImportError {
  None , **InvalidToken** , **EmptySpecification** , **InvalidSpecification** ,
  OperationFailed }

  Enumerates model import errors for worker language-ingress operations.
- enum class WorkerJobError {
  None , **InvalidToken** , **MissingCurrentModel** , **JobNotFound** ,
  AccessDenied , **OperationFailed** , **ResultNotReady** }

  Enumerates worker job operation errors.

Public Member Functions

- SimulatorSessionService (SessionManager &sessionManager, WorkerJobManager &workerJobManager)

  Builds a service bound to the provided session manager.
- CreateSessionResult createSession ()

  Creates a new authenticated session.
- bool tryGetSimulatorInfo (const std::string &accessToken, SimulatorInfoResult &outInfo)

  Fetches simulator metadata using a session token.
- WorkerInfoResult getWorkerInfo () const

  Fetches public worker identity metadata.
- WorkerCapabilitiesResult getWorkerCapabilities () const

Fetches worker capability flags for the current implementation state.

- bool tryCreateModel (const std::string &accessToken, ModelInfoResult &outInfo)

  Creates a new model in the token-scoped simulator session.
- bool tryGetCurrentModelInfo (const std::string &accessToken, ModelInfoResult &outInfo)

  Returns metadata for the current model in a session.
- SimulationStatusResult getSimulationStatus (const std::string &accessToken)

  Returns simulation status for the session's current model.
- SimulationConfigResult configureSimulation (const std::string &accessToken, const SimulationConfigInput &input)

  Applies simulation configuration to the current model.
- SimulationActionResult runSimulation (const std::string &accessToken)

  Executes a synchronous simulation run.
- SimulationActionResult stepSimulation (const std::string &accessToken)

  Executes one synchronous simulation step.
- ModelPersistenceResult saveCurrentModel (const std::string &accessToken, const std::string &filename)

  Saves the current model into the session workspace.
- ModelPersistenceResult loadModel (const std::string &accessToken, const std::string &filename)

  Loads a model from the session workspace by filename.
- ModelImportResult importModelFromLanguage (const std::string &accessToken, const std::string &model↩ Specification)

  Imports a model from plain text model language into the token-scoped session.
- WorkerJobCreationResult createWorkerJob (const std::string &accessToken)

  Creates a queued worker job for the token-scoped session model snapshot.
- WorkerJobQueryResult getWorkerJob (const std::string &accessToken, const std::string &jobId)

  Returns worker job metadata for a token-scoped session.
- WorkerJobRunResult runWorkerJob (const std::string &accessToken, const std::string &jobId)

  Executes a worker job synchronously in the token-scoped simulator session.
- WorkerJobResultQueryResult getWorkerJobResult (const std::string &accessToken, const std::string &jobId)

  Returns persisted terminal result data for a token-scoped worker job.

17.884.1 Detailed Description

Encapsulates session-scoped simulator operations exposed by the Web API.

17.884.2 Constructor & Destructor Documentation

17.884.2.1 SimulatorSessionService()

```
SimulatorSessionService::SimulatorSessionService (
            SessionManager & sessionManager,
            WorkerJobManager & workerJobManager )  [explicit]
```

Builds a service bound to the provided session manager.
Wires session lookup with per-session worker job storage.

Parameters

sessionManager	Session manager used to resolve active sessions.
workerJobManager	In-memory worker job storage manager.

17.884.3 Member Function Documentation

17.884.3.1 configureSimulation()

```
SimulatorSessionService::SimulationConfigResult SimulatorSessionService::configureSimulation (
            const std::string & accessToken,
            const SimulationConfigInput & input )
```

Applies simulation configuration to the current model.
Applies user-provided simulation parameters to the current model.

Parameters

accessToken	Bearer token associated with a session.
input	Configuration values to apply.

Returns

Structured configuration result and resulting status.

17.884.3.2 createSession()

```
SimulatorSessionService::CreateSessionResult SimulatorSessionService::createSession ( )
```

Creates a new authenticated session.
Creates one authenticated session and returns its public identifiers.

Returns

Session identifiers and token for API usage.

17.884.3.3 createWorkerJob()

```
SimulatorSessionService::WorkerJobCreationResult SimulatorSessionService::createWorkerJob (
            const std::string & accessToken )
```

Creates a queued worker job for the token-scoped session model snapshot.
Creates a queued worker job by snapshotting the current model.

Parameters

accessToken	Bearer token associated with a session.

Returns

Worker job creation output and error state.

17.884.3.4 getSimulationStatus()

```
SimulatorSessionService::SimulationStatusResult SimulatorSessionService::getSimulationStatus (
            const std::string & accessToken )
```

Returns simulation status for the session's current model.
Returns the current simulation status for a session token.

Parameters

accessToken	Bearer token associated with a session.

Returns

Structured simulation status query result.

17.884.3.5 getWorkerCapabilities()

```
SimulatorSessionService::WorkerCapabilitiesResult SimulatorSessionService::getWorkerCapabilities
( ) const
```

Fetches worker capability flags for the current implementation state.
Advertises the runtime capabilities supported by this worker flavor.

Returns

Worker capability flags.

17.884.3.6 getWorkerInfo()

```
SimulatorSessionService::WorkerInfoResult SimulatorSessionService::getWorkerInfo ( ) const
```

Fetches public worker identity metadata.
Returns the fixed worker identity metadata used for discovery.

Returns

Worker identity information for discovery endpoints.

17.884.3.7 getWorkerJob()

```
SimulatorSessionService::WorkerJobQueryResult SimulatorSessionService::getWorkerJob (
            const std::string & accessToken,
            const std::string & jobId )
```

Returns worker job metadata for a token-scoped session.
Retrieves worker-job metadata when the job belongs to the session.

Parameters

accessToken	Bearer token associated with a session.
jobId	Worker job identifier to query.

Returns

Worker job lookup output and error state.

17.884.3.8 getWorkerJobResult()

```
SimulatorSessionService::WorkerJobResultQueryResult SimulatorSessionService::getWorkerJob↩
Result (
            const std::string & accessToken,
            const std::string & jobId )
```

Returns persisted terminal result data for a token-scoped worker job.
Retrieves the terminal result for a completed worker job.

Parameters

accessToken	Bearer token associated with a session.
jobId	Worker job identifier to query.

Returns

Worker job terminal result lookup output and error state.

17.884.3.9 importModelFromLanguage()

```
SimulatorSessionService::ModelImportResult SimulatorSessionService::importModelFromLanguage (
            const std::string & accessToken,
            const std::string & modelSpecification )
```

Imports a model from plain text model language into the token-scoped session.
Imports a model from textual Genesys language.

Parameters

accessToken	Bearer token associated with a session.
modelSpecification	Plain text model language content.

Returns

Import output and error state.

17.884.3.10 loadModel()

```
SimulatorSessionService::ModelPersistenceResult SimulatorSessionService::loadModel (
            const std::string & accessToken,
            const std::string & filename )
```

Loads a model from the session workspace by filename.
Loads a saved model file from the session workspace.

Parameters

accessToken	Bearer token associated with a session.
filename	Safe basename to load.

Returns

Persistence output and error state.

17.884.3.11 runSimulation()

```
SimulatorSessionService::SimulationActionResult SimulatorSessionService::runSimulation (
            const std::string & accessToken )
```

Executes a synchronous simulation run.
Starts the current simulation for the token-scoped session.

Parameters

accessToken	Bearer token associated with a session.

Returns

Structured action result and updated simulation status.

17.884.3.12 runWorkerJob()

```
SimulatorSessionService::WorkerJobRunResult SimulatorSessionService::runWorkerJob (
```

```
            const std::string & accessToken,
            const std::string & jobId )
```

Executes a worker job synchronously in the token-scoped simulator session.
Executes a queued worker job synchronously from its stored snapshot.

Parameters

accessToken	Bearer token associated with a session.
jobId	Worker job identifier to execute.

Returns

Worker job run output and error state.

17.884.3.13 saveCurrentModel()

```
SimulatorSessionService::ModelPersistenceResult SimulatorSessionService::saveCurrentModel (
            const std::string & accessToken,
            const std::string & filename )
```

Saves the current model into the session workspace.
Persists the current model into the session workspace.

Parameters

accessToken	Bearer token associated with a session.
filename	Safe basename to use for persistence.

Returns

Persistence output and error state.

17.884.3.14 stepSimulation()

```
SimulatorSessionService::SimulationActionResult SimulatorSessionService::stepSimulation (
            const std::string & accessToken )
```

Executes one synchronous simulation step.
Advances the current simulation by one step.

Parameters

accessToken	Bearer token associated with a session.

Returns

Structured action result and updated simulation status.

17.884.3.15 tryCreateModel()

```
bool SimulatorSessionService::tryCreateModel (
            const std::string & accessToken,
            ModelInfoResult & outInfo )
```

Creates a new model in the token-scoped simulator session.
Creates a new kernel model in the current session.

Parameters

accessToken	Bearer token associated with a session.
outInfo	Receives model information on success.

Returns

True when the model was created and output was populated.

17.884.3.16 tryGetCurrentModelInfo()

```
bool SimulatorSessionService::tryGetCurrentModelInfo (
            const std::string & accessToken,
            ModelInfoResult & outInfo )
```

Returns metadata for the current model in a session.
Returns metadata for the current model if one exists.

Parameters

accessToken	Bearer token associated with a session.
outInfo	Receives current model data.

Returns

True when token is valid and query completed.

17.884.3.17 tryGetSimulatorInfo()

```
bool SimulatorSessionService::tryGetSimulatorInfo (
            const std::string & accessToken,
            SimulatorInfoResult & outInfo )
```

Fetches simulator metadata using a session token.
Resolves the simulator metadata visible to a session token.

Parameters

accessToken	Bearer token associated with a session.
outInfo	Receives simulator identity information on success.

Returns

True when token is valid and metadata was populated.

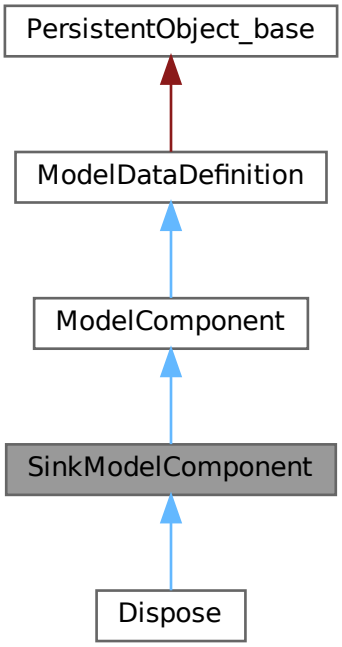
The documentation for this class was generated from the following files:

- applications/worker/service/SimulatorSessionService.h
- applications/worker/service/SimulatorSessionService.cpp

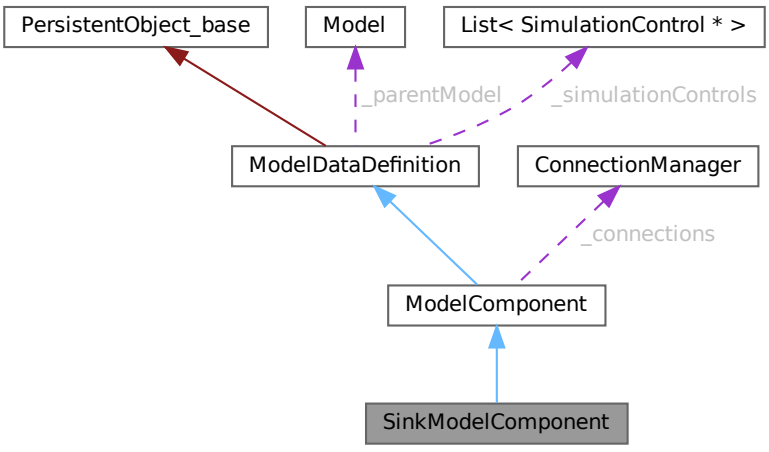
17.885 SinkModelComponent Class Reference

```
#include <kernel/simulator/SinkModelComponent.h>
```

Inheritance diagram for SinkModelComponent:



Collaboration diagram for SinkModelComponent:



Public Member Functions

- **SinkModelComponent** (Model *model, std::string componentTypename, std::string name="")

Public Member Functions inherited from ModelComponent

- ModelComponent (Model *model, std::string componentTypename, std::string name="")

  constructors
- virtual ~**ModelComponent** ()

  Releases component-owned resources and unregisters it from the model.
- ConnectionManager * getConnectionManager () const

  new public user methods for this component
- void connectTo (ModelComponent *component, unsigned int inputPortNumber=0)

  Connects this component to another component.
- bool hasBreakpointAt ()

  Indicates whether a simulation breakpoint is set on this component.
- void setDescription (std::string _description)

  Updates the free-form description shown by the GUI.
- std::string getDescription () const

  Returns the free-form description associated with this component.
- void remove (ModelComponent *comp)

  Removes a connected component from this component.
- virtual std::string show () override

  virtual public methods

Public Member Functions inherited from ModelDataDefinition

- ModelDataDefinition (Model *model, std::string datadefinitionTypename, std::string name="", bool insert↩ IntoModel=true)

  Creates a model data definition and optionally inserts it into the model.
- virtual ~**ModelDataDefinition** ()

  Releases resources owned by this data definition.
- Util::identification getId () const

  Returns the unique identifier of this instance.
- void setName (const std::string &name)

  Updates the logical name of this instance.
- const std::string & getName () const

  Returns the logical name of this instance.
- void setLabel (const std::string &label)

  Updates the user-visible label of this instance.
- const std::string & getLabel () const

  Returns the user-visible label of this instance.
- const std::string & getClassname () const

  Returns the runtime class name used by the plugin system.
- Model * getParentModel () const

  Returns the parent model that owns this definition.
- bool isReportStatistics () const

  Indicates whether this data definition contributes report statistics.
- void setReportStatistics (bool reportStatistics)

  Enables or disables report-statistics generation for this definition.
- ModelDataDefinition * getInternalData (const std::string &name) const

  Looks up a named internal child data definition.
- std::map< std::string, ModelDataDefinition * > * getInternalData () const

  Returns the full map of internal child data definitions.
- std::map< std::string, ModelDataDefinition * > * getAttachedData () const

  Returns the full map of attached data definitions.

- bool hasChanged () const

  Indicates whether this instance has been modified since the last reset.
- void setHasChanged (bool hasChanged)

  Updates the changed flag for this data definition.
- unsigned int getLevel () const

  Returns the hierarchical editing context containing this element.
- void setModelLevel (unsigned int _modelLevel)

  Sets this element's hierarchical editing context.
- List< SimulationControl * > * getSimulationControls () const

  Returns the simulation controls owned by this data definition.
- TraceManager::Level getTraceLevelSpecific () const

  Returns the trace level that applies specifically to this definition.
- void setTraceLevelSpecific (TraceManager::Level level)

  Updates the trace level used by this definition.
- void defineTraceLevelSpecific (TraceManager::Level traceLevelspecific, bool traceLevelSpecific↩ Enabled=true)

  Defines the specific trace level and optionally enables it immediately.
- bool isTraceLevelSpecificEnabled () const

  Indicates whether the specific trace level is enabled.
- void setTraceLevelSpecificEnabled (bool traceLevelSpecificEnabled)

  Enables or disables the specific trace level.

Protected Member Functions

- virtual bool _loadInstance (PersistenceRecord *fields) override

  virtual protected method that must be overriden
- virtual void _saveInstance (PersistenceRecord *fields, bool saveDefaultValues) override

  Saves object fields into a serialization structure.
- virtual bool _check (std::string &errorMessage) override

  could be overriden by derived classes

Protected Member Functions inherited from ModelComponent

- virtual void _onDispatchEvent (Entity *entity, unsigned int inputPortNumber)=0

  Handles a dispatched event for this component type.

Protected Member Functions inherited from ModelDataDefinition

- bool _getSaveDefaultsOption ()
- virtual ParserChangesInformation * _getParserChangesInformation ()
- virtual void _initBetweenReplications ()
- virtual void _addSimulationControl (SimulationControl *control)

- void **_optionalNonEditableDataDefinitionRemove** (const std::string &key)
- void **_optionalNonEditableDataDefinitionsClear** ()
- void **_checkCreateAttachedReferencedDataDefinition** (const std::string &expression)

  method to be called to insert attached dataelements that are referenced by string expressions (detected by the parser), to avoid orphaned data definitions
- void **trace** (const std::string &text, TraceManager::Level level=TraceManager::Level::L8_detailed)

  not just an easy access to trace manager, but wrappers to check if specific trace level applies
- void **traceError** (const std::string &text, const std::exception &e)
- void **traceError** (const std::string &text, TraceManager::Level level=TraceManager::Level::L1_errorFatal)
- void **traceReport** (const std::string &text, TraceManager::Level level=TraceManager::Level::L2_results)
- void **traceSimulation** (void *thisobject, double time, Entity *entity, ModelComponent *component, const std::string &text, TraceManager::Level level=TraceManager::Level::L8_detailed)
- void traceSimulation (void *thisobject, const std::string &text, TraceManager::Level level=TraceManager::↩ Level::L8_detailed)

  Traces text to the simulation output.
- void **traceSimulation** (void *thisobject, TraceManager::Level level, const std::string &text)

Additional Inherited Members

Static Public Member Functions inherited from ModelComponent

- static ModelComponent * LoadInstance (Model *model, PersistenceRecord *fields)

  static public methods that must have implementations (Load and New just the same. GetInformation must provide specific infos for the new component
- static bool Check (ModelComponent *component)

  Validates a component instance.
- static void CreateInternalData (ModelComponent *component)

  Creates internal data required by a component instance.
- static void SaveInstance (PersistenceRecord *fields, ModelComponent *component)

  Serializes a component instance into a persistence record.
- static void DispatchEvent (Event *event)

  Dispatches a simulation event to the target component.

Static Public Member Functions inherited from ModelDataDefinition

- static ModelDataDefinition * LoadInstance (Model *model, PersistenceRecord *fields, bool insertIntoModel)

  Loads a model data definition instance from serialized fields.
- static ModelDataDefinition * NewInstance (Model *model, std::string name="")

  Creates a new instance of a data definition using the plugin registry.
- static void SaveInstance (PersistenceRecord *fields, ModelDataDefinition *modeldatum)

  Serializes a data definition instance into a persistence record.
- static bool Check (ModelDataDefinition *modeldatum, std::string &errorMessage)

  Validates a data definition instance.
- static void InitBetweenReplications (ModelDataDefinition *modeldatum)

  Resets simulation-time state between replications.
- static void CreateInternalData (ModelDataDefinition *modeldatum)

  Creates internal and attached data required by this instance.
- static bool CreateRelatedDataElements (ModelDataDefinition *modeldatum, std::string &errorMessage)

  Creates related data and validates the instance in a single call.

Protected Attributes inherited from ModelComponent

- ConnectionManager * _connections = new ConnectionManager()

  virtual protected methods that could be overriden by derived classes, if needed

Protected Attributes inherited from ModelDataDefinition

- Util::identification **_id**
- std::string **_typename**
- bool **_reportStatistics**
- bool **_hasChanged**
- unsigned int **_modelLevel** = 0
- Model * **_parentModel**
- List< SimulationControl * > * **_simulationControls** = new List<SimulationControl*>()
- TraceManager::Level **_traceLevelSpecific**
- bool **_traceLevelSpecificEnabled** = false

17.885.1 Detailed Description

This class is the basis for any component representing the end of a process flow, such as a Dispose. It can remove entities from the system and collect statistics.

17.885.2 Member Function Documentation

17.885.2.1 _check()

```
bool SinkModelComponent::_check (
            std::string & errorMessage )  [override], [protected], [virtual]
```

could be overriden by derived classes
Reimplemented from ModelDataDefinition.
Reimplemented in Dispose.

17.885.2.2 _loadInstance()

```
bool SinkModelComponent::_loadInstance (
            PersistenceRecord * fields )  [override], [protected], [virtual]
```

virtual protected method that must be overriden
Reimplemented from ModelComponent.
Reimplemented in Dispose.

17.885.2.3 _saveInstance()

```
void SinkModelComponent::_saveInstance (
            PersistenceRecord * fields,
            bool saveDefaultValues )  [override], [protected], [virtual]
```

Saves object fields into a serialization structure.

Parameters

fields	a table-like structure used for serialization.
saveDefaultValues	indicates whether or not to save fields which are set to their default value.

Reimplemented from ModelComponent.
Reimplemented in Dispose.
The documentation for this class was generated from the following files:

- kernel/simulator/SinkModelComponent.h
- kernel/simulator/SinkModelComponent.cpp

17.886 yy::genesyspp_parser::stack< T, S >::slice Class Reference

Present a slice of the top of a stack.
`#include <parser/GenesysParser.h>`

Public Member Functions

- **slice** (const stack &stack, index_type range) YY_NOEXCEPT
- const T & **operator[ ]** (index_type i) const

17.886.1 Detailed Description

template<typename T, typename S = std::vector<T>>
class yy::genesyspp_parser::stack< T, S >::slice

Present a slice of the top of a stack.
The documentation for this class was generated from the following file:

- parser/GenesysParser.h

17.912.1 Member Function Documentation

17.912.1.1 main()

```
int Smart_DefiningAttributesAsStrings::main (
            int argc,
            char ** argv )  [override], [virtual]
```

This is the main function of the application. It instanciates the simulator, builds a simulation model and then simulate that model.
Reimplemented from BaseGenesysTerminalApplication.
The documentation for this class was generated from the following files:

- applications/modelSpecific/arenaSmarts/Smart_DefiningAttributesAsStrings.h
- applications/modelSpecific/arenaSmarts/Smart_DefiningAttributesAsStrings.cpp

17.938.1.8 onReplicationStartHandler()

```
void Smart_OnEvent::onReplicationStartHandler (
            SimulationEvent * re )  [override], [virtual]
```

Reimplemented from BaseGenesysTerminalApplication.

17.938.1.9 onReplicationStepHandler()

```
void Smart_OnEvent::onReplicationStepHandler (
            SimulationEvent * re )  [override], [virtual]
```

Reimplemented from BaseGenesysTerminalApplication.

17.938.1.10 onSimulationEndHandler()

```
void Smart_OnEvent::onSimulationEndHandler (
            SimulationEvent * re )  [override], [virtual]
```

Reimplemented from BaseGenesysTerminalApplication.

17.938.1.11 onSimulationPausedHandler()

```
void Smart_OnEvent::onSimulationPausedHandler (
            SimulationEvent * re )  [override], [virtual]
```

Reimplemented from BaseGenesysTerminalApplication.

17.938.1.12 onSimulationResumeHandler()

```
void Smart_OnEvent::onSimulationResumeHandler (
            SimulationEvent * re )  [override], [virtual]
```

Reimplemented from BaseGenesysTerminalApplication.

17.938.1.13 onSimulationStartHandler()

```
void Smart_OnEvent::onSimulationStartHandler (
            SimulationEvent * re )  [override], [virtual]
```

Reimplemented from BaseGenesysTerminalApplication.
The documentation for this class was generated from the following files:

- applications/modelSpecific/smarts/Synchronization/Smart_OnEvent.h
- applications/modelSpecific/smarts/Synchronization/Smart_OnEvent.cpp

17.951.1 Detailed Description

Builds a minimal Create -> RSimulator -> Dispose model.
The example exercises the component-level R integration and is intended as a compact smoke model for RSimulator and its internal RSimulatorRunner.

17.951.2 Member Function Documentation

17.951.2.1 main()

```
int Smart_R_Simulator::main (
            int argc,
            char ** argv )  [override], [virtual]
```

Builds, saves and simulates the example model.
Reimplemented from BaseGenesysTerminalApplication.
The documentation for this class was generated from the following files:

- applications/modelSpecific/smarts/ExternalIntegration/Smart_R_Simulator.h
- applications/modelSpecific/smarts/ExternalIntegration/Smart_R_Simulator.cpp

17.972 WebWorkerRuntime::Snapshot Struct Reference

Captures a thread-safe snapshot of the worker state.
`#include <applications/worker/service/WebWorkerRuntime.h>`

Public Attributes

- bool **isRunning** = false
- bool **isStarting** = false
- bool **isStopping** = false
- bool **hasFailed** = false
- unsigned short **port** = 8080
- unsigned long **maxRequests** = 0
- unsigned long **servedRequests** = 0
- unsigned long **activeRequests** = 0
- std::string **statusMessage**
- std::string **lastError**
- std::vector< std::string > **recentEvents**
- std::vector< std::string > **recentErrors**

17.972.1 Detailed Description

Captures a thread-safe snapshot of the worker state.
The documentation for this struct was generated from the following file:

- applications/worker/service/WebWorkerRuntime.h

17.973 MetabolicFluxBalanceSolver::Solution Struct Reference

Public Attributes

- bool **feasible** = false
- double **objectiveValue** = 0.0
- std::vector< double > **fluxes**
- std::string **errorMessage**

The documentation for this struct was generated from the following file:

- tools/Biochemical/MetabolicFluxBalanceSolver.h

17.974 Optimizer_if::SolutionSummary Struct Reference

Captures one candidate or best-known optimization solution.
`#include <tools/Optimization/Optimizer_if.h>`

Public Attributes

- unsigned int **iteration** = 0
- unsigned int **simulationNumber** = 0
- bool **feasible** = false
- double **aggregatedObjectiveValue** = 0.0
- std::string **description**

17.974.1 Detailed Description

Captures one candidate or best-known optimization solution.
A solution stores the controls/responses snapshot produced by one simulation scenario and whether all constraints were satisfied.
The documentation for this struct was generated from the following file:

- tools/Optimization/Optimizer_if.h

17.975 Solver_if Class Reference

Legacy compatibility interface for numerical routines.
`#include <tools/Continuous/Solver_if.h>`

- virtual double **derivate** (double initPoint, double initValue, double(∗f)(double, double, double, double, double), double p2, double p3, double p4, double p5)=0

17.975.1 Detailed Description

Legacy compatibility interface for numerical routines.
Architectural role:

- Historically groups two responsibilities: 1) Numerical quadrature/integration. 2) Numerical advancement/derivation for ODE-like flows.

Mathematical meaning:

- Function signatures use the first functional parameter as time `t`.
- Parameters p2..p5 represent model parameters passed through old-style function pointers.

Limitations:

- The p2/p3/p4/p5 model reflects a historical constraint and is not the preferred long-term abstraction.

Planned evolution:

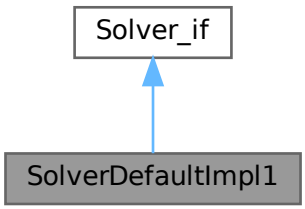
- Split into focused interfaces (quadrature, root finding, ODE systems and ODE solvers) while preserving this API for backward compatibility.

The documentation for this class was generated from the following file:

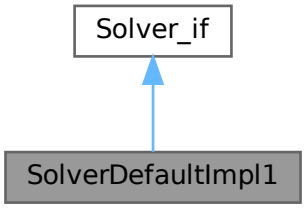
- tools/Continuous/Solver_if.h

17.976 SolverDefaultImpl1 Class Reference

Legacy default implementation of Solver_if.
`#include <tools/Continuous/SolverDefaultImpl1.h>`
Inheritance diagram for SolverDefaultImpl1:



Collaboration diagram for SolverDefaultImpl1:



Public Member Functions

- virtual double derivate (double initPoint, double initValue, double(∗f)(double, double, double, double, double), double p2, double p3, double p4, double p5) override

17.976.1 Detailed Description

Legacy default implementation of Solver_if.
Supported behavior:

- Numerical quadrature through composite Simpson 1/3 with a positive even number of subintervals.

Unsupported behavior:

- The historical derivate() signatures do not expose a defined step-size contract and are not used by current repository clients. They fail explicitly instead of returning silent or undefined numerical results.

Planned evolution:

- Split the historical interface into focused quadrature and ODE abstractions while preserving compatibility where a valid contract exists.

17.976.2 Member Function Documentation

17.976.2.1 derivate() [1/4]

```
double SolverDefaultImpl1::derivate (
            double initPoint,
            double initValue,

17.977 SortFile Class Reference

Utility class that sorts numeric values persisted in a data file.
`#include <kernel/statistics/SorttFile.h>`

Public Member Functions

- **SortFile** ()

  Creates an unbound sorter (filename must be configured before use).
- bool sort ()

  Executes in-file sorting for the configured dataset.
- void setDataFilename (std::string filename)

  Sets the target data filename to be sorted.

17.977.1 Detailed Description

Utility class that sorts numeric values persisted in a data file.
Used by file-based statistics implementations to support quantile/median computations that require ordered samples.

17.977.2 Member Function Documentation

17.977.2.1 setDataFilename()

```
void SortFile::setDataFilename (
            std::string filename )
```

Sets the target data filename to be sorted.

Parameters

filename	Path to the backing data file.

17.977.2.2 sort()

```
bool SortFile::sort ( )
```

Executes in-file sorting for the configured dataset.

Returns

True if sorting operation completes successfully.

The documentation for this class was generated from the following files:

- kernel/statistics/SorttFile.h
- kernel/statistics/SorttFile.cpp

- ConnectionManager * getConnectionManager () const

  new public user methods for this component
- void connectTo (ModelComponent *component, unsigned int inputPortNumber=0)

  Connects this component to another component.
- bool hasBreakpointAt ()

  Indicates whether a simulation breakpoint is set on this component.
- void setDescription (std::string _description)

  Updates the free-form description shown by the GUI.
- std::string getDescription () const

  Returns the free-form description associated with this component.
- void remove (ModelComponent *comp)

  Removes a connected component from this component.

Public Member Functions inherited from ModelDataDefinition

- ModelDataDefinition (Model *model, std::string datadefinitionTypename, std::string name="", bool insert↩ IntoModel=true)

  Creates a model data definition and optionally inserts it into the model.
- virtual ~**ModelDataDefinition** ()

  Releases resources owned by this data definition.
- Util::identification getId () const

  Returns the unique identifier of this instance.
- void setName (const std::string &name)

  Updates the logical name of this instance.
- const std::string & getName () const

  Returns the logical name of this instance.
- void setLabel (const std::string &label)

  Updates the user-visible label of this instance.
- const std::string & getLabel () const

  Returns the user-visible label of this instance.
- const std::string & getClassname () const

  Returns the runtime class name used by the plugin system.
- Model * getParentModel () const

  Returns the parent model that owns this definition.
- bool isReportStatistics () const

  Indicates whether this data definition contributes report statistics.
- void setReportStatistics (bool reportStatistics)

Enables or disables report-statistics generation for this definition.

- ModelDataDefinition * getInternalData (const std::string &name) const

  Looks up a named internal child data definition.
- std::map< std::string, ModelDataDefinition * > * getInternalData () const

  Returns the full map of internal child data definitions.
- std::map< std::string, ModelDataDefinition * > * getAttachedData () const

  Returns the full map of attached data definitions.
- bool hasChanged () const

  Indicates whether this instance has been modified since the last reset.
- void setHasChanged (bool hasChanged)

  Updates the changed flag for this data definition.
- unsigned int getLevel () const

  Returns the hierarchical editing context containing this element.
- void setModelLevel (unsigned int _modelLevel)

  Sets this element's hierarchical editing context.
- List< SimulationControl * > * getSimulationControls () const

  Returns the simulation controls owned by this data definition.
- TraceManager::Level getTraceLevelSpecific () const

  Returns the trace level that applies specifically to this definition.
- void setTraceLevelSpecific (TraceManager::Level level)

  Updates the trace level used by this definition.
- void defineTraceLevelSpecific (TraceManager::Level traceLevelspecific, bool traceLevelSpecific↩ Enabled=true)

  Defines the specific trace level and optionally enables it immediately.
- bool isTraceLevelSpecificEnabled () const

  Indicates whether the specific trace level is enabled.
- void setTraceLevelSpecificEnabled (bool traceLevelSpecificEnabled)

  Enables or disables the specific trace level.

Protected Member Functions

- virtual bool _loadInstance (PersistenceRecord *fields) override

  virtual protected method that must be overriden
- virtual void _saveInstance (PersistenceRecord *fields, bool saveDefaultValues) override

  Saves object fields into a serialization structure.
- virtual void _initBetweenReplications () override
- virtual bool _check (std::string &errorMessage) override

  could be overriden by derived classes
- virtual void _createEditableDataDefinitions ()
- virtual void _createAttachedAttributes ()

Protected Member Functions inherited from ModelComponent

- virtual void _onDispatchEvent (Entity *entity, unsigned int inputPortNumber)=0

  Handles a dispatched event for this component type.

Protected Member Functions inherited from ModelDataDefinition

- bool _getSaveDefaultsOption ()
- virtual ParserChangesInformation * _getParserChangesInformation ()
- virtual void _addSimulationControl (SimulationControl *control)
- virtual void _createInternalAndAttachedData ()

Additional Inherited Members

Static Public Member Functions inherited from ModelComponent

- static ModelComponent * LoadInstance (Model *model, PersistenceRecord *fields)

  static public methods that must have implementations (Load and New just the same. GetInformation must provide specific infos for the new component
- static bool Check (ModelComponent *component)

  Validates a component instance.
- static void CreateInternalData (ModelComponent *component)

  Creates internal data required by a component instance.
- static void SaveInstance (PersistenceRecord *fields, ModelComponent *component)

  Serializes a component instance into a persistence record.
- static void DispatchEvent (Event *event)

  Dispatches a simulation event to the target component.

Static Public Member Functions inherited from ModelDataDefinition

- static ModelDataDefinition * LoadInstance (Model *model, PersistenceRecord *fields, bool insertIntoModel)

  Loads a model data definition instance from serialized fields.
- static ModelDataDefinition * NewInstance (Model *model, std::string name="")

  Creates a new instance of a data definition using the plugin registry.
- static void SaveInstance (PersistenceRecord *fields, ModelDataDefinition *modeldatum)

  Serializes a data definition instance into a persistence record.
- static bool Check (ModelDataDefinition *modeldatum, std::string &errorMessage)

  Validates a data definition instance.
- static void InitBetweenReplications (ModelDataDefinition *modeldatum)

Resets simulation-time state between replications.

- static void CreateInternalData (ModelDataDefinition *modeldatum)

  Creates internal and attached data required by this instance.

- static bool CreateRelatedDataElements (ModelDataDefinition *modeldatum, std::string &errorMessage)

  Creates related data and validates the instance in a single call.

17.979.1 Detailed Description

Kernel base class for components that inject entities into the model (only Create derives from it so far), generalizing the fields Arena exposes on its "Create module" (Rockwell Automation, *Getting Started with Arena*, "The Basic Process Panel", pp. 31-32): Entity Type (`_entityType`), First Creation (`_firstCreation`), Entities per Arrival (`_entitiesPerCreation`), Max Arrivals (`_maxCreationsExpression`, a parsed expression rather than a static integer) and the time-between-creations expression/time unit.
A source component populates the initially empty future events list with the first creation events for every source component in the model.

17.979.2 Member Function Documentation

17.979.2.1 _check()

```
bool SourceModelComponent::_check (
            std::string & errorMessage )  [override], [protected], [virtual]
```

could be overriden by derived classes
Reimplemented from ModelDataDefinition.
Reimplemented in Create.

17.979.2.2 _createAttachedAttributes()

```
void SourceModelComponent::_createAttachedAttributes ( )  [protected], [virtual]
```

Reimplemented from ModelDataDefinition.

17.979.2.3 _createEditableDataDefinitions()

```
void SourceModelComponent::_createEditableDataDefinitions ( )  [protected], [virtual]
```

Reimplemented from ModelDataDefinition.

17.979.2.4 _initBetweenReplications()

```
void SourceModelComponent::_initBetweenReplications ( )  [override], [protected], [virtual]
```

Reimplemented from ModelDataDefinition.

17.979.2.5 _loadInstance()

```
bool SourceModelComponent::_loadInstance (
            PersistenceRecord * fields )  [override], [protected], [virtual]
```

virtual protected method that must be overriden
Reimplemented from ModelComponent.
Reimplemented in Create.

17.979.2.6 _saveInstance()

```
void SourceModelComponent::_saveInstance (
            PersistenceRecord * fields,
            bool saveDefaultValues )  [override], [protected], [virtual]
```

Saves object fields into a serialization structure.

Parameters

fields	a table-like structure used for serialization.
saveDefaultValues	indicates whether or not to save fields which are set to their default value.

Reimplemented from ModelComponent.
Reimplemented in Create.

17.979.2.7 getEntitiesCreated()

```
unsigned int SourceModelComponent::getEntitiesCreated ( ) const
```
getEntitiesCreated

Returns

17.979.2.8 getEntitiesPerCreation()

```
unsigned int SourceModelComponent::getEntitiesPerCreation ( ) const
```
getEntitiesPerCreation

Returns

17.979.2.9 getEntityType()

```
EntityType * SourceModelComponent::getEntityType ( ) const
```
getEntityType

Returns

17.979.2.10 getFirstCreation()

```
double SourceModelComponent::getFirstCreation ( ) const
```
getFirstCreation

Returns

17.979.2.11 getMaxCreations()

```
std::string SourceModelComponent::getMaxCreations ( ) const
```
getMaxCreations

Returns

17.979.2.12 getTimeBetweenCreationsExpression()

```
std::string SourceModelComponent::getTimeBetweenCreationsExpression ( ) const
```
getTimeBetweenCreationsExpression

Returns

17.979.2.13 getTimeUnit()

```
Util::TimeUnit SourceModelComponent::getTimeUnit ( ) const
```

getTimeUnit

Returns

17.979.2.14 setEntitiesCreated()

```
void SourceModelComponent::setEntitiesCreated (
            unsigned int _entitiesCreated )
```

setEntitiesCreated

Parameters

_entitiesCreated	

17.979.2.15 setEntitiesPerCreation()

```
void SourceModelComponent::setEntitiesPerCreation (
            unsigned int _entitiesPerCreation )
```

setEntitiesPerCreation

Parameters

_entitiesPerCreation	

17.979.2.16 setEntityType()

```
void SourceModelComponent::setEntityType (
            EntityType * _entityType )
```

setEntityType

Parameters

_entityType	

17.979.2.17 setEntityTypeName()

```
void SourceModelComponent::setEntityTypeName (
            std::string entityTypeName )
```

setEntityTypeName

Parameters

entityTypeName	

17.979.2.18 setFirstCreation()

```
void SourceModelComponent::setFirstCreation (
            double _firstCreation )
```

setFirstCreation

Parameters

_firstCreation	

17.979.2.19 setMaxCreations() [1/2]

```
void SourceModelComponent::setMaxCreations (
            std::string _maxCreationsExpression )
```

setMaxCreations

Parameters

_maxCreationsExpression	

17.979.2.20 setMaxCreations() [2/2]

```
void SourceModelComponent::setMaxCreations (
            unsigned long _maxCreations )
```

setMaxCreations

Parameters

_maxCreations	

17.979.2.21 setTimeBetweenCreationsExpression()

```
void SourceModelComponent::setTimeBetweenCreationsExpression (
            std::string _timeBetweenCreations,
            Util::TimeUnit _timeUnit = Util::TimeUnit::unknown )
```

setTimeBetweenCreationsExpression

Parameters

_timeBetweenCreations	
_timeUnit	

17.979.2.22 setTimeUnit()

```
void SourceModelComponent::setTimeUnit (
            Util::TimeUnit _timeUnit )
```

setTimeUnit

Parameters

_timeUnit	

17.979.2.23 show()

```
std::string SourceModelComponent::show ( )  [override], [virtual]
```

virtual public methods
Returns a textual representation of this component.

Returns

Human-readable description used for tracing and debugging.

Reimplemented from ModelComponent.
Reimplemented in Create.
The documentation for this class was generated from the following files:

- kernel/simulator/SourceModelComponent.h
- kernel/simulator/SourceModelComponent.cpp

17.980 SparseValueStore Class Reference

Sparse N-dimensional numeric store using GenESyS textual index keys.
`#include <kernel/simulator/essentialPlugins/SparseValueStore.h>`

Public Member Functions

- double **value** (const std::string &index="") const

  Reads a sparse position, returning 0.0 when the position is absent.
- void **setValue** (double value, const std::string &index="")

  Writes a sparse position, creating it when needed.
- void **setValues** (const std::map< std::string, double > &values)

  Replaces all sparse values with a copy of the provided values.
- void **copyFrom** (const SparseValueStore &other)

  Replaces this store with a deep copy of another store.
- void **insertDimensionSize** (unsigned int size)

  Inserts one dimension size at the end of the dimension list.
- std::list< unsigned int > * **dimensionSizes** ()

  Returns mutable dimension sizes for compatibility with legacy callers.
- const std::list< unsigned int > * **dimensionSizes** () const

  Returns immutable dimension sizes.
- std::map< std::string, double > * **values** ()

  Returns mutable sparse values for compatibility with legacy callers.
- const std::map< std::string, double > * **values** () const

  Returns immutable sparse values.
- void **clear** ()

  Clears dimensions and values.
- void **loadDimensions** (PersistenceRecord *fields)

  Loads dimensions using the legacy fields dimensions/dimension[i].
- void **saveDimensions** (PersistenceRecord *fields, bool saveDefaultValues) const

  Saves dimensions using the legacy fields dimensions/dimension[i].
- void **loadValues** (PersistenceRecord *fields, const std::string &countField, const std::string &positionPrefix, const std::string &valuePrefix)

  Loads sparse values using the provided count/position/value field prefixes.
- void **saveValues** (PersistenceRecord *fields, const std::string &countField, const std::string &positionPrefix, const std::string &valuePrefix, bool saveDefaultValues) const

  Saves sparse values using the provided count/position/value field prefixes.
- std::string **showValues** () const

  Returns a compact textual representation used by show/debug paths.

Static Public Member Functions

- static std::string **makeIndexKey** (const std::vector< unsigned int > &indexes)

  Builds the textual key used by legacy sparse matrices from index values.
- static std::string **makeIndexKeyFromDoubles** (const std::vector< double > &indexes)

  Builds the textual key used by legacy sparse matrices from expression values.
- static std::string **appendIndexKey** (const std::string &currentKey, unsigned int index)

  Appends one index to an existing textual sparse key.
- static std::string **appendIndexKeyFromDouble** (const std::string &currentKey, double index)

  Appends one expression value to an existing textual sparse key.
- static std::string **normalizeIndexKey** (const std::string &index)

  Returns a normalized copy of an already textual key.

17.980.1 Detailed Description

Sparse N-dimensional numeric store using GenESyS textual index keys.
The store preserves the existing Variable semantics: the scalar position is represented by an empty key, multidimensional indexes are represented as comma-separated unsigned integers such as "1,2,3", and any missing position reads back as 0.0. It is intentionally small so Variable, Attribute and Entity can share the same behavior without changing the persistence format.
The documentation for this class was generated from the following file:

- kernel/simulator/essentialPlugins/SparseValueStore.h

17.981 MassActionOdeSystem::Species Struct Reference

Public Attributes

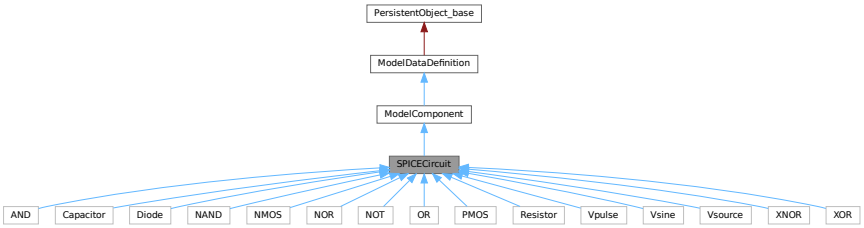
- std::string **name**
- double **initialAmount** = 0.0
- bool **boundaryCondition** = false
- bool **constant** = false

The documentation for this struct was generated from the following file:

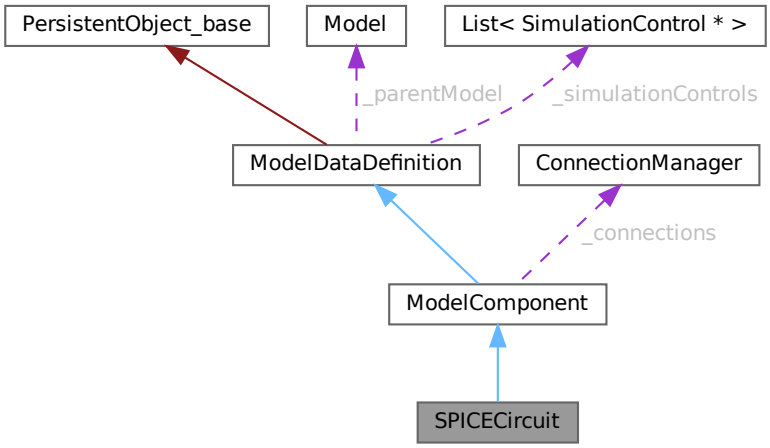
- tools/Biochemical/MassActionOdeSystem.h

17.982 SPICECircuit Class Reference

`#include <plugins/components/ElectronicsSimulation/SPICECircuit.h>`
Inheritance diagram for SPICECircuit:



Collaboration diagram for SPICECircuit:



Public Member Functions

- **SPICECircuit** (Model *model, std::string name="")

  constructors
- void **setRunner** (SPICERunner *runner)

  new public user methods for this components
- SPICERunner * **getRunner** ()
- virtual std::string show () override

  virtual public methods

Public Member Functions inherited from ModelComponent

- ModelComponent (Model *model, std::string componentTypename, std::string name="")

  constructors
- virtual ~**ModelComponent** ()

  Releases component-owned resources and unregisters it from the model.
- ConnectionManager * getConnectionManager () const

  new public user methods for this component
- void connectTo (ModelComponent *component, unsigned int inputPortNumber=0)

  Connects this component to another component.
- bool hasBreakpointAt ()

  Indicates whether a simulation breakpoint is set on this component.
- void setDescription (std::string _description)

  Updates the free-form description shown by the GUI.
- std::string getDescription () const

  Returns the free-form description associated with this component.
- void remove (ModelComponent *comp)

  Removes a connected component from this component.

Public Member Functions inherited from ModelDataDefinition

- ModelDataDefinition (Model *model, std::string datadefinitionTypename, std::string name="", bool insertIntoModel=true)

  Creates a model data definition and optionally inserts it into the model.
- virtual ~**ModelDataDefinition** ()

  Releases resources owned by this data definition.
- Util::identification getId () const

  Returns the unique identifier of this instance.
- void setName (const std::string &name)

  Updates the logical name of this instance.
- const std::string & getName () const

  Returns the logical name of this instance.
- void setLabel (const std::string &label)

  Updates the user-visible label of this instance.
- const std::string & getLabel () const

  Returns the user-visible label of this instance.
- const std::string & getClassname () const

  Returns the runtime class name used by the plugin system.
- Model * getParentModel () const

  Returns the parent model that owns this definition.
- bool isReportStatistics () const

  Indicates whether this data definition contributes report statistics.
- void setReportStatistics (bool reportStatistics)

  Enables or disables report-statistics generation for this definition.
- ModelDataDefinition * getInternalData (const std::string &name) const

  Looks up a named internal child data definition.
- std::map< std::string, ModelDataDefinition * > * getInternalData () const

  Returns the full map of internal child data definitions.
- std::map< std::string, ModelDataDefinition * > * getAttachedData () const

  Returns the full map of attached data definitions.
- bool hasChanged () const

  Indicates whether this instance has been modified since the last reset.
- void setHasChanged (bool hasChanged)

  Updates the changed flag for this data definition.
- unsigned int getLevel () const

  Returns the hierarchical editing context containing this element.
- void setModelLevel (unsigned int _modelLevel)

  Sets this element's hierarchical editing context.
- List< SimulationControl * > * getSimulationControls () const

  Returns the simulation controls owned by this data definition.
- TraceManager::Level getTraceLevelSpecific () const

  Returns the trace level that applies specifically to this definition.
- void setTraceLevelSpecific (TraceManager::Level level)

  Updates the trace level used by this definition.
- void defineTraceLevelSpecific (TraceManager::Level traceLevelspecific, bool traceLevelSpecificEnabled=true)

  Defines the specific trace level and optionally enables it immediately.
- bool isTraceLevelSpecificEnabled () const

  Indicates whether the specific trace level is enabled.
- void setTraceLevelSpecificEnabled (bool traceLevelSpecificEnabled)

  Enables or disables the specific trace level.

Static Public Member Functions

- static PluginInformation * **GetPluginInformation** ()

  static public methods that must have implementations (Load and New just the same. GetInformation must provide specific infos for the new component
- static ModelComponent * **LoadInstance** (Model *model, PersistenceRecord *fields)
- static ModelDataDefinition * **NewInstance** (Model *model, std::string name="")
- static std::vector< std::string > **split** (std::string word, char split_char)

  Externalize function GetPluginInformation to be accessible throught dynamic linked library.

Static Public Member Functions inherited from ModelComponent

- static ModelComponent * LoadInstance (Model *model, PersistenceRecord *fields)

  static public methods that must have implementations (Load and New just the same. GetInformation must provide specific infos for the new component
- static bool Check (ModelComponent *component)

  Validates a component instance.
- static void CreateInternalData (ModelComponent *component)

  Creates internal data required by a component instance.
- static void SaveInstance (PersistenceRecord *fields, ModelComponent *component)

  Serializes a component instance into a persistence record.
- static void DispatchEvent (Event *event)

  Dispatches a simulation event to the target component.

Static Public Member Functions inherited from ModelDataDefinition

- static ModelDataDefinition * LoadInstance (Model *model, PersistenceRecord *fields, bool insertIntoModel)

  Loads a model data definition instance from serialized fields.
- static ModelDataDefinition * NewInstance (Model *model, std::string name="")

  Creates a new instance of a data definition using the plugin registry.
- static void SaveInstance (PersistenceRecord *fields, ModelDataDefinition *modeldatum)

  Serializes a data definition instance into a persistence record.
- static bool Check (ModelDataDefinition *modeldatum, std::string &errorMessage)

  Validates a data definition instance.
- static void InitBetweenReplications (ModelDataDefinition *modeldatum)

  Resets simulation-time state between replications.
- static void CreateInternalData (ModelDataDefinition *modeldatum)

  Creates internal and attached data required by this instance.
- static bool CreateRelatedDataElements (ModelDataDefinition *modeldatum, std::string &errorMessage)

  Creates related data and validates the instance in a single call.

Protected Member Functions

- void **BuildCircuit** (std::string description, unsigned int id, std::vector< std::string > the_params={""}, std::string the_model="", std::string the_model_file="")

  virtual protected method that must be overriden
- void **UpdateConnections** ()
- virtual void **Build** ()
- virtual bool _loadInstance (PersistenceRecord *fields) override

  virtual protected method that must be overriden
- virtual void _saveInstance (PersistenceRecord *fields, bool saveDefaultValues) override

  Saves object fields into a serialization structure.
- virtual void _onDispatchEvent (Entity *entity, unsigned int inputPortNumber) override

  This method is only for ModelComponents, not ModelDataElements.
- virtual void _createNonEditableDataDefinitions () override

  virtual protected methods that could be overriden by derived classes, if needed

17.982.1 Detailed Description

This component ...

17.982.2 Member Function Documentation

17.982.2.1 _createNonEditableDataDefinitions()

```
void SPICECircuit::_createNonEditableDataDefinitions ( )  [override], [protected], [virtual]
```

virtual protected methods that could be overriden by derived classes, if needed
This method is called by ModelChecker during model check. The component should check itself to verify if user parameters are ok (ex: correct syntax for the parser) and everithing in its parameters allow the model too run without errors in this component
This method returns all changes in the parser that are needed by plugins of this ModelDatas. When connecting a new plugin, ParserChangesInformation are used to change parser source code, whch is after compiled and dinamically linked to to simulator kernel to reflect the changes
This method is called by ModelSimulation when initianting the replication. The model should set all value for a new replication (Ex: setting back to 0 any internal counter, clearing lists, etc.
Reimplemented from ModelDataDefinition.

17.982.2.2 _loadInstance()

```
bool SPICECircuit::_loadInstance (
            PersistenceRecord * fields )  [override], [protected], [virtual]
```

virtual protected method that must be overriden
Reimplemented from ModelComponent.
Reimplemented in Resistor, Vsource, Vpulse, Vsine, Capacitor, Diode, PMOS, NMOS, NOT, NAND, AND, NOR, OR, XOR, and XNOR.

17.982.2.3 _onDispatchEvent()

```
void SPICECircuit::_onDispatchEvent (
            Entity * entity,
            unsigned int inputPortNumber )  [override], [protected], [virtual]
```

This method is only for ModelComponents, not ModelDataElements.
Implements ModelComponent.

17.982.2.4 _saveInstance()

```
void SPICECircuit::_saveInstance (
            PersistenceRecord * fields,
            bool saveDefaultValues )  [override], [protected], [virtual]
```

Saves object fields into a serialization structure.

Parameters

fields	a table-like structure used for serialization.
saveDefaultValues	indicates whether or not to save fields which are set to their default value.

Reimplemented from ModelComponent.
Reimplemented in Resistor, Vsource, Vpulse, Vsine, Capacitor, Diode, PMOS, NMOS, NOT, NAND, AND, NOR, OR, XOR, and XNOR.

17.982.2.5 show()

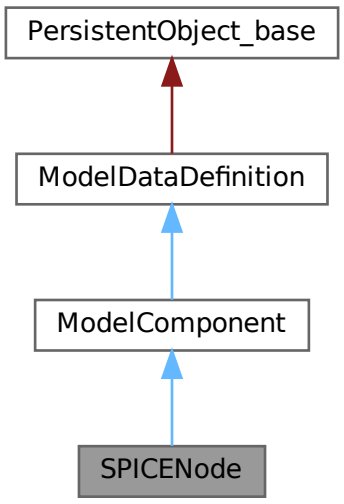
```
std::string SPICECircuit::show ( )  [override], [virtual]
```

virtual public methods
Reimplemented from ModelComponent.
The documentation for this class was generated from the following files:

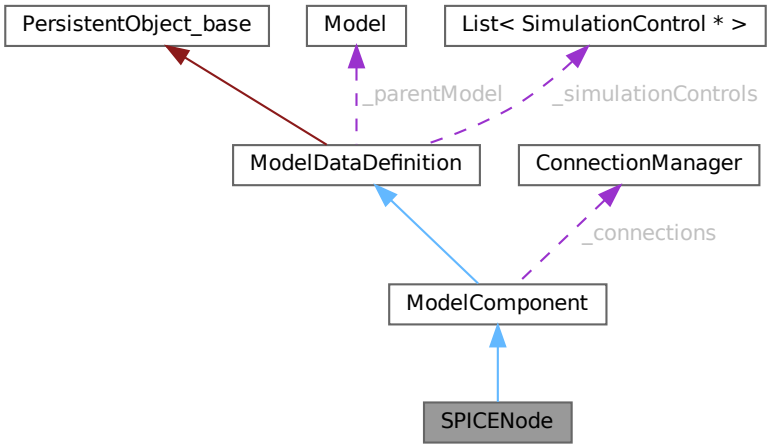
- plugins/components/ElectronicsSimulation/SPICECircuit.h
- plugins/components/ElectronicsSimulation/SPICECircuit.cpp

17.983 SPICENode Class Reference

`#include <plugins/components/ElectronicsSimulation/SPICENode.h>`
Inheritance diagram for SPICENode:



Collaboration diagram for SPICENode:



Public Member Functions

- **SPICENode** (Model *model, std::string name="")

  constructors
- std::string **getNodeName** ()

  new public user methods for this component
- virtual std::string show () override

  virtual public methods
- **operator std::string** () const

Public Member Functions inherited from ModelComponent

- ModelComponent (Model *model, std::string componentTypename, std::string name="")

  constructors
- virtual ~**ModelComponent** ()

  Releases component-owned resources and unregisters it from the model.
- ConnectionManager * getConnectionManager () const

  new public user methods for this component
- void connectTo (ModelComponent *component, unsigned int inputPortNumber=0)

  Connects this component to another component.
- bool hasBreakpointAt ()

  Indicates whether a simulation breakpoint is set on this component.
- void setDescription (std::string _description)

  Updates the free-form description shown by the GUI.
- std::string getDescription () const

  Returns the free-form description associated with this component.
- void remove (ModelComponent *comp)

  Removes a connected component from this component.

Public Member Functions inherited from ModelDataDefinition

- ModelDataDefinition (Model *model, std::string datadefinitionTypename, std::string name="", bool insertIntoModel=true)

  Creates a model data definition and optionally inserts it into the model.
- virtual ~**ModelDataDefinition** ()

  Releases resources owned by this data definition.
- Util::identification getId () const

  Returns the unique identifier of this instance.
- void setName (const std::string &name)

  Updates the logical name of this instance.
- const std::string & getName () const

  Returns the logical name of this instance.
- void setLabel (const std::string &label)

  Updates the user-visible label of this instance.
- const std::string & getLabel () const

  Returns the user-visible label of this instance.
- const std::string & getClassname () const

  Returns the runtime class name used by the plugin system.
- Model * getParentModel () const

  Returns the parent model that owns this definition.
- bool isReportStatistics () const

  Indicates whether this data definition contributes report statistics.
- void setReportStatistics (bool reportStatistics)

  Enables or disables report-statistics generation for this definition.
- ModelDataDefinition * getInternalData (const std::string &name) const

  Looks up a named internal child data definition.
- std::map< std::string, ModelDataDefinition * > * getInternalData () const

  Returns the full map of internal child data definitions.
- std::map< std::string, ModelDataDefinition * > * getAttachedData () const

  Returns the full map of attached data definitions.
- bool hasChanged () const

  Indicates whether this instance has been modified since the last reset.
- void setHasChanged (bool hasChanged)

  Updates the changed flag for this data definition.
- unsigned int getLevel () const

  Returns the hierarchical editing context containing this element.
- void setModelLevel (unsigned int _modelLevel)

  Sets this element's hierarchical editing context.
- List< SimulationControl * > * getSimulationControls () const

  Returns the simulation controls owned by this data definition.
- TraceManager::Level getTraceLevelSpecific () const

  Returns the trace level that applies specifically to this definition.
- void setTraceLevelSpecific (TraceManager::Level level)

  Updates the trace level used by this definition.
- void defineTraceLevelSpecific (TraceManager::Level traceLevelspecific, bool traceLevelSpecificEnabled=true)

  Defines the specific trace level and optionally enables it immediately.
- bool isTraceLevelSpecificEnabled () const

  Indicates whether the specific trace level is enabled.
- void setTraceLevelSpecificEnabled (bool traceLevelSpecificEnabled)

  Enables or disables the specific trace level.

Static Public Member Functions

- static PluginInformation * **GetPluginInformation** ()

  static public methods that must have implementations (Load and New just the same. GetInformation must provide specific infos for the new component
- static ModelComponent * **LoadInstance** (Model *model, PersistenceRecord *fields)
- static ModelDataDefinition * **NewInstance** (Model *model, std::string name="")

Static Public Member Functions inherited from ModelComponent

- static ModelComponent * LoadInstance (Model *model, PersistenceRecord *fields)

  static public methods that must have implementations (Load and New just the same. GetInformation must provide specific infos for the new component
- static bool Check (ModelComponent *component)

  Validates a component instance.
- static void CreateInternalData (ModelComponent *component)

  Creates internal data required by a component instance.
- static void SaveInstance (PersistenceRecord *fields, ModelComponent *component)

  Serializes a component instance into a persistence record.
- static void DispatchEvent (Event *event)

  Dispatches a simulation event to the target component.

Static Public Member Functions inherited from ModelDataDefinition

- static ModelDataDefinition * LoadInstance (Model *model, PersistenceRecord *fields, bool insertIntoModel)

  Loads a model data definition instance from serialized fields.
- static ModelDataDefinition * NewInstance (Model *model, std::string name="")

  Creates a new instance of a data definition using the plugin registry.
- static void SaveInstance (PersistenceRecord *fields, ModelDataDefinition *modeldatum)

  Serializes a data definition instance into a persistence record.
- static bool Check (ModelDataDefinition *modeldatum, std::string &errorMessage)

  Validates a data definition instance.
- static void InitBetweenReplications (ModelDataDefinition *modeldatum)

  Resets simulation-time state between replications.
- static void CreateInternalData (ModelDataDefinition *modeldatum)

  Creates internal and attached data required by this instance.
- static bool CreateRelatedDataElements (ModelDataDefinition *modeldatum, std::string &errorMessage)

  Creates related data and validates the instance in a single call.

Protected Member Functions

- virtual bool _loadInstance (PersistenceRecord *fields) override

  virtual protected method that must be overriden
- virtual void _saveInstance (PersistenceRecord *fields, bool saveDefaultValues) override

  Saves object fields into a serialization structure.
- virtual void _onDispatchEvent (Entity *entity, unsigned int inputPortNumber) override

  This method is only for ModelComponents, not ModelDataElements.

Protected Member Functions inherited from ModelDataDefinition

- bool _getSaveDefaultsOption ()
- virtual bool _check (std::string &errorMessage)

  could be overriden by derived classes
- virtual ParserChangesInformation * _getParserChangesInformation ()
- virtual void _initBetweenReplications ()
- virtual void _addSimulationControl (SimulationControl *control)
- virtual void _createInternalAndAttachedData ()
- virtual void **_createInternalStatisticReporters** ()
- virtual void _createAttachedAttributes ()
- virtual void _createNonEditableDataDefinitions ()
- virtual void _createEditableDataDefinitions ()
- void **_templateCreateInternalStatisticReporters** ()
- void **_templateCreateAttachedAttributes** ()
- void **_templateCreateNonEditableDataDefinitions** ()
- void **_templateCreateEditableDataDefinitions** ()
- void **_internaStatisticReportersClear** ()

  legacy helper methods used by the granular create hooks*
- void **_internalDataClear** ()
- void **_internalDataInsert** (const std::string &key, ModelDataDefinition *child)
- void **_internalDataRemove** (const std::string &key)
- void **_attachedDataClear** ()
- void **_attachedDataInsert** (const std::string &key, ModelDataDefinition *data)
- void **_attachedDataRemove** (const std::string &key)
- void **_attachedAttributesInsert** (const std::vector< std::string > &neededNames)
- void **_statisticReporterInsert** (const std::string &key, ModelDataDefinition *data)
- void **_statisticReporterRemove** (const std::string &key)
- void **_statisticReportersClear** ()
- void **_mandatoryAttachedAttributeInsert** (const std::string &key, ModelDataDefinition *data)
- void **_mandatoryAttachedAttributeRemove** (const std::string &key)
- void **_mandatoryAttachedAttributesClear** ()
- void **_mandatoryEditableDataDefinitionInsert** (const std::string &key, ModelDataDefinition *data)
- void **_mandatoryEditableDataDefinitionRemove** (const std::string &key)
- void **_mandatoryEditableDataDefinitionsClear** ()
- void **_optionalEditableDataDefinitionInsert** (const std::string &key, ModelDataDefinition *data)
- void **_optionalEditableDataDefinitionRemove** (const std::string &key)
- void **_optionalEditableDataDefinitionsClear** ()
- void **_mandatoryNonEditableDataDefinitionInsert** (const std::string &key, ModelDataDefinition *data)
- void **_mandatoryNonEditableDataDefinitionRemove** (const std::string &key)
- void **_mandatoryNonEditableDataDefinitionsClear** ()
- void **_optionalNonEditableDataDefinitionInsert** (const std::string &key, ModelDataDefinition *data)
- void **_optionalNonEditableDataDefinitionRemove** (const std::string &key)
- void **_optionalNonEditableDataDefinitionsClear** ()
- void **_checkCreateAttachedReferencedDataDefinition** (const std::string &expression)

  method to be called to insert attached dataelements that are referenced by string expressions (detected by the parser), to avoid orphaned data definitions
- void **trace** (const std::string &text, TraceManager::Level level=TraceManager::Level::L8_detailed)

  not just an easy access to trace manager, but wrappers to check if specific trace level applies
- void **traceError** (const std::string &text, const std::exception &e)
- void **traceError** (const std::string &text, TraceManager::Level level=TraceManager::Level::L1_errorFatal)
- void **traceReport** (const std::string &text, TraceManager::Level level=TraceManager::Level::L2_results)
- void **traceSimulation** (void *thisobject, double time, Entity *entity, ModelComponent *component, const std::string &text, TraceManager::Level level=TraceManager::Level::L8_detailed)
- void traceSimulation (void *thisobject, const std::string &text, TraceManager::Level level=TraceManager::↩ Level::L8_detailed)

  Traces text to the simulation output.
- void **traceSimulation** (void *thisobject, TraceManager::Level level, const std::string &text)

Additional Inherited Members

Protected Attributes inherited from ModelComponent

17.983.1 Detailed Description

This component ...

17.983.2 Member Function Documentation

17.983.2.1 _loadInstance()

```
bool SPICENode::_loadInstance (
            PersistenceRecord * fields )  [override], [protected], [virtual]
```

virtual protected method that must be overriden
Reimplemented from ModelComponent.

17.983.2.2 _onDispatchEvent()

```
void SPICENode::_onDispatchEvent (
            Entity * entity,
            unsigned int inputPortNumber )  [override], [protected], [virtual]
```

This method is only for ModelComponents, not ModelDataElements.
Implements ModelComponent.

17.983.2.3 _saveInstance()

```
void SPICENode::_saveInstance (
            PersistenceRecord * fields,
            bool saveDefaultValues )  [override], [protected], [virtual]
```

Saves object fields into a serialization structure.

Parameters

fields	a table-like structure used for serialization.
saveDefaultValues	indicates whether or not to save fields which are set to their default value.

Reimplemented from ModelComponent.

17.983.2.4 show()

```
std::string SPICENode::show ( )  [override], [virtual]
```

virtual public methods
Reimplemented from ModelComponent.

The documentation for this class was generated from the following files:

- plugins/components/ElectronicsSimulation/SPICENode.h
- plugins/components/ElectronicsSimulation/SPICENode.cpp

  virtual public methods

Public Member Functions inherited from ModelDataDefinition

- ModelDataDefinition (Model *model, std::string datadefinitionTypename, std::string name="", bool insert↩ IntoModel=true)

  Creates a model data definition and optionally inserts it into the model.
- virtual ~**ModelDataDefinition** ()

  Releases resources owned by this data definition.
- Util::identification getId () const

  Returns the unique identifier of this instance.
- void setName (const std::string &name)

  Updates the logical name of this instance.
- const std::string & getName () const

  Returns the logical name of this instance.
- void setLabel (const std::string &label)

  Updates the user-visible label of this instance.
- const std::string & getLabel () const

  Returns the user-visible label of this instance.
- const std::string & getClassname () const

  Returns the runtime class name used by the plugin system.
- Model * getParentModel () const

  Returns the parent model that owns this definition.
- bool isReportStatistics () const

Indicates whether this data definition contributes report statistics.

- void setReportStatistics (bool reportStatistics)

  Enables or disables report-statistics generation for this definition.
- ModelDataDefinition * getInternalData (const std::string &name) const

  Looks up a named internal child data definition.
- std::map< std::string, ModelDataDefinition * > * getInternalData () const

  Returns the full map of internal child data definitions.
- std::map< std::string, ModelDataDefinition * > * getAttachedData () const

  Returns the full map of attached data definitions.
- bool hasChanged () const

  Indicates whether this instance has been modified since the last reset.
- void setHasChanged (bool hasChanged)

  Updates the changed flag for this data definition.
- unsigned int getLevel () const

  Returns the hierarchical editing context containing this element.
- void setModelLevel (unsigned int _modelLevel)

  Sets this element's hierarchical editing context.
- List< SimulationControl * > * getSimulationControls () const

  Returns the simulation controls owned by this data definition.
- TraceManager::Level getTraceLevelSpecific () const

  Returns the trace level that applies specifically to this definition.
- void setTraceLevelSpecific (TraceManager::Level level)

  Updates the trace level used by this definition.
- void defineTraceLevelSpecific (TraceManager::Level traceLevelspecific, bool traceLevelSpecific↩ Enabled=true)

  Defines the specific trace level and optionally enables it immediately.
- bool isTraceLevelSpecificEnabled () const

  Indicates whether the specific trace level is enabled.
- void setTraceLevelSpecificEnabled (bool traceLevelSpecificEnabled)

  Enables or disables the specific trace level.

Static Public Member Functions

- static PluginInformation * **GetPluginInformation** ()

  static public methods that must have implementations (Load and New just the same. GetInformation must provide specific infos for the new component
- static ModelDataDefinition * **LoadInstance** (Model *model, PersistenceRecord *fields)
- static ModelDataDefinition * **NewInstance** (Model *model, std::string name="")
- static std::vector< std::string > **split** (std::string word, char split_char)

Static Public Member Functions inherited from ModelDataDefinition

- static ModelDataDefinition * LoadInstance (Model *model, PersistenceRecord *fields, bool insertIntoModel)

  Loads a model data definition instance from serialized fields.
- static ModelDataDefinition * NewInstance (Model *model, std::string name="")

  Creates a new instance of a data definition using the plugin registry.
- static void SaveInstance (PersistenceRecord *fields, ModelDataDefinition *modeldatum)

  Serializes a data definition instance into a persistence record.
- static bool Check (ModelDataDefinition *modeldatum, std::string &errorMessage)

  Validates a data definition instance.
- static void InitBetweenReplications (ModelDataDefinition *modeldatum)

  Resets simulation-time state between replications.

- static void CreateInternalData (ModelDataDefinition *modeldatum)

  Creates internal and attached data required by this instance.
- static bool CreateRelatedDataElements (ModelDataDefinition *modeldatum, std::string &errorMessage)

  Creates related data and validates the instance in a single call.

Protected Member Functions

- virtual bool _loadInstance (PersistenceRecord *fields) override

  virtual protected method that must be overriden
- virtual void _saveInstance (PersistenceRecord *fields, bool saveDefaultValues) override

  Saves object fields into a serialization structure.
- virtual bool _check (std::string &errorMessage) override

  virtual protected methods that could be overriden by derived classes, if needed

Protected Member Functions inherited from ModelDataDefinition

17.984.1 Member Function Documentation

17.984.1.1 _check()

```
bool SPICERunner::_check (
            std::string & errorMessage )  [override], [protected], [virtual]
```

virtual protected methods that could be overriden by derived classes, if needed
This method is called by ModelChecker during model check. The component should check itself to verify if user parameters are ok (ex: correct syntax for the parser) and everithing in its parameters allow the model too run without errors in this component
Reimplemented from ModelDataDefinition.

17.984.1.2 _loadInstance()

```
bool SPICERunner::_loadInstance (
            PersistenceRecord * fields )  [override], [protected], [virtual]
```

virtual protected method that must be overriden
Reimplemented from ModelDataDefinition.

17.984.1.3 _saveInstance()

```
void SPICERunner::_saveInstance (
            PersistenceRecord * fields,
            bool saveDefaultValues )  [override], [protected], [virtual]
```

Saves object fields into a serialization structure.

Parameters

fields	a table-like structure used for serialization.
saveDefaultValues	indicates whether or not to save fields which are set to their default value.

Reimplemented from ModelDataDefinition.

17.984.1.4 show()

```
std::string SPICERunner::show ( )  [override], [virtual]
```

virtual public methods
Reimplemented from ModelDataDefinition.
The documentation for this class was generated from the following files:

- plugins/data/ExternalIntegration/SPICERunner.h
- plugins/data/ExternalIntegration/SPICERunner.cpp

17.985 Start Class Reference

```
#include <plugins/components/MaterialHandling/Start.h>
```

- std::string **getVelocityExpression** () const

Public Member Functions inherited from ModelComponent

- ModelComponent (Model *model, std::string componentTypename, std::string name="")

  constructors
- virtual ~**ModelComponent** ()

  Releases component-owned resources and unregisters it from the model.
- ConnectionManager * getConnectionManager () const

  new public user methods for this component
- void connectTo (ModelComponent *component, unsigned int inputPortNumber=0)

  Connects this component to another component.
- bool hasBreakpointAt ()

  Indicates whether a simulation breakpoint is set on this component.
- void setDescription (std::string _description)

  Updates the free-form description shown by the GUI.
- std::string getDescription () const

  Returns the free-form description associated with this component.
- void remove (ModelComponent *comp)

  Removes a connected component from this component.

Public Member Functions inherited from ModelDataDefinition

- ModelDataDefinition (Model *model, std::string datadefinitionTypename, std::string name="", bool insertIntoModel=true)

  Creates a model data definition and optionally inserts it into the model.
- virtual ~**ModelDataDefinition** ()

  Releases resources owned by this data definition.
- Util::identification getId () const

  Returns the unique identifier of this instance.
- void setName (const std::string &name)

  Updates the logical name of this instance.
- const std::string & getName () const

  Returns the logical name of this instance.
- void setLabel (const std::string &label)

  Updates the user-visible label of this instance.
- const std::string & getLabel () const

  Returns the user-visible label of this instance.
- const std::string & getClassname () const

  Returns the runtime class name used by the plugin system.
- Model * getParentModel () const

  Returns the parent model that owns this definition.
- bool isReportStatistics () const

  Indicates whether this data definition contributes report statistics.
- void setReportStatistics (bool reportStatistics)

  Enables or disables report-statistics generation for this definition.
- ModelDataDefinition * getInternalData (const std::string &name) const

  Looks up a named internal child data definition.
- std::map< std::string, ModelDataDefinition * > * getInternalData () const

  Returns the full map of internal child data definitions.
- std::map< std::string, ModelDataDefinition * > * getAttachedData () const

  Returns the full map of attached data definitions.
- bool hasChanged () const

  Indicates whether this instance has been modified since the last reset.
- void setHasChanged (bool hasChanged)

  Updates the changed flag for this data definition.
- unsigned int getLevel () const

  Returns the hierarchical editing context containing this element.
- void setModelLevel (unsigned int _modelLevel)

  Sets this element's hierarchical editing context.
- List< SimulationControl * > * getSimulationControls () const

  Returns the simulation controls owned by this data definition.
- TraceManager::Level getTraceLevelSpecific () const

  Returns the trace level that applies specifically to this definition.
- void setTraceLevelSpecific (TraceManager::Level level)

  Updates the trace level used by this definition.
- void defineTraceLevelSpecific (TraceManager::Level traceLevelspecific, bool traceLevelSpecificEnabled=true)

  Defines the specific trace level and optionally enables it immediately.
- bool isTraceLevelSpecificEnabled () const

  Indicates whether the specific trace level is enabled.
- void setTraceLevelSpecificEnabled (bool traceLevelSpecificEnabled)

  Enables or disables the specific trace level.

Static Public Member Functions

- static PluginInformation * **GetPluginInformation** ()
- static ModelComponent * **LoadInstance** (Model *model, PersistenceRecord *fields)
- static ModelDataDefinition * **NewInstance** (Model *model, std::string name="")

Static Public Member Functions inherited from ModelComponent

- static ModelComponent * LoadInstance (Model *model, PersistenceRecord *fields)

  static public methods that must have implementations (Load and New just the same. GetInformation must provide specific infos for the new component
- static bool Check (ModelComponent *component)

  Validates a component instance.
- static void CreateInternalData (ModelComponent *component)

  Creates internal data required by a component instance.
- static void SaveInstance (PersistenceRecord *fields, ModelComponent *component)

  Serializes a component instance into a persistence record.
- static void DispatchEvent (Event *event)

  Dispatches a simulation event to the target component.

Static Public Member Functions inherited from ModelDataDefinition

- static ModelDataDefinition * LoadInstance (Model *model, PersistenceRecord *fields, bool insertIntoModel)

  Loads a model data definition instance from serialized fields.
- static ModelDataDefinition * NewInstance (Model *model, std::string name="")

  Creates a new instance of a data definition using the plugin registry.
- static void SaveInstance (PersistenceRecord *fields, ModelDataDefinition *modeldatum)

  Serializes a data definition instance into a persistence record.
- static bool Check (ModelDataDefinition *modeldatum, std::string &errorMessage)

  Validates a data definition instance.
- static void InitBetweenReplications (ModelDataDefinition *modeldatum)

  Resets simulation-time state between replications.
- static void CreateInternalData (ModelDataDefinition *modeldatum)

  Creates internal and attached data required by this instance.
- static bool CreateRelatedDataElements (ModelDataDefinition *modeldatum, std::string &errorMessage)

  Creates related data and validates the instance in a single call.

Protected Member Functions

- virtual void _onDispatchEvent (Entity *entity, unsigned int inputPortNumber) override

  Handles a dispatched event for this component type.
- virtual bool _loadInstance (PersistenceRecord *fields) override

  virtual protected method that must be overriden
- virtual void _saveInstance (PersistenceRecord *fields, bool saveDefaultValues) override

  Saves object fields into a serialization structure.
- virtual bool _check (std::string &errorMessage) override

  could be overriden by derived classes

Protected Member Functions inherited from ModelDataDefinition

17.985.1 Detailed Description

Start module DESCRIPTION The Start module changes the status of a conveyor from inactive to active. The conveyor may have been deactivated from either the Stop module or by initially being set to inactive at the start of the simulation. The velocity of the conveyor may be changed permanently when the conveyor is started. TYPICAL USES Start a bottling conveyor after scheduled maintenance Start a baggage claim conveyor when bags have arrived PROMPTS Prompt Description Name Unique name of the module that will be displayed in the flowchart. Conveyor Name Name of the conveyor to start. Velocity Speed of the conveyor once it begins to operate. This value will change the speed of the conveyor permanently, until it is changed in another module. Units Velocity time units.

17.985.2 Member Function Documentation

17.985.2.1 _check()

```
bool Start::_check (
            std::string & errorMessage )  [override], [protected], [virtual]
```

could be overriden by derived classes
Reimplemented from ModelDataDefinition.

17.985.2.2 _loadInstance()

```
bool Start::_loadInstance (
            PersistenceRecord * fields )  [override], [protected], [virtual]
```

virtual protected method that must be overriden
Reimplemented from ModelComponent.

17.985.2.3 _onDispatchEvent()

```
void Start::_onDispatchEvent (
            Entity * entity,
            unsigned int inputPortNumber )  [override], [protected], [virtual]
```

Handles a dispatched event for this component type.
This method is only for ModelComponents, not for ModelDataElements.

Parameters

entity	Entity being processed.
inputPortNumber	Input port where the entity arrived.

Implements ModelComponent.

17.985.2.4 _saveInstance()

```
void Start::_saveInstance (
            PersistenceRecord * fields,
            bool saveDefaultValues )  [override], [protected], [virtual]
```

Saves object fields into a serialization structure.

Parameters

fields	a table-like structure used for serialization.
saveDefaultValues	indicates whether or not to save fields which are set to their default value.

Reimplemented from ModelComponent.

17.985.2.5 show()

```
std::string Start::show ( )  [override], [virtual]
```

virtual public methods
Returns a textual representation of this component.

Returns

Human-readable description used for tracing and debugging.

Reimplemented from ModelComponent.
The documentation for this class was generated from the following files:

- plugins/components/MaterialHandling/Start.h
- plugins/components/MaterialHandling/Start.cpp

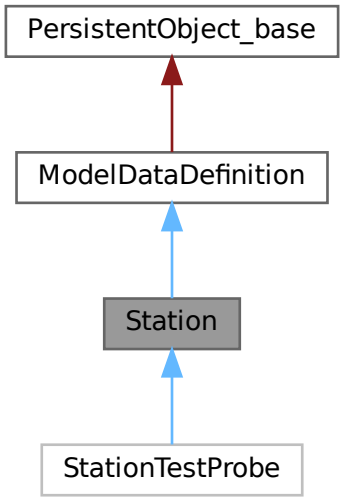
- plugins/components/ModalModel/CellularAutomata/StateSet_Enumerable.h
- plugins/components/ModalModel/CellularAutomata/StateSet_Enumerable.cpp

17.992 Station Class Reference

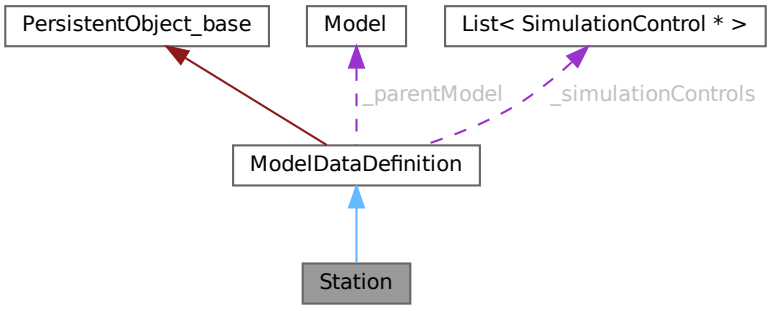
Data definition representing one physical/logical processing location, tracking the entities currently in it and their sojourn time.

`#include <plugins/data/MaterialHandling/Station.h>`

Inheritance diagram for Station:



Collaboration diagram for Station:



Public Member Functions

- **Station** (Model *model, std::string name="")
- virtual std::string show () override

  Returns a textual representation of this data definition.
- void **initBetweenReplications** ()
- void **enter** (Entity *entity)
- void **leave** (Entity *entity)

- void **setEnterIntoStationComponent** (ModelComponent *_enterIntoStationComponent)
- ModelComponent * **getEnterIntoStationComponent** () const

Public Member Functions inherited from ModelDataDefinition

- ModelDataDefinition (Model *model, std::string datadefinitionTypename, std::string name="", bool insertIntoModel=true)

  Creates a model data definition and optionally inserts it into the model.
- virtual ~**ModelDataDefinition** ()

  Releases resources owned by this data definition.
- Util::identification getId () const

  Returns the unique identifier of this instance.
- void setName (const std::string &name)

  Updates the logical name of this instance.
- const std::string & getName () const

  Returns the logical name of this instance.
- void setLabel (const std::string &label)

  Updates the user-visible label of this instance.
- const std::string & getLabel () const

  Returns the user-visible label of this instance.
- const std::string & getClassname () const

  Returns the runtime class name used by the plugin system.
- Model * getParentModel () const

  Returns the parent model that owns this definition.
- bool isReportStatistics () const

  Indicates whether this data definition contributes report statistics.
- void setReportStatistics (bool reportStatistics)

  Enables or disables report-statistics generation for this definition.
- ModelDataDefinition * getInternalData (const std::string &name) const

  Looks up a named internal child data definition.
- std::map< std::string, ModelDataDefinition * > * getInternalData () const

  Returns the full map of internal child data definitions.
- std::map< std::string, ModelDataDefinition * > * getAttachedData () const

  Returns the full map of attached data definitions.
- bool hasChanged () const

  Indicates whether this instance has been modified since the last reset.
- void setHasChanged (bool hasChanged)

  Updates the changed flag for this data definition.
- unsigned int getLevel () const

  Returns the hierarchical editing context containing this element.
- void setModelLevel (unsigned int _modelLevel)

  Sets this element's hierarchical editing context.
- List< SimulationControl * > * getSimulationControls () const

  Returns the simulation controls owned by this data definition.
- TraceManager::Level getTraceLevelSpecific () const

  Returns the trace level that applies specifically to this definition.
- void setTraceLevelSpecific (TraceManager::Level level)

  Updates the trace level used by this definition.
- void defineTraceLevelSpecific (TraceManager::Level traceLevelspecific, bool traceLevelSpecificEnabled=true)

  Defines the specific trace level and optionally enables it immediately.

- bool isTraceLevelSpecificEnabled () const

  Indicates whether the specific trace level is enabled.
- void setTraceLevelSpecificEnabled (bool traceLevelSpecificEnabled)

  Enables or disables the specific trace level.

Static Public Member Functions

- static PluginInformation * **GetPluginInformation** ()
- static ModelDataDefinition * **LoadInstance** (Model *model, PersistenceRecord *fields)
- static ModelDataDefinition * **NewInstance** (Model *model, std::string name="")

Static Public Member Functions inherited from ModelDataDefinition

- static ModelDataDefinition * LoadInstance (Model *model, PersistenceRecord *fields, bool insertIntoModel)

  Loads a model data definition instance from serialized fields.
- static ModelDataDefinition * NewInstance (Model *model, std::string name="")

  Creates a new instance of a data definition using the plugin registry.
- static void SaveInstance (PersistenceRecord *fields, ModelDataDefinition *modeldatum)

  Serializes a data definition instance into a persistence record.
- static bool Check (ModelDataDefinition *modeldatum, std::string &errorMessage)

  Validates a data definition instance.
- static void InitBetweenReplications (ModelDataDefinition *modeldatum)

  Resets simulation-time state between replications.
- static void CreateInternalData (ModelDataDefinition *modeldatum)

  Creates internal and attached data required by this instance.
- static bool CreateRelatedDataElements (ModelDataDefinition *modeldatum, std::string &errorMessage)

  Creates related data and validates the instance in a single call.

Protected Member Functions

- virtual bool _loadInstance (PersistenceRecord *fields) override

  must be overriden by derived classes
- virtual void _saveInstance (PersistenceRecord *fields, bool saveDefaultValues) override

  Saves object fields into a serialization structure.

17.992.1 Detailed Description

Data definition representing one physical/logical processing location, tracking the entities currently in it and their sojourn time.
Arena correspondence: Arena's "Station module" (Rockwell Automation, *Getting Started with Arena*, "The Advanced Transfer Panel", pp. 86-87). Note that in Arena, Station is a flowchart module placed on the diagram (with a matching Activity Area for cost/time roll-up), whereas in GenESyS this class is purely a data definition referenced by Material↩ Handling components (Enter, Route, PickStation, etc.); `enter()` / `leave()` and the `NumberInStation`/↩ `TimeInStation` statistics collectors are the closest correspondence to Arena's per-station/Activity-Area counts and times.
Known differences from Arena, still to verify against the MaterialHandling components in Phase B: no station-set concept (Arena's "Station Type = Set" with member list and Save Attribute), no parent Activity Area for hierarchical cost roll-up, and no associated-intersection field for a guided transporter network — GenESyS currently has no Transporter/Network data definitions at all (see the compatibility matrix).

17.992.2 Member Function Documentation

17.992.2.1 _check()

```
bool Station::_check (
            std::string & errorMessage )  [override], [protected], [virtual]
```

could be overriden by derived classes
Reimplemented from ModelDataDefinition.

17.992.2.2 _createAttachedAttributes()

```
void Station::_createAttachedAttributes ( )  [override], [protected], [virtual]
```

Reimplemented from ModelDataDefinition.

17.992.2.3 _createInternalStatisticReporters()

```
void Station::_createInternalStatisticReporters ( )  [override], [protected], [virtual]
```

Reimplemented from ModelDataDefinition.

17.992.2.4 _initBetweenReplications()

```
void Station::_initBetweenReplications ( )  [override], [protected], [virtual]
```

Reimplemented from ModelDataDefinition.

17.992.2.5 _loadInstance()

```
bool Station::_loadInstance (
            PersistenceRecord * fields )  [override], [protected], [virtual]
```

must be overriden by derived classes
Reimplemented from ModelDataDefinition.

17.992.2.6 _saveInstance()

```
void Station::_saveInstance (
            PersistenceRecord * fields,
            bool saveDefaultValues )  [override], [protected], [virtual]
```

Saves object fields into a serialization structure.

Parameters

fields	a table-like structure used for serialization.
saveDefaultValues	indicates whether or not to save fields which are set to their default value.

Reimplemented from ModelDataDefinition.

17.992.2.7 show()

`std::string Station::show ( ) [override], [virtual]`

Returns a textual representation of this data definition.
Returns the keys of internal ModelDataDefinitions such as counters, statistics collectors and other children needed before model checking.

Returns

Human-readable summary used by traces and debug output.

Reimplemented from ModelDataDefinition.
The documentation for this class was generated from the following files:

- plugins/data/MaterialHandling/Station.h

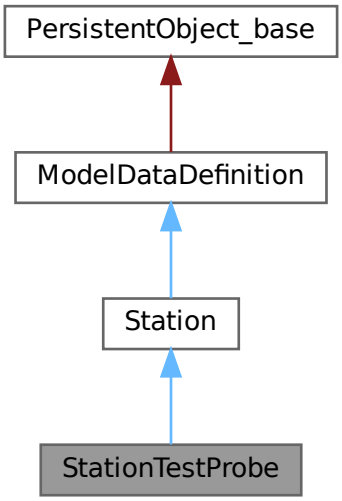
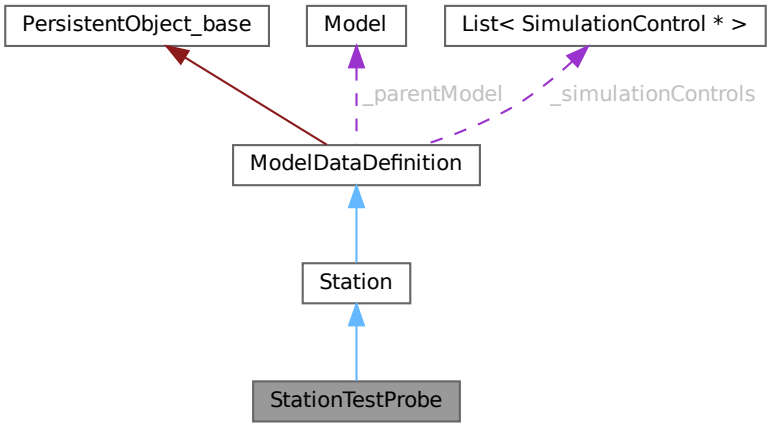
17.993 StationTestProbe Class Reference

Inheritance diagram for StationTestProbe:



Collaboration diagram for StationTestProbe:



Public Member Functions

- **StationTestProbe** (Model *model, const std::string &name="")
- void **CreateInternalAndAttachedDataProbe** ()
- void **InitBetweenReplicationsProbe** ()
- StatisticsCollector * **NumberInStationCollectorProbe** () const
- StatisticsCollector * **TimeInStationCollectorProbe** () const
- unsigned int **NumberInStationProbe** () const

Public Member Functions inherited from Station

- **Station** (Model *model, std::string name="")
- virtual std::string show () override

  Returns a textual representation of this data definition.
- void **initBetweenReplications** ()
- void **enter** (Entity *entity)
- void **leave** (Entity *entity)
- void **setEnterIntoStationComponent** (ModelComponent *_enterIntoStationComponent)
- ModelComponent * **getEnterIntoStationComponent** () const

Public Member Functions inherited from ModelDataDefinition

- ModelDataDefinition (Model *model, std::string datadefinitionTypename, std::string name="", bool insert↩ IntoModel=true)

  Creates a model data definition and optionally inserts it into the model.
- virtual ~**ModelDataDefinition** ()

  Releases resources owned by this data definition.
- Util::identification getId () const

  Returns the unique identifier of this instance.
- void setName (const std::string &name)

  Updates the logical name of this instance.
- const std::string & getName () const

  Returns the logical name of this instance.

- void setLabel (const std::string &label)

  Updates the user-visible label of this instance.
- const std::string & getLabel () const

  Returns the user-visible label of this instance.
- const std::string & getClassname () const

  Returns the runtime class name used by the plugin system.
- Model * getParentModel () const

  Returns the parent model that owns this definition.
- bool isReportStatistics () const

  Indicates whether this data definition contributes report statistics.
- void setReportStatistics (bool reportStatistics)

  Enables or disables report-statistics generation for this definition.
- ModelDataDefinition * getInternalData (const std::string &name) const

  Looks up a named internal child data definition.
- std::map< std::string, ModelDataDefinition * > * getInternalData () const

  Returns the full map of internal child data definitions.
- std::map< std::string, ModelDataDefinition * > * getAttachedData () const

  Returns the full map of attached data definitions.
- bool hasChanged () const

  Indicates whether this instance has been modified since the last reset.
- void setHasChanged (bool hasChanged)

  Updates the changed flag for this data definition.
- unsigned int getLevel () const

  Returns the hierarchical editing context containing this element.
- void setModelLevel (unsigned int _modelLevel)

  Sets this element's hierarchical editing context.
- List< SimulationControl * > * getSimulationControls () const

  Returns the simulation controls owned by this data definition.
- TraceManager::Level getTraceLevelSpecific () const

  Returns the trace level that applies specifically to this definition.
- void setTraceLevelSpecific (TraceManager::Level level)

  Updates the trace level used by this definition.
- void defineTraceLevelSpecific (TraceManager::Level traceLevelspecific, bool traceLevelSpecific↩ Enabled=true)

  Defines the specific trace level and optionally enables it immediately.
- bool isTraceLevelSpecificEnabled () const

  Indicates whether the specific trace level is enabled.
- void setTraceLevelSpecificEnabled (bool traceLevelSpecificEnabled)

  Enables or disables the specific trace level.

Additional Inherited Members

Static Public Member Functions inherited from Station

- static PluginInformation * **GetPluginInformation** ()
- static ModelDataDefinition * **LoadInstance** (Model *model, PersistenceRecord *fields)
- static ModelDataDefinition * **NewInstance** (Model *model, std::string name="")

Static Public Member Functions inherited from ModelDataDefinition

- static ModelDataDefinition * LoadInstance (Model *model, PersistenceRecord *fields, bool insertIntoModel)

  Loads a model data definition instance from serialized fields.
- static ModelDataDefinition * NewInstance (Model *model, std::string name="")

  Creates a new instance of a data definition using the plugin registry.
- static void SaveInstance (PersistenceRecord *fields, ModelDataDefinition *modeldatum)

  Serializes a data definition instance into a persistence record.
- static bool Check (ModelDataDefinition *modeldatum, std::string &errorMessage)

  Validates a data definition instance.
- static void InitBetweenReplications (ModelDataDefinition *modeldatum)

  Resets simulation-time state between replications.
- static void CreateInternalData (ModelDataDefinition *modeldatum)

  Creates internal and attached data required by this instance.
- static bool CreateRelatedDataElements (ModelDataDefinition *modeldatum, std::string &errorMessage)

  Creates related data and validates the instance in a single call.

Protected Member Functions inherited from Station

- virtual bool _loadInstance (PersistenceRecord *fields) override

  must be overriden by derived classes
- virtual void _saveInstance (PersistenceRecord *fields, bool saveDefaultValues) override

  Saves object fields into a serialization structure.
- virtual bool _check (std::string &errorMessage) override

  could be overriden by derived classes
- virtual void _initBetweenReplications () override
- virtual void _createInternalStatisticReporters () override
- virtual void _createAttachedAttributes () override

Protected Member Functions inherited from ModelDataDefinition

- bool _getSaveDefaultsOption ()

  setConfidenceLevel

17.994.1 Detailed Description

Interface for statistical synthesis over values provided by a `Collector_if`.
Implementations may compute metrics incrementally (online) or based on persisted datasets, but must expose a consistent API for descriptive and inferential measures.

17.994.2 Member Function Documentation

17.994.2.1 average()

```
virtual double Statistics_if::average ( )  [pure virtual]
```

average

Returns

Returns the sample mean of observations.
Implemented in StatisticsDatafileDefaultImpl1, and StatisticsDefaultImpl1.

17.994.2.2 confidenceLevel()

```
virtual double Statistics_if::confidenceLevel ( )  [pure virtual]
```

confidenceLevel

Returns

Returns the confidence level used for interval estimates.
Implemented in StatisticsDatafileDefaultImpl1, and StatisticsDefaultImpl1.

17.994.2.3 getCollector()

```
virtual Collector_if * Statistics_if::getCollector ( ) const  [pure virtual]
```

Returns the data collector associated with these statistics.
Implemented in StatisticsDatafileDefaultImpl1, and StatisticsDefaultImpl1.

17.994.2.4 halfWidthConfidenceInterval()

```
virtual double Statistics_if::halfWidthConfidenceInterval ( )  [pure virtual]
```

halfWidthConfidenceInterval

Returns

Returns the half-width of the current confidence interval.
Implemented in StatisticsDatafileDefaultImpl1, and StatisticsDefaultImpl1.

17.994.2.5 max()

```
virtual double Statistics_if::max ( )  [pure virtual]
```

max

Returns

Returns the maximum observed value.
Implemented in StatisticsDatafileDefaultImpl1, and StatisticsDefaultImpl1.

17.994.2.6 min()

```
virtual double Statistics_if::min ( )  [pure virtual]
```

min

Returns

Returns the minimum observed value.
Implemented in StatisticsDatafileDefaultImpl1, and StatisticsDefaultImpl1.

17.994.2.7 newSampleSize()

```
virtual unsigned int Statistics_if::newSampleSize (
            double halfWidth )  [pure virtual]
```

newSampleSize

Parameters

halfWidth	

Returns

Estimates the sample size needed to reach a target half-width.
Implemented in StatisticsDatafileDefaultImpl1, and StatisticsDefaultImpl1.

17.994.2.8 numElements()

```
virtual unsigned int Statistics_if::numElements ( )  [pure virtual]
```

numElements

Returns

Returns the number of observations considered in calculations.
Implemented in StatisticsDatafileDefaultImpl1, and StatisticsDefaultImpl1.

17.994.2.9 setCollector()

```
virtual void Statistics_if::setCollector (
            Collector_if * collector )  [pure virtual]
```

Sets the collector used as source for statistical calculations.
Implemented in StatisticsDatafileDefaultImpl1, and StatisticsDefaultImpl1.

17.994.2.10 setConfidenceLevel()

```
virtual void Statistics_if::setConfidenceLevel (
            double confidencelevel )  [pure virtual]
```

setConfidenceLevel

Parameters

confidencelevel	

Sets the confidence level used in inferential calculations.
Implemented in StatisticsDatafileDefaultImpl1, and StatisticsDefaultImpl1.

17.994.2.11 stddeviation()

```
virtual double Statistics_if::stddeviation ( )  [pure virtual]
```

stddeviation

Returns

Returns the sample standard deviation.
Implemented in StatisticsDatafileDefaultImpl1, and StatisticsDefaultImpl1.

17.994.2.12 variance()

```
virtual double Statistics_if::variance ( )  [pure virtual]
```

variance

Returns

Returns the sample variance of observations.
Implemented in StatisticsDatafileDefaultImpl1, and StatisticsDefaultImpl1.

17.994.2.13 variationCoef()

```
virtual double Statistics_if::variationCoef ( )  [pure virtual]
```

variationCoef

Returns

Returns the coefficient of variation (standard deviation / mean).
Implemented in StatisticsDatafileDefaultImpl1, and StatisticsDefaultImpl1.

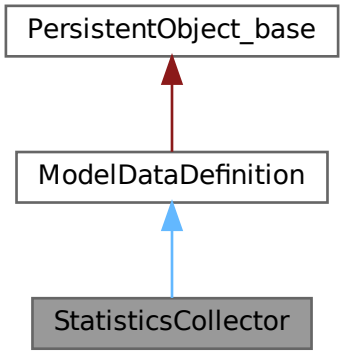
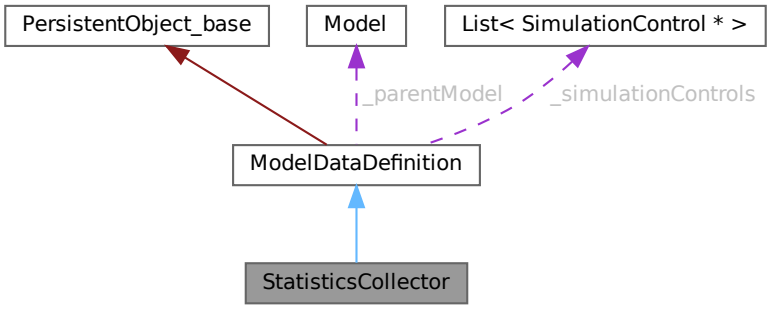
17.995 StatisticsCollector Class Reference

`#include <kernel/simulator/essentialPlugins/StatisticsCollector.h>`
Inheritance diagram for StatisticsCollector:



Collaboration diagram for StatisticsCollector:



Public Member Functions

- **StatisticsCollector** (Model *model, std::string name="", ModelDataDefinition *parent=nullptr, bool insert↩ IntoModel=true)
- virtual std::string show () override

  Returns a textual representation of this data definition.
- ModelDataDefinition * getParent () const

  getParent
- Statistics_if * getStatistics () const

  getStatistics

Public Member Functions inherited from ModelDataDefinition

- ModelDataDefinition (Model *model, std::string datadefinitionTypename, std::string name="", bool insert↩ IntoModel=true)

  Creates a model data definition and optionally inserts it into the model.
- virtual ~**ModelDataDefinition** ()

  Releases resources owned by this data definition.
- Util::identification getId () const

  Returns the unique identifier of this instance.
- void setName (const std::string &name)

  Updates the logical name of this instance.
- const std::string & getName () const

  Returns the logical name of this instance.
- void setLabel (const std::string &label)

  Updates the user-visible label of this instance.
- const std::string & getLabel () const

  Returns the user-visible label of this instance.
- const std::string & getClassname () const

  Returns the runtime class name used by the plugin system.
- Model * getParentModel () const

  Returns the parent model that owns this definition.
- bool isReportStatistics () const

  Indicates whether this data definition contributes report statistics.
- void setReportStatistics (bool reportStatistics)

Enables or disables report-statistics generation for this definition.

- ModelDataDefinition * getInternalData (const std::string &name) const

  Looks up a named internal child data definition.
- std::map< std::string, ModelDataDefinition * > * getInternalData () const

  Returns the full map of internal child data definitions.
- std::map< std::string, ModelDataDefinition * > * getAttachedData () const

  Returns the full map of attached data definitions.
- bool hasChanged () const

  Indicates whether this instance has been modified since the last reset.
- void setHasChanged (bool hasChanged)

  Updates the changed flag for this data definition.
- unsigned int getLevel () const

  Returns the hierarchical editing context containing this element.
- void setModelLevel (unsigned int _modelLevel)

  Sets this element's hierarchical editing context.
- List< SimulationControl * > * getSimulationControls () const

  Returns the simulation controls owned by this data definition.
- TraceManager::Level getTraceLevelSpecific () const

  Returns the trace level that applies specifically to this definition.
- void setTraceLevelSpecific (TraceManager::Level level)

  Updates the trace level used by this definition.
- void defineTraceLevelSpecific (TraceManager::Level traceLevelspecific, bool traceLevelSpecific↩ Enabled=true)

  Defines the specific trace level and optionally enables it immediately.
- bool isTraceLevelSpecificEnabled () const

  Indicates whether the specific trace level is enabled.
- void setTraceLevelSpecificEnabled (bool traceLevelSpecificEnabled)

  Enables or disables the specific trace level.

17.995.1 Detailed Description

The StatisticsCollector is the ModelDataDefinition responsible for collecting data from the model (using the Collector) and simultaneouly keeping statistics updated (using the Statistics)

17.995.2 Member Function Documentation

17.995.2.1 _check()

```
bool StatisticsCollector::_check (
            std::string & errorMessage )  [override], [protected], [virtual]
```

could be overriden by derived classes
Reimplemented from ModelDataDefinition.

17.995.2.2 _loadInstance()

```
bool StatisticsCollector::_loadInstance (
            PersistenceRecord * fields )  [override], [protected], [virtual]
```

must be overriden by derived classes
Reimplemented from ModelDataDefinition.

17.995.2.3 _saveInstance()

```
void StatisticsCollector::_saveInstance (
            PersistenceRecord * fields,
            bool saveDefaultValues )  [override], [protected], [virtual]
```

Saves object fields into a serialization structure.

Parameters

fields	a table-like structure used for serialization.
saveDefaultValues	indicates whether or not to save fields which are set to their default value.

Reimplemented from ModelDataDefinition.

17.995.2.4 getParent()

```
ModelDataDefinition * StatisticsCollector::getParent ( ) const
```

getParent

Returns

17.995.2.5 getStatistics()

```
Statistics_if * StatisticsCollector::getStatistics ( ) const
```

getStatistics

Returns

17.995.2.6 show()

```
std::string StatisticsCollector::show ( )  [override], [virtual]
```

Returns a textual representation of this data definition.
Returns the keys of internal ModelDataDefinitions such as counters, statistics collectors and other children needed before model checking.

Returns

Human-readable summary used by traces and debug output.

Reimplemented from ModelDataDefinition.

17.996.1 Detailed Description

Extension of `Statistics_if` for metrics that require full data access.
This interface targets collector implementations backed by data files, enabling order-based measures (median, quantiles) and histogram-related operations.

17.996.2 Member Function Documentation

17.996.2.1 centil()

```
virtual double StatisticsDatafile_if::centil (
            unsigned short num )  [pure virtual]
```

centil

Parameters

num	

Returns

Returns the requested percentile (1 to 99).
Implemented in StatisticsDatafileDefaultImpl1.

17.996.2.2 decil()

```
virtual double StatisticsDatafile_if::decil (
            unsigned short num )  [pure virtual]
```

decil

Parameters

num	

Returns

Returns the requested decile (1 to 9).
Implemented in StatisticsDatafileDefaultImpl1.

17.996.2.3 histogramClassFrequency()

```
virtual unsigned int StatisticsDatafile_if::histogramClassFrequency (
            unsigned short classNum )  [pure virtual]
```

histogramClassFrequency

Parameters

classNum	

Returns

Returns the absolute frequency of the requested histogram class.
Implemented in StatisticsDatafileDefaultImpl1.

17.996.2.4 histogramClassLowerLimit()

```
virtual double StatisticsDatafile_if::histogramClassLowerLimit (
            unsigned short classNum )  [pure virtual]
```

histogramClassLowerLimit

Parameters

classNum	

Returns

Returns the lower bound of the histogram class at index `classNum`.
Implemented in StatisticsDatafileDefaultImpl1.

17.996.2.5 histogramNumClasses()

```
virtual unsigned short StatisticsDatafile_if::histogramNumClasses ( )  [pure virtual]
```

histogramNumClasses

Returns

Returns the configured number of histogram classes.
Implemented in StatisticsDatafileDefaultImpl1.

17.996.2.6 mediane()

```
virtual double StatisticsDatafile_if::mediane ( )  [pure virtual]
```

mediane

Returns

Returns the sample median.
Implemented in StatisticsDatafileDefaultImpl1.

17.996.2.7 mode()

```
virtual double StatisticsDatafile_if::mode ( )  [pure virtual]
```

mode

Returns

Returns the mode of the sample stored in file.
Implemented in StatisticsDatafileDefaultImpl1.

17.996.2.8 quartil()

```
virtual double StatisticsDatafile_if::quartil (
            unsigned short num )  [pure virtual]
```

quartil

Parameters

num	

Returns

Returns the requested quartile (1 to 3).
Implemented in StatisticsDatafileDefaultImpl1.

17.996.2.9 setHistogramNumClasses()

```
virtual void StatisticsDatafile_if::setHistogramNumClasses (
            unsigned short num )  [pure virtual]
```

setHistogramNumClasses

Parameters

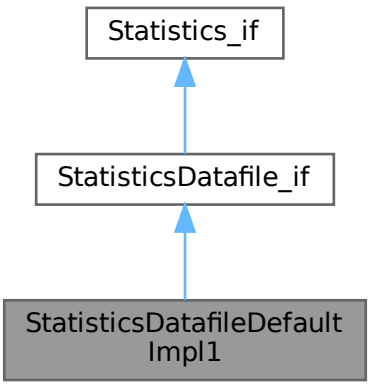
num	

Sets the number of classes used in the histogram.
Implemented in StatisticsDatafileDefaultImpl1.
The documentation for this class was generated from the following file:

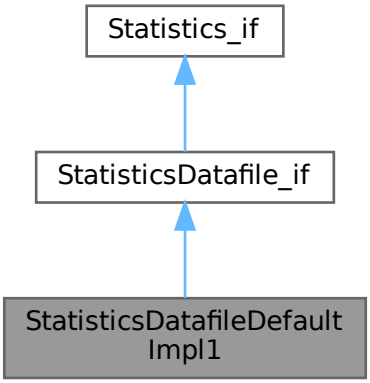
- kernel/statistics/StatisticsDataFile_if.h

17.997 StatisticsDatafileDefaultImpl1 Class Reference

Default implementation of `StatisticsDatafile_if` for file-backed samples.
`#include <kernel/statistics/StatisticsDataFileDefaultImpl.h>`
Inheritance diagram for StatisticsDatafileDefaultImpl1:



Collaboration diagram for StatisticsDatafileDefaultImpl1:



Public Member Functions

- **StatisticsDatafileDefaultImpl1** ()

  Creates statistics object with default collector implementation.
- virtual ~**StatisticsDatafileDefaultImpl1** ()

  Releases owned collector/sorter resources when configured as owner.
- virtual Collector_if * getCollector () const override

  Returns the collector currently used as data source.
- virtual void setCollector (Collector_if *collector) override

  Sets a collector to be used as data source for calculations.
- virtual unsigned int numElements () override

  Returns number of observations available in the collector.
- virtual double min () override

  Returns minimum observed value.
- virtual double max () override

  Returns maximum observed value.
- virtual double average () override

  Returns arithmetic mean.
- virtual double variance () override

  Returns sample variance.
- virtual double stddeviation () override

  Returns sample standard deviation.
- virtual double variationCoef () override

  Returns coefficient of variation.
- virtual double halfWidthConfidenceInterval () override

  Returns current confidence interval half-width.
- virtual double confidenceLevel () override

  Returns configured confidence level.
- virtual unsigned int newSampleSize (double halfWidth) override

  Estimates sample size needed for a desired half-width.
- virtual void setConfidenceLevel (double confidencelevel) override

Sets confidence level used in inferential calculations.

- virtual double mode () override

  Returns sample mode.
- virtual double mediane () override

  Returns sample median.
- virtual double quartil (unsigned short num) override

  Returns requested quartile.
- virtual double decil (unsigned short num) override

  Returns requested decile.
- virtual double centil (unsigned short num) override

  Returns requested percentile.
- virtual void setHistogramNumClasses (unsigned short num) override

  Sets number of histogram classes.
- virtual unsigned short histogramNumClasses () override

  Returns current number of histogram classes.
- virtual double histogramClassLowerLimit (unsigned short classNum) override

  Returns lower limit of histogram class `classNum`.
- virtual unsigned int histogramClassFrequency (unsigned short classNum) override

  Returns absolute frequency of histogram class `classNum`.

17.997.1 Detailed Description

Default implementation of `StatisticsDatafile_if` for file-backed samples.
Computes descriptive/inferential statistics from a `CollectorDatafile_if` and caches results to avoid recomputation until source data changes.

17.997.2 Member Function Documentation

17.997.2.1 average()

```
double StatisticsDatafileDefaultImpl1::average ( )  [override], [virtual]
```

Returns arithmetic mean.
Implements Statistics_if.

17.997.2.2 centil()

```
double StatisticsDatafileDefaultImpl1::centil (
            unsigned short num )  [override], [virtual]
```

Returns requested percentile.
Implements StatisticsDatafile_if.

17.997.2.3 confidenceLevel()

```
double StatisticsDatafileDefaultImpl1::confidenceLevel ( )  [override], [virtual]
```

Returns configured confidence level.
Implements Statistics_if.

17.997.2.4 decil()

```
double StatisticsDatafileDefaultImpl1::decil (
            unsigned short num )  [override], [virtual]
```

Returns requested decile.
Implements StatisticsDatafile_if.

17.997.2.5 getCollector()

```
Collector_if * StatisticsDatafileDefaultImpl1::getCollector ( ) const  [override], [virtual]
```

Returns the collector currently used as data source.
Implements Statistics_if.

17.997.2.6 halfWidthConfidenceInterval()

```
double StatisticsDatafileDefaultImpl1::halfWidthConfidenceInterval ( )  [override], [virtual]
```

Returns current confidence interval half-width.
Implements Statistics_if.

17.997.2.7 histogramClassFrequency()

```
unsigned int StatisticsDatafileDefaultImpl1::histogramClassFrequency (
            unsigned short classNum )  [override], [virtual]
```

Returns absolute frequency of histogram class `classNum`.
Implements StatisticsDatafile_if.

17.997.2.8 histogramClassLowerLimit()

```
double StatisticsDatafileDefaultImpl1::histogramClassLowerLimit (
            unsigned short classNum )  [override], [virtual]
```

Returns lower limit of histogram class `classNum`.
Implements StatisticsDatafile_if.

17.997.2.9 histogramNumClasses()

```
unsigned short StatisticsDatafileDefaultImpl1::histogramNumClasses ( )  [override], [virtual]
```

Returns current number of histogram classes.
Implements StatisticsDatafile_if.

17.997.2.10 max()

```
double StatisticsDatafileDefaultImpl1::max ( )  [override], [virtual]
```

Returns maximum observed value.
Implements Statistics_if.

17.997.2.11 mediane()

```
double StatisticsDatafileDefaultImpl1::mediane ( )  [override], [virtual]
```

Returns sample median.
Implements StatisticsDatafile_if.

17.997.2.12 min()

```
double StatisticsDatafileDefaultImpl1::min ( )  [override], [virtual]
```

Returns minimum observed value.
Implements Statistics_if.

17.997.2.13 mode()

```
double StatisticsDatafileDefaultImpl1::mode ( )  [override], [virtual]
```

Returns sample mode.
Implements StatisticsDatafile_if.

17.997.2.14 newSampleSize()

```
unsigned int StatisticsDatafileDefaultImpl1::newSampleSize (
            double halfWidth ) [override], [virtual]
```

Estimates sample size needed for a desired half-width.
Implements Statistics_if.

17.997.2.15 numElements()

```
unsigned int StatisticsDatafileDefaultImpl1::numElements ( ) [override], [virtual]
```

Returns number of observations available in the collector.
Implements Statistics_if.

17.997.2.16 quartil()

```
double StatisticsDatafileDefaultImpl1::quartil (
            unsigned short num ) [override], [virtual]
```

Returns requested quartile.
Implements StatisticsDatafile_if.

17.997.2.17 setCollector()

```
void StatisticsDatafileDefaultImpl1::setCollector (
            Collector_if * collector ) [override], [virtual]
```

Sets a collector to be used as data source for calculations.
Implements Statistics_if.

17.997.2.18 setConfidenceLevel()

```
void StatisticsDatafileDefaultImpl1::setConfidenceLevel (
            double confidencelevel ) [override], [virtual]
```

Sets confidence level used in inferential calculations.
Implements Statistics_if.

17.997.2.19 setHistogramNumClasses()

```
void StatisticsDatafileDefaultImpl1::setHistogramNumClasses (
            unsigned short num ) [override], [virtual]
```

Sets number of histogram classes.
Implements StatisticsDatafile_if.

17.997.2.20 stddeviation()

```
double StatisticsDatafileDefaultImpl1::stddeviation ( ) [override], [virtual]
```

Returns sample standard deviation.
Implements Statistics_if.

17.997.2.21 variance()

```
double StatisticsDatafileDefaultImpl1::variance ( ) [override], [virtual]
```

Returns sample variance.
Implements Statistics_if.

17.997.2.22 variationCoef()

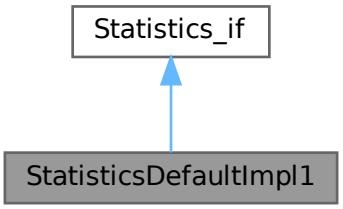
```
double StatisticsDatafileDefaultImpl1::variationCoef ( ) [override], [virtual]
```

Returns coefficient of variation.
Implements Statistics_if.
The documentation for this class was generated from the following files:

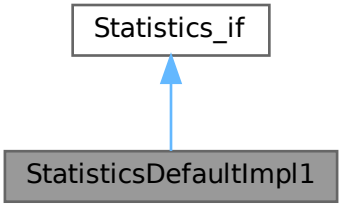
- kernel/statistics/StatisticsDataFileDefaultImpl.h
- kernel/statistics/StatisticsDataFileDefaultImpl.cpp

17.998 StatisticsDefaultImpl1 Class Reference

Default online statistics implementation over a `Collector_if` source.
`#include <kernel/statistics/StatisticsDefaultImpl1.h>`
Inheritance diagram for StatisticsDefaultImpl1:



Collaboration diagram for StatisticsDefaultImpl1:



Public Member Functions

- StatisticsDefaultImpl1 ()

  Creates statistics object using configured default collector implementation.
- **StatisticsDefaultImpl1** (Collector_if ∗collector)

  Creates statistics object bound to an external collector.
- virtual Collector_if ∗ getCollector () const override

  Returns current collector data source.
- virtual void setCollector (Collector_if ∗collector) override

  Sets collector source and reconnects internal callbacks.
- virtual unsigned int numElements () override

  Returns number of observed samples.
- virtual double min () override

  Returns minimum observed value.
- virtual double max () override

Returns maximum observed value.

- virtual double average () override

  Returns arithmetic mean.
- virtual double variance () override

  Returns sample variance.
- virtual double stddeviation () override

  Returns sample standard deviation.
- virtual double variationCoef () override

  Returns coefficient of variation.
- virtual double halfWidthConfidenceInterval () override

  Returns confidence interval half-width.
- virtual double confidenceLevel () override

  Returns configured confidence level.
- virtual unsigned int newSampleSize (double halfWidth) override

  Estimates sample size required for desired half-width.
- virtual void setConfidenceLevel (double confidencelevel) override

  Sets confidence level used in inferential formulas.

17.998.1 Detailed Description

Default online statistics implementation over a `Collector_if` source.
Updates core metrics incrementally through collector callbacks, avoiding complete rescans for every query.

17.998.2 Constructor & Destructor Documentation

17.998.2.1 StatisticsDefaultImpl1()

```
StatisticsDefaultImpl1::StatisticsDefaultImpl1 ( )
```

Creates statistics object using configured default collector implementation.
When constructor is invoked without a Collector, it is taken from Traits<Statistics_if>::CollectorImplementation configuration

17.998.3 Member Function Documentation

17.998.3.1 average()

```
double StatisticsDefaultImpl1::average ( )  [override], [virtual]
```

Returns arithmetic mean.
Implements Statistics_if.

17.998.3.2 confidenceLevel()

```
double StatisticsDefaultImpl1::confidenceLevel ( )  [override], [virtual]
```

Returns configured confidence level.
Implements Statistics_if.

17.998.3.3 getCollector()

```
Collector_if * StatisticsDefaultImpl1::getCollector ( ) const  [override], [virtual]
```

Returns current collector data source.
Implements Statistics_if.

17.998.3.4 halfWidthConfidenceInterval()

```
double StatisticsDefaultImpl1::halfWidthConfidenceInterval ( )  [override], [virtual]
```

Returns confidence interval half-width.
Implements Statistics_if.

17.998.3.5 max()

```
double StatisticsDefaultImpl1::max ( )  [override], [virtual]
```

Returns maximum observed value.
Implements Statistics_if.

17.998.3.6 min()

```
double StatisticsDefaultImpl1::min ( )  [override], [virtual]
```

Returns minimum observed value.
Implements Statistics_if.

17.998.3.7 newSampleSize()

```
unsigned int StatisticsDefaultImpl1::newSampleSize (
            double halfWidth )  [override], [virtual]
```

Estimates sample size required for desired half-width.
Implements Statistics_if.

17.998.3.8 numElements()

```
unsigned int StatisticsDefaultImpl1::numElements ( )  [override], [virtual]
```

Returns number of observed samples.
Implements Statistics_if.

17.998.3.9 setCollector()

```
void StatisticsDefaultImpl1::setCollector (
            Collector_if * collector )  [override], [virtual]
```

Sets collector source and reconnects internal callbacks.
Implements Statistics_if.

17.998.3.10 setConfidenceLevel()

```
void StatisticsDefaultImpl1::setConfidenceLevel (
            double confidencelevel )  [override], [virtual]
```

Sets confidence level used in inferential formulas.
Implements Statistics_if.

17.998.3.11 stddeviation()

```
double StatisticsDefaultImpl1::stddeviation ( )  [override], [virtual]
```

Returns sample standard deviation.
Implements Statistics_if.

17.998.3.12 variance()

```
double StatisticsDefaultImpl1::variance ( )  [override], [virtual]
```

Returns sample variance.
Implements Statistics_if.

17.998.3.13 variationCoef()

```
double StatisticsDefaultImpl1::variationCoef ( )  [override], [virtual]
```

Returns coefficient of variation.
Implements Statistics_if.

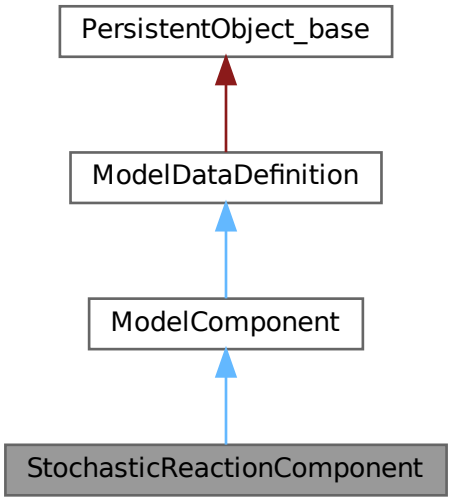
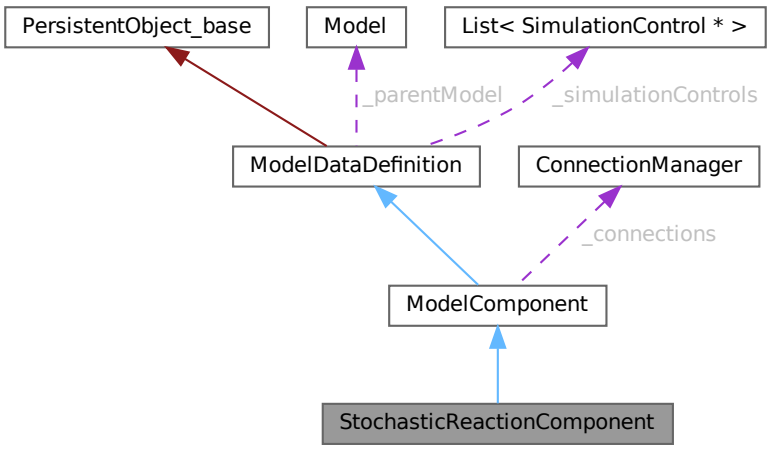
17.999 StochasticReactionComponent Class Reference

`#include <plugins/components/WholeCellModeling/StochasticReactionComponent.h>`

Inheritance diagram for StochasticReactionComponent:



Collaboration diagram for StochasticReactionComponent:



Public Member Functions

- **StochasticReactionComponent** (Model *model, std::string name="")
- void **setWholeCellState** (WholeCellState *state)
- WholeCellState * **getWholeCellState** () const

- void **setTimeWindow** (double timeWindow)
- double **getTimeWindow** () const
- void **setAdvanceWholeCellClock** (bool advance)
- bool **getAdvanceWholeCellClock** () const
- void **setRandomSeed** (unsigned int seed)
- unsigned int **getRandomSeed** () const
- int **getLastReactionCount** () const
- double **getLastSimulatedTime** () const
- virtual std::string show () override

  virtual public methods

Public Member Functions inherited from ModelComponent

- ModelComponent (Model *model, std::string componentTypename, std::string name="")

  constructors
- virtual ~**ModelComponent** ()

  Releases component-owned resources and unregisters it from the model.
- ConnectionManager * getConnectionManager () const

  new public user methods for this component
- void connectTo (ModelComponent *component, unsigned int inputPortNumber=0)

  Connects this component to another component.
- bool hasBreakpointAt ()

  Indicates whether a simulation breakpoint is set on this component.
- void setDescription (std::string _description)

  Updates the free-form description shown by the GUI.
- std::string getDescription () const

  Returns the free-form description associated with this component.
- void remove (ModelComponent *comp)

  Removes a connected component from this component.

Public Member Functions inherited from ModelDataDefinition

- ModelDataDefinition (Model *model, std::string datadefinitionTypename, std::string name="", bool insert↩ IntoModel=true)

  Creates a model data definition and optionally inserts it into the model.
- virtual ~**ModelDataDefinition** ()

  Releases resources owned by this data definition.
- Util::identification getId () const

  Returns the unique identifier of this instance.
- void setName (const std::string &name)

  Updates the logical name of this instance.
- const std::string & getName () const

  Returns the logical name of this instance.
- void setLabel (const std::string &label)

  Updates the user-visible label of this instance.
- const std::string & getLabel () const

  Returns the user-visible label of this instance.
- const std::string & getClassname () const

  Returns the runtime class name used by the plugin system.
- Model * getParentModel () const

  Returns the parent model that owns this definition.
- bool isReportStatistics () const

Indicates whether this data definition contributes report statistics.

- void setReportStatistics (bool reportStatistics)

  Enables or disables report-statistics generation for this definition.
- ModelDataDefinition * getInternalData (const std::string &name) const

  Looks up a named internal child data definition.
- std::map< std::string, ModelDataDefinition * > * getInternalData () const

  Returns the full map of internal child data definitions.
- std::map< std::string, ModelDataDefinition * > * getAttachedData () const

  Returns the full map of attached data definitions.
- bool hasChanged () const

  Indicates whether this instance has been modified since the last reset.
- void setHasChanged (bool hasChanged)

  Updates the changed flag for this data definition.
- unsigned int getLevel () const

  Returns the hierarchical editing context containing this element.
- void setModelLevel (unsigned int _modelLevel)

  Sets this element's hierarchical editing context.
- List< SimulationControl * > * getSimulationControls () const

  Returns the simulation controls owned by this data definition.
- TraceManager::Level getTraceLevelSpecific () const

  Returns the trace level that applies specifically to this definition.
- void setTraceLevelSpecific (TraceManager::Level level)

  Updates the trace level used by this definition.
- void defineTraceLevelSpecific (TraceManager::Level traceLevelspecific, bool traceLevelSpecific↩ Enabled=true)

  Defines the specific trace level and optionally enables it immediately.
- bool isTraceLevelSpecificEnabled () const

  Indicates whether the specific trace level is enabled.
- void setTraceLevelSpecificEnabled (bool traceLevelSpecificEnabled)

  Enables or disables the specific trace level.

Static Public Member Functions

- static PluginInformation * **GetPluginInformation** ()
- static ModelComponent * **LoadInstance** (Model *model, PersistenceRecord *fields)
- static ModelDataDefinition * **NewInstance** (Model *model, std::string name="")

Static Public Member Functions inherited from ModelComponent

- static ModelComponent * LoadInstance (Model *model, PersistenceRecord *fields)

  static public methods that must have implementations (Load and New just the same. GetInformation must provide specific infos for the new component
- static bool Check (ModelComponent *component)

  Validates a component instance.
- static void CreateInternalData (ModelComponent *component)

  Creates internal data required by a component instance.
- static void SaveInstance (PersistenceRecord *fields, ModelComponent *component)

  Serializes a component instance into a persistence record.
- static void DispatchEvent (Event *event)

  Dispatches a simulation event to the target component.

Static Public Member Functions inherited from ModelDataDefinition

- static ModelDataDefinition * LoadInstance (Model *model, PersistenceRecord *fields, bool insertIntoModel)

  Loads a model data definition instance from serialized fields.
- static ModelDataDefinition * NewInstance (Model *model, std::string name="")

  Creates a new instance of a data definition using the plugin registry.
- static void SaveInstance (PersistenceRecord *fields, ModelDataDefinition *modeldatum)

  Serializes a data definition instance into a persistence record.
- static bool Check (ModelDataDefinition *modeldatum, std::string &errorMessage)

  Validates a data definition instance.
- static void InitBetweenReplications (ModelDataDefinition *modeldatum)

  Resets simulation-time state between replications.
- static void CreateInternalData (ModelDataDefinition *modeldatum)

  Creates internal and attached data required by this instance.
- static bool CreateRelatedDataElements (ModelDataDefinition *modeldatum, std::string &errorMessage)

  Creates related data and validates the instance in a single call.

Protected Member Functions

- virtual bool _loadInstance (PersistenceRecord *fields) override

  virtual protected method that must be overriden
- virtual void _saveInstance (PersistenceRecord *fields, bool saveDefaultValues) override

  Saves object fields into a serialization structure.
- virtual bool _check (std::string &errorMessage) override

  could be overriden by derived classes
- virtual void _initBetweenReplications () override
- virtual void _onDispatchEvent (Entity *entity, unsigned int inputPortNumber) override

  Handles a dispatched event for this component type.
- virtual void _createEditableDataDefinitions () override

Protected Member Functions inherited from ModelDataDefinition

- bool _getSaveDefaultsOption ()
- virtual ParserChangesInformation * _getParserChangesInformation ()
- virtual void _addSimulationControl (SimulationControl *control)
- virtual void _createInternalAndAttachedData ()
- virtual void **_createInternalStatisticReporters** ()
- virtual void _createAttachedAttributes ()
- virtual void _createNonEditableDataDefinitions ()
- void **_templateCreateInternalStatisticReporters** ()
- void **_templateCreateAttachedAttributes** ()
- void **_templateCreateNonEditableDataDefinitions** ()
- void **_templateCreateEditableDataDefinitions** ()
- void **_internaStatisticReportersClear** ()

  legacy helper methods used by the granular create hooks*
- void **_internalDataClear** ()
- void **_internalDataInsert** (const std::string &key, ModelDataDefinition *child)
- void **_internalDataRemove** (const std::string &key)
- void **_attachedDataClear** ()
- void **_attachedDataInsert** (const std::string &key, ModelDataDefinition *data)
- void **_attachedDataRemove** (const std::string &key)
- void **_attachedAttributesInsert** (const std::vector< std::string > &neededNames)
- void **_statisticReporterInsert** (const std::string &key, ModelDataDefinition *data)
- void **_statisticReporterRemove** (const std::string &key)

- void **_statisticReportersClear** ()
- void **_mandatoryAttachedAttributeInsert** (const std::string &key, ModelDataDefinition *data)
- void **_mandatoryAttachedAttributeRemove** (const std::string &key)
- void **_mandatoryAttachedAttributesClear** ()
- void **_mandatoryEditableDataDefinitionInsert** (const std::string &key, ModelDataDefinition *data)
- void **_mandatoryEditableDataDefinitionRemove** (const std::string &key)
- void **_mandatoryEditableDataDefinitionsClear** ()
- void **_optionalEditableDataDefinitionInsert** (const std::string &key, ModelDataDefinition *data)
- void **_optionalEditableDataDefinitionRemove** (const std::string &key)
- void **_optionalEditableDataDefinitionsClear** ()
- void **_mandatoryNonEditableDataDefinitionInsert** (const std::string &key, ModelDataDefinition *data)
- void **_mandatoryNonEditableDataDefinitionRemove** (const std::string &key)
- void **_mandatoryNonEditableDataDefinitionsClear** ()
- void **_optionalNonEditableDataDefinitionInsert** (const std::string &key, ModelDataDefinition *data)
- void **_optionalNonEditableDataDefinitionRemove** (const std::string &key)
- void **_optionalNonEditableDataDefinitionsClear** ()
- void **_checkCreateAttachedReferencedDataDefinition** (const std::string &expression)

  method to be called to insert attached dataelements that are referenced by string expressions (detected by the parser), to avoid orphaned data definitions
- void **trace** (const std::string &text, TraceManager::Level level=TraceManager::Level::L8_detailed)

  not just an easy access to trace manager, but wrappers to check if specific trace level applies
- void **traceError** (const std::string &text, const std::exception &e)
- void **traceError** (const std::string &text, TraceManager::Level level=TraceManager::Level::L1_errorFatal)
- void **traceReport** (const std::string &text, TraceManager::Level level=TraceManager::Level::L2_results)
- void **traceSimulation** (void *thisobject, double time, Entity *entity, ModelComponent *component, const std::string &text, TraceManager::Level level=TraceManager::Level::L8_detailed)
- void traceSimulation (void *thisobject, const std::string &text, TraceManager::Level level=TraceManager::↩ Level::L8_detailed)

  Traces text to the simulation output.
- void **traceSimulation** (void *thisobject, TraceManager::Level level, const std::string &text)

Additional Inherited Members

Protected Attributes inherited from ModelComponent

- ConnectionManager * _connections = new ConnectionManager()

  virtual protected methods that could be overriden by derived classes, if needed

Protected Attributes inherited from ModelDataDefinition

- Util::identification **_id**
- std::string **_typename**
- bool **_reportStatistics**
- bool **_hasChanged**
- unsigned int **_modelLevel** = 0
- Model * **_parentModel**
- List< SimulationControl * > * **_simulationControls** = new List<SimulationControl*>()
- TraceManager::Level **_traceLevelSpecific**
- bool **_traceLevelSpecificEnabled** = false

17.999.1 Detailed Description

Gillespie Direct Method SSA runner for whole-cell stochastic simulations.
On each entity arrival the component runs the Direct Method (Gillespie 1977) for a configurable time window [0, timeWindow] using all StochasticReactionRule definitions registered in the model. Species counts are read from and written back to the referenced WholeCellState (if set) or directly to MolecularSpecies objects in the model.
Contract (Q7b): Input: current molecule counts from WholeCellState (or MolecularSpecies)

- resource budget from WholeCellState Output: updated counts written back to WholeCellState; entity forwarded

Resource cap: reactions whose firing would deplete a species below its resource budget floor are skipped, matching the fair-allocation contract of the WholeCell M. genitalium model (Karr et al. 2012).

17.999.2 Member Function Documentation

17.999.2.1 _check()

```
bool StochasticReactionComponent::_check (
            std::string & errorMessage )  [override], [protected], [virtual]
```

could be overriden by derived classes
Reimplemented from ModelDataDefinition.

17.999.2.2 _createEditableDataDefinitions()

```
void StochasticReactionComponent::_createEditableDataDefinitions ( )  [override], [protected],
[virtual]
```

Reimplemented from ModelDataDefinition.

17.999.2.3 _initBetweenReplications()

```
void StochasticReactionComponent::_initBetweenReplications ( )  [override], [protected], [virtual]
```

Reimplemented from ModelDataDefinition.

17.999.2.4 _loadInstance()

```
bool StochasticReactionComponent::_loadInstance (
            PersistenceRecord * fields )  [override], [protected], [virtual]
```

virtual protected method that must be overriden
Reimplemented from ModelComponent.

17.999.2.5 _onDispatchEvent()

```
void StochasticReactionComponent::_onDispatchEvent (
            Entity * entity,
            unsigned int inputPortNumber )  [override], [protected], [virtual]
```

Handles a dispatched event for this component type.
This method is only for ModelComponents, not for ModelDataElements.

Parameters

entity	Entity being processed.
inputPortNumber	Input port where the entity arrived.

Implements ModelComponent.

17.999.2.6 _saveInstance()

```
void StochasticReactionComponent::_saveInstance (
            PersistenceRecord * fields,
```

```
bool saveDefaultValues )  [override], [protected], [virtual]
```

Saves object fields into a serialization structure.

Parameters

fields	a table-like structure used for serialization.
saveDefaultValues	indicates whether or not to save fields which are set to their default value.

Reimplemented from ModelComponent.

17.999.2.7 show()

```
std::string StochasticReactionComponent::show ( )  [override], [virtual]
```

virtual public methods
Returns a textual representation of this component.

Returns

Human-readable description used for tracing and debugging.

Reimplemented from ModelComponent.
The documentation for this class was generated from the following files:

- plugins/components/WholeCellModeling/StochasticReactionComponent.h
- plugins/components/WholeCellModeling/StochasticReactionComponent.cpp

17.1000 StochasticReactionRule Class Reference

```
#include <plugins/data/WholeCellModeling/StochasticReactionRule.h>
```

Inheritance diagram for StochasticReactionRule:

Classes

- struct StoichiometricTerm

Public Member Functions

- **StochasticReactionRule** (Model *model, std::string name="")
- void **addReactant** (std::string speciesName, int stoichiometry=1)
- void **addProduct** (std::string speciesName, int stoichiometry=1)
- void **clearReactants** ()
- void **clearProducts** ()
- const std::vector< StoichiometricTerm > & **getReactants** () const
- const std::vector< StoichiometricTerm > & **getProducts** () const
- void **setRateConstant** (double rateConstant)
- double **getRateConstant** () const
- void **setCompartment** (std::string compartment)
- std::string **getCompartment** () const
- double **computePropensity** (const std::map< std::string, int > &counts) const
- virtual std::string show () override

  Returns a textual representation of this data definition.

Public Member Functions inherited from ModelDataDefinition

- ModelDataDefinition (Model *model, std::string datadefinitionTypename, std::string name="", bool insert↩ IntoModel=true)

  Creates a model data definition and optionally inserts it into the model.
- virtual ~**ModelDataDefinition** ()

  Releases resources owned by this data definition.
- Util::identification getId () const

  Returns the unique identifier of this instance.
- void setName (const std::string &name)

  Updates the logical name of this instance.
- const std::string & getName () const

  Returns the logical name of this instance.
- void setLabel (const std::string &label)

  Updates the user-visible label of this instance.
- const std::string & getLabel () const

Returns the user-visible label of this instance.

- const std::string & getClassname () const

  Returns the runtime class name used by the plugin system.
- Model * getParentModel () const

  Returns the parent model that owns this definition.
- bool isReportStatistics () const

  Indicates whether this data definition contributes report statistics.
- void setReportStatistics (bool reportStatistics)

  Enables or disables report-statistics generation for this definition.
- ModelDataDefinition * getInternalData (const std::string &name) const

  Looks up a named internal child data definition.
- std::map< std::string, ModelDataDefinition * > * getInternalData () const

  Returns the full map of internal child data definitions.
- std::map< std::string, ModelDataDefinition * > * getAttachedData () const

  Returns the full map of attached data definitions.
- bool hasChanged () const

  Indicates whether this instance has been modified since the last reset.
- void setHasChanged (bool hasChanged)

  Updates the changed flag for this data definition.
- unsigned int getLevel () const

  Returns the hierarchical editing context containing this element.
- void setModelLevel (unsigned int _modelLevel)

  Sets this element's hierarchical editing context.
- List< SimulationControl * > * getSimulationControls () const

  Returns the simulation controls owned by this data definition.
- TraceManager::Level getTraceLevelSpecific () const

  Returns the trace level that applies specifically to this definition.
- void setTraceLevelSpecific (TraceManager::Level level)

  Updates the trace level used by this definition.
- void defineTraceLevelSpecific (TraceManager::Level traceLevelspecific, bool traceLevelSpecific↩ Enabled=true)

  Defines the specific trace level and optionally enables it immediately.
- bool isTraceLevelSpecificEnabled () const

  Indicates whether the specific trace level is enabled.
- void setTraceLevelSpecificEnabled (bool traceLevelSpecificEnabled)

  Enables or disables the specific trace level.

Static Public Member Functions

- static ModelDataDefinition * **LoadInstance** (Model *model, PersistenceRecord *fields)
- static PluginInformation * **GetPluginInformation** ()
- static ModelDataDefinition * **NewInstance** (Model *model, std::string name="")

Static Public Member Functions inherited from ModelDataDefinition

- static ModelDataDefinition * LoadInstance (Model *model, PersistenceRecord *fields, bool insertIntoModel)

  Loads a model data definition instance from serialized fields.
- static ModelDataDefinition * NewInstance (Model *model, std::string name="")

  Creates a new instance of a data definition using the plugin registry.
- static void SaveInstance (PersistenceRecord *fields, ModelDataDefinition *modeldatum)

  Serializes a data definition instance into a persistence record.
- static bool Check (ModelDataDefinition *modeldatum, std::string &errorMessage)

Validates a data definition instance.

- static void InitBetweenReplications (ModelDataDefinition *modeldatum)

  Resets simulation-time state between replications.
- static void CreateInternalData (ModelDataDefinition *modeldatum)

  Creates internal and attached data required by this instance.
- static bool CreateRelatedDataElements (ModelDataDefinition *modeldatum, std::string &errorMessage)

  Creates related data and validates the instance in a single call.

Protected Member Functions

- virtual bool _loadInstance (PersistenceRecord *fields) override

  must be overriden by derived classes
- virtual void _saveInstance (PersistenceRecord *fields, bool saveDefaultValues) override

  Saves object fields into a serialization structure.
- virtual bool _check (std::string &errorMessage) override

  could be overriden by derived classes

17.1000.1 Detailed Description

Stochastic reaction rule for Gillespie SSA whole-cell simulations.
Reactants and products are named by MolecularSpecies with integer stoichiometry. The propensity is computed as k * combinatorial(counts), where the combinatorial term is the product of C(x_i, n_i) for each reactant species i with stoichiometry n_i.
The rate constant k uses stochastic (microscopic) units: s^-1 for unimolecular, molecules^-1 * s^-1 for bimolecular reactions.

17.1000.2 Member Function Documentation

17.1000.2.1 _check()

```
bool StochasticReactionRule::_check (
            std::string & errorMessage )  [override], [protected], [virtual]
```

could be overriden by derived classes
Reimplemented from ModelDataDefinition.

17.1000.2.2 _loadInstance()

```
bool StochasticReactionRule::_loadInstance (
            PersistenceRecord * fields )  [override], [protected], [virtual]
```

must be overriden by derived classes
Reimplemented from ModelDataDefinition.

17.1000.2.3 _saveInstance()

```
void StochasticReactionRule::_saveInstance (
            PersistenceRecord * fields,
            bool saveDefaultValues )  [override], [protected], [virtual]
```

Saves object fields into a serialization structure.

Parameters

fields	a table-like structure used for serialization.
saveDefaultValues	indicates whether or not to save fields which are set to their default value.

Reimplemented from ModelDataDefinition.

17.1000.2.4 show()

```
std::string StochasticReactionRule::show ( )  [override], [virtual]
```

Returns a textual representation of this data definition.
Returns the keys of internal ModelDataDefinitions such as counters, statistics collectors and other children needed before model checking.

Returns

Human-readable summary used by traces and debug output.

Reimplemented from ModelDataDefinition.
The documentation for this class was generated from the following files:

- plugins/data/WholeCellModeling/StochasticReactionRule.h
- plugins/data/WholeCellModeling/StochasticReactionRule.cpp

17.1001 StochasticTranscription Class Reference

  virtual public methods

Public Member Functions inherited from ModelComponent

- ModelComponent (Model *model, std::string componentTypename, std::string name="")

  constructors
- virtual ~**ModelComponent** ()

  Releases component-owned resources and unregisters it from the model.
- ConnectionManager * getConnectionManager () const

  new public user methods for this component
- void connectTo (ModelComponent *component, unsigned int inputPortNumber=0)

  Connects this component to another component.

- bool hasBreakpointAt ()

  Indicates whether a simulation breakpoint is set on this component.
- void setDescription (std::string _description)

  Updates the free-form description shown by the GUI.
- std::string getDescription () const

  Returns the free-form description associated with this component.
- void remove (ModelComponent *comp)

  Removes a connected component from this component.

Public Member Functions inherited from ModelDataDefinition

- ModelDataDefinition (Model *model, std::string datadefinitionTypename, std::string name="", bool insert↩ IntoModel=true)

  Creates a model data definition and optionally inserts it into the model.
- virtual ~**ModelDataDefinition** ()

  Releases resources owned by this data definition.
- Util::identification getId () const

  Returns the unique identifier of this instance.
- void setName (const std::string &name)

  Updates the logical name of this instance.
- const std::string & getName () const

  Returns the logical name of this instance.
- void setLabel (const std::string &label)

  Updates the user-visible label of this instance.
- const std::string & getLabel () const

  Returns the user-visible label of this instance.
- const std::string & getClassname () const

  Returns the runtime class name used by the plugin system.
- Model * getParentModel () const

  Returns the parent model that owns this definition.
- bool isReportStatistics () const

  Indicates whether this data definition contributes report statistics.
- void setReportStatistics (bool reportStatistics)

  Enables or disables report-statistics generation for this definition.
- ModelDataDefinition * getInternalData (const std::string &name) const

  Looks up a named internal child data definition.
- std::map< std::string, ModelDataDefinition * > * getInternalData () const

  Returns the full map of internal child data definitions.
- std::map< std::string, ModelDataDefinition * > * getAttachedData () const

  Returns the full map of attached data definitions.
- bool hasChanged () const

  Indicates whether this instance has been modified since the last reset.
- void setHasChanged (bool hasChanged)

  Updates the changed flag for this data definition.
- unsigned int getLevel () const

  Returns the hierarchical editing context containing this element.
- void setModelLevel (unsigned int _modelLevel)

  Sets this element's hierarchical editing context.
- List< SimulationControl * > * getSimulationControls () const

  Returns the simulation controls owned by this data definition.
- TraceManager::Level getTraceLevelSpecific () const

Returns the trace level that applies specifically to this definition.

- void setTraceLevelSpecific (TraceManager::Level level)

  Updates the trace level used by this definition.
- void defineTraceLevelSpecific (TraceManager::Level traceLevelspecific, bool traceLevelSpecific↩ Enabled=true)

  Defines the specific trace level and optionally enables it immediately.
- bool isTraceLevelSpecificEnabled () const

  Indicates whether the specific trace level is enabled.
- void setTraceLevelSpecificEnabled (bool traceLevelSpecificEnabled)

  Enables or disables the specific trace level.

Static Public Member Functions

- static PluginInformation * **GetPluginInformation** ()

17.1001.1 Detailed Description

Stochastic mRNA synthesis via Poisson tau-leaping for whole-cell simulations.
Models the M. genitalium Transcription process (Karr et al. 2012): λ_i = (elongationRate / meanGeneLength) $\times$ bindingProbability $\times$ RNAP_free $\times$ Δt N_synth_i $\sim$ Poisson(λ_i)
This is a tau-leaping approximation (not full Gillespie) appropriate for transcription because RNAP count ($\sim$200) acting over many genes ($\sim$473) with a 1–10 s window produces moderate propensities where the Poisson approximation is valid. Full Gillespie is implemented in StochasticReactionComponent for individual reactions with low copy numbers.
Parameters loaded from WholeCellState (set by loadParameters()): param.rnaPolymeraseElongationRate — 50 nt/s (from parameters.json)
mRNA species in WholeCellState are identified by the prefix set in mRNASpeciesPrefix (default "mRNA_"). RNAP free count is read from the WholeCellState molecule count with key rnapCountKey (default "RNAP_free").

17.1001.2 Member Function Documentation

17.1001.2.1 _check()

```
bool StochasticTranscription::_check (
            std::string & errorMessage )  [override], [protected], [virtual]
```

could be overriden by derived classes
Reimplemented from ModelDataDefinition.

17.1001.2.2 _createEditableDataDefinitions()

```
void StochasticTranscription::_createEditableDataDefinitions ( )  [override], [protected],
[virtual]
```

Reimplemented from ModelDataDefinition.

17.1001.2.3 _initBetweenReplications()

```
void StochasticTranscription::_initBetweenReplications ( )  [override], [protected], [virtual]
```

Reimplemented from ModelDataDefinition.

17.1001.2.4 _loadInstance()

```
bool StochasticTranscription::_loadInstance (
            PersistenceRecord * fields )  [override], [protected], [virtual]
```

virtual protected method that must be overriden
Reimplemented from ModelComponent.

17.1001.2.5 _onDispatchEvent()

```
void StochasticTranscription::_onDispatchEvent (
            Entity * entity,
            unsigned int inputPortNumber )  [override], [protected], [virtual]
```

Handles a dispatched event for this component type.
This method is only for ModelComponents, not for ModelDataElements.

Parameters

entity	Entity being processed.
inputPortNumber	Input port where the entity arrived.

Implements ModelComponent.

17.1001.2.6 _saveInstance()

```
void StochasticTranscription::_saveInstance (
            PersistenceRecord * fields,
            bool saveDefaultValues )  [override], [protected], [virtual]
```

Saves object fields into a serialization structure.

Parameters

fields	a table-like structure used for serialization.
saveDefaultValues	indicates whether or not to save fields which are set to their default value.

Reimplemented from ModelComponent.

17.1001.2.7 show()

```
std::string StochasticTranscription::show ( )  [override], [virtual]
```

virtual public methods
Returns a textual representation of this component.

Returns

Human-readable description used for tracing and debugging.

Reimplemented from ModelComponent.
The documentation for this class was generated from the following files:

- plugins/components/WholeCellModeling/StochasticTranscription.h

- plugins/components/WholeCellModeling/StochasticTranscription.cpp

17.1002.1 Detailed Description

Stochastic protein synthesis via Poisson tau-leaping for whole-cell simulations.
Models the M. genitalium Translation process (Karr et al. 2012): λ_i = (ribosomeElongationRate / meanProtein↩ Length) $\times$ mRNA_count_i $\times$ ribosome_free / max(1, total_mRNA) $\times$ Δt N_protein_i $\sim$ Poisson(λ_i)
Each mRNA template (prefix proteinSpeciesPrefix) is matched to its corresponding mRNA species (prefix m↩ RNASpeciesPrefix) in WholeCellState. Free ribosome count is read from WholeCellState with key ribosome↩ CountKey.
Parameters loaded from WholeCellState (set by loadParameters()): param.ribosomeElongationRate — 16 AA/s (from parameters.json)
mRNA degradation is not modeled here; use a separate StochasticReactionRule for mRNA decay (first-order, rate $\sim$1/mRNA_halflife).

17.1002.2 Member Function Documentation

17.1002.2.1 _check()

```
bool StochasticTranslation::_check (
            std::string & errorMessage )  [override], [protected], [virtual]
```

could be overriden by derived classes
Reimplemented from ModelDataDefinition.

17.1002.2.2 _createEditableDataDefinitions()

```
void StochasticTranslation::_createEditableDataDefinitions ( )  [override], [protected], [virtual]
```

Reimplemented from ModelDataDefinition.

17.1002.2.3 _initBetweenReplications()

```
void StochasticTranslation::_initBetweenReplications ( )  [override], [protected], [virtual]
```

Reimplemented from ModelDataDefinition.

17.1002.2.4 _loadInstance()

```
bool StochasticTranslation::_loadInstance (
            PersistenceRecord * fields )  [override], [protected], [virtual]
```

virtual protected method that must be overriden
Reimplemented from ModelComponent.

17.1002.2.5 _onDispatchEvent()

```
void StochasticTranslation::_onDispatchEvent (
            Entity * entity,
            unsigned int inputPortNumber )  [override], [protected], [virtual]
```

Handles a dispatched event for this component type.
This method is only for ModelComponents, not for ModelDataElements.

Parameters

entity	Entity being processed.
inputPortNumber	Input port where the entity arrived.

Implements ModelComponent.

17.1002.2.6 _saveInstance()

```
void StochasticTranslation::_saveInstance (
            PersistenceRecord * fields,
            bool saveDefaultValues )  [override], [protected], [virtual]
```

Saves object fields into a serialization structure.

Parameters

fields	a table-like structure used for serialization.
saveDefaultValues	indicates whether or not to save fields which are set to their default value.

Reimplemented from ModelComponent.

17.1002.2.7 show()

`std::string StochasticTranslation::show ( ) [override], [virtual]`
virtual public methods
Returns a textual representation of this component.

Returns

Human-readable description used for tracing and debugging.

Reimplemented from ModelComponent.
The documentation for this class was generated from the following files:

- plugins/components/WholeCellModeling/StochasticTranslation.h
- plugins/components/WholeCellModeling/StochasticTranslation.cpp

17.1003 BioReaction::StoichiometricTerm Struct Reference

Public Attributes

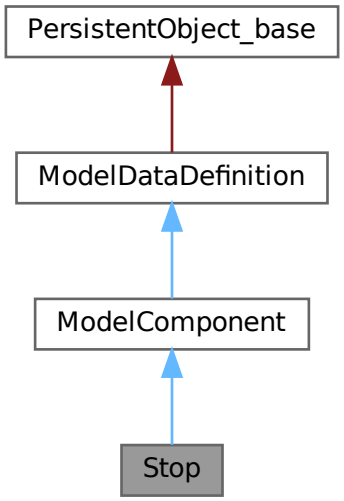
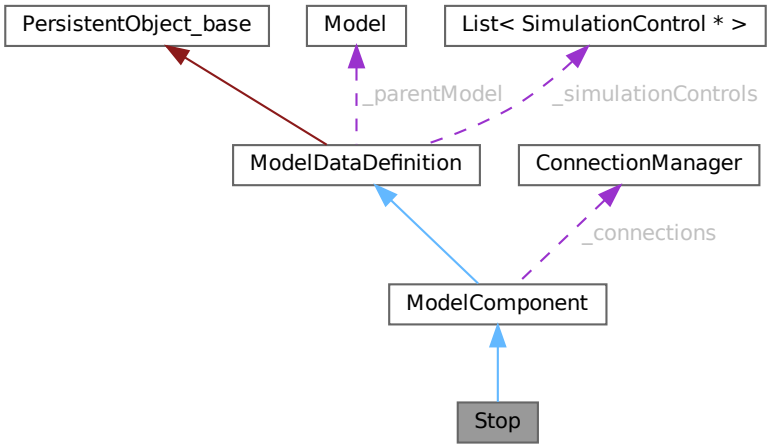
17.1007 Stop Class Reference

`#include <plugins/components/MaterialHandling/Stop.h>`
Inheritance diagram for Stop:



Collaboration diagram for Stop:



Public Member Functions

- **Stop** (Model *model, std::string name="")
- virtual std::string show () override

  virtual public methods
- void **setConveyor** (Conveyor *conveyor)
- Conveyor * **getConveyor** () const

Public Member Functions inherited from ModelComponent

- ModelComponent (Model *model, std::string componentTypename, std::string name="")

  constructors
- virtual ~**ModelComponent** ()

  Releases component-owned resources and unregisters it from the model.
- ConnectionManager * getConnectionManager () const

  new public user methods for this component
- void connectTo (ModelComponent *component, unsigned int inputPortNumber=0)

  Connects this component to another component.
- bool hasBreakpointAt ()

  Indicates whether a simulation breakpoint is set on this component.
- void setDescription (std::string _description)

  Updates the free-form description shown by the GUI.
- std::string getDescription () const

  Returns the free-form description associated with this component.
- void remove (ModelComponent *comp)

  Removes a connected component from this component.

Public Member Functions inherited from ModelDataDefinition

- ModelDataDefinition (Model *model, std::string datadefinitionTypename, std::string name="", bool insert↩ IntoModel=true)

  Creates a model data definition and optionally inserts it into the model.

- virtual ~**ModelDataDefinition** ()

  Releases resources owned by this data definition.
- Util::identification getId () const

  Returns the unique identifier of this instance.
- void setName (const std::string &name)

  Updates the logical name of this instance.
- const std::string & getName () const

  Returns the logical name of this instance.
- void setLabel (const std::string &label)

  Updates the user-visible label of this instance.
- const std::string & getLabel () const

  Returns the user-visible label of this instance.
- const std::string & getClassname () const

  Returns the runtime class name used by the plugin system.
- Model * getParentModel () const

  Returns the parent model that owns this definition.
- bool isReportStatistics () const

  Indicates whether this data definition contributes report statistics.
- void setReportStatistics (bool reportStatistics)

  Enables or disables report-statistics generation for this definition.
- ModelDataDefinition * getInternalData (const std::string &name) const

  Looks up a named internal child data definition.
- std::map< std::string, ModelDataDefinition * > * getInternalData () const

  Returns the full map of internal child data definitions.
- std::map< std::string, ModelDataDefinition * > * getAttachedData () const

  Returns the full map of attached data definitions.
- bool hasChanged () const

  Indicates whether this instance has been modified since the last reset.
- void setHasChanged (bool hasChanged)

  Updates the changed flag for this data definition.
- unsigned int getLevel () const

  Returns the hierarchical editing context containing this element.
- void setModelLevel (unsigned int _modelLevel)

  Sets this element's hierarchical editing context.
- List< SimulationControl * > * getSimulationControls () const

  Returns the simulation controls owned by this data definition.
- TraceManager::Level getTraceLevelSpecific () const

  Returns the trace level that applies specifically to this definition.
- void setTraceLevelSpecific (TraceManager::Level level)

  Updates the trace level used by this definition.
- void defineTraceLevelSpecific (TraceManager::Level traceLevelspecific, bool traceLevelSpecific↩ Enabled=true)

  Defines the specific trace level and optionally enables it immediately.
- bool isTraceLevelSpecificEnabled () const

  Indicates whether the specific trace level is enabled.
- void setTraceLevelSpecificEnabled (bool traceLevelSpecificEnabled)

  Enables or disables the specific trace level.

Static Public Member Functions

- static PluginInformation * **GetPluginInformation** ()
- static ModelComponent * **LoadInstance** (Model *model, PersistenceRecord *fields)
- static ModelDataDefinition * **NewInstance** (Model *model, std::string name="")

Static Public Member Functions inherited from ModelComponent

- static ModelComponent * LoadInstance (Model *model, PersistenceRecord *fields)

  static public methods that must have implementations (Load and New just the same. GetInformation must provide specific infos for the new component
- static bool Check (ModelComponent *component)

  Validates a component instance.
- static void CreateInternalData (ModelComponent *component)

  Creates internal data required by a component instance.
- static void SaveInstance (PersistenceRecord *fields, ModelComponent *component)

  Serializes a component instance into a persistence record.
- static void DispatchEvent (Event *event)

  Dispatches a simulation event to the target component.

Static Public Member Functions inherited from ModelDataDefinition

- static ModelDataDefinition * LoadInstance (Model *model, PersistenceRecord *fields, bool insertIntoModel)

  Loads a model data definition instance from serialized fields.
- static ModelDataDefinition * NewInstance (Model *model, std::string name="")

  Creates a new instance of a data definition using the plugin registry.
- static void SaveInstance (PersistenceRecord *fields, ModelDataDefinition *modeldatum)

  Serializes a data definition instance into a persistence record.
- static bool Check (ModelDataDefinition *modeldatum, std::string &errorMessage)

  Validates a data definition instance.
- static void InitBetweenReplications (ModelDataDefinition *modeldatum)

  Resets simulation-time state between replications.
- static void CreateInternalData (ModelDataDefinition *modeldatum)

  Creates internal and attached data required by this instance.
- static bool CreateRelatedDataElements (ModelDataDefinition *modeldatum, std::string &errorMessage)

  Creates related data and validates the instance in a single call.

Protected Member Functions

- virtual void _onDispatchEvent (Entity *entity, unsigned int inputPortNumber) override

  Handles a dispatched event for this component type.
- virtual bool _loadInstance (PersistenceRecord *fields) override

  virtual protected method that must be overriden
- virtual void _saveInstance (PersistenceRecord *fields, bool saveDefaultValues) override

  Saves object fields into a serialization structure.

17.1007.1 Detailed Description

Stop module DESCRIPTION The Stop module sets the operational status of a conveyor to inactive. The conveyor may have been activated from either the Start module or by initially being set to active at the start of the simulation. When the entity enters the Stop module, the conveyor will stop immediately, regardless of the type of conveyor or the number of entities currently on the conveyor. TYPICAL USES Stop a baggage conveyor after a pre-determined amount of time Stop a conveyor for scheduled maintenance PROMPTS Prompt Description Name Unique name of the module that will be displayed in the flowchart. Conveyor Name Name of the conveyor to stop.

17.1007.2 Member Function Documentation

17.1007.2.1 _check()

```
bool Stop::_check (
            std::string & errorMessage )  [override], [protected], [virtual]
```

could be overriden by derived classes
Reimplemented from ModelDataDefinition.

17.1007.2.2 _loadInstance()

```
bool Stop::_loadInstance (
            PersistenceRecord * fields )  [override], [protected], [virtual]
```

virtual protected method that must be overriden
Reimplemented from ModelComponent.

17.1007.2.3 _onDispatchEvent()

```
void Stop::_onDispatchEvent (
            Entity * entity,
            unsigned int inputPortNumber )  [override], [protected], [virtual]
```

Handles a dispatched event for this component type.
This method is only for ModelComponents, not for ModelDataElements.

Parameters

entity	Entity being processed.
inputPortNumber	Input port where the entity arrived.

Implements ModelComponent.

17.1007.2.4 _saveInstance()

```
void Stop::_saveInstance (
            PersistenceRecord * fields,
            bool saveDefaultValues )  [override], [protected], [virtual]
```

Saves object fields into a serialization structure.

Parameters

fields	a table-like structure used for serialization.
saveDefaultValues	indicates whether or not to save fields which are set to their default value.

Reimplemented from ModelComponent.

17.1007.2.5 show()

```
std::string Stop::show ( )  [override], [virtual]
```

virtual public methods
Returns a textual representation of this component.

Returns

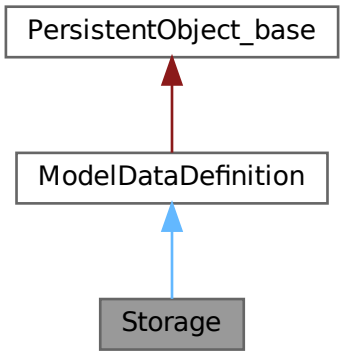
Human-readable description used for tracing and debugging.

Reimplemented from ModelComponent.
The documentation for this class was generated from the following files:

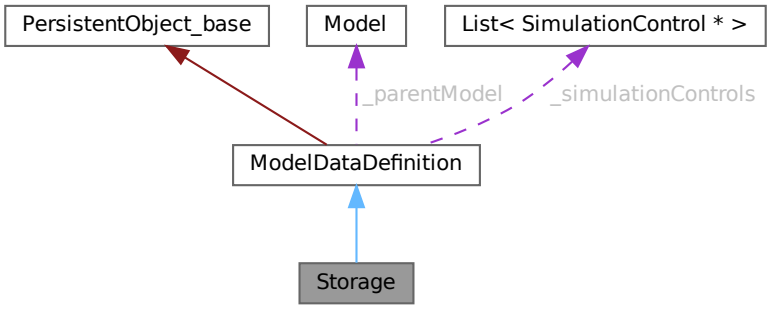
- plugins/components/MaterialHandling/Stop.h
- plugins/components/MaterialHandling/Stop.cpp

17.1008 Storage Class Reference

Data definition representing a named storage location with explicit area/capacity/density accounting.
`#include <plugins/data/MaterialHandling/Storage.h>`
Inheritance diagram for Storage:



Collaboration diagram for Storage:



Public Member Functions

17.1008.1 Detailed Description

Data definition representing a named storage location with explicit area/capacity/density accounting.
Arena correspondence: Arena's "Storage module" (Rockwell Automation, *Getting Started with Arena*, "The Advanced Process Panel", p. 78), which is a near-empty placeholder object (only a Name) auto-created by the Store/Unstore modules and only needed explicitly as a Storage-Set member.
Known difference from Arena (GenESyS extends the concept rather than narrowing it): this class carries real capacity semantics — `_totalArea`, `_capacity` and `_unitsPerArea` — that Arena's Storage module does not model at all; Arena tracks storage occupancy purely through animation, not through a declared capacity/area contract.

17.1008.2 Member Function Documentation

17.1008.2.1 _check()

```
bool Storage::_check (
            std::string & errorMessage )  [override], [protected], [virtual]
```

could be overriden by derived classes
Reimplemented from ModelDataDefinition.

17.1008.2.2 _getParserChangesInformation()

```
ParserChangesInformation * Storage::_getParserChangesInformation ( )  [override], [protected],
[virtual]
```

This method returns all changes in the parser that are needed by plugins of this ModelDatas. When connecting a new plugin, ParserChangesInformation are used to change parser source code, whch is after compiled and dinamically linked to to simulator kernel to reflect the changes
Reimplemented from ModelDataDefinition.

17.1008.2.3 _initBetweenReplications()

```
void Storage::_initBetweenReplications ( )  [override], [protected], [virtual]
```

Reimplemented from ModelDataDefinition.

17.1008.2.4 _loadInstance()

```
bool Storage::_loadInstance (
            PersistenceRecord * fields )  [override], [protected], [virtual]
```

must be overriden by derived classes
Reimplemented from ModelDataDefinition.

17.1008.2.5 _saveInstance()

```
void Storage::_saveInstance (
            PersistenceRecord * fields,
            bool saveDefaultValues )  [override], [protected], [virtual]
```

Saves object fields into a serialization structure.

Parameters

fields	a table-like structure used for serialization.
saveDefaultValues	indicates whether or not to save fields which are set to their default value.

Persist Storage parameters using symmetric keys from _loadInstance.
Reimplemented from ModelDataDefinition.

17.1008.2.6 show()

```
std::string Storage::show ( )  [override], [virtual]
```

Returns a textual representation of this data definition.
Returns the keys of internal ModelDataDefinitions such as counters, statistics collectors and other children needed before model checking.

Returns

Human-readable summary used by traces and debug output.

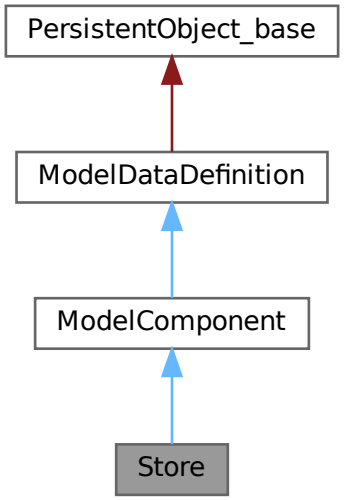
Reimplemented from ModelDataDefinition.
The documentation for this class was generated from the following files:

- plugins/data/MaterialHandling/Storage.h
- plugins/data/MaterialHandling/Storage.cpp

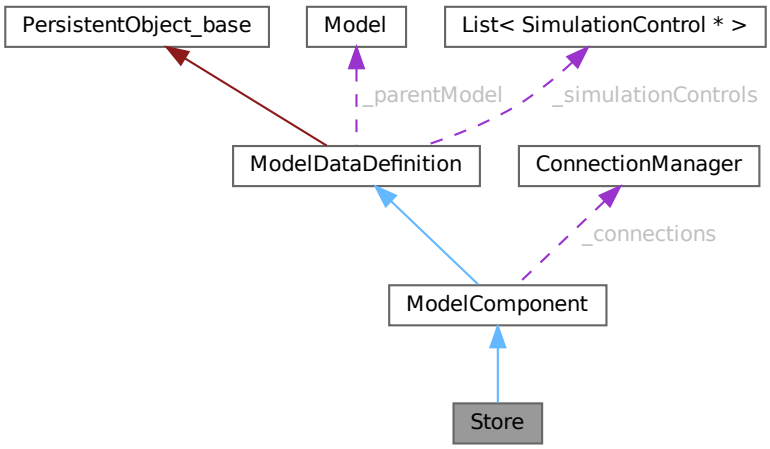
17.1009 Store Class Reference

Placeholder for adding an entity to a Storage (§5.11).
`#include <plugins/components/MaterialHandling/Store.h>`

Inheritance diagram for Store:



Collaboration diagram for Store:



Public Member Functions

- **Store** (Model *model, std::string name="")
- virtual std::string show () override

  virtual public methods
- void **setStorage** (Storage *storage)
- Storage * **getStorage** () const
- void **setQuantityExpression** (std::string quantityExpression)
- std::string **getQuantityExpression** () const

Public Member Functions inherited from ModelComponent

- ModelComponent (Model *model, std::string componentTypename, std::string name="")

  constructors
- virtual ~**ModelComponent** ()

  Releases component-owned resources and unregisters it from the model.
- ConnectionManager * getConnectionManager () const

  new public user methods for this component
- void connectTo (ModelComponent *component, unsigned int inputPortNumber=0)

  Connects this component to another component.
- bool hasBreakpointAt ()

  Indicates whether a simulation breakpoint is set on this component.
- void setDescription (std::string _description)

  Updates the free-form description shown by the GUI.
- std::string getDescription () const

  Returns the free-form description associated with this component.
- void remove (ModelComponent *comp)

  Removes a connected component from this component.

Public Member Functions inherited from ModelDataDefinition

- ModelDataDefinition (Model *model, std::string datadefinitionTypename, std::string name="", bool insert↩ IntoModel=true)

  Creates a model data definition and optionally inserts it into the model.
- virtual ~**ModelDataDefinition** ()

  Releases resources owned by this data definition.
- Util::identification getId () const

  Returns the unique identifier of this instance.
- void setName (const std::string &name)

  Updates the logical name of this instance.
- const std::string & getName () const

  Returns the logical name of this instance.
- void setLabel (const std::string &label)

  Updates the user-visible label of this instance.
- const std::string & getLabel () const

  Returns the user-visible label of this instance.
- const std::string & getClassname () const

  Returns the runtime class name used by the plugin system.
- Model * getParentModel () const

  Returns the parent model that owns this definition.
- bool isReportStatistics () const

  Indicates whether this data definition contributes report statistics.
- void setReportStatistics (bool reportStatistics)

  Enables or disables report-statistics generation for this definition.
- ModelDataDefinition * getInternalData (const std::string &name) const

  Looks up a named internal child data definition.
- std::map< std::string, ModelDataDefinition * > * getInternalData () const

  Returns the full map of internal child data definitions.
- std::map< std::string, ModelDataDefinition * > * getAttachedData () const

  Returns the full map of attached data definitions.
- bool hasChanged () const

  Indicates whether this instance has been modified since the last reset.

- void setHasChanged (bool hasChanged)

  Updates the changed flag for this data definition.
- unsigned int getLevel () const

  Returns the hierarchical editing context containing this element.
- void setModelLevel (unsigned int _modelLevel)

  Sets this element's hierarchical editing context.
- List< SimulationControl * > * getSimulationControls () const

  Returns the simulation controls owned by this data definition.
- TraceManager::Level getTraceLevelSpecific () const

  Returns the trace level that applies specifically to this definition.
- void setTraceLevelSpecific (TraceManager::Level level)

  Updates the trace level used by this definition.
- void defineTraceLevelSpecific (TraceManager::Level traceLevelspecific, bool traceLevelSpecific↩ Enabled=true)

  Defines the specific trace level and optionally enables it immediately.
- bool isTraceLevelSpecificEnabled () const

  Indicates whether the specific trace level is enabled.
- void setTraceLevelSpecificEnabled (bool traceLevelSpecificEnabled)

  Enables or disables the specific trace level.

Static Public Member Functions

- static PluginInformation * **GetPluginInformation** ()
- static ModelComponent * **LoadInstance** (Model *model, PersistenceRecord *fields)
- static ModelDataDefinition * **NewInstance** (Model *model, std::string name="")

Static Public Member Functions inherited from ModelComponent

- static ModelComponent * LoadInstance (Model *model, PersistenceRecord *fields)

  static public methods that must have implementations (Load and New just the same. GetInformation must provide specific infos for the new component
- static bool Check (ModelComponent *component)

  Validates a component instance.
- static void CreateInternalData (ModelComponent *component)

  Creates internal data required by a component instance.
- static void SaveInstance (PersistenceRecord *fields, ModelComponent *component)

  Serializes a component instance into a persistence record.
- static void DispatchEvent (Event *event)

  Dispatches a simulation event to the target component.

Static Public Member Functions inherited from ModelDataDefinition

- static ModelDataDefinition * LoadInstance (Model *model, PersistenceRecord *fields, bool insertIntoModel)

  Loads a model data definition instance from serialized fields.
- static ModelDataDefinition * NewInstance (Model *model, std::string name="")

  Creates a new instance of a data definition using the plugin registry.
- static void SaveInstance (PersistenceRecord *fields, ModelDataDefinition *modeldatum)

  Serializes a data definition instance into a persistence record.
- static bool Check (ModelDataDefinition *modeldatum, std::string &errorMessage)

  Validates a data definition instance.
- static void InitBetweenReplications (ModelDataDefinition *modeldatum)

  Resets simulation-time state between replications.
- static void CreateInternalData (ModelDataDefinition *modeldatum)

Creates internal and attached data required by this instance.

- static bool CreateRelatedDataElements (ModelDataDefinition *modeldatum, std::string &errorMessage)

  Creates related data and validates the instance in a single call.

Protected Member Functions

- virtual void _onDispatchEvent (Entity *entity, unsigned int inputPortNumber) override

  Handles a dispatched event for this component type.
- virtual bool _loadInstance (PersistenceRecord *fields) override

  virtual protected method that must be overriden
- virtual void _saveInstance (PersistenceRecord *fields, bool saveDefaultValues) override

  Saves object fields into a serialization structure.
- virtual void _createEditableDataDefinitions () override
- virtual bool _check (std::string &errorMessage) override

  could be overriden by derived classes

Protected Member Functions inherited from ModelDataDefinition

17.1009.1 Detailed Description

Placeholder for adding an entity to a Storage (§5.11).
Arena correspondence: the "Store module" (Rockwell Automation, *Getting Started with Arena*, "The Advanced Process Panel", p. 66).

Warning

> Incomplete stub template: this class declares no fields at all, and `_onDispatchEvent()` unconditionally forwards the entity without touching any Storage. `_check()`/`_loadInstance()`/`_saveInstance()` are not implemented either. See `docs/ai_assistants/reference/ARENA_GENESYS_↩ COMPATIBILITY.md` §6.17.

17.1009.2 Member Function Documentation

17.1009.2.1 _check()

```
bool Store::_check (
            std::string & errorMessage )  [override], [protected], [virtual]
```

could be overriden by derived classes
Reimplemented from ModelDataDefinition.

17.1009.2.2 _createEditableDataDefinitions()

```
void Store::_createEditableDataDefinitions ( )  [override], [protected], [virtual]
```

Reimplemented from ModelDataDefinition.

17.1009.2.3 _loadInstance()

```
bool Store::_loadInstance (
            PersistenceRecord * fields )  [override], [protected], [virtual]
```

virtual protected method that must be overriden
Reimplemented from ModelComponent.

17.1009.2.4 _onDispatchEvent()

```
void Store::_onDispatchEvent (
            Entity * entity,
            unsigned int inputPortNumber )  [override], [protected], [virtual]
```

Handles a dispatched event for this component type.
This method is only for ModelComponents, not for ModelDataElements.

Parameters

entity	Entity being processed.
inputPortNumber	Input port where the entity arrived.

Implements ModelComponent.

17.1009.2.5 _saveInstance()

```
void Store::_saveInstance (
            PersistenceRecord * fields,
            bool saveDefaultValues )  [override], [protected], [virtual]
```

Saves object fields into a serialization structure.

Parameters

fields	a table-like structure used for serialization.
saveDefaultValues	indicates whether or not to save fields which are set to their default value.

Reimplemented from ModelComponent.

17.1009.2.6 show()

```
std::string Store::show ( )  [override], [virtual]
```

virtual public methods
Returns a textual representation of this component.

Returns

Human-readable description used for tracing and debugging.

Reimplemented from ModelComponent.
The documentation for this class was generated from the following files:

- plugins/components/MaterialHandling/Store.h
- plugins/components/MaterialHandling/Store.cpp

17.1012.1 Detailed Description

This component ...

17.1012.2 Member Function Documentation

17.1012.2.1 _check()

```
bool Submodel::_check (
            std::string & errorMessage )  [override], [protected], [virtual]
```

could be overriden by derived classes
Reimplemented from ModelDataDefinition.

17.1012.2.2 _loadInstance()

```
bool Submodel::_loadInstance (
            PersistenceRecord * fields )  [override], [protected], [virtual]
```

virtual protected method that must be overriden
Reimplemented from ModelComponent.

17.1012.2.3 _onDispatchEvent()

```
void Submodel::_onDispatchEvent (
            Entity * entity,
            unsigned int inputPortNumber )  [override], [protected], [virtual]
```

Handles a dispatched event for this component type.
This method is only for ModelComponents, not for ModelDataElements.

Parameters

entity	Entity being processed.
inputPortNumber	Input port where the entity arrived.

Implements ModelComponent.

17.1012.2.4 _saveInstance()

```
void Submodel::_saveInstance (
            PersistenceRecord * fields,
            bool saveDefaultValues )  [override], [protected], [virtual]
```

Saves object fields into a serialization structure.

Parameters

fields	a table-like structure used for serialization.
saveDefaultValues	indicates whether or not to save fields which are set to their default value.

Reimplemented from ModelComponent.

17.1012.2.5 show()

```
std::string Submodel::show ( )  [override], [virtual]
```

virtual public methods
Returns a textual representation of this component.

Returns

Human-readable description used for tracing and debugging.

Reimplemented from ModelComponent.
The documentation for this class was generated from the following files:

17.1014.1 Detailed Description

Symbol kinds.

17.1014.2 Member Enumeration Documentation

17.1014.2.1 symbol_kind_type

enum yy::genesyspp_parser::symbol_kind::symbol_kind_type

Enumerator

YYNTOKENS	Number of tokens.

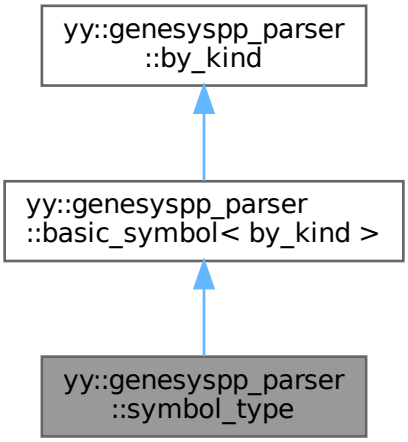
The documentation for this struct was generated from the following file:

- parser/GenesysParser.h

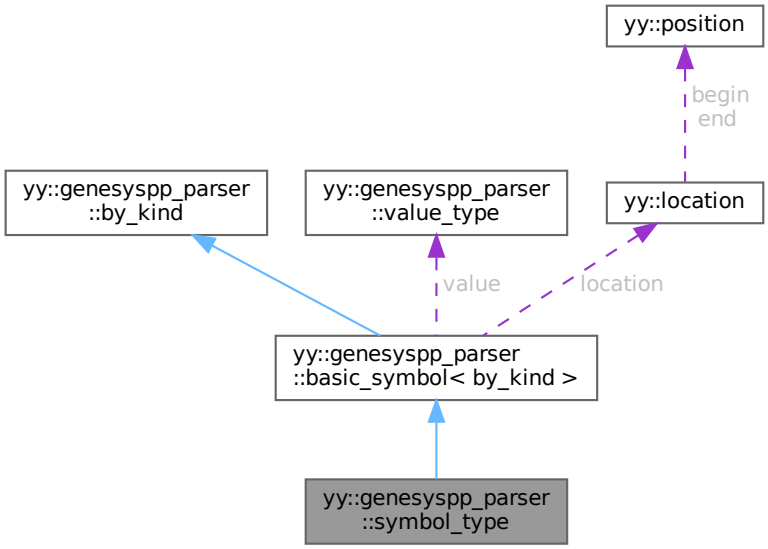
17.1015 yy::genesyspp_parser::symbol_type Struct Reference

"External" symbols: returned by the scanner.
`#include <parser/GenesysParser.h>`

Inheritance diagram for yy::genesyspp_parser::symbol_type:



Collaboration diagram for yy::genesyspp_parser::symbol_type:



Public Types

- typedef basic_symbol< by_kind > **super_type**

  Superclass.

Public Types inherited from yy::genesyspp_parser::basic_symbol< by_kind >

- typedef by_kind **super_type**

Alias to Base.

Public Types inherited from yy::genesyspp_parser::by_kind

- typedef token_kind_type **kind_type**

  The symbol kind as needed by the constructor.

Public Member Functions

- **symbol_type** () YY_NOEXCEPT

  Empty symbol.
- **symbol_type** (int tok, const location_type &l)

  Constructor for valueless symbols, and symbols from each type.
- **symbol_type** (int tok, const obj_t &v, const location_type &l)

Public Member Functions inherited from yy::genesyspp_parser::basic_symbol< by_kind >

- **basic_symbol** () YY_NOEXCEPT

  Default constructor.
- **basic_symbol** (const basic_symbol &that)

  Copy constructor.
- **basic_symbol** (typename Base::kind_type t, const location_type &l)

  Constructors for typed symbols.
- **basic_symbol** (typename Base::kind_type t, const obj_t &v, const location_type &l)
- **basic_symbol** (typename Base::kind_type t, const std::string &v, const location_type &l)
- ~**basic_symbol** ()

  Destroy the symbol.
- void **clear** () YY_NOEXCEPT

  Destroy contents, and record that is empty.
- std::string **name** () const YY_NOEXCEPT

  The user-facing name of this symbol.
- symbol_kind_type **type_get** () const YY_NOEXCEPT

  Backward compatibility (Bison 3.6).
- bool **empty** () const YY_NOEXCEPT

  Whether empty.
- void **move** (basic_symbol &s)

  Destructive move, s is emptied into this.

Public Member Functions inherited from yy::genesyspp_parser::by_kind

- **by_kind** () YY_NOEXCEPT

  Default constructor.
- **by_kind** (const by_kind &that) YY_NOEXCEPT

  Copy constructor.
- **by_kind** (kind_type t) YY_NOEXCEPT

  Constructor from (external) token numbers.
- void **clear** () YY_NOEXCEPT

  Record that this symbol is empty.
- void **move** (by_kind &that)

  Steal the symbol kind from that.
- symbol_kind_type kind () const YY_NOEXCEPT
- symbol_kind_type **type_get** () const YY_NOEXCEPT

  Backward compatibility (Bison 3.6).

Additional Inherited Members

Public Attributes inherited from yy::genesyspp_parser::basic_symbol< by_kind >

- value_type **value**

  The semantic value.
- location_type **location**

  The location.

Public Attributes inherited from yy::genesyspp_parser::by_kind

- symbol_kind_type kind_

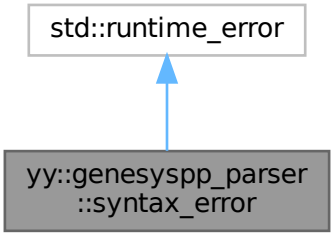
17.1015.1 Detailed Description

"External" symbols: returned by the scanner.
The documentation for this struct was generated from the following file:

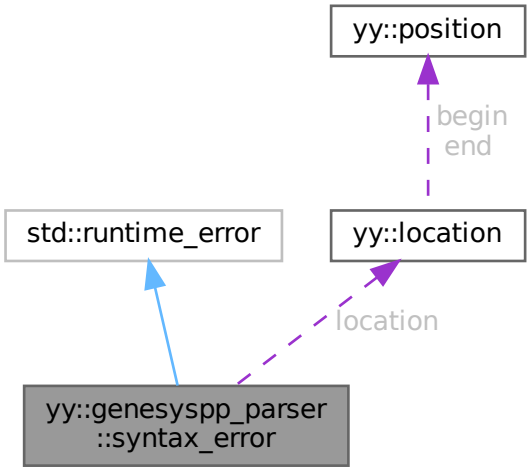
- parser/GenesysParser.h

17.1016 yy::genesyspp_parser::syntax_error Struct Reference

Syntax errors thrown from user actions.
`#include <parser/GenesysParser.h>`
Inheritance diagram for yy::genesyspp_parser::syntax_error:



Collaboration diagram for yy::genesyspp_parser::syntax_error:



Public Member Functions

- **syntax_error** (const location_type &l, const std::string &m)
- **syntax_error** (const syntax_error &s)

Public Attributes

- location_type **location**

17.1016.1 Detailed Description

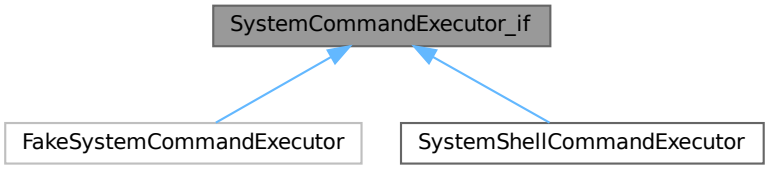
Syntax errors thrown from user actions.
The documentation for this struct was generated from the following files:

- parser/GenesysParser.h
- parser/GenesysParser.cpp

17.1017 SystemCommandExecutor_if Class Reference

Minimal command execution interface used to make system dependency checks testable.
`#include <kernel/simulator/SystemDependencyResolver.h>`

Inheritance diagram for SystemCommandExecutor_if:



Public Member Functions

- virtual ~**SystemCommandExecutor_if** ()=default

  Destroys the command executor abstraction.
- virtual SystemCommandResult run (const std::string &command)=0

  Runs a shell command and returns its observable result.

17.1017.1 Detailed Description

Minimal command execution interface used to make system dependency checks testable.

17.1017.2 Member Function Documentation

17.1017.2.1 run()

```
virtual SystemCommandResult SystemCommandExecutor_if::run (
            const std::string & command )  [pure virtual]
```

Runs a shell command and returns its observable result.
Implemented in SystemShellCommandExecutor, and FakeSystemCommandExecutor.
The documentation for this class was generated from the following file:

- kernel/simulator/SystemDependencyResolver.h

17.1018 SystemCommandResult Struct Reference

Captures the result of executing a system command used by dependency checks.
`#include <kernel/simulator/SystemDependencyResolver.h>`

Public Member Functions

- bool **succeeded** () const

  Returns true when the command started and exited successfully.

Public Attributes

- bool **started** = false

  True when the command process was started by the executor.
- int **exitCode** = -1

  Process exit code, or -1 when the command could not be started.
- std::string **output** = ""

  Combined standard output and diagnostic text produced by the command.
- std::string **errorMessage** = ""

  Internal executor error message, when starting or collecting the command failed.

17.1018.1 Detailed Description

Captures the result of executing a system command used by dependency checks.
The documentation for this struct was generated from the following files:

- kernel/simulator/SystemDependencyResolver.h
- kernel/simulator/SystemDependencyResolver.cpp

17.1019 SystemDependency Class Reference

Public Types

- enum class **OS** {
  Any , **Linux** , **Windows** , **MacOS** ,
  Unknown }

Public Member Functions

- **SystemDependency** (OS os, std::string name, std::string installCommand="", std::string checkCommand="")
- OS **getOS** () const
- std::string **getName** () const
- std::string **getInstallCommand** () const
- std::string **getCheckCommand** () const
- std::string **show** () const

Static Public Member Functions

- static std::string **osToString** (OS os)

The documentation for this class was generated from the following files:

- kernel/simulator/PluginInformation.h
- kernel/simulator/PluginInformation.cpp

17.1020 SystemDependencyCheckEntry Class Reference

One dependency entry produced by a system dependency preflight.
`#include <kernel/simulator/SystemDependencyResolver.h>`

Public Types

- enum class Status { **Satisfied** , **Missing** , **NotVerifiable** , **IgnoredDifferentOS** }

  Classification assigned to one declared dependency after preflight.

Public Member Functions

- **SystemDependencyCheckEntry** (SystemDependency dependency, Status status, SystemCommandResult checkResult={}, std::string message="")

  Builds a preflight entry for one declared dependency.
- const SystemDependency & **dependency** () const

  Returns the dependency declaration evaluated by this entry.
- Status **status** () const

  Returns the preflight status for this dependency.
- const SystemCommandResult & **checkResult** () const

  Returns the result of the check command, when one was executed.
- const std::string & **message** () const

  Returns human-readable diagnostic context for this entry.

- bool **blocksInsertion** () const

  Returns true when this entry should prevent plugin insertion.
- bool **canAttemptInstall** () const

  Returns true when this missing dependency has an installation command.
- std::string **diagnosticText** () const

  Returns a multi-line diagnostic with check/install commands and command results.

Static Public Member Functions

- static std::string **statusToString** (Status status)

  Converts a status value into a stable textual representation.

17.1020.1 Detailed Description

One dependency entry produced by a system dependency preflight.
The documentation for this class was generated from the following files:

- kernel/simulator/SystemDependencyResolver.h
- kernel/simulator/SystemDependencyResolver.cpp

17.1021 SystemDependencyCheckResult Class Reference

Full preflight result for the system dependencies declared by one plugin.
`#include <kernel/simulator/SystemDependencyResolver.h>`

Public Member Functions

- void **add** (SystemDependencyCheckEntry entry)

  Adds one dependency evaluation entry.
- const std::list< SystemDependencyCheckEntry > & **entries** () const

  Returns every evaluated dependency entry, including ignored entries.
- bool **canInsertPlugin** () const

  Returns true when no applicable dependency blocks insertion.
- bool **hasBlockingEntries** () const

  Returns true when at least one dependency blocks insertion.
- bool **canAttemptInstallForAllMissing** () const

  Returns true when every blocking missing dependency has an installation command.
- std::string **summary** () const

  Returns a compact diagnostic summary suitable for trace logs.
- std::string **diagnosticText** (bool includeSatisfied=false) const

  Returns a multi-line diagnostic suitable for terminal, GUI and trace details.

17.1021.1 Detailed Description

Full preflight result for the system dependencies declared by one plugin.
The documentation for this class was generated from the following files:

- kernel/simulator/SystemDependencyResolver.h
- kernel/simulator/SystemDependencyResolver.cpp

17.1022 SystemDependencyInstallEntry Class Reference

One command result from an attempted system dependency installation.
`#include <kernel/simulator/SystemDependencyResolver.h>`

Public Member Functions

- **SystemDependencyInstallEntry** (SystemDependency dependency, SystemCommandResult installResult)

  Builds an installation result for a single dependency.
- const SystemDependency & **dependency** () const

  Returns the dependency whose install command was executed.
- const SystemCommandResult & **installResult** () const

  Returns the result produced by the install command.
- std::string **diagnosticText** () const

  Returns command, exit code and captured output for trace or GUI feedback.

17.1022.1 Detailed Description

One command result from an attempted system dependency installation.
The documentation for this class was generated from the following files:

- kernel/simulator/SystemDependencyResolver.h
- kernel/simulator/SystemDependencyResolver.cpp

17.1023 SystemDependencyInstallResult Class Reference

Aggregates commands executed while trying to satisfy missing system dependencies.
`#include <kernel/simulator/SystemDependencyResolver.h>`

Public Member Functions

- void **add** (SystemDependencyInstallEntry entry)

  Adds one installation command result.
- const std::list< SystemDependencyInstallEntry > & **entries** () const

  Returns all attempted installation command results.
- bool **succeeded** () const

  Returns true when every attempted installation command succeeded.
- std::string **summary** () const

  Returns a compact diagnostic summary suitable for trace logs.
- std::string **diagnosticText** () const

  Returns detailed diagnostic text for every executed install command.

17.1023.1 Detailed Description

Aggregates commands executed while trying to satisfy missing system dependencies.
The documentation for this class was generated from the following files:

- kernel/simulator/SystemDependencyResolver.h
- kernel/simulator/SystemDependencyResolver.cpp

17.1024 SystemDependencyResolver Class Reference

Evaluates and optionally installs plugin system dependencies.
`#include <kernel/simulator/SystemDependencyResolver.h>`

Static Public Member Functions

- static SystemDependency::OS **currentOS** ()

  Returns the operating system represented by the current executable.
- static bool **appliesToCurrentOS** (const SystemDependency &dependency)

  Returns true when a dependency declaration applies to the current OS.
- static SystemDependencyCheckResult **evaluate** (const std::list< SystemDependency > *dependencies, SystemCommandExecutor_if &executor)

  Evaluates all dependency declarations using check commands when available.
- static SystemDependencyInstallResult **installMissingDependencies** (const SystemDependencyCheckResult &checkResult, SystemCommandExecutor_if &executor)

  Executes install commands for missing dependencies from a preflight result.

17.1024.1 Detailed Description

Evaluates and optionally installs plugin system dependencies.
The resolver deliberately contains no user-interface code. It only decides whether dependencies apply to the current OS, runs declared check/install commands through an executor, and reports diagnostics to the caller.
The documentation for this class was generated from the following files:

- kernel/simulator/SystemDependencyResolver.h
- kernel/simulator/SystemDependencyResolver.cpp

17.1025 SystemPreferences Class Reference

Persistent application preferences used by the Qt GUI.
`#include <applications/gui/genesys/systempreferences.h>`

Public Types

- enum class StartupModelMode : unsigned short { **NoModel** = 0 , **NewModel** = 1 , **OpenSpecificModel** = 2 , **OpenLastModel** = 3 }

  Startup model selection remembered in the preferences file.
- enum class VisualTheme { **Light** , **Dark** }

  Global visual style used by the GUI.
- enum class InterfaceStyle { **Classic** , **Modern** }

  Interface density/style preset used by the Qt application.
- enum class AutomaticPositioningStrategy { **Legacy** = 0 , **Centered** = 1 }

  Automatic positioning policy for graphical elements.

Static Public Member Functions

- static bool load ()

  Loads preferences from the configuration file.
- static bool save ()

  Saves the current preferences to disk.
- static void **resetToDefaults** ()

  Restores every preference to its built-in default value.
- static QString **configFilePath** ()

  Returns the full path to the active preferences file.
- static bool **startMaximized** ()

  Returns whether the application should start maximized.
- static void **setStartMaximized** (bool newStartMaximized)

  Updates the start-maximized preference.

- static bool **autoLoadPlugins** ()

  Returns whether plug-ins are loaded automatically at startup.
- static void **setAutoLoadPlugins** (bool newAutoLoadPlugins)

  Updates the automatic plug-in loading preference.
- static StartupModelMode **startupModelMode** ()

  Returns the startup model mode.
- static void **setStartupModelMode** (StartupModelMode newStartupModelMode)

  Updates the startup model mode.
- static unsigned short **modelAtStart** ()

  Returns the configured model index for the startup flow.
- static void **setModelAtStart** (unsigned short newModelAtStart)

  Updates the configured model index for the startup flow.
- static std::string **modelfilename** ()

  Returns the filename requested for startup loading.
- static void **setModelfilename** (const std::string &newModelfilename)

  Updates the filename requested for startup loading.
- static std::string **lastModelFilename** ()

  Returns the last model filename successfully opened by the GUI.
- static void **setLastModelFilename** (const std::string &newLastModelFilename)

  Updates the last model filename successfully opened by the GUI.
- static std::vector< std::string > **recentModelFiles** ()

  Returns the list of recently opened model files.
- static void **setRecentModelFiles** (const std::vector< std::string > &recentModelFiles)

  Replaces the recent model file list.
- static void pushRecentModelFile (const std::string &modelFilename)

  Pushes a file to the recent model list with limit handling.
- static unsigned int **recentModelFilesLimit** ()

  Returns the maximum number of recent model entries to keep.
- static void **setRecentModelFilesLimit** (unsigned int recentModelFilesLimit)

  Updates the maximum number of recent model entries.
- static bool **checkSystemPackagesAtStart** ()

  Returns whether system packages should be checked at startup.
- static void **setCheckSystemPackagesAtStart** (bool newCheckSystemPackagesAtStart)

  Updates the system-package check preference.
- static TraceManager::Level **traceLevel** ()

  Returns the current trace verbosity level.
- static void **setTraceLevel** (TraceManager::Level newTraceLevel)

  Updates the trace verbosity level.
- static VisualTheme **visualTheme** ()

  Returns the selected visual theme.
- static void **setVisualTheme** (VisualTheme newVisualTheme)

  Updates the selected visual theme.
- static std::string **visualThemeName** ()

  Returns the persisted name of the selected visual theme.
- static InterfaceStyle **interfaceStyle** ()

  Returns the selected interface style preset.
- static void **setInterfaceStyle** (InterfaceStyle newInterfaceStyle)

  Updates the selected interface style preset.
- static std::string **interfaceStyleName** ()

  Returns the persisted name of the selected interface style.
- static int **applicationFontPointSize** ()

Returns the application font size used by the GUI.

- static void **setApplicationFontPointSize** (int newApplicationFontPointSize)

  Updates the application font size used by the GUI.

- static bool **diagramUsesThemeColors** ()

  Returns whether diagram widgets should derive colors from the theme.

- static void **setDiagramUsesThemeColors** (bool newDiagramUsesThemeColors)

  Updates whether diagram widgets should derive colors from the theme.

- static AutomaticPositioningStrategy **automaticPositioningStrategy** ()

  Returns the automatic placement strategy used by the diagram canvas.

- static void **setAutomaticPositioningStrategy** (AutomaticPositioningStrategy strategy)

  Updates the automatic placement strategy used by the diagram canvas.

- static unsigned int **canvasBackgroundColor** ()

  Returns the RGB color used for the main canvas background.

- static unsigned int **canvasDisabledBackgroundColor** ()

  Returns the RGB color used for the disabled canvas background.

- static unsigned int **gridColor** ()

  Returns the RGB color used for the diagram grid.

17.1025.1 Detailed Description

Persistent application preferences used by the Qt GUI.
The class behaves like a singleton configuration store backed by a local preferences file. All access is static so the GUI can query and update the current runtime settings without manually passing a preferences object around.

17.1025.2 Member Function Documentation

17.1025.2.1 load()

```
bool SystemPreferences::load ( )  [static]
```

Loads preferences from the configuration file.
Loads GUI preferences from disk and normalizes invalid data.

17.1025.2.2 pushRecentModelFile()

```
void SystemPreferences::pushRecentModelFile (
            const std::string & modelFilename )  [static]
```

Pushes a file to the recent model list with limit handling.
Pushes a model file to the top of the recent-file list.

17.1025.2.3 save()

```
bool SystemPreferences::save ( )  [static]
```

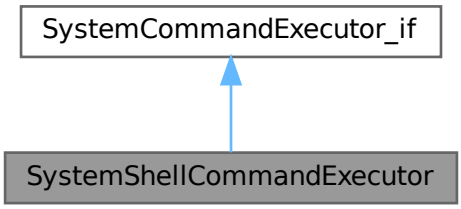
Saves the current preferences to disk.
Serializes the current GUI preferences to the preferences file.
The documentation for this class was generated from the following files:

- applications/gui/genesys/systempreferences.h
- applications/gui/genesys/systempreferences.cpp

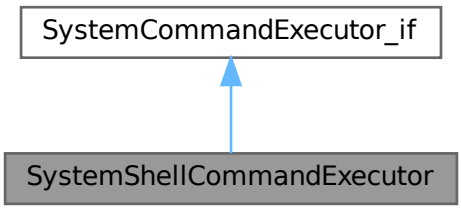
17.1026 SystemShellCommandExecutor Class Reference

Shell-based executor used by production plugin dependency preflight.
`#include <kernel/simulator/SystemDependencyResolver.h>`

Inheritance diagram for SystemShellCommandExecutor:



Collaboration diagram for SystemShellCommandExecutor:



Public Member Functions

- SystemCommandResult run (const std::string &command) override

  Executes a command through the host shell and captures combined output.

Public Member Functions inherited from SystemCommandExecutor_if

- virtual ~**SystemCommandExecutor_if** ()=default

  Destroys the command executor abstraction.

17.1026.1 Detailed Description

Shell-based executor used by production plugin dependency preflight.

17.1026.2 Member Function Documentation

17.1026.2.1 run()

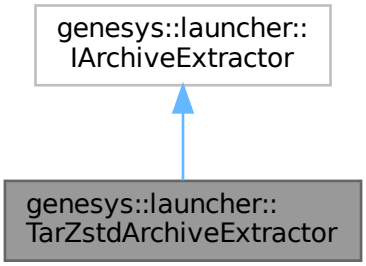
```
SystemCommandResult SystemShellCommandExecutor::run (
            const std::string & command )  [override], [virtual]
```

Executes a command through the host shell and captures combined output.
Implements SystemCommandExecutor_if.
The documentation for this class was generated from the following files:

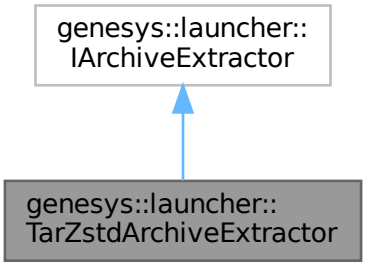
- kernel/simulator/SystemDependencyResolver.h
- kernel/simulator/SystemDependencyResolver.cpp

17.1027 genesys::launcher::TarZstdArchiveExtractor Class Reference

Inheritance diagram for genesys::launcher::TarZstdArchiveExtractor:



Collaboration diagram for genesys::launcher::TarZstdArchiveExtractor:



Public Member Functions

- **TarZstdArchiveExtractor** (int timeoutMs=60000)
- ExtractionResult extract (const QString &archivePath, const QString &destinationRoot) override

Static Public Member Functions

- static ExtractionResult **validatePathListing** (const QByteArray &listing)
- static ExtractionResult **validateVerboseListing** (const QByteArray &listing)

17.1027.1 Member Function Documentation

17.1027.1.1 extract()

```
ExtractionResult genesys::launcher::TarZstdArchiveExtractor::extract (
            const QString & archivePath,
            const QString & destinationRoot )  [override], [virtual]
```

Implements genesys::launcher::IArchiveExtractor.

The documentation for this class was generated from the following files:

- applications/launcher/ArchiveExtractor.h
- applications/launcher/ArchiveExtractor.cpp

17.1028 testing::internal::Templates< Head_, Tail_ > Struct Template Reference

Public Types

- using **Head** = TemplateSel< Head_ >
- using **Tail** = Templates< Tail_... >

The documentation for this struct was generated from the following file:

- gtest/gtest/internal/gtest-type-util.h

17.1029 testing::internal::Templates< Head_ > Struct Template Reference

Public Types

17.1054 TraceConsoleController Class Reference

Controller that routes simulator trace events to GUI text widgets.
`#include <applications/gui/genesys/controllers/TraceConsoleController.h>`

Public Member Functions

- **TraceConsoleController** (QTextEdit *console, QTextEdit *simulationText, QTextEdit *reportsText, std::function< bool()> traceWidgetsEnabled={})

  Creates the trace-output bridge used by MainWindow trace wrappers.
- void **simulatorTraceHandler** (TraceEvent e) const

  Renders generic traces to the main console pane.
- void **simulatorTraceErrorHandler** (TraceErrorEvent e) const

  Renders error traces to the main console pane.
- void **simulatorTraceSimulationHandler** (TraceSimulationEvent e) const

  Renders simulation traces to the simulation output pane.
- void **simulatorTraceReportsHandler** (TraceEvent e) const

  Renders reports traces to the reports output pane.

17.1054.1 Detailed Description

Controller that routes simulator trace events to GUI text widgets.
This controller is the Phase-4 extraction for trace presentation. MainWindow keeps compatibility handlers registered in the kernel trace manager and delegates rendering to this class, reducing direct UI formatting logic in the façade.
Responsibilities:

- render regular/error traces to the main console pane;
- render simulation traces to the simulation output pane;
- render report traces to the reports pane.

Boundaries:

- it does not subscribe handlers by itself (registration stays in MainWindow/event layer);
- it does not change simulation flow, model state, or controller orchestration;
- it acts as a UI bridge, not as a domain service.

The documentation for this class was generated from the following files:

- applications/gui/genesys/controllers/TraceConsoleController.h
- applications/gui/genesys/controllers/TraceConsoleController.cpp

17.1058.1 Detailed Description

The TraceManager is used to trace back model simulation information and track/debug the simulation. It works as the model simulation output (cout) and allows external methods to hook up such output as listeners.

17.1058.2 Member Function Documentation

17.1058.2.1 addTraceErrorHandler() [1/2]

```
template<typename Class >
void TraceManager::addTraceErrorHandler (
            Class * object,
            void(Class::*)(TraceErrorEvent) function )
```

addTraceErrorHandler

Parameters

object	Add a method to by notified/invoked then a traceError is called

17.1058.2.2 addTraceErrorHandler() [2/2]

```
void TraceManager::addTraceErrorHandler (
            traceErrorListener traceErrorListener )
```

addTraceErrorHandler

Parameters

traceErrorListener	Add a function to by notified/invoked then a traceError is called

17.1058.2.3 addTraceHandler() [1/2]

```
template<typename Class >
void TraceManager::addTraceHandler (
            Class * object,
            void(Class::*)(TraceEvent) function )
```

addTraceHandler

Parameters

object	Add a method to by notified/invoked then a trace is called

17.1058.2.4 addTraceHandler() [2/2]

```
void TraceManager::addTraceHandler (
            traceListener traceListener )
```

addTraceHandler

Parameters

traceListener	Add a function to by notified/invoked then a trace is called

17.1058.2.5 addTraceReportHandler() [1/2]

```
template<typename Class >
void TraceManager::addTraceReportHandler (
            Class * object,
            void(Class::*)(TraceEvent) function )
```

addTraceReportHandler

Parameters

object	Add a method to by notified/invoked then a traceReport is called

17.1058.2.6 addTraceReportHandler() [2/2]

```
void TraceManager::addTraceReportHandler (
            traceListener traceReportListener )
```

addTraceReportHandler

Parameters

traceReportListener	Add a function to by notified/invoked then a traceReport is called

17.1058.2.7 addTraceSimulationHandler() [1/2]

```
template<typename Class >
void TraceManager::addTraceSimulationHandler (
            Class * object,
            void(Class::*)(TraceSimulationEvent) function )
```

addTraceSimulationHandler

Parameters

object	Add a method to by notified/invoked then a traceSimulation is called

17.1058.2.8 addTraceSimulationHandler() [2/2]

```
void TraceManager::addTraceSimulationHandler (
            traceSimulationListener traceSimulationListener )
```

addTraceSimulationHandler

Parameters

traceSimulationListener	Add a function to by notified/invoked then a traceSimulation is called

17.1058.2.9 errorMessages()

```
List< std::string > * TraceManager::errorMessages ( ) const
```

errorMessages

Returns

17.1058.2.10 getParentSimulator()

```
Simulator * TraceManager::getParentSimulator ( ) const
```

getParentSimulator

Returns

17.1058.2.11 getTraceLevel()

```
TraceManager::Level TraceManager::getTraceLevel ( ) const
```

getTraceLevel

Returns

17.1058.2.12 isTraceSimulationRuleAllAllowed()

```
bool TraceManager::isTraceSimulationRuleAllAllowed ( ) const
```

isTraceSimulationRuleAllAllowed

Returns

17.1058.2.13 setTraceLevel()

```
void TraceManager::setTraceLevel (
            TraceManager::Level _traceLevel )
```

setTraceLevel

Parameters

_traceLevel	

17.1058.2.14 setTraceSimulationRuleAllAllowed()

```
void TraceManager::setTraceSimulationRuleAllAllowed (
            bool _traceSimulationRuleAllAllowed )
```

setTraceSimulationRuleAllAllowed

Parameters

_traceSimulationRuleAllAllowed	

The documentation for this class was generated from the following files:

17.1060.1 Detailed Description

Events related to simulation "process" (usually process analyser), associated to entire replication or simulation events (begin/end/pause of replication/simulation) @ToDo: (importante): CLASS NOT FULLY IMPLEMENTED (to be implemented for process analyser)
The documentation for this class was generated from the following file:

- kernel/simulator/TraceManager.h

17.1061 TraitsGUI< T > Struct Template Reference

GUI-specific trait constants used to tune default rendering behavior.
`#include <applications/gui/genesys/TraitsGUI.h>`

17.1061.1 Detailed Description

template<class T>
struct TraitsGUI< T >

GUI-specific trait constants used to tune default rendering behavior.
These specializations keep visual defaults close to the legacy Qt interface without scattering magic numbers across the graphics and editor code.
The documentation for this struct was generated from the following file:

- applications/gui/genesys/TraitsGUI.h

17.1062 TraitsGUI< GAssociation > Struct Reference

Static Public Attributes

- static const uint64_t **foreColor** = 0x808080FF
- static constexpr const int **margin** = 2

17.1085 TraitsTools< T > Struct Template Reference

Registry-like traits to bind abstractions to concrete tools classes.
`#include <tools/TraitsTools.h>`

17.1085.1 Detailed Description

template<typename T>
struct TraitsTools< T >

Registry-like traits to bind abstractions to concrete tools classes.
Architectural role:

- Central selection point for concrete implementations used by this package.

Implementation status:

- Currently covers only a subset of tool abstractions.

Planned evolution:

- Extend bindings as new stable interfaces receive concrete implementations.

- New abstractions without safe concrete implementations should remain documented-only for now to avoid build instability.

The documentation for this struct was generated from the following file:

- tools/TraitsTools.h

17.1086 TraitsTools< AIAssistant_if > Struct Reference

`#include <tools/TraitsTools.h>`

Public Types

- typedef AIAssistantDefaultImpl **Implementation**

17.1086.1 Detailed Description

Configure the AI Assistant to be used
The documentation for this struct was generated from the following file:

- tools/TraitsTools.h

17.1087 TraitsTools< Fitter_if > Struct Reference

`#include <tools/TraitsTools.h>`

Public Types

- typedef FitterDefaultImpl **Implementation**

17.1087.1 Detailed Description

Configure the Fitter to be used
The documentation for this struct was generated from the following file:

- tools/TraitsTools.h

17.1088 TraitsTools< HypothesisTester_if > Struct Reference

`#include <tools/TraitsTools.h>`

Public Types

- typedef HypothesisTesterDefaultImpl1 **Implementation**

Static Public Attributes

- static constexpr unsigned int **ConfidenceLevel** = 95

17.1088.1 Detailed Description

Configure the Hypothesis Tester to be used
The documentation for this struct was generated from the following file:

- tools/TraitsTools.h

17.1089 TraitsTools< Solver_if > Struct Reference

`#include <tools/TraitsTools.h>`

Public Types

- typedef SolverDefaultImpl1 **Implementation**

Static Public Attributes

- static constexpr double **Precision** = 1e-5
- static constexpr unsigned int **MaxSteps** = 1e2

17.1089.1 Detailed Description

Configure the Solver to be used
The documentation for this struct was generated from the following file:

- tools/TraitsTools.h

17.1090 EFSMNetworkDiagramLayout::TransitionLayout Struct Reference

Public Attributes

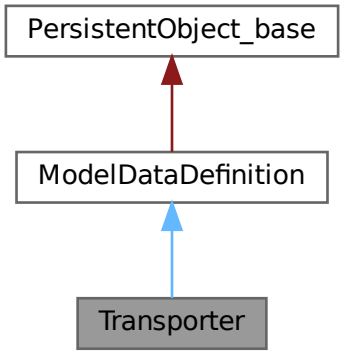
- QString **sourceName**
- QString **destinationName**
- QString **transitionName**
- int **ordinal** = 0
- QVector< QPointF > **controlPoints**
- bool **hasLabelPosition** = false
- QPointF **labelPosition**

The documentation for this struct was generated from the following file:

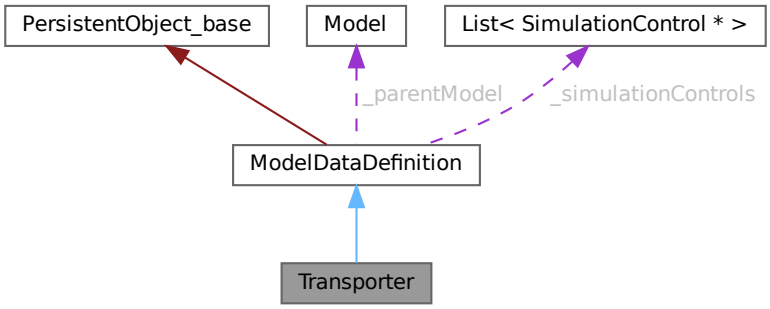
- applications/gui/genesys/services/EFSMNetworkDiagramLayout.h

17.1091 Transporter Class Reference

Inheritance diagram for Transporter:



Collaboration diagram for Transporter:



Classes

- struct TravelCompletion

Public Member Functions

- **Transporter** (Model *model, std::string name="")
- virtual std::string show () override

  Returns a textual representation of this data definition.
- void **setDistance** (Distance *distance)
- Distance * **getDistance** () const
- void **setInitialStation** (Station *station)
- Station * **getInitialStation** () const
- Station * **getCurrentStation** () const
- void **setSpeed** (double speed)
- double **getSpeed** () const
- void **setInitiallyActive** (bool initiallyActive)
- bool **isInitiallyActive** () const
- void **setActive** (bool active)
- bool **isActive** () const
- bool **isBusy** () const
- bool **reserve** ()
- void **releaseAt** (Station *station)
- double **getTravelTime** (const Station *fromStation, const Station *toStation) const
- void **handleTravelCompletion** (void *parameter)

Public Member Functions inherited from ModelDataDefinition

- ModelDataDefinition (Model *model, std::string datadefinitionTypename, std::string name="", bool insert↩ IntoModel=true)

  Creates a model data definition and optionally inserts it into the model.
- virtual ~**ModelDataDefinition** ()

  Releases resources owned by this data definition.
- Util::identification getId () const

  Returns the unique identifier of this instance.
- void setName (const std::string &name)

  Updates the logical name of this instance.

- const std::string & getName () const

  Returns the logical name of this instance.
- void setLabel (const std::string &label)

  Updates the user-visible label of this instance.
- const std::string & getLabel () const

  Returns the user-visible label of this instance.
- const std::string & getClassname () const

  Returns the runtime class name used by the plugin system.
- Model * getParentModel () const

  Returns the parent model that owns this definition.
- bool isReportStatistics () const

  Indicates whether this data definition contributes report statistics.
- void setReportStatistics (bool reportStatistics)

  Enables or disables report-statistics generation for this definition.
- ModelDataDefinition * getInternalData (const std::string &name) const

  Looks up a named internal child data definition.
- std::map< std::string, ModelDataDefinition * > * getInternalData () const

  Returns the full map of internal child data definitions.
- std::map< std::string, ModelDataDefinition * > * getAttachedData () const

  Returns the full map of attached data definitions.
- bool hasChanged () const

  Indicates whether this instance has been modified since the last reset.
- void setHasChanged (bool hasChanged)

  Updates the changed flag for this data definition.
- unsigned int getLevel () const

  Returns the hierarchical editing context containing this element.
- void setModelLevel (unsigned int _modelLevel)

  Sets this element's hierarchical editing context.
- List< SimulationControl * > * getSimulationControls () const

  Returns the simulation controls owned by this data definition.
- TraceManager::Level getTraceLevelSpecific () const

  Returns the trace level that applies specifically to this definition.
- void setTraceLevelSpecific (TraceManager::Level level)

  Updates the trace level used by this definition.
- void defineTraceLevelSpecific (TraceManager::Level traceLevelspecific, bool traceLevelSpecific↩ Enabled=true)

  Defines the specific trace level and optionally enables it immediately.
- bool isTraceLevelSpecificEnabled () const

  Indicates whether the specific trace level is enabled.
- void setTraceLevelSpecificEnabled (bool traceLevelSpecificEnabled)

  Enables or disables the specific trace level.

Static Public Member Functions

- static ModelDataDefinition * **LoadInstance** (Model *model, PersistenceRecord *fields)
- static PluginInformation * **GetPluginInformation** ()
- static ModelDataDefinition * **NewInstance** (Model *model, std::string name="")

Static Public Member Functions inherited from ModelDataDefinition

- static ModelDataDefinition * LoadInstance (Model *model, PersistenceRecord *fields, bool insertIntoModel)

  Loads a model data definition instance from serialized fields.
- static ModelDataDefinition * NewInstance (Model *model, std::string name="")

  Creates a new instance of a data definition using the plugin registry.
- static void SaveInstance (PersistenceRecord *fields, ModelDataDefinition *modeldatum)

  Serializes a data definition instance into a persistence record.
- static bool Check (ModelDataDefinition *modeldatum, std::string &errorMessage)

  Validates a data definition instance.
- static void InitBetweenReplications (ModelDataDefinition *modeldatum)

  Resets simulation-time state between replications.
- static void CreateInternalData (ModelDataDefinition *modeldatum)

  Creates internal and attached data required by this instance.
- static bool CreateRelatedDataElements (ModelDataDefinition *modeldatum, std::string &errorMessage)

  Creates related data and validates the instance in a single call.

Protected Member Functions

- virtual bool _loadInstance (PersistenceRecord *fields) override

  must be overriden by derived classes
- virtual void _saveInstance (PersistenceRecord *fields, bool saveDefaultValues) override

  Saves object fields into a serialization structure.
- virtual bool _check (std::string &errorMessage) override

  could be overriden by derived classes
- virtual void _initBetweenReplications () override
- virtual void _createEditableDataDefinitions () override

Protected Member Functions inherited from ModelDataDefinition

- bool _getSaveDefaultsOption ()
- virtual ParserChangesInformation * _getParserChangesInformation ()
- virtual void _addSimulationControl (SimulationControl *control)
- virtual void _createInternalAndAttachedData ()

17.1091.1 Member Function Documentation

17.1091.1.1 _check()

```
bool Transporter::_check (
            std::string & errorMessage )  [override], [protected], [virtual]
```

could be overriden by derived classes
Reimplemented from ModelDataDefinition.

17.1091.1.2 _createEditableDataDefinitions()

```
void Transporter::_createEditableDataDefinitions ( )  [override], [protected], [virtual]
```

Reimplemented from ModelDataDefinition.

17.1091.1.3 _initBetweenReplications()

```
void Transporter::_initBetweenReplications ( )  [override], [protected], [virtual]
```

Reimplemented from ModelDataDefinition.

17.1091.1.4 _loadInstance()

```
bool Transporter::_loadInstance (
            PersistenceRecord * fields )  [override], [protected], [virtual]
```

must be overriden by derived classes
Reimplemented from ModelDataDefinition.

17.1091.1.5 _saveInstance()

```
void Transporter::_saveInstance (
            PersistenceRecord * fields,
            bool saveDefaultValues )  [override], [protected], [virtual]
```

Saves object fields into a serialization structure.

Parameters

fields	a table-like structure used for serialization.
saveDefaultValues	indicates whether or not to save fields which are set to their default value.

Reimplemented from ModelDataDefinition.

17.1091.1.6 show()

```
std::string Transporter::show ( )  [override], [virtual]
```

Returns a textual representation of this data definition.
Returns the keys of internal ModelDataDefinitions such as counters, statistics collectors and other children needed before model checking.

Returns

Human-readable summary used by traces and debug output.

Reimplemented from ModelDataDefinition.
The documentation for this class was generated from the following files:

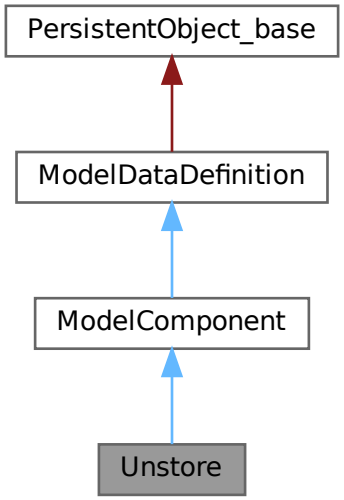
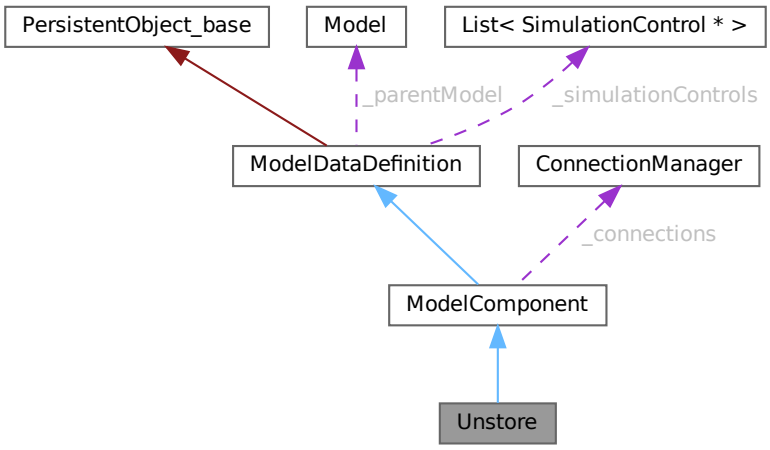
17.1124 Unstore Class Reference

Placeholder for removing an entity from a Storage (§5.11).
`#include <plugins/components/MaterialHandling/Unstore.h>`

Inheritance diagram for Unstore:



Collaboration diagram for Unstore:



Public Member Functions

- **Unstore** (Model ∗model, std::string name="")
- virtual std::string show () override

  virtual public methods
- void **setStorage** (Storage ∗storage)
- Storage ∗ **getStorage** () const
- void **setQuantityExpression** (std::string quantityExpression)
- std::string **getQuantityExpression** () const

Public Member Functions inherited from ModelComponent

- ModelComponent (Model *model, std::string componentTypename, std::string name="")

  constructors
- virtual ~**ModelComponent** ()

  Releases component-owned resources and unregisters it from the model.
- ConnectionManager * getConnectionManager () const

  new public user methods for this component
- void connectTo (ModelComponent *component, unsigned int inputPortNumber=0)

  Connects this component to another component.
- bool hasBreakpointAt ()

  Indicates whether a simulation breakpoint is set on this component.
- void setDescription (std::string _description)

  Updates the free-form description shown by the GUI.
- std::string getDescription () const

  Returns the free-form description associated with this component.
- void remove (ModelComponent *comp)

  Removes a connected component from this component.

Public Member Functions inherited from ModelDataDefinition

- ModelDataDefinition (Model *model, std::string datadefinitionTypename, std::string name="", bool insert↩ IntoModel=true)

  Creates a model data definition and optionally inserts it into the model.
- virtual ~**ModelDataDefinition** ()

  Releases resources owned by this data definition.
- Util::identification getId () const

  Returns the unique identifier of this instance.
- void setName (const std::string &name)

  Updates the logical name of this instance.
- const std::string & getName () const

  Returns the logical name of this instance.
- void setLabel (const std::string &label)

  Updates the user-visible label of this instance.
- const std::string & getLabel () const

  Returns the user-visible label of this instance.
- const std::string & getClassname () const

  Returns the runtime class name used by the plugin system.
- Model * getParentModel () const

  Returns the parent model that owns this definition.
- bool isReportStatistics () const

  Indicates whether this data definition contributes report statistics.
- void setReportStatistics (bool reportStatistics)

  Enables or disables report-statistics generation for this definition.
- ModelDataDefinition * getInternalData (const std::string &name) const

  Looks up a named internal child data definition.
- std::map< std::string, ModelDataDefinition * > * getInternalData () const

  Returns the full map of internal child data definitions.
- std::map< std::string, ModelDataDefinition * > * getAttachedData () const

  Returns the full map of attached data definitions.
- bool hasChanged () const

  Indicates whether this instance has been modified since the last reset.

- void setHasChanged (bool hasChanged)

  Updates the changed flag for this data definition.
- unsigned int getLevel () const

  Returns the hierarchical editing context containing this element.
- void setModelLevel (unsigned int _modelLevel)

  Sets this element's hierarchical editing context.
- List< SimulationControl * > * getSimulationControls () const

  Returns the simulation controls owned by this data definition.
- TraceManager::Level getTraceLevelSpecific () const

  Returns the trace level that applies specifically to this definition.
- void setTraceLevelSpecific (TraceManager::Level level)

  Updates the trace level used by this definition.
- void defineTraceLevelSpecific (TraceManager::Level traceLevelspecific, bool traceLevelSpecific↩ Enabled=true)

  Defines the specific trace level and optionally enables it immediately.
- bool isTraceLevelSpecificEnabled () const

  Indicates whether the specific trace level is enabled.
- void setTraceLevelSpecificEnabled (bool traceLevelSpecificEnabled)

  Enables or disables the specific trace level.

Static Public Member Functions

- static PluginInformation * **GetPluginInformation** ()
- static ModelComponent * **LoadInstance** (Model *model, PersistenceRecord *fields)
- static ModelDataDefinition * **NewInstance** (Model *model, std::string name="")

Static Public Member Functions inherited from ModelComponent

- static ModelComponent * LoadInstance (Model *model, PersistenceRecord *fields)

  static public methods that must have implementations (Load and New just the same. GetInformation must provide specific infos for the new component
- static bool Check (ModelComponent *component)

  Validates a component instance.
- static void CreateInternalData (ModelComponent *component)

  Creates internal data required by a component instance.
- static void SaveInstance (PersistenceRecord *fields, ModelComponent *component)

  Serializes a component instance into a persistence record.
- static void DispatchEvent (Event *event)

  Dispatches a simulation event to the target component.

Static Public Member Functions inherited from ModelDataDefinition

- static ModelDataDefinition * LoadInstance (Model *model, PersistenceRecord *fields, bool insertIntoModel)

  Loads a model data definition instance from serialized fields.
- static ModelDataDefinition * NewInstance (Model *model, std::string name="")

  Creates a new instance of a data definition using the plugin registry.
- static void SaveInstance (PersistenceRecord *fields, ModelDataDefinition *modeldatum)

  Serializes a data definition instance into a persistence record.
- static bool Check (ModelDataDefinition *modeldatum, std::string &errorMessage)

  Validates a data definition instance.
- static void InitBetweenReplications (ModelDataDefinition *modeldatum)

  Resets simulation-time state between replications.
- static void CreateInternalData (ModelDataDefinition *modeldatum)

Creates internal and attached data required by this instance.

- static bool CreateRelatedDataElements (ModelDataDefinition *modeldatum, std::string &errorMessage)

  Creates related data and validates the instance in a single call.

Protected Member Functions

- virtual void _onDispatchEvent (Entity *entity, unsigned int inputPortNumber) override

  Handles a dispatched event for this component type.
- virtual bool _loadInstance (PersistenceRecord *fields) override

  virtual protected method that must be overriden
- virtual void _saveInstance (PersistenceRecord *fields, bool saveDefaultValues) override

  Saves object fields into a serialization structure.
- virtual void _createEditableDataDefinitions () override
- virtual bool _check (std::string &errorMessage) override

  could be overriden by derived classes

Protected Member Functions inherited from ModelDataDefinition

- bool _getSaveDefaultsOption ()
- virtual ParserChangesInformation * _getParserChangesInformation ()

- bool **_traceLevelSpecificEnabled** = false

17.1124.1 Detailed Description

Placeholder for removing an entity from a Storage (§5.11).
Arena correspondence: the "Unstore module" (Rockwell Automation, *Getting Started with Arena*, "The Advanced Process Panel", p. 67).

Warning

Incomplete stub template: this class declares no fields at all, and `_onDispatchEvent()` unconditionally forwards the entity without touching any Storage. See `docs/ai_assistants/reference/ARENA_GENESYS_COMPATIBILITY.md` §6.17.

17.1124.2 Member Function Documentation

17.1124.2.1 _check()

```
bool Unstore::_check (
            std::string & errorMessage )  [override], [protected], [virtual]
```

could be overriden by derived classes
Reimplemented from ModelDataDefinition.

17.1124.2.2 _createEditableDataDefinitions()

```
void Unstore::_createEditableDataDefinitions ( )  [override], [protected], [virtual]
```

Reimplemented from ModelDataDefinition.

17.1124.2.3 _loadInstance()

```
bool Unstore::_loadInstance (
            PersistenceRecord * fields )  [override], [protected], [virtual]
```

virtual protected method that must be overriden
Reimplemented from ModelComponent.

17.1124.2.4 _onDispatchEvent()

```
void Unstore::_onDispatchEvent (
            Entity * entity,
            unsigned int inputPortNumber )  [override], [protected], [virtual]
```

Handles a dispatched event for this component type.
This method is only for ModelComponents, not for ModelDataElements.

Parameters

entity	Entity being processed.
inputPortNumber	Input port where the entity arrived.

Implements ModelComponent.

17.1124.2.5 _saveInstance()

```
void Unstore::_saveInstance (
            PersistenceRecord * fields,
            bool saveDefaultValues )  [override], [protected], [virtual]
```

Saves object fields into a serialization structure.

Parameters

fields	a table-like structure used for serialization.
saveDefaultValues	indicates whether or not to save fields which are set to their default value.

Reimplemented from ModelComponent.

17.1124.2.6 show()

```
std::string Unstore::show ( )  [override], [virtual]
```

virtual public methods
Returns a textual representation of this component.

Returns

Human-readable description used for tracing and debugging.

Reimplemented from ModelComponent.
The documentation for this class was generated from the following files:

- plugins/components/MaterialHandling/Unstore.h
- plugins/components/MaterialHandling/Unstore.cpp

17.1125 genesys::launcher::UpdateChecker Class Reference

Public Types

- using **Clock** = std::function< QDateTime()>

Public Member Functions

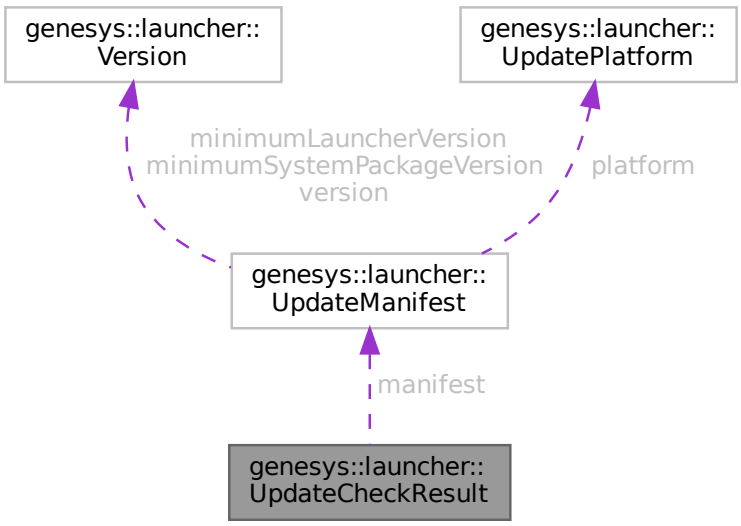
- **UpdateChecker** (RuntimePaths paths, LauncherConfig config, PlatformInfo platform, Version current↩ RuntimeVersion, Version launcherVersion, Version systemPackageVersion, INetworkTransport &transport, LauncherLogger *logger=nullptr, Clock clock={})
- UpdateCheckResult **check** (bool force=false)

The documentation for this class was generated from the following files:

- applications/launcher/UpdateChecker.h
- applications/launcher/UpdateChecker.cpp

17.1126 genesys::launcher::UpdateCheckResult Struct Reference

Collaboration diagram for genesys::launcher::UpdateCheckResult:



Public Attributes

- UpdateCheckStatus **status** = UpdateCheckStatus::Disabled
- bool **ok** = false
- bool **updateAvailable** = false
- UpdateManifest **manifest**
- QString **message**

The documentation for this struct was generated from the following file:

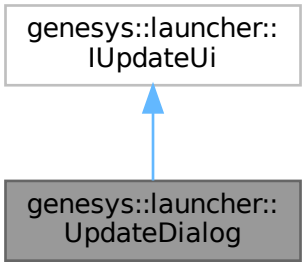
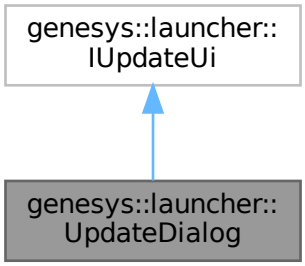
17.1127 genesys::launcher::UpdateDialog Class Reference

Inheritance diagram for genesys::launcher::UpdateDialog:



Collaboration diagram for genesys::launcher::UpdateDialog:



Public Member Functions

- **UpdateDialog** (QWidget *parent=nullptr)
- bool confirmUpdate (const Version &currentVersion, const Version &candidateVersion, const QString &releaseNotes) override
- void beginDownload (qint64 totalBytes) override
- bool updateDownloadProgress (qint64 receivedBytes, qint64 totalBytes) override
- void finishDownload () override
- void showError (const QString &message) override
- void showInfo (const QString &message) override

17.1127.1 Member Function Documentation

17.1127.1.1 beginDownload()

```
void genesys::launcher::UpdateDialog::beginDownload (
            qint64 totalBytes )  [override], [virtual]
```

Implements genesys::launcher::IUpdateUi.

17.1127.1.2 confirmUpdate()

```
bool genesys::launcher::UpdateDialog::confirmUpdate (
            const Version & currentVersion,
            const Version & candidateVersion,
            const QString & releaseNotes )  [override], [virtual]
```

Implements genesys::launcher::IUpdateUi.

17.1127.1.3 finishDownload()

```
void genesys::launcher::UpdateDialog::finishDownload ( )  [override], [virtual]
```

Implements genesys::launcher::IUpdateUi.

17.1127.1.4 showError()

```
void genesys::launcher::UpdateDialog::showError (
            const QString & message )  [override], [virtual]
```

Implements genesys::launcher::IUpdateUi.

17.1127.1.5 showInfo()

```
void genesys::launcher::UpdateDialog::showInfo (
            const QString & message )  [override], [virtual]
```

Implements genesys::launcher::IUpdateUi.

17.1127.1.6 updateDownloadProgress()

```
bool genesys::launcher::UpdateDialog::updateDownloadProgress (
            qint64 receivedBytes,
            qint64 totalBytes )  [override], [virtual]
```

Implements genesys::launcher::IUpdateUi.
The documentation for this class was generated from the following files:

- RuntimeInstallResult **installAndActivate** (const QString &verifiedBundlePath, const UpdateManifest &manifest, int maxUserVersions)
- bool **validateRuntime** (const QString &runtimeRoot, const UpdateManifest &manifest, QString ∗error=nullptr) const

The documentation for this class was generated from the following files:

- applications/launcher/UserRuntimeManager.h
- applications/launcher/UserRuntimeManager.cpp

17.1134 Util Class Reference

Classes

- class CommandResult

Public Types

- enum class TimeUnit : int {
  unknown = 0 , **picosecond** = 1 , **nanosecond** = 2 , **microsecond** = 3 ,
  milisecond = 4 , **second** = 5 , **minute** = 6 , **hour** = 7 ,
  day = 8 , **week** = 9 , **num_elements** = 10 }

  The TimeUnit enum.
- enum class **AllocationType** : int {
  ValueAdded = 0 , **NonValueAdded** = 1 , **Transfer** = 2 , **Wait** = 3 ,
  Others = 4 , **num_elements** = 5 }
- enum class **TimeFormat** : unsigned int { **twelve** = 12 , **twentyFour** = 24 }
- typedef unsigned long **identification**
- typedef unsigned int **rank**

Static Public Member Functions

- static std::string StrTimeUnitShort (Util::TimeUnit timeUnit)

  Returns the short textual symbol for a time unit.
- static std::string StrTimeUnitLong (Util::TimeUnit timeUnit)

  Returns the long textual label for a time unit.
- static std::string convertEnumToStr (Util::TimeUnit timeUnit)

  Converts a time unit enum value to its canonical string representation.
- static std::string StrAllocation (Util::AllocationType allocation)

  Returns the string representation for an allocation category.
- static std::string convertEnumToStr (Util::AllocationType allocation)

  Converts an allocation category enum value to a string.
- static void SetIndent (const unsigned short indent)

  Sets the indentation level used by `Indent()`.
- static void **IncIndent** ()

  Increments the current indentation level.
- static void **DecIndent** ()

  Decrements the current indentation level.
- static void SepKeyVal (std::string str, std::string &key, std::string &value)

  Splits a key-value string around the first = character.
- static std::string Indent ()

  Returns the current indentation prefix.
- static std::string SetW (std::string text, unsigned short width)

  Pads or truncates text to a fixed width.
- static std::string StrTruncIfInt (double value)

  Formats a numeric value without losing integer semantics.
- static std::string StrTruncIfInt (std::string strValue)

  Removes a trailing .000000 suffix when present.
- static std::string Trim (std::string str)

  Trims leading and trailing whitespace.
- static std::string StrReplace (std::string text, std::string searchFor, std::string replaceBy)

  Replaces all occurrences of one substring with another.
- static std::string StrReplaceSpecialChars (std::string text)

  Sanitizes a text for identifier-like usage.
- static std::string StrIndex (int index)

  Formats an integer index in bracket notation.
- static void Trimwithin (std::string &str)

  Removes all spaces from a string in place.
- static std::string Map2str (std::map< std::string, std::string > *mapss)

Serializes a string-to-string map to a compact text form.

- static std::string Map2str (std::map< std::string, double > *mapss)

  Serializes a string-to-double map to a compact text form.
- static std::string List2str (std::list< unsigned int > *list)

  Serializes a list of unsigned integers to a compact text form.
- static Util::identification GenerateNewId ()

  Generates a globally unique identifier.
- static Util::identification GenerateNewIdOfType (std::string objtype)

  Generates the next identifier for a given runtime type name.
- static Util::identification GetLastIdOfType (std::string objtype)

  Returns the most recently generated identifier for a type.
- static void ResetIdOfType (std::string objtype)

  Resets the identifier counter for a specific type.
- static void **ResetAllIds** ()

  Resets all identifier counters maintained by the utility class.
- static double TimeUnitConvert (Util::TimeUnit timeUnit1, Util::TimeUnit timeUnit2)

  Computes the multiplicative factor between two time units.
- static char DirSeparator ()

  Returns the platform directory separator character.
- static std::string FilenameFromFullFilename (const std::string &s)

  Extracts the file name from a full path.
- static void FileDelete (const std::string &filename)

  Deletes a file if it exists.
- static std::string PathFromFullFilename (const std::string &s)

  Extracts the directory path from a full filename.
- static std::string RunningPath ()

  Returns the directory that contains the running binary.
- static std::vector< std::string > ListFiles (std::string dir, std::string fileFilter="", mode_t attribFilter=S_IFREG &S_IFDIR)

  Lists files in a directory using an optional substring filter.
- static bool FileExists (const std::string &name)

  Checks whether a file can be opened for reading.
- static Util::CommandResult ExecuteCommand (std::string command)

  Executes a shell command and captures the result.
- template<typename T >
  static std::string TypeOf ()

  Returns the compiler type name used for `T`.
- template<class T >
  static Util::identification GenerateNewIdOfType ()

  Generates the next identifier in the namespace of `T`.

17.1134.1 Member Function Documentation

17.1134.1.1 convertEnumToStr() [1/2]

```
std::string Util::convertEnumToStr (
            Util::AllocationType allocation ) [static]
```

Converts an allocation category enum value to a string.

Parameters

allocation	Allocation category to convert.

Returns

Canonical string representation for the enum value.

17.1134.1.2 convertEnumToStr() [2/2]

```
std::string Util::convertEnumToStr (
            Util::TimeUnit timeUnit )  [static]
```

Converts a time unit enum value to its canonical string representation.

Parameters

timeUnit	Time unit to convert.

Returns

Canonical string representation for the enum value.

17.1134.1.3 DirSeparator()

```
char Util::DirSeparator ( )  [static]
```

Returns the platform directory separator character.

Returns

Directory separator for the current platform.

17.1134.1.4 ExecuteCommand()

```
Util::CommandResult Util::ExecuteCommand (
            std::string command )  [static]
```

Executes a shell command and captures the result.

Parameters

command	Command line to run.

Returns

Command execution outcome and captured output buffers.

17.1134.1.5 FileDelete()

```
void Util::FileDelete (
            const std::string & filename )  [static]
```

Deletes a file if it exists.

Parameters

filename	Path to the file to delete.

17.1134.1.6 FileExists()

```
bool Util::FileExists (
            const std::string & name )  [static]
```

Checks whether a file can be opened for reading.

Parameters

name	File path to test.

Returns

`true` if the file exists and can be opened.

17.1134.1.7 FilenameFromFullFilename()

```
std::string Util::FilenameFromFullFilename (
            const std::string & s )  [static]
```

Extracts the file name from a full path.

Parameters

s	Full file path.

Returns

Trailing file name portion.

17.1134.1.8 GenerateNewId()

```
Util::identification Util::GenerateNewId ( )  [static]
```

Generates a globally unique identifier.

Returns

Next process-wide identifier value.

17.1134.1.9 GenerateNewIdOfType() [1/2]

```
template<class T >
static Util::identification Util::GenerateNewIdOfType ( )  [inline], [static]
```

Generates the next identifier in the namespace of `T`.

Template Parameters

T	Type whose namespace should receive a new identifier.

Returns

Next sequential identifier for the type.

17.1134.1.10 GenerateNewIdOfType() [2/2]

```
Util::identification Util::GenerateNewIdOfType (
            std::string objtype )  [static]
```

Generates the next identifier for a given runtime type name.

Parameters

objtype	Type name used as identifier namespace.

Returns

Next identifier within the requested type namespace.

17.1134.1.11 GetLastIdOfType()

```
Util::identification Util::GetLastIdOfType (
            std::string objtype )  [static]
```

Returns the most recently generated identifier for a type.

Parameters

objtype	Type name used as identifier namespace.

Returns

Last identifier value for the requested type.

17.1134.1.12 Indent()

```
std::string Util::Indent ( )  [static]
```

Returns the current indentation prefix.

Returns

A string made of repeated indentation markers.

17.1134.1.13 List2str()

```
std::string Util::List2str (
            std::list< unsigned int > * list )  [static]
```

Serializes a list of unsigned integers to a compact text form.

Parameters

list	List to serialize.

Returns

One-line representation of the list contents.

17.1134.1.14 ListFiles()

```
std::vector< std::string > Util::ListFiles (
            std::string dir,
            std::string fileFilter = "",
            mode_t attribFilter = S_IFREG & S_IFDIR )  [static]
```

Lists files in a directory using an optional substring filter.

Parameters

dir	Directory to scan.
fileFilter	Optional substring filter for file names.
attribFilter	Attribute mask applied to `stat` results.

Returns

Matching file names found in the directory.

17.1134.1.15 Map2str() [1/2]

```
std::string Util::Map2str (
            std::map< std::string, double > * mapss )  [static]
```

Serializes a string-to-double map to a compact text form.

Parameters

mapss	Map to serialize.

Returns

One-line representation of the map contents.

17.1134.1.16 Map2str() [2/2]

```
std::string Util::Map2str (
            std::map< std::string, std::string > * mapss )  [static]
```

Serializes a string-to-string map to a compact text form.

Parameters

mapss	Map to serialize.

Returns

One-line representation of the map contents.

17.1134.1.17 PathFromFullFilename()

```
std::string Util::PathFromFullFilename (
            const std::string & s )  [static]
```

Extracts the directory path from a full filename.

Parameters

s	Full file path.

Returns

Directory portion of the path.

17.1134.1.18 ResetIdOfType()

```
void Util::ResetIdOfType (
            std::string objtype )  [static]
```

Resets the identifier counter for a specific type.

Parameters

objtype	Type name to reset.

17.1134.1.19 RunningPath()

```
std::string Util::RunningPath ( )  [static]
```

Returns the directory that contains the running binary.

Returns

Current executable directory.

17.1134.1.20 SepKeyVal()

```
void Util::SepKeyVal (
            std::string str,
            std::string & key,
            std::string & value )  [static]
```

Splits a key-value string around the first = character.

Parameters

str	Source text in the form `key=value`.
key	Output key portion.
value	Output value portion.

17.1134.1.21 SetIndent()

```
void Util::SetIndent (
            const unsigned short indent )  [static]
```

Sets the indentation level used by `Indent()`.

Parameters

indent	New indentation depth.

17.1134.1.22 SetW()

```
std::string Util::SetW (
            std::string text,
            unsigned short width )  [static]
```

Pads or truncates text to a fixed width.

Parameters

text	Text to adjust.
width	Target width.

Returns

Text resized to the requested width.

17.1134.1.23 StrAllocation()

```
std::string Util::StrAllocation (
            Util::AllocationType allocation )  [static]
```

Returns the string representation for an allocation category.

Parameters

allocation	Allocation category to convert.

Returns

Allocation label used in reports and logs.

17.1134.1.24 StrIndex()

```
std::string Util::StrIndex (
            int index )  [static]
```

Formats an integer index in bracket notation.

Parameters

index	Index to format.

Returns

Text such as [4].

17.1134.1.25 StrReplace()

```
std::string Util::StrReplace (
            std::string text,
            std::string searchFor,
            std::string replaceBy )  [static]
```

Replaces all occurrences of one substring with another.

Parameters

text	Input text.
searchFor	Substring to replace.
replaceBy	Replacement text.

Returns

Updated text.

17.1134.1.26 StrReplaceSpecialChars()

```
std::string Util::StrReplaceSpecialChars (
            std::string text )  [static]
```

Sanitizes a text for identifier-like usage.

Parameters

text	Input text.

Returns

Text with spaces and selected punctuation normalized.

17.1134.1.27 StrTimeUnitLong()

```
std::string Util::StrTimeUnitLong (
            Util::TimeUnit timeUnit )  [static]
```

Returns the long textual label for a time unit.

Parameters

timeUnit	Time unit to convert.

Returns

Long label such as `millisecond` or `hour`.

17.1134.1.28 StrTimeUnitShort()

```
std::string Util::StrTimeUnitShort (
            Util::TimeUnit timeUnit )  [static]
```

Returns the short textual symbol for a time unit.

Parameters

timeUnit	Time unit to convert.

Returns

Short symbol such as `ms` or `h`.

17.1134.1.29 StrTruncIfInt() [1/2]

```
std::string Util::StrTruncIfInt (
            double value )  [static]
```

Formats a numeric value without losing integer semantics.

Parameters

value	Value to format.

Returns

A string that preserves the decimal point for exact integers.

17.1134.1.30 StrTruncIfInt() [2/2]

```
std::string Util::StrTruncIfInt (
            std::string strValue )  [static]
```

Removes a trailing .000000 suffix when present.

Parameters

strValue	String representation to normalize.

Returns

Normalized string value.

17.1134.1.31 TimeUnitConvert()

```
double Util::TimeUnitConvert (
            Util::TimeUnit timeUnit1,
            Util::TimeUnit timeUnit2 )  [static]
```

Computes the multiplicative factor between two time units.

Parameters

timeUnit1	Source unit.
timeUnit2	Target unit.

Returns

Conversion factor from `timeUnit1` to `timeUnit2`.

17.1134.1.32 Trim()

```
std::string Util::Trim (
            std::string str )  [static]
```

Trims leading and trailing whitespace.

Parameters

str	Input string.

Returns

Trimmed string.

17.1134.1.33 Trimwithin()

```
void Util::Trimwithin (
            std::string & str )  [static]
```

Removes all spaces from a string in place.

Parameters

str	String to normalize.

17.1134.1.34 TypeOf()

```
template<typename T >
static std::string Util::TypeOf ( )  [inline], [static]
```

Returns the compiler type name used for `T`.

Template Parameters

T	Type to inspect.

Returns

Compiler-provided type name, normalized when possible.

The documentation for this class was generated from the following files:

- kernel/util/Util.h
- kernel/util/Util.cpp

17.1135 yy::genesyspp_parser::value_type Class Reference

`#include <parser/GenesysParser.h>`

Public Types

- typedef value_type **self_type**

  Type of ∗this.

Public Member Functions

- **value_type** () YY_NOEXCEPT

  Empty construction.
- template<typename T >
  value_type (YY_RVREF(T) t)

  Construct and fill.
- ∼**value_type** () YY_NOEXCEPT

  Destruction, allowed only if empty.
- template<typename T >
  T & **emplace** ()

  Instantiate an empty T in here.
- template<typename T >
  T & **emplace** (const T &t)

  Instantiate a T in here from t.
- template<typename T >
  T & build ()
- template<typename T >
  T & build (const T &t)
- template<typename T >
  T & **as** () YY_NOEXCEPT

  Accessor to a built T.
- template<typename T >
  const T & **as** () const YY_NOEXCEPT

  Const accessor to a built T (for printer).
- template<typename T >
  void swap (self_type &that) YY_NOEXCEPT
- template<typename T >
  void move (self_type &that)
- template<typename T >
  void **copy** (const self_type &that)

  Copy the content of that to this.
- template<typename T >
  void **destroy** ()

  Destroy the stored T.

17.1135.1 Detailed Description

A buffer to store and retrieve objects.
Sort of a variant, but does not keep track of the nature of the stored data, since that knowledge is available via the current parser state.

17.1135.2 Member Function Documentation

17.1135.2.1 build() [1/2]

```
template<typename T >
T & yy::genesyspp_parser::value_type::build ( )  [inline]
```

Instantiate an empty *T* in here. Obsolete, use emplace.

17.1135.2.2 build() [2/2]

```
template<typename T >
T & yy::genesyspp_parser::value_type::build (
            const T & t )  [inline]
```

Instantiate a *T* in here from *t*. Obsolete, use emplace.

17.1135.2.3 move()

```
template<typename T >
void yy::genesyspp_parser::value_type::move (
            self_type & that )  [inline]
```

Move the content of *that* to this.
Destroys *that*.

17.1135.2.4 swap()

```
template<typename T >
void yy::genesyspp_parser::value_type::swap (
            self_type & that )  [inline]
```

Swap the content with *that*, of same type.
Both variants must be built beforehand, because swapping the actual data requires reading it (with as()), and this is not possible on unconstructed variants: it would require some dynamic testing, which should not be the variant's responsibility. Swapping between built and (possibly) non-built is done with self_type::move ().
The documentation for this class was generated from the following file:

```

Implements testing::internal::ParamGeneratorInterface< T >.

The documentation for this class was generated from the following file:

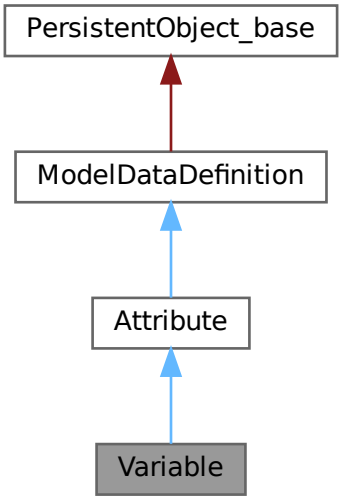
- gtest/gtest/internal/gtest-param-util.h

17.1138 Variable Class Reference

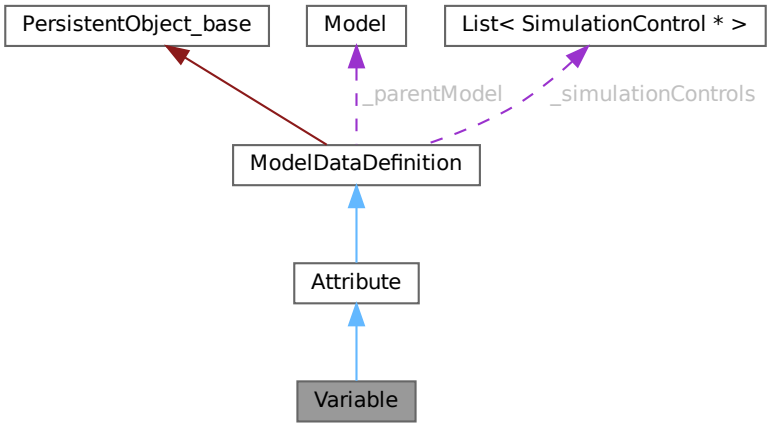
Data definition for a named value (scalar or indexed array) that is global to the whole model, as opposed to Attribute's per-entity values.

```
#include <plugins/data/Logic/Variable.h>
```

Inheritance diagram for Variable:



Collaboration diagram for Variable:



Public Member Functions

- **Variable** (Model *model, std::string name="")
- virtual std::string show () override

  Returns a textual representation of this data definition.
- double **getValue** (std::string index="")

  Reads the current sparse value, returning 0.0 when the index is absent.
- void **setValue** (double value, std::string index="")

  Writes the current sparse value at the scalar or indexed position.
- void **copyValuesFrom** (const Variable &source)

  Copies the full runtime sparse store from another variable.
- std::string getInitialValuesText () const override

  Returns the initial values serialized in bracket notation.
- void setInitialValuesText (std::string valuesText) override

  Parses bracket notation and replaces both initial and runtime stores.
- void **insertDimentionSize** (unsigned int size)

  Appends one dimension size to the variable definition.
- std::map< std::string, double > * **getValues** () const

  Returns mutable current sparse values for compatibility with existing callers.
- SparseValueStore * **getValueStore** ()

  Returns current value store used by this variable.
- ModelDataDefinition * **get_scope** ()
- void **set_scope** (ModelDataDefinition *const scope)

Public Member Functions inherited from Attribute

- **Attribute** (Model *model, std::string name="", std::string dataDefinitionTypename=Util::TypeOf< Attribute >())

  Creates an entity attribute definition in the model.
- virtual ~**Attribute** () override

  Releases sparse initial values owned by this definition.
- double **getInitialValue** (std::string index="")

Reads the initial sparse value, returning 0.0 when the index is absent.

- void **setInitialValue** (double value, std::string index="")

  Writes the initial sparse value at the scalar or indexed position.
- void **setInitialValues** (const std::vector< std::pair< std::string, double > > values)

  Replaces/extends initial sparse values from textual index/value pairs.
- void **copyInitialValuesFrom** (const Attribute &source)

  Copies the full initial sparse store from another attribute.
- void **insertDimentionSize** (unsigned int size)

  Appends one dimension size to the attribute definition.
- std::list< unsigned int > * **getDimensionSizes** () const

  Returns dimension sizes for compatibility with existing callers.
- std::map< std::string, double > * **getInitialValues** () const

  Returns mutable initial sparse values for compatibility with existing callers.
- SparseValueStore * **getInitialValueStore** ()

  Returns the sparse initial value store used by this attribute.
- bool **isInitialValuesTextValid** () const

  Returns whether the last textual initial value is syntactically valid.

Public Member Functions inherited from ModelDataDefinition

- ModelDataDefinition (Model *model, std::string datadefinitionTypename, std::string name="", bool insert↩ IntoModel=true)

  Creates a model data definition and optionally inserts it into the model.
- virtual ~**ModelDataDefinition** ()

  Releases resources owned by this data definition.
- Util::identification getId () const

  Returns the unique identifier of this instance.
- void setName (const std::string &name)

  Updates the logical name of this instance.
- const std::string & getName () const

  Returns the logical name of this instance.
- void setLabel (const std::string &label)

  Updates the user-visible label of this instance.
- const std::string & getLabel () const

  Returns the user-visible label of this instance.
- const std::string & getClassname () const

  Returns the runtime class name used by the plugin system.
- Model * getParentModel () const

  Returns the parent model that owns this definition.
- bool isReportStatistics () const

  Indicates whether this data definition contributes report statistics.
- void setReportStatistics (bool reportStatistics)

  Enables or disables report-statistics generation for this definition.
- ModelDataDefinition * getInternalData (const std::string &name) const

  Looks up a named internal child data definition.
- std::map< std::string, ModelDataDefinition * > * getInternalData () const

  Returns the full map of internal child data definitions.
- std::map< std::string, ModelDataDefinition * > * getAttachedData () const

  Returns the full map of attached data definitions.
- bool hasChanged () const

  Indicates whether this instance has been modified since the last reset.

- void setHasChanged (bool hasChanged)

  Updates the changed flag for this data definition.
- unsigned int getLevel () const

  Returns the hierarchical editing context containing this element.
- void setModelLevel (unsigned int _modelLevel)

  Sets this element's hierarchical editing context.
- List< SimulationControl * > * getSimulationControls () const

  Returns the simulation controls owned by this data definition.
- TraceManager::Level getTraceLevelSpecific () const

  Returns the trace level that applies specifically to this definition.
- void setTraceLevelSpecific (TraceManager::Level level)

  Updates the trace level used by this definition.
- void defineTraceLevelSpecific (TraceManager::Level traceLevelspecific, bool traceLevelSpecific↩ Enabled=true)

  Defines the specific trace level and optionally enables it immediately.
- bool isTraceLevelSpecificEnabled () const

  Indicates whether the specific trace level is enabled.
- void setTraceLevelSpecificEnabled (bool traceLevelSpecificEnabled)

  Enables or disables the specific trace level.

Static Public Member Functions

- static PluginInformation * **GetPluginInformation** ()
- static ModelDataDefinition * **LoadInstance** (Model *model, PersistenceRecord *fields)
- static ModelDataDefinition * **NewInstance** (Model *model, std::string name="")

Static Public Member Functions inherited from Attribute

- static PluginInformation * **GetPluginInformation** ()
- static ModelDataDefinition * **LoadInstance** (Model *model, PersistenceRecord *fields)
- static ModelDataDefinition * **NewInstance** (Model *model, std::string name="")

Static Public Member Functions inherited from ModelDataDefinition

- static ModelDataDefinition * LoadInstance (Model *model, PersistenceRecord *fields, bool insertIntoModel)

  Loads a model data definition instance from serialized fields.
- static ModelDataDefinition * NewInstance (Model *model, std::string name="")

  Creates a new instance of a data definition using the plugin registry.
- static void SaveInstance (PersistenceRecord *fields, ModelDataDefinition *modeldatum)

  Serializes a data definition instance into a persistence record.
- static bool Check (ModelDataDefinition *modeldatum, std::string &errorMessage)

  Validates a data definition instance.
- static void InitBetweenReplications (ModelDataDefinition *modeldatum)

  Resets simulation-time state between replications.
- static void CreateInternalData (ModelDataDefinition *modeldatum)

  Creates internal and attached data required by this instance.
- static bool CreateRelatedDataElements (ModelDataDefinition *modeldatum, std::string &errorMessage)

  Creates related data and validates the instance in a single call.

Protected Member Functions

- virtual bool _loadInstance (PersistenceRecord *fields) override

  must be overriden by derived classes
- virtual void _saveInstance (PersistenceRecord *fields, bool saveDefaultValues) override

  Saves object fields into a serialization structure.
- virtual bool _check (std::string &errorMessage) override

  could be overriden by derived classes
- virtual void _initBetweenReplications () override

Protected Member Functions inherited from ModelDataDefinition

- bool _getSaveDefaultsOption ()
- virtual ParserChangesInformation * _getParserChangesInformation ()
- virtual void _addSimulationControl (SimulationControl *control)
- virtual void _createInternalAndAttachedData ()
- virtual void **_createInternalStatisticReporters** ()
- virtual void _createAttachedAttributes ()

- bool **_traceLevelSpecificEnabled** = false

17.1138.1 Detailed Description

Data definition for a named value (scalar or indexed array) that is global to the whole model, as opposed to Attribute's per-entity values.
Arena correspondence: the "Variable module" (Rockwell Automation, *Getting Started with Arena*, "The Basic Process Panel", pp. 48-49).
GenESyS models Variable as a subclass of Attribute, reusing its dimension/rows/columns model and sparse initial-value store (`SparseValueStore`) instead of duplicating that infrastructure; `getValue()`/`setValue`() operate on a second, independent runtime store (`_values`) that starts from the inherited initial values but is not per-entity.
Known differences from Arena: there is no "Clear Option" (Statistics / System / None reset timing) and no external-file linkage (File Name, Recordset, File Read Time); a Variable's runtime values are only reset through `_init↩ BetweenReplications()`.

17.1138.2 Member Function Documentation

17.1138.2.1 _check()

```
bool Variable::_check (
            std::string & errorMessage )  [override], [protected], [virtual]
```

could be overriden by derived classes
Reimplemented from Attribute.

17.1138.2.2 _initBetweenReplications()

```
void Variable::_initBetweenReplications ( )  [override], [protected], [virtual]
```

Reimplemented from ModelDataDefinition.

17.1138.2.3 _loadInstance()

```
bool Variable::_loadInstance (
            PersistenceRecord * fields )  [override], [protected], [virtual]
```

must be overriden by derived classes
Reimplemented from Attribute.

17.1138.2.4 _saveInstance()

```
void Variable::_saveInstance (
            PersistenceRecord * fields,
            bool saveDefaultValues )  [override], [protected], [virtual]
```

Saves object fields into a serialization structure.

Parameters

fields	a table-like structure used for serialization.
saveDefaultValues	indicates whether or not to save fields which are set to their default value.

Reimplemented from Attribute.

17.1138.2.5 getInitialValuesText()

```
std::string Variable::getInitialValuesText ( ) const  [override], [virtual]
```

Returns the initial values serialized in bracket notation.
Reimplemented from Attribute.

17.1138.2.6 setInitialValuesText()

```
void Variable::setInitialValuesText (
            std::string valuesText )  [override], [virtual]
```

Parses bracket notation and replaces both initial and runtime stores.
Reimplemented from Attribute.

17.1138.2.7 show()

```
std::string Variable::show ( )  [override], [virtual]
```

Returns a textual representation of this data definition.
Returns the keys of internal ModelDataDefinitions such as counters, statistics collectors and other children needed before model checking.

Returns

Human-readable summary used by traces and debug output.

Reimplemented from Attribute.

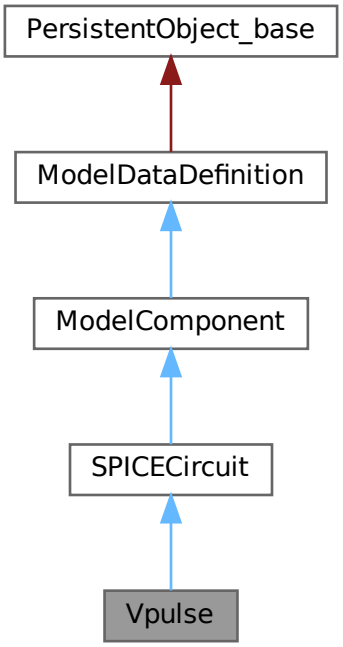
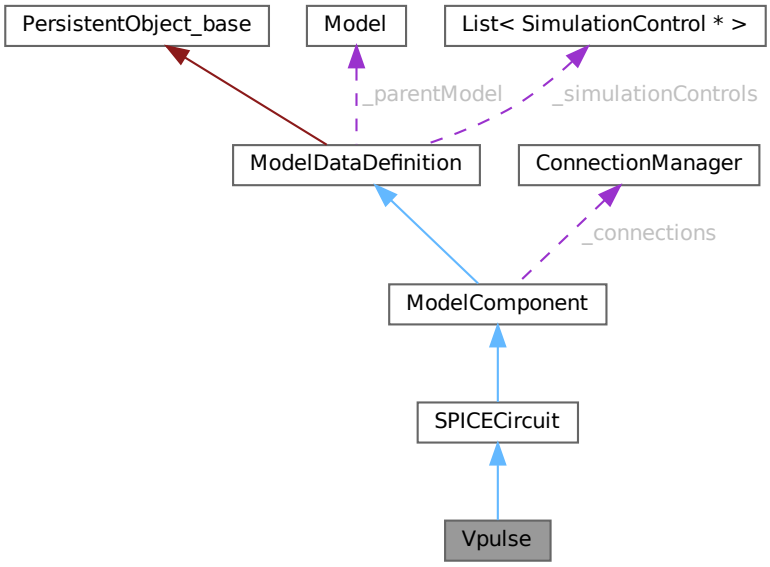
17.1141 Vpulse Class Reference

Inheritance diagram for Vpulse:



Collaboration diagram for Vpulse:



Public Member Functions

- **Vpulse** (Model *model, std::string name="")
- void Build () override
- void **setVoltage** (float voltage)
- void **setFreq** (float freq)
- void **setSlope** (float slope)

Public Member Functions inherited from SPICECircuit

- **SPICECircuit** (Model *model, std::string name="")

  constructors
- void **setRunner** (SPICERunner *runner)

  new public user methods for this components
- SPICERunner * **getRunner** ()
- virtual std::string show () override

  virtual public methods

Public Member Functions inherited from ModelComponent

- ModelComponent (Model *model, std::string componentTypename, std::string name="")

  constructors
- virtual ~**ModelComponent** ()

  Releases component-owned resources and unregisters it from the model.
- ConnectionManager * getConnectionManager () const

  new public user methods for this component
- void connectTo (ModelComponent *component, unsigned int inputPortNumber=0)

  Connects this component to another component.
- bool hasBreakpointAt ()

Indicates whether a simulation breakpoint is set on this component.

- void setDescription (std::string _description)

  Updates the free-form description shown by the GUI.
- std::string getDescription () const

  Returns the free-form description associated with this component.
- void remove (ModelComponent *comp)

  Removes a connected component from this component.

Public Member Functions inherited from ModelDataDefinition

- ModelDataDefinition (Model *model, std::string datadefinitionTypename, std::string name="", bool insert↩ IntoModel=true)

  Creates a model data definition and optionally inserts it into the model.
- virtual ~**ModelDataDefinition** ()

  Releases resources owned by this data definition.
- Util::identification getId () const

  Returns the unique identifier of this instance.
- void setName (const std::string &name)

  Updates the logical name of this instance.
- const std::string & getName () const

  Returns the logical name of this instance.
- void setLabel (const std::string &label)

  Updates the user-visible label of this instance.
- const std::string & getLabel () const

  Returns the user-visible label of this instance.
- const std::string & getClassname () const

  Returns the runtime class name used by the plugin system.
- Model * getParentModel () const

  Returns the parent model that owns this definition.
- bool isReportStatistics () const

  Indicates whether this data definition contributes report statistics.
- void setReportStatistics (bool reportStatistics)

  Enables or disables report-statistics generation for this definition.
- ModelDataDefinition * getInternalData (const std::string &name) const

  Looks up a named internal child data definition.
- std::map< std::string, ModelDataDefinition * > * getInternalData () const

  Returns the full map of internal child data definitions.
- std::map< std::string, ModelDataDefinition * > * getAttachedData () const

  Returns the full map of attached data definitions.
- bool hasChanged () const

  Indicates whether this instance has been modified since the last reset.
- void setHasChanged (bool hasChanged)

  Updates the changed flag for this data definition.
- unsigned int getLevel () const

  Returns the hierarchical editing context containing this element.
- void setModelLevel (unsigned int _modelLevel)

  Sets this element's hierarchical editing context.
- List< SimulationControl * > * getSimulationControls () const

  Returns the simulation controls owned by this data definition.
- TraceManager::Level getTraceLevelSpecific () const

  Returns the trace level that applies specifically to this definition.

- void setTraceLevelSpecific (TraceManager::Level level)

  Updates the trace level used by this definition.
- void defineTraceLevelSpecific (TraceManager::Level traceLevelspecific, bool traceLevelSpecific↩ Enabled=true)

  Defines the specific trace level and optionally enables it immediately.
- bool isTraceLevelSpecificEnabled () const

  Indicates whether the specific trace level is enabled.
- void setTraceLevelSpecificEnabled (bool traceLevelSpecificEnabled)

  Enables or disables the specific trace level.

Static Public Member Functions

- static PluginInformation * **GetPluginInformation** ()
- static ModelComponent * **LoadInstance** (Model *model, PersistenceRecord *fields)
- static ModelDataDefinition * **NewInstance** (Model *model, std::string name="")

Static Public Member Functions inherited from SPICECircuit

- static PluginInformation * **GetPluginInformation** ()

  static public methods that must have implementations (Load and New just the same. GetInformation must provide specific infos for the new component
- static ModelComponent * **LoadInstance** (Model *model, PersistenceRecord *fields)
- static ModelDataDefinition * **NewInstance** (Model *model, std::string name="")
- static std::vector< std::string > **split** (std::string word, char split_char)

  Externalize function GetPluginInformation to be accessible throught dynamic linked library.

Static Public Member Functions inherited from ModelComponent

- static ModelComponent * LoadInstance (Model *model, PersistenceRecord *fields)

  static public methods that must have implementations (Load and New just the same. GetInformation must provide specific infos for the new component
- static bool Check (ModelComponent *component)

  Validates a component instance.
- static void CreateInternalData (ModelComponent *component)

  Creates internal data required by a component instance.
- static void SaveInstance (PersistenceRecord *fields, ModelComponent *component)

  Serializes a component instance into a persistence record.
- static void DispatchEvent (Event *event)

  Dispatches a simulation event to the target component.

Static Public Member Functions inherited from ModelDataDefinition

- static ModelDataDefinition * LoadInstance (Model *model, PersistenceRecord *fields, bool insertIntoModel)

  Loads a model data definition instance from serialized fields.
- static ModelDataDefinition * NewInstance (Model *model, std::string name="")

  Creates a new instance of a data definition using the plugin registry.
- static void SaveInstance (PersistenceRecord *fields, ModelDataDefinition *modeldatum)

  Serializes a data definition instance into a persistence record.
- static bool Check (ModelDataDefinition *modeldatum, std::string &errorMessage)

  Validates a data definition instance.
- static void InitBetweenReplications (ModelDataDefinition *modeldatum)

  Resets simulation-time state between replications.
- static void CreateInternalData (ModelDataDefinition *modeldatum)

  Creates internal and attached data required by this instance.
- static bool CreateRelatedDataElements (ModelDataDefinition *modeldatum, std::string &errorMessage)

  Creates related data and validates the instance in a single call.

Protected Member Functions

- virtual bool _loadInstance (PersistenceRecord *fields) override

  virtual protected method that must be overriden
- virtual void _saveInstance (PersistenceRecord *fields, bool saveDefaultValues) override

  Saves object fields into a serialization structure.

Protected Member Functions inherited from SPICECircuit

- void **BuildCircuit** (std::string description, unsigned int id, std::vector< std::string > the_params={""}, std::string the_model="", std::string the_model_file="")

  virtual protected method that must be overriden
- void **UpdateConnections** ()
- virtual void _onDispatchEvent (Entity *entity, unsigned int inputPortNumber) override

  This method is only for ModelComponents, not ModelDataElements.
- virtual void _createNonEditableDataDefinitions () override

  virtual protected methods that could be overriden by derived classes, if needed

Protected Member Functions inherited from ModelDataDefinition

- bool _getSaveDefaultsOption ()
- virtual bool _check (std::string &errorMessage)

  could be overriden by derived classes
- virtual ParserChangesInformation * _getParserChangesInformation ()
- virtual void _initBetweenReplications ()
- virtual void _addSimulationControl (SimulationControl *control)
- virtual void _createInternalAndAttachedData ()
- virtual void **_createInternalStatisticReporters** ()
- virtual void _createAttachedAttributes ()
- virtual void _createEditableDataDefinitions ()
- void **_templateCreateInternalStatisticReporters** ()
- void **_templateCreateAttachedAttributes** ()
- void **_templateCreateNonEditableDataDefinitions** ()
- void **_templateCreateEditableDataDefinitions** ()

17.1141.1 Member Function Documentation

17.1141.1.1 _loadInstance()

```
bool Vpulse::_loadInstance (
            PersistenceRecord * fields ) [override], [protected], [virtual]
```

virtual protected method that must be overriden
Reimplemented from SPICECircuit.

17.1141.1.2 _saveInstance()

```
void Vpulse::_saveInstance (
            PersistenceRecord * fields,
            bool saveDefaultValues )  [override], [protected], [virtual]
```

Saves object fields into a serialization structure.

Parameters

fields	a table-like structure used for serialization.
saveDefaultValues	indicates whether or not to save fields which are set to their default value.

Reimplemented from SPICECircuit.

17.1141.1.3 Build()

```
void Vpulse::Build ( )  [override], [virtual]
```

Reimplemented from SPICECircuit.

The documentation for this class was generated from the following files:

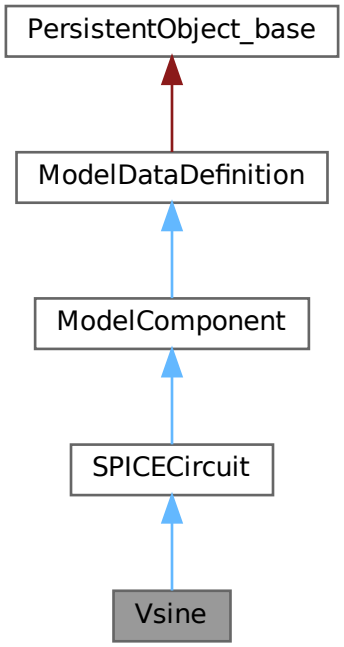
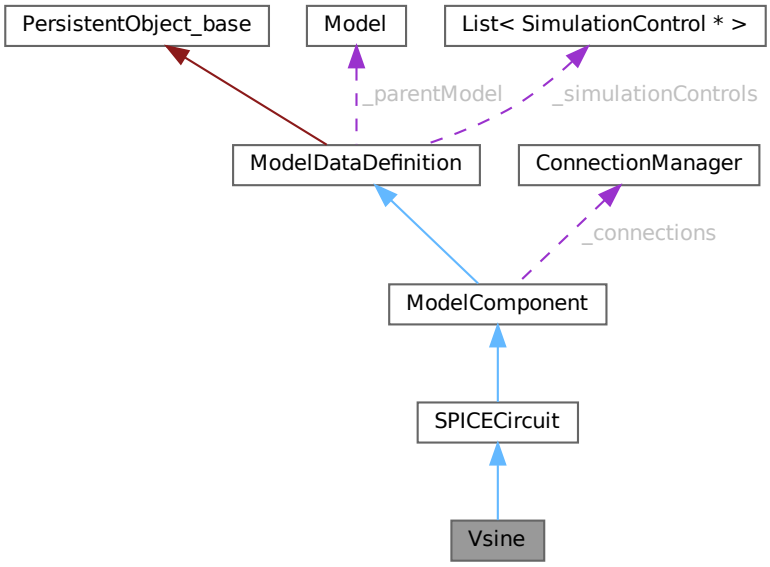
- plugins/components/ElectronicsSimulation/SPICECircuit.cpp

17.1142 Vsine Class Reference

Inheritance diagram for Vsine:



Collaboration diagram for Vsine:



Public Member Functions

- **Vsine** (Model ∗model, std::string name="")
- void Build () override
- void **setVoltage** (float voltage)
- void **setFreq** (float freq)

Public Member Functions inherited from SPICECircuit

- **SPICECircuit** (Model ∗model, std::string name="")

  constructors
- void **setRunner** (SPICERunner ∗runner)

  new public user methods for this components
- SPICERunner ∗ **getRunner** ()
- virtual std::string show () override

  virtual public methods

Public Member Functions inherited from ModelComponent

- ModelComponent (Model ∗model, std::string componentTypename, std::string name="")

  constructors
- virtual ∼**ModelComponent** ()

  Releases component-owned resources and unregisters it from the model.
- ConnectionManager ∗ getConnectionManager () const

  new public user methods for this component
- void connectTo (ModelComponent ∗component, unsigned int inputPortNumber=0)

  Connects this component to another component.
- bool hasBreakpointAt ()

  Indicates whether a simulation breakpoint is set on this component.

- void setDescription (std::string _description)

  Updates the free-form description shown by the GUI.
- std::string getDescription () const

  Returns the free-form description associated with this component.
- void remove (ModelComponent *comp)

  Removes a connected component from this component.

Public Member Functions inherited from ModelDataDefinition

- ModelDataDefinition (Model *model, std::string datadefinitionTypename, std::string name="", bool insert↩ IntoModel=true)

  Creates a model data definition and optionally inserts it into the model.
- virtual ~**ModelDataDefinition** ()

  Releases resources owned by this data definition.
- Util::identification getId () const

  Returns the unique identifier of this instance.
- void setName (const std::string &name)

  Updates the logical name of this instance.
- const std::string & getName () const

  Returns the logical name of this instance.
- void setLabel (const std::string &label)

  Updates the user-visible label of this instance.
- const std::string & getLabel () const

  Returns the user-visible label of this instance.
- const std::string & getClassname () const

  Returns the runtime class name used by the plugin system.
- Model * getParentModel () const

  Returns the parent model that owns this definition.
- bool isReportStatistics () const

  Indicates whether this data definition contributes report statistics.
- void setReportStatistics (bool reportStatistics)

  Enables or disables report-statistics generation for this definition.
- ModelDataDefinition * getInternalData (const std::string &name) const

  Looks up a named internal child data definition.
- std::map< std::string, ModelDataDefinition * > * getInternalData () const

  Returns the full map of internal child data definitions.
- std::map< std::string, ModelDataDefinition * > * getAttachedData () const

  Returns the full map of attached data definitions.
- bool hasChanged () const

  Indicates whether this instance has been modified since the last reset.
- void setHasChanged (bool hasChanged)

  Updates the changed flag for this data definition.
- unsigned int getLevel () const

  Returns the hierarchical editing context containing this element.
- void setModelLevel (unsigned int _modelLevel)

  Sets this element's hierarchical editing context.
- List< SimulationControl * > * getSimulationControls () const

  Returns the simulation controls owned by this data definition.
- TraceManager::Level getTraceLevelSpecific () const

  Returns the trace level that applies specifically to this definition.
- void setTraceLevelSpecific (TraceManager::Level level)

Updates the trace level used by this definition.

- void defineTraceLevelSpecific (TraceManager::Level traceLevelspecific, bool traceLevelSpecific↩ Enabled=true)

  Defines the specific trace level and optionally enables it immediately.
- bool isTraceLevelSpecificEnabled () const

  Indicates whether the specific trace level is enabled.
- void setTraceLevelSpecificEnabled (bool traceLevelSpecificEnabled)

  Enables or disables the specific trace level.

Static Public Member Functions

- static PluginInformation * **GetPluginInformation** ()
- static ModelComponent * **LoadInstance** (Model *model, PersistenceRecord *fields)
- static ModelDataDefinition * **NewInstance** (Model *model, std::string name="")

Static Public Member Functions inherited from SPICECircuit

- static PluginInformation * **GetPluginInformation** ()

  static public methods that must have implementations (Load and New just the same. GetInformation must provide specific infos for the new component
- static ModelComponent * **LoadInstance** (Model *model, PersistenceRecord *fields)
- static ModelDataDefinition * **NewInstance** (Model *model, std::string name="")
- static std::vector< std::string > **split** (std::string word, char split_char)

  Externalize function GetPluginInformation to be accessible throught dynamic linked library.

Static Public Member Functions inherited from ModelComponent

- static ModelComponent * LoadInstance (Model *model, PersistenceRecord *fields)

  static public methods that must have implementations (Load and New just the same. GetInformation must provide specific infos for the new component
- static bool Check (ModelComponent *component)

  Validates a component instance.
- static void CreateInternalData (ModelComponent *component)

  Creates internal data required by a component instance.
- static void SaveInstance (PersistenceRecord *fields, ModelComponent *component)

  Serializes a component instance into a persistence record.
- static void DispatchEvent (Event *event)

  Dispatches a simulation event to the target component.

Static Public Member Functions inherited from ModelDataDefinition

- static ModelDataDefinition * LoadInstance (Model *model, PersistenceRecord *fields, bool insertIntoModel)

  Loads a model data definition instance from serialized fields.
- static ModelDataDefinition * NewInstance (Model *model, std::string name="")

  Creates a new instance of a data definition using the plugin registry.
- static void SaveInstance (PersistenceRecord *fields, ModelDataDefinition *modeldatum)

  Serializes a data definition instance into a persistence record.
- static bool Check (ModelDataDefinition *modeldatum, std::string &errorMessage)

  Validates a data definition instance.
- static void InitBetweenReplications (ModelDataDefinition *modeldatum)

  Resets simulation-time state between replications.
- static void CreateInternalData (ModelDataDefinition *modeldatum)

  Creates internal and attached data required by this instance.
- static bool CreateRelatedDataElements (ModelDataDefinition *modeldatum, std::string &errorMessage)

  Creates related data and validates the instance in a single call.

Protected Member Functions

- virtual bool _loadInstance (PersistenceRecord *fields) override

  virtual protected method that must be overriden
- virtual void _saveInstance (PersistenceRecord *fields, bool saveDefaultValues) override

  Saves object fields into a serialization structure.

Protected Member Functions inherited from SPICECircuit

- void **BuildCircuit** (std::string description, unsigned int id, std::vector< std::string > the_params={""}, std::string the_model="", std::string the_model_file="")

  virtual protected method that must be overriden
- void **UpdateConnections** ()
- virtual void _onDispatchEvent (Entity *entity, unsigned int inputPortNumber) override

  This method is only for ModelComponents, not ModelDataElements.
- virtual void _createNonEditableDataDefinitions () override

  virtual protected methods that could be overriden by derived classes, if needed

Protected Member Functions inherited from ModelDataDefinition

- bool _getSaveDefaultsOption ()
- virtual bool _check (std::string &errorMessage)

  could be overriden by derived classes

17.1142.1 Member Function Documentation

17.1142.1.1 _loadInstance()

```
bool Vsine::_loadInstance (
            PersistenceRecord * fields ) [override], [protected], [virtual]
```

virtual protected method that must be overriden
Reimplemented from SPICECircuit.

17.1142.1.2 _saveInstance()

```
void Vsine::_saveInstance (
            PersistenceRecord * fields,
            bool saveDefaultValues )  [override], [protected], [virtual]
```

Saves object fields into a serialization structure.

Parameters

fields	a table-like structure used for serialization.
saveDefaultValues	indicates whether or not to save fields which are set to their default value.

Reimplemented from SPICECircuit.

17.1142.1.3 Build()

```
void Vsine::Build ( )  [override], [virtual]
```

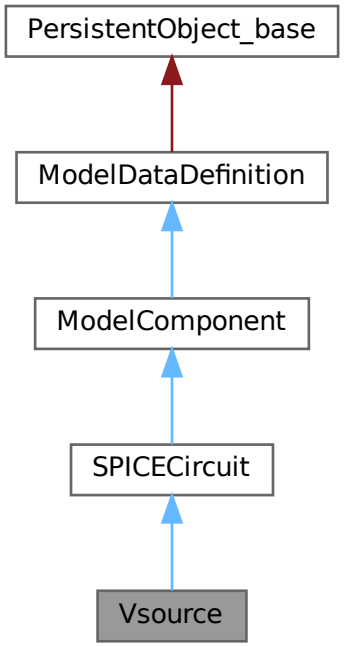
Reimplemented from SPICECircuit.

The documentation for this class was generated from the following files:

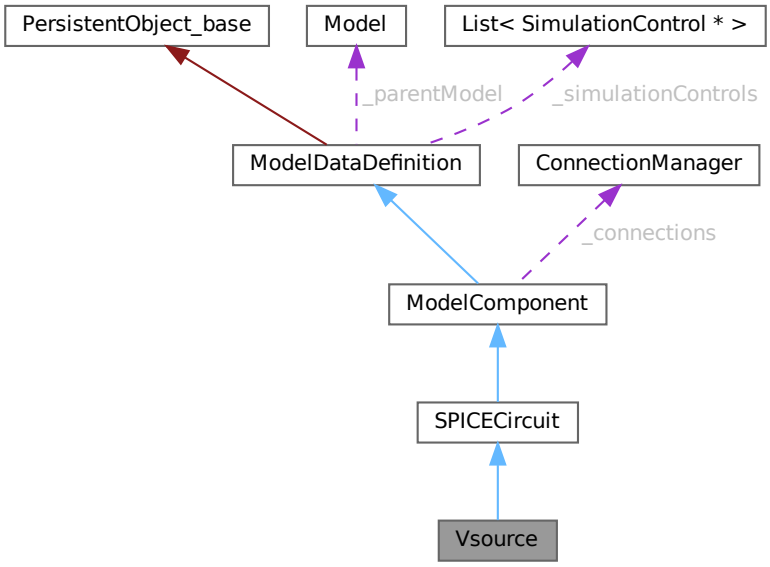
- plugins/components/ElectronicsSimulation/SPICECircuit.h
- plugins/components/ElectronicsSimulation/SPICECircuit.cpp

17.1143 Vsource Class Reference

Inheritance diagram for Vsource:



Collaboration diagram for Vsource:



Public Member Functions

- **Vsource** (Model ∗model, std::string name="")
- void Build () override
- void **setVoltage** (float voltage)

Public Member Functions inherited from SPICECircuit

- **SPICECircuit** (Model ∗model, std::string name="")

  constructors
- void **setRunner** (SPICERunner ∗runner)

  new public user methods for this components
- SPICERunner ∗ **getRunner** ()
- virtual std::string show () override

  virtual public methods

Public Member Functions inherited from ModelComponent

- ModelComponent (Model ∗model, std::string componentTypename, std::string name="")

  constructors
- virtual ∼**ModelComponent** ()

  Releases component-owned resources and unregisters it from the model.
- ConnectionManager ∗ getConnectionManager () const

  new public user methods for this component
- void connectTo (ModelComponent ∗component, unsigned int inputPortNumber=0)

  Connects this component to another component.
- bool hasBreakpointAt ()

  Indicates whether a simulation breakpoint is set on this component.
- void setDescription (std::string _description)

Updates the free-form description shown by the GUI.

- std::string getDescription () const

  Returns the free-form description associated with this component.

- void remove (ModelComponent *comp)

  Removes a connected component from this component.

Public Member Functions inherited from ModelDataDefinition

- ModelDataDefinition (Model *model, std::string datadefinitionTypename, std::string name="", bool insert↩ IntoModel=true)

  Creates a model data definition and optionally inserts it into the model.

- virtual ~**ModelDataDefinition** ()

  Releases resources owned by this data definition.

- Util::identification getId () const

  Returns the unique identifier of this instance.

- void setName (const std::string &name)

  Updates the logical name of this instance.

- const std::string & getName () const

  Returns the logical name of this instance.

- void setLabel (const std::string &label)

  Updates the user-visible label of this instance.

- const std::string & getLabel () const

  Returns the user-visible label of this instance.

- const std::string & getClassname () const

  Returns the runtime class name used by the plugin system.

- Model * getParentModel () const

  Returns the parent model that owns this definition.

- bool isReportStatistics () const

  Indicates whether this data definition contributes report statistics.

- void setReportStatistics (bool reportStatistics)

  Enables or disables report-statistics generation for this definition.

- ModelDataDefinition * getInternalData (const std::string &name) const

  Looks up a named internal child data definition.

- std::map< std::string, ModelDataDefinition * > * getInternalData () const

  Returns the full map of internal child data definitions.

- std::map< std::string, ModelDataDefinition * > * getAttachedData () const

  Returns the full map of attached data definitions.

- bool hasChanged () const

  Indicates whether this instance has been modified since the last reset.

- void setHasChanged (bool hasChanged)

  Updates the changed flag for this data definition.

- unsigned int getLevel () const

  Returns the hierarchical editing context containing this element.

- void setModelLevel (unsigned int _modelLevel)

  Sets this element's hierarchical editing context.

- List< SimulationControl * > * getSimulationControls () const

  Returns the simulation controls owned by this data definition.

- TraceManager::Level getTraceLevelSpecific () const

  Returns the trace level that applies specifically to this definition.

- void setTraceLevelSpecific (TraceManager::Level level)

  Updates the trace level used by this definition.

- void defineTraceLevelSpecific (TraceManager::Level traceLevelspecific, bool traceLevelSpecific↩ Enabled=true)

  Defines the specific trace level and optionally enables it immediately.
- bool isTraceLevelSpecificEnabled () const

  Indicates whether the specific trace level is enabled.
- void setTraceLevelSpecificEnabled (bool traceLevelSpecificEnabled)

  Enables or disables the specific trace level.

Static Public Member Functions

- static PluginInformation * **GetPluginInformation** ()
- static ModelComponent * **LoadInstance** (Model *model, PersistenceRecord *fields)
- static ModelDataDefinition * **NewInstance** (Model *model, std::string name="")

Static Public Member Functions inherited from SPICECircuit

- static PluginInformation * **GetPluginInformation** ()

  static public methods that must have implementations (Load and New just the same. GetInformation must provide specific infos for the new component
- static ModelComponent * **LoadInstance** (Model *model, PersistenceRecord *fields)
- static ModelDataDefinition * **NewInstance** (Model *model, std::string name="")
- static std::vector< std::string > **split** (std::string word, char split_char)

  Externalize function GetPluginInformation to be accessible throught dynamic linked library.

Static Public Member Functions inherited from ModelComponent

- static ModelComponent * LoadInstance (Model *model, PersistenceRecord *fields)

  static public methods that must have implementations (Load and New just the same. GetInformation must provide specific infos for the new component
- static bool Check (ModelComponent *component)

  Validates a component instance.
- static void CreateInternalData (ModelComponent *component)

  Creates internal data required by a component instance.
- static void SaveInstance (PersistenceRecord *fields, ModelComponent *component)

  Serializes a component instance into a persistence record.
- static void DispatchEvent (Event *event)

  Dispatches a simulation event to the target component.

Static Public Member Functions inherited from ModelDataDefinition

- static ModelDataDefinition * LoadInstance (Model *model, PersistenceRecord *fields, bool insertIntoModel)

  Loads a model data definition instance from serialized fields.
- static ModelDataDefinition * NewInstance (Model *model, std::string name="")

  Creates a new instance of a data definition using the plugin registry.
- static void SaveInstance (PersistenceRecord *fields, ModelDataDefinition *modeldatum)

  Serializes a data definition instance into a persistence record.
- static bool Check (ModelDataDefinition *modeldatum, std::string &errorMessage)

  Validates a data definition instance.
- static void InitBetweenReplications (ModelDataDefinition *modeldatum)

  Resets simulation-time state between replications.
- static void CreateInternalData (ModelDataDefinition *modeldatum)

  Creates internal and attached data required by this instance.
- static bool CreateRelatedDataElements (ModelDataDefinition *modeldatum, std::string &errorMessage)

  Creates related data and validates the instance in a single call.

Protected Member Functions

- virtual bool _loadInstance (PersistenceRecord *fields) override

  virtual protected method that must be overriden
- virtual void _saveInstance (PersistenceRecord *fields, bool saveDefaultValues) override

  Saves object fields into a serialization structure.

Protected Member Functions inherited from SPICECircuit

- void **BuildCircuit** (std::string description, unsigned int id, std::vector< std::string > the_params={""}, std::string the_model="", std::string the_model_file="")

  virtual protected method that must be overriden
- void **UpdateConnections** ()
- virtual void _onDispatchEvent (Entity *entity, unsigned int inputPortNumber) override

  This method is only for ModelComponents, not ModelDataElements.
- virtual void _createNonEditableDataDefinitions () override

  virtual protected methods that could be overriden by derived classes, if needed

Protected Member Functions inherited from ModelDataDefinition

- bool _getSaveDefaultsOption ()
- virtual bool _check (std::string &errorMessage)

  could be overriden by derived classes

17.1143.1 Member Function Documentation

17.1143.1.1 _loadInstance()

```
bool Vsource::_loadInstance (
            PersistenceRecord * fields ) [override], [protected], [virtual]
```

virtual protected method that must be overriden
Reimplemented from SPICECircuit.

17.1143.1.2 _saveInstance()

```
void Vsource::_saveInstance (
            PersistenceRecord * fields,
            bool saveDefaultValues )  [override], [protected], [virtual]
```

Saves object fields into a serialization structure.

Parameters

fields	a table-like structure used for serialization.
saveDefaultValues	indicates whether or not to save fields which are set to their default value.

Reimplemented from SPICECircuit.

17.1143.1.3 Build()

```
void Vsource::Build ( )  [override], [virtual]
```

Reimplemented from SPICECircuit.

The documentation for this class was generated from the following files:

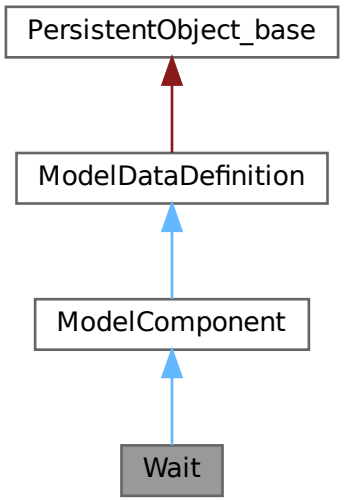
- plugins/components/ElectronicsSimulation/SPICECircuit.h
- plugins/components/ElectronicsSimulation/SPICECircuit.cpp

17.1144 Wait Class Reference

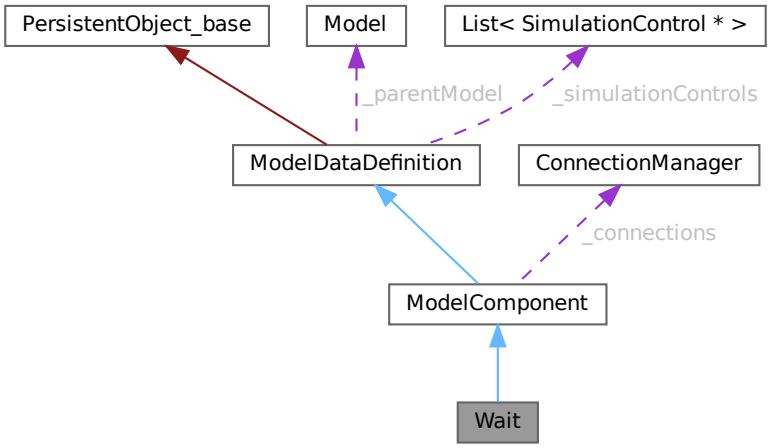
Holds an entity in a queue until a signal arrives, a condition becomes true, or it is explicitly removed elsewhere.

`#include <plugins/components/Synchronization/Wait.h>`

Inheritance diagram for Wait:



Collaboration diagram for Wait:



Public Types

- enum class **WaitType** : int { **WaitForSignal** = 0 , **InfiniteHold** = 1 , **ScanForCondition** = 2 , **num_elements** = 3 }

Public Member Functions

- **Wait** (Model ∗model, std::string name="")
- virtual std::string show () override

  virtual public methods
- void **setSignalData** (SignalData ∗signal)
- void **setWaitType** (WaitType _watType)
- Wait::WaitType **getWaitType** () const
- void **setCondition** (std::string _condition)
- std::string **getCondition** () const
- Queue ∗ **getQueue** () const
- void **setQueue** (Queue ∗queue)
- std::string **getlimitExpression** () const
- void **setLimitExpression** (const std::string &newLimitExpression)

Public Member Functions inherited from ModelComponent

- ModelComponent (Model ∗model, std::string componentTypename, std::string name="")

  constructors
- virtual ∼**ModelComponent** ()

  Releases component-owned resources and unregisters it from the model.
- ConnectionManager ∗ getConnectionManager () const

  new public user methods for this component
- void connectTo (ModelComponent ∗component, unsigned int inputPortNumber=0)

  Connects this component to another component.
- bool hasBreakpointAt ()

  Indicates whether a simulation breakpoint is set on this component.
- void setDescription (std::string _description)

Updates the free-form description shown by the GUI.

- std::string getDescription () const

  Returns the free-form description associated with this component.

- void remove (ModelComponent *comp)

  Removes a connected component from this component.

Public Member Functions inherited from ModelDataDefinition

- ModelDataDefinition (Model *model, std::string datadefinitionTypename, std::string name="", bool insert↩ IntoModel=true)

  Creates a model data definition and optionally inserts it into the model.

- virtual ~**ModelDataDefinition** ()

  Releases resources owned by this data definition.

- Util::identification getId () const

  Returns the unique identifier of this instance.

- void setName (const std::string &name)

  Updates the logical name of this instance.

- const std::string & getName () const

  Returns the logical name of this instance.

- void setLabel (const std::string &label)

  Updates the user-visible label of this instance.

- const std::string & getLabel () const

  Returns the user-visible label of this instance.

- const std::string & getClassname () const

  Returns the runtime class name used by the plugin system.

- Model * getParentModel () const

  Returns the parent model that owns this definition.

- bool isReportStatistics () const

  Indicates whether this data definition contributes report statistics.

- void setReportStatistics (bool reportStatistics)

  Enables or disables report-statistics generation for this definition.

- ModelDataDefinition * getInternalData (const std::string &name) const

  Looks up a named internal child data definition.

- std::map< std::string, ModelDataDefinition * > * getInternalData () const

  Returns the full map of internal child data definitions.

- std::map< std::string, ModelDataDefinition * > * getAttachedData () const

  Returns the full map of attached data definitions.

- bool hasChanged () const

  Indicates whether this instance has been modified since the last reset.

- void setHasChanged (bool hasChanged)

  Updates the changed flag for this data definition.

- unsigned int getLevel () const

  Returns the hierarchical editing context containing this element.

- void setModelLevel (unsigned int _modelLevel)

  Sets this element's hierarchical editing context.

- List< SimulationControl * > * getSimulationControls () const

  Returns the simulation controls owned by this data definition.

- TraceManager::Level getTraceLevelSpecific () const

  Returns the trace level that applies specifically to this definition.

- void setTraceLevelSpecific (TraceManager::Level level)

  Updates the trace level used by this definition.

- void defineTraceLevelSpecific (TraceManager::Level traceLevelspecific, bool traceLevelSpecific↩ Enabled=true)

  Defines the specific trace level and optionally enables it immediately.
- bool isTraceLevelSpecificEnabled () const

  Indicates whether the specific trace level is enabled.
- void setTraceLevelSpecificEnabled (bool traceLevelSpecificEnabled)

  Enables or disables the specific trace level.

Static Public Member Functions

- static std::string **convertEnumToStr** (WaitType type)
- static PluginInformation * **GetPluginInformation** ()
- static ModelComponent * **LoadInstance** (Model *model, PersistenceRecord *fields)
- static ModelDataDefinition * **NewInstance** (Model *model, std::string name="")

Static Public Member Functions inherited from ModelComponent

- static ModelComponent * LoadInstance (Model *model, PersistenceRecord *fields)

  static public methods that must have implementations (Load and New just the same. GetInformation must provide specific infos for the new component
- static bool Check (ModelComponent *component)

  Validates a component instance.
- static void CreateInternalData (ModelComponent *component)

  Creates internal data required by a component instance.
- static void SaveInstance (PersistenceRecord *fields, ModelComponent *component)

  Serializes a component instance into a persistence record.
- static void DispatchEvent (Event *event)

  Dispatches a simulation event to the target component.

Static Public Member Functions inherited from ModelDataDefinition

- static ModelDataDefinition * LoadInstance (Model *model, PersistenceRecord *fields, bool insertIntoModel)

  Loads a model data definition instance from serialized fields.
- static ModelDataDefinition * NewInstance (Model *model, std::string name="")

  Creates a new instance of a data definition using the plugin registry.
- static void SaveInstance (PersistenceRecord *fields, ModelDataDefinition *modeldatum)

  Serializes a data definition instance into a persistence record.
- static bool Check (ModelDataDefinition *modeldatum, std::string &errorMessage)

  Validates a data definition instance.
- static void InitBetweenReplications (ModelDataDefinition *modeldatum)

  Resets simulation-time state between replications.
- static void CreateInternalData (ModelDataDefinition *modeldatum)

  Creates internal and attached data required by this instance.
- static bool CreateRelatedDataElements (ModelDataDefinition *modeldatum, std::string &errorMessage)

  Creates related data and validates the instance in a single call.

Protected Member Functions

- virtual bool _loadInstance (PersistenceRecord *fields) override

  virtual protected method that must be overriden
- virtual void _saveInstance (PersistenceRecord *fields, bool saveDefaultValues) override

  Saves object fields into a serialization structure.
- virtual void _onDispatchEvent (Entity *entity, unsigned int inputPortNumber) override

Handles a dispatched event for this component type.

- virtual bool _check (std::string &errorMessage) override

  could be overriden by derived classes

17.1144.1 Detailed Description

Holds an entity in a queue until a signal arrives, a condition becomes true, or it is explicitly removed elsewhere.
Arena correspondence: this is Arena's "Hold module" (Rockwell Automation, *Getting Started with Arena*, "The Advanced Process Panel", p. 54), renamed `Wait` in GenESyS. `WaitType` (`WaitForSignal/InfiniteHold/ScanForCondition`) matches Arena's Type exactly; `_condition` and `_limitExpression` match Condition and Limit; the attached `SignalData` matches Wait for Value; an entity held with `InfiniteHold` is later released by Remove, exactly as in Arena.
Known difference from Arena: `_queue` is a plain `Queue*` rather than a full `QueueableItem` (Queue/Set/↩ Attribute/Expression), a gap already flagged with a `@TODO` in the source.

17.1144.2 Member Function Documentation

17.1144.2.1 _check()

```
bool Wait::_check (
            std::string & errorMessage )  [override], [protected], [virtual]
```

could be overriden by derived classes
Reimplemented from ModelDataDefinition.

17.1144.2.2 _createEditableDataDefinitions()

```
void Wait::_createEditableDataDefinitions ( )  [override], [protected], [virtual]
```

Reimplemented from ModelDataDefinition.

17.1144.2.3 _createNonEditableDataDefinitions()

```
void Wait::_createNonEditableDataDefinitions ( )  [override], [protected], [virtual]
```

Reimplemented from ModelDataDefinition.

17.1144.2.4 _initBetweenReplications()

```
void Wait::_initBetweenReplications ( )  [override], [protected], [virtual]
```

Reimplemented from ModelDataDefinition.

17.1144.2.5 _loadInstance()

```
bool Wait::_loadInstance (
            PersistenceRecord * fields )  [override], [protected], [virtual]
```

virtual protected method that must be overriden
Reimplemented from ModelComponent.

17.1144.2.6 _onDispatchEvent()

```
void Wait::_onDispatchEvent (
            Entity * entity,
            unsigned int inputPortNumber )  [override], [protected], [virtual]
```

Handles a dispatched event for this component type.
This method is only for ModelComponents, not for ModelDataElements.

Parameters

entity	Entity being processed.
inputPortNumber	Input port where the entity arrived.

Implements ModelComponent.

17.1144.2.7 _saveInstance()

```
void Wait::_saveInstance (
            PersistenceRecord * fields,
            bool saveDefaultValues )  [override], [protected], [virtual]
```

Saves object fields into a serialization structure.

Parameters

fields	a table-like structure used for serialization.
saveDefaultValues	indicates whether or not to save fields which are set to their default value.

Reimplemented from ModelComponent.

17.1144.2.8 show()

```
std::string Wait::show ( )  [override], [virtual]
```

virtual public methods
Returns a textual representation of this component.

Returns

Human-readable description used for tracing and debugging.

Reimplemented from ModelComponent.

17.1147.1 Detailed Description

Demonstrates a minimal deterministic/stochastic whole-cell bridge.
The example builds a small deterministic BioNetwork for nutrient conversion, projects its final state into a WholeCellState, and then runs stochastic transcription, translation, and degradation components. It is a didactic integration test for GenESyS abstractions, not a complete organism model.

17.1147.2 Member Function Documentation

17.1147.2.1 main()

17.1148.1 Detailed Description

Whole-cell MVP with compartment-aware metabolic transport.
This example extends the flux-balance whole-cell path with a tiny extracellular-to-cytosol transport chain. It demonstrates how projected metabolic fluxes can feed:

- global energy proxies;
- compartment-scoped metabolite pools; and
- pathway activity checkpoints.

The biological scope is still didactic. The purpose is to validate the architecture for multi-compartment hybrid whole-cell simulations.

17.1148.2 Member Function Documentation

17.1148.2.1 main()

```
int WcmCompartmentTransportWholeCellMvp::main (
            int argc,

17.1149.1 Detailed Description

Whole-cell MVP driven by flux-balance metabolism.
This example demonstrates a second metabolic integration path for GenESyS whole-cell models. Instead of using the deterministic BioNetwork runner, it executes a small FBA problem through MetabolicFluxBalance, projects selected fluxes into WholeCellState, and then runs expression, growth, lifecycle checkpointing, fate routing, and division.

17.1149.2 Member Function Documentation

17.1149.2.1 main()

```

17.1150.1 Detailed Description

Central dogma simulation: stochastic transcription + translation + SSA degradation.
Models 4 genes using two complementary approximations:

- Poisson tau-leaping for transcription (StochasticTranscription) and translation (StochasticTranslation) — valid for high-copy-number RNAP/ribosome
- Gillespie Direct Method SSA for low-copy-number mRNA and protein degradation

Biological parameters (M. genitalium ballpark): RNAP_free = 200 molecules ribosome_free = 400 molecules 4 genes: geneA (metabolic), geneB (regulatory), geneC (structural), geneD (transport) Transcription: elongRate=50 nt/s, meanGeneLen=900 nt, bindProb=0.25, Δt=60 s Translation: elongRate=16 AA/s, meanProtLen=300 AA, Δt=60 s mRNA decay: k = 0.01/s (mean lifetime $\approx$ 100 s) Protein decay: k = 0.001/s (mean lifetime $\approx$ 1000 s $\approx$ 16 min)
Simulation: 10 replications $\times$ 3600 s, 60 s time steps.
Run via GENESYS_TERMINAL_EXAMPLE: cmake -DGENESYS_TERMINAL_EXAMPLE=wcm/WcmGene↩ Expression.cpp ...

17.1150.2 Member Function Documentation

17.1150.2.1 main()

```
int WcmGeneExpression::main (
            int argc,
            char ** argv )  [override], [virtual]
```

Reimplemented from BaseGenesysTerminalApplication.
The documentation for this class was generated from the following files:

- applications/modelSpecific/wcm/WcmGeneExpression.h
- applications/modelSpecific/wcm/WcmGeneExpression.cpp

17.1151 WcmLifecycleStress Class Reference

17.1152.1 Detailed Description

Whole-cell simulation analog of the M. genitalium model (Karr et al. 2012).
Reference: Karr JR, Sanghvi JC, Macklin DN, et al. "A Whole-Cell Computational Model Predicts Phenotype from Genotype." Cell 150(2):389–401, 2012. doi:10.1016/j.cell.2012.05.044
Architecture: This model uses all four GenESyS WholeCellModeling plugins in sequence:
SimClock → Transcription → Translation → MetabolicSSA → CellDivision |- port 0 (no division) → Dispose |- port 1 (division) → RecordDivision → Dispose
StochasticTranscription: Poisson tau-leaping for 10 representative M. genitalium genes StochasticTranslation↩ : Poisson tau-leaping mapping mRNA_ → prot_ species StochasticReactionComponent: Gillespie SSA for ATP/↩ GTP metabolism + FtsZ ring polymerization CellDivisionEvent: Triggers when FtsZ ring reaches 35% completion (350/1000 units) (mass-only trigger disabled; FtsZ-driven as in Karr et al.)
Biologically realistic parameters (from CovertLab/WholeCell parameters.json, MIT): RNAP_free = 200 molecules (Karr et al. 2012, Supplementary Table S2) ribosome_free = 400 molecules Transcription rate = 50 nt/s Translation rate = 16 AA/s Mean gene length = 900 nt Mean protein len = 300 AA Cell cycle ≈ 600 min (modeled as 600 × 60 s steps)
10 representative genes (selected from M. genitalium 473-gene model): MG_001 — metabolic (glycolytic enzyme) MG_006 — ATP synthase subunit (energy metabolism) MG_055 — DNA polymerase III subunit alpha (DNA replication) MG_139 — RNAP beta subunit (transcription machinery) MG_175 — 30S ribosomal protein S1 (translation machinery) MG_196 — FtsZ (cell division; drives the division trigger) MG_203 — RNAP sigma factor (transcription regulation) MG_339 — phosphoglycerate mutase (central metabolism) MG_398 — pyruvate kinase (central metabolism) MG_462 — ribosomal protein L7/L12 (translation machinery)
Simulation: 3 replications × 36000 s (10 h ≈ 1 M. genitalium cell cycle), 60 s steps.
Run via GENESYS_TERMINAL_EXAMPLE: cmake -DGENESYS_TERMINAL_EXAMPLE=wcm/Wcm↩ MgenitaliumKarr2012.cpp ...

17.1154.1 Detailed Description

Minimal whole-cell modeling example using the Gillespie Direct Method SSA.
Models stochastic gene expression of a single gene via 4 reactions: R1: transcription — DNA + RNAP $\rightarrow$ DNA + RNAP + mRNA_geneA (k = 0.02/s) R2: mRNA degradation — mRNA_geneA $\rightarrow \emptyset$ (k = 0.01/s) R3: translation — mRNA_geneA $\rightarrow$ mRNA_geneA + prot_geneA (k = 0.10/s) R4: protein degradation — prot_geneA $\rightarrow \emptyset$ (k = 0.001/s)
Steady-state analytic predictions: mRNA_geneA $\approx$ 2 molecules (k_tx / k_deg_mRNA = 0.02 / 0.01) prot_geneA $\approx$ 200 molecules (k_tl $*$ mRNA_ss / k_deg_prot = 0.1 $*$ 2 / 0.001)
Simulation runs 30 replications $\times$ 3600 s each (1 hour of biological time) in 60 s Gillespie windows triggered by periodic clock entities.
Run via GENESYS_TERMINAL_EXAMPLE: cmake -DGENESYS_TERMINAL_EXAMPLE=wcm/WcmSimple↩ Ssa.cpp ...

17.1155.1 Detailed Description

Minimal whole-cell MVP combining metabolism, expression, growth, and division.
This example is intentionally small and didactic. It combines:

- deterministic biochemical metabolism through BioNetwork;
- runtime projection into WholeCellState;
- stochastic transcription and translation;
- energy-gated mass growth;
- mass-triggered cell division.

The result is not a calibrated organism model. It is a compact whole-cell analog intended to validate the GenESyS architecture for hybrid deterministic/stochastic cell simulations.

17.1155.2 Member Function Documentation

17.1155.2.1 main()

```
int WcmWholeCellMvp::main (
            int argc,

17.1156.1 Detailed Description

Didactic yeast-oriented whole-cell MVP built on GEM-inspired metabolism.
This example is intentionally small and pedagogical. It combines a compact FBA network inspired by Saccharomyces cerevisiae carbon metabolism with whole-cell state projection, compartment exchange, stochastic expression, growth, lifecycle checkpointing, fate routing, and division.
It is not a canonical or validated yeast whole-cell model. It should be interpreted as a GenESyS architecture example informed by yeast-GEM style metabolic concepts, not as a public operational WCM for S. cerevisiae.

17.1156.2 Member Function Documentation

17.1156.2.1 main()

```
int WcmYeastDidacticWholeCellMvp::main (
            int argc,
            char ** argv )  [override], [virtual]
```

Reimplemented from BaseGenesysTerminalApplication.

17.1157.1 Detailed Description

Didactic eukaryotic whole-cell MVP inspired by budding yeast.
This example combines:

- a compact GEM-inspired FBA core;
- explicit biological compartments;
- compartment exchange and organelle energy proxies;
- stochastic expression and growth; and
- a simplified eukaryotic cell-cycle coordinator.

It is a didactic whole-cell example for Saccharomyces cerevisiae-inspired architecture. It is not a canonical public yeast whole-cell model.

17.1157.2 Member Function Documentation

17.1157.2.1 main()

```
int WcmYeastEukaryoticWholeCellMvp::main (
            int argc,
            char ** argv )  [override], [virtual]
```

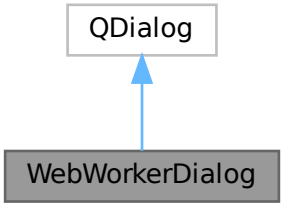
Reimplemented from BaseGenesysTerminalApplication.
The documentation for this class was generated from the following files:

- applications/modelSpecific/wcm/WcmYeastEukaryoticWholeCellMvp.h
- applications/modelSpecific/wcm/WcmYeastEukaryoticWholeCellMvp.cpp

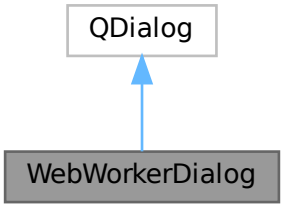
17.1158 WebWorkerDialog Class Reference

Lightweight control window for the embedded GenESyS web worker.
`#include <applications/gui/httpworker/WebWorkerDialog.h>`

Inheritance diagram for WebWorkerDialog:



Collaboration diagram for WebWorkerDialog:



Public Member Functions

- **WebWorkerDialog** (QWidget ∗parent=nullptr, bool allowClose=false)

Protected Member Functions

- void **closeEvent** (QCloseEvent ∗event) override
- void **showEvent** (QShowEvent ∗event) override

17.1158.1 Detailed Description

Lightweight control window for the embedded GenESyS web worker.
The documentation for this class was generated from the following files:

- applications/gui/httpworker/WebWorkerDialog.h
- applications/gui/httpworker/WebWorkerDialog.cpp

17.1159 WebWorkerRuntime Class Reference

Owns the embedded worker runtime used by the GUI and the standalone worker app.
`#include <applications/worker/service/WebWorkerRuntime.h>`

Classes

- struct Snapshot

  Captures a thread-safe snapshot of the worker state.

Public Member Functions

- **WebWorkerRuntime** (unsigned short defaultPort=8080, unsigned long maxRequests=0)

  Builds the reusable worker runtime with a default port and request cap.
- ~**WebWorkerRuntime** ()

  Stops the worker and releases background resources.
- bool start ()

  Starts the worker if it is not already running.
- void **stop** ()

  Requests a graceful shutdown and waits for the worker thread to finish.
- void **wait** ()

  Waits for the worker thread to complete if it is running.
- bool restart ()

  Restarts the worker using the currently configured settings.
- bool **isRunning** () const

  Returns whether the worker thread is currently serving requests.
- Snapshot **snapshot** () const

  Returns a snapshot of the current worker lifecycle and counters.
- void **setConfiguredPort** (unsigned short port)

  Updates the configured listening port used by the next start.
- unsigned short **configuredPort** () const

  Returns the listening port configured for the next start.
- void **setConfiguredMaxRequests** (unsigned long maxRequests)

  Updates the configured request cap used by the next start.
- unsigned long **configuredMaxRequests** () const

  Returns the configured request cap used by the next start.

17.1159.1 Detailed Description

Owns the embedded worker runtime used by the GUI and the standalone worker app.
The runtime wires the HTTP server, routing stack, and simulator-backed session services into a reusable lifecycle object. GUI code can start, stop, and inspect the worker without embedding HTTP details in the main window.

17.1159.2 Member Function Documentation

17.1159.2.1 restart()

```
bool WebWorkerRuntime::restart ( )
```

Restarts the worker using the currently configured settings.

Returns

True when the worker was scheduled to start again.

17.1159.2.2 start()

```
bool WebWorkerRuntime::start ( )
```

Starts the worker if it is not already running.

Returns

True when a new background worker thread was launched.

The documentation for this class was generated from the following files:

- applications/worker/service/WebWorkerRuntime.h
- applications/worker/service/WebWorkerRuntime.cpp

17.1160 WholeCellParameterReader Class Reference

```
#include <tools/Biochemical/WholeCellParameterReader.h>
```

Static Public Member Functions

- static std::map< std::string, double > **read** (const std::string &filePath)

17.1160.1 Detailed Description

Minimal JSON reader for the CovertLab/WholeCell M. genitalium parameter files.
Reads parameters.json and fixedConstants.json (MIT license) which have the two-level structure: {"processes": {"ProcessName": {"key": value, ...}, ...}, "states": {"StateName": {"key": value, ...}, ...}}
Scalar double values are extracted into a flat map keyed by "processes.ProcessName.key" or "states.StateName.↩ key".
Arrays and nested objects are skipped. Non-numeric leaf values are ignored. No external JSON library is required. Usage: auto params = WholeCellParameterReader::read("data/parameters.json"); double rate = params.↩ count("processes.Transcription.rnaPolymeraseElongationRate") ? params.at("processes.Transcription.rna↩ PolymeraseElongationRate") : 50.0;
The documentation for this class was generated from the following file:

- tools/Biochemical/WholeCellParameterReader.h

- std::string **getFixedConstantsPath** () const
- void **setParametersPath** (std::string path)
- std::string **getParametersPath** () const
- virtual std::string show () override

  Returns a textual representation of this data definition.

Public Member Functions inherited from ModelDataDefinition

- ModelDataDefinition (Model *model, std::string datadefinitionTypename, std::string name="", bool insert↩ IntoModel=true)

  Creates a model data definition and optionally inserts it into the model.
- virtual ~**ModelDataDefinition** ()

  Releases resources owned by this data definition.
- Util::identification getId () const

  Returns the unique identifier of this instance.
- void setName (const std::string &name)

  Updates the logical name of this instance.
- const std::string & getName () const

  Returns the logical name of this instance.
- void setLabel (const std::string &label)

  Updates the user-visible label of this instance.
- const std::string & getLabel () const

  Returns the user-visible label of this instance.
- const std::string & getClassname () const

  Returns the runtime class name used by the plugin system.
- Model * getParentModel () const

  Returns the parent model that owns this definition.
- bool isReportStatistics () const

  Indicates whether this data definition contributes report statistics.
- void setReportStatistics (bool reportStatistics)

  Enables or disables report-statistics generation for this definition.
- ModelDataDefinition * getInternalData (const std::string &name) const

  Looks up a named internal child data definition.
- std::map< std::string, ModelDataDefinition * > * getInternalData () const

  Returns the full map of internal child data definitions.
- std::map< std::string, ModelDataDefinition * > * getAttachedData () const

  Returns the full map of attached data definitions.
- bool hasChanged () const

  Indicates whether this instance has been modified since the last reset.
- void setHasChanged (bool hasChanged)

  Updates the changed flag for this data definition.
- unsigned int getLevel () const

  Returns the hierarchical editing context containing this element.
- void setModelLevel (unsigned int _modelLevel)

  Sets this element's hierarchical editing context.
- List< SimulationControl * > * getSimulationControls () const

Returns the simulation controls owned by this data definition.

- TraceManager::Level getTraceLevelSpecific () const

  Returns the trace level that applies specifically to this definition.

- void setTraceLevelSpecific (TraceManager::Level level)

  Updates the trace level used by this definition.

- void defineTraceLevelSpecific (TraceManager::Level traceLevelspecific, bool traceLevelSpecific↩ Enabled=true)

  Defines the specific trace level and optionally enables it immediately.

- bool isTraceLevelSpecificEnabled () const

  Indicates whether the specific trace level is enabled.

- void setTraceLevelSpecificEnabled (bool traceLevelSpecificEnabled)

  Enables or disables the specific trace level.

Static Public Member Functions

- static ModelDataDefinition ∗ **LoadInstance** (Model ∗model, PersistenceRecord ∗fields)
- static PluginInformation ∗ **GetPluginInformation** ()
- static ModelDataDefinition ∗ **NewInstance** (Model ∗model, std::string name="")

Static Public Member Functions inherited from ModelDataDefinition

- static ModelDataDefinition ∗ LoadInstance (Model ∗model, PersistenceRecord ∗fields, bool insertIntoModel)

  Loads a model data definition instance from serialized fields.

- static ModelDataDefinition ∗ NewInstance (Model ∗model, std::string name="")

  Creates a new instance of a data definition using the plugin registry.

- static void SaveInstance (PersistenceRecord ∗fields, ModelDataDefinition ∗modeldatum)

  Serializes a data definition instance into a persistence record.

- static bool Check (ModelDataDefinition ∗modeldatum, std::string &errorMessage)

  Validates a data definition instance.

- static void InitBetweenReplications (ModelDataDefinition ∗modeldatum)

  Resets simulation-time state between replications.

- static void CreateInternalData (ModelDataDefinition ∗modeldatum)

  Creates internal and attached data required by this instance.

- static bool CreateRelatedDataElements (ModelDataDefinition ∗modeldatum, std::string &errorMessage)

  Creates related data and validates the instance in a single call.

Protected Member Functions

- virtual bool _loadInstance (PersistenceRecord ∗fields) override

  must be overriden by derived classes

- virtual void _saveInstance (PersistenceRecord ∗fields, bool saveDefaultValues) override

  Saves object fields into a serialization structure.

17.1161.1 Detailed Description

Shared state container for whole-cell model simulations.
WholeCellState is the GenESyS analog to the Vivarium Store: a single ModelDataDefinition instance shared by all WCM component plugins in a simulation step. It holds:

- discrete molecule counts (mRNA, proteins) updated by SSA
- continuous metabolite pool (ATP, amino acids) updated by FBA
- resource budget allocated by fair-allocation before each step
- cell geometry (volume, mass) for propensity scaling

JSON loading (Q5a) reads fixedConstants.json and parameters.json from the CovertLab/WholeCell M. genitalium repository (MIT license).

17.1161.2 Member Function Documentation

17.1161.2.1 _check()

```
bool WholeCellState::_check (
            std::string & errorMessage )  [override], [protected], [virtual]
```

could be overriden by derived classes
Reimplemented from ModelDataDefinition.

17.1161.2.2 _initBetweenReplications()

```
void WholeCellState::_initBetweenReplications ( )  [override], [protected], [virtual]
```

Reimplemented from ModelDataDefinition.

17.1161.2.3 _loadInstance()

```
bool WholeCellState::_loadInstance (
            PersistenceRecord * fields )  [override], [protected], [virtual]
```

must be overriden by derived classes
Reimplemented from ModelDataDefinition.

17.1161.2.4 _saveInstance()

```
void WholeCellState::_saveInstance (
            PersistenceRecord * fields,
            bool saveDefaultValues )  [override], [protected], [virtual]
```

Saves object fields into a serialization structure.

Parameters

fields	a table-like structure used for serialization.
saveDefaultValues	indicates whether or not to save fields which are set to their default value.

Reimplemented from ModelDataDefinition.

17.1161.2.5 show()

```
std::string WholeCellState::show ( )  [override], [virtual]
```

Returns a textual representation of this data definition.
Returns the keys of internal ModelDataDefinitions such as counters, statistics collectors and other children needed before model checking.

Returns

Human-readable summary used by traces and debug output.

Reimplemented from ModelDataDefinition.
The documentation for this class was generated from the following files:

- plugins/data/WholeCellModeling/WholeCellState.h
- plugins/data/WholeCellModeling/WholeCellState.cpp

17.1165 SimulatorSessionService::WorkerCapabilitiesResult Struct Reference

Describes currently supported worker features.
`#include <applications/worker/service/SimulatorSessionService.h>`

Public Attributes

- bool **supportsSessionApi** = false
- bool **supportsSessionScopedSimulator** = false
- bool **supportsModelCreation** = false
- bool **supportsModelPersistence** = false
- bool **supportsSimulationStatus** = false
- bool **supportsSimulationConfig** = false
- bool **supportsSynchronousRun** = false
- bool **supportsSynchronousStep** = false
- bool **supportsDistributedJobs** = false
- bool **supportsJobPolling** = false
- bool **supportsBackgroundExecution** = false
- bool **supportsModelUpload** = false
- bool **supportsStreamingEvents** = false
- bool **supportsJobResultRetrieval** = false

17.1165.1 Detailed Description

Describes currently supported worker features.
The documentation for this struct was generated from the following file:

- applications/worker/service/SimulatorSessionService.h

17.1166 SimulatorSessionService::WorkerInfoResult Struct Reference

Describes worker identity metadata for distributed discovery.
`#include <applications/worker/service/SimulatorSessionService.h>`

Public Attributes

- std::string **role**
- std::string **application**
- std::string **apiFamily**
- std::string **apiVersion**
- std::string **simulatorName**
- std::string **simulatorVersionName**
- unsigned int **simulatorVersionNumber** = 0

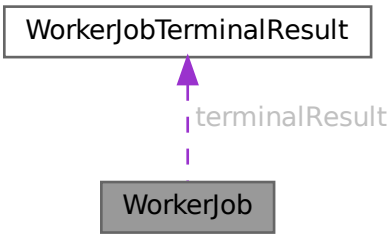
17.1166.1 Detailed Description

Describes worker identity metadata for distributed discovery.
The documentation for this struct was generated from the following file:

- applications/worker/service/SimulatorSessionService.h

17.1167 WorkerJob Struct Reference

Stores metadata for a worker job snapshot owned by the web worker.
`#include <applications/worker/worker/WorkerJob.h>`
Collaboration diagram for WorkerJob:



Public Attributes

- std::string **jobId**

  Stable job identifier returned to API clients.
- std::string **sessionId**

  Session that owns the job snapshot and execution context.
- WorkerJobState **state** = WorkerJobState::Queued

  Current lifecycle state of the job.
- std::string **snapshotFilename**

  Snapshot filename stored in the session workspace.
- std::string **createdMarker**

  Monotonic creation marker used to preserve job ordering.
- std::string **message**

  Human-readable status or error text.
- bool **hasTerminalResult** = false

  True when terminalResult contains valid completion data.
- WorkerJobTerminalResult **terminalResult**

  Final simulation summary written when the job finishes.

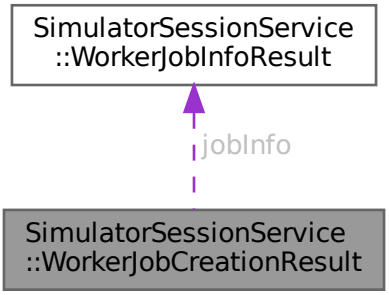
17.1167.1 Detailed Description

Stores metadata for a worker job snapshot owned by the web worker.
The documentation for this struct was generated from the following file:

- applications/worker/worker/WorkerJob.h

17.1168 SimulatorSessionService::WorkerJobCreationResult Struct Reference

Contains worker job creation output and error state.
`#include <applications/worker/service/SimulatorSessionService.h>`
Collaboration diagram for SimulatorSessionService::WorkerJobCreationResult:



Public Attributes

- bool **success** = false
- WorkerJobError **error** = WorkerJobError::None
- WorkerJobInfoResult **jobInfo**

17.1168.1 Detailed Description

Contains worker job creation output and error state.
The documentation for this struct was generated from the following file:

- applications/worker/service/SimulatorSessionService.h

17.1169 SimulatorSessionService::WorkerJobInfoResult Struct Reference

Describes worker job metadata exposed by worker stage 3 endpoints.
`#include <applications/worker/service/SimulatorSessionService.h>`

Public Attributes

- std::string **jobId**
- std::string **sessionId**
- WorkerJobState **state** = WorkerJobState::Queued
- std::string **snapshotFilename**
- std::string **createdMarker**
- std::string **message**

17.1169.1 Detailed Description

Describes worker job metadata exposed by worker stage 3 endpoints.
The documentation for this struct was generated from the following file:

- applications/worker/service/SimulatorSessionService.h

17.1170 WorkerJobManager Class Reference

Owns worker job records in memory and assigns unique identifiers.
`#include <applications/worker/worker/WorkerJobManager.h>`

Public Member Functions

- WorkerJob createQueuedJob (const std::string &sessionId)

  Creates and stores a queued worker job with generated identifiers.
- bool setSnapshotFilename (const std::string &jobId, const std::string &snapshotFilename)

  Replaces the snapshot filename for an existing job.
- bool setState (const std::string &jobId, WorkerJobState state)

  Updates the lifecycle state for an existing job.
- bool setMessage (const std::string &jobId, const std::string &message)

  Replaces the message text for an existing job.
- bool setTerminalResult (const std::string &jobId, const WorkerJobTerminalResult &terminalResult)

  Persists the terminal simulation summary for an existing job.
- std::optional< WorkerJob > getJob (const std::string &jobId) const

  Fetches a previously stored job record.

17.1170.1 Detailed Description

Owns worker job records in memory and assigns unique identifiers.
The manager is intentionally simple: it keeps all job metadata in memory and provides synchronized read/write helpers for the web API and background jobs.

17.1170.2 Member Function Documentation

17.1170.2.1 createQueuedJob()

```
WorkerJob WorkerJobManager::createQueuedJob (
            const std::string & sessionId )
```

Creates and stores a queued worker job with generated identifiers.
Creates and stores a queued worker job with a monotonic identifier.

Parameters

sessionId	Identifier of the owning session.

Returns

Newly stored worker job metadata.

17.1170.2.2 getJob()

```
std::optional< WorkerJob > WorkerJobManager::getJob (
            const std::string & jobId ) const
```

Fetches a previously stored job record.
Retrieves a copy of a job record when it exists.

Parameters

jobId	Job identifier.

Returns

Copy of the job when found.

17.1170.2.3 setMessage()

```
bool WorkerJobManager::setMessage (
            const std::string & jobId,
            const std::string & message )
```

Replaces the message text for an existing job.
Replaces the human-readable message for a stored job.

Parameters

jobId	Job identifier to update.
message	Human-readable status or error message.

Returns

True when the job exists and was updated.

17.1170.2.4 setSnapshotFilename()

```
bool WorkerJobManager::setSnapshotFilename (
            const std::string & jobId,
            const std::string & snapshotFilename )
```

Replaces the snapshot filename for an existing job.
Updates the snapshot filename for a stored job.

Parameters

jobId	Job identifier to update.
snapshotFilename	Snapshot filename persisted in session workspace.

Returns

True when the job exists and was updated.

17.1170.2.5 setState()

```
bool WorkerJobManager::setState (
            const std::string & jobId,
            WorkerJobState state )
```

Updates the lifecycle state for an existing job.
Updates the lifecycle state for a stored job.

Parameters

jobId	Job identifier to update.
state	New worker job state.

Returns

True when the job exists and was updated.

17.1170.2.6 setTerminalResult()

```
bool WorkerJobManager::setTerminalResult (
            const std::string & jobId,
            const WorkerJobTerminalResult & terminalResult )
```

Persists the terminal simulation summary for an existing job.
Stores the terminal simulation result and marks it available.

Parameters

jobId	Job identifier to update.
terminalResult	Terminal simulation summary values.

Returns

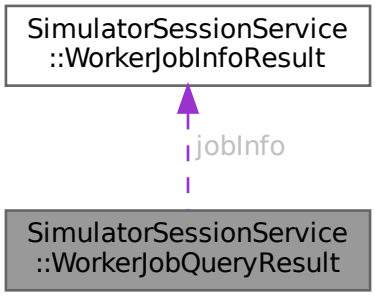
True when the job exists and was updated.

The documentation for this class was generated from the following files:

- applications/worker/worker/WorkerJobManager.h
- applications/worker/worker/WorkerJobManager.cpp

17.1171 SimulatorSessionService::WorkerJobQueryResult Struct Reference

Contains worker job lookup output and error state.
`#include <applications/worker/service/SimulatorSessionService.h>`
Collaboration diagram for SimulatorSessionService::WorkerJobQueryResult:



Public Attributes

- bool **success** = false
- WorkerJobError **error** = WorkerJobError::None
- WorkerJobInfoResult **jobInfo**

17.1171.1 Detailed Description

Contains worker job lookup output and error state.
The documentation for this struct was generated from the following file:

- applications/worker/service/SimulatorSessionService.h

17.1172 SimulatorSessionService::WorkerJobResultInfo Struct Reference

Describes terminal worker job result data exposed by worker stage 5 endpoint.
`#include <applications/worker/service/SimulatorSessionService.h>`

Public Attributes

- std::string **jobId**
- WorkerJobState **state** = WorkerJobState::Queued
- std::string **message**
- double **simulatedTime** = 0.0
- unsigned int **currentReplicationNumber** = 0
- unsigned int **numberOfReplications** = 0
- double **replicationLength** = 0.0
- double **warmUpPeriod** = 0.0
- bool **hasIsPaused** = false
- bool **isPaused** = false

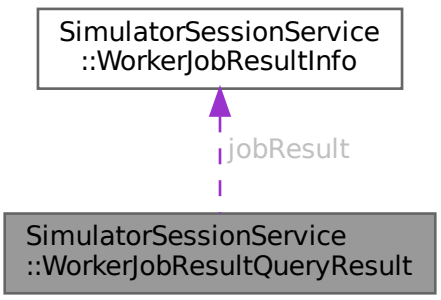
17.1172.1 Detailed Description

Describes terminal worker job result data exposed by worker stage 5 endpoint.
The documentation for this struct was generated from the following file:

- applications/worker/service/SimulatorSessionService.h

17.1173 SimulatorSessionService::WorkerJobResultQueryResult Struct Reference

Contains worker job terminal result lookup output and error state.
`#include <applications/worker/service/SimulatorSessionService.h>`
Collaboration diagram for SimulatorSessionService::WorkerJobResultQueryResult:



Public Attributes

- bool **success** = false
- WorkerJobError **error** = WorkerJobError::None
- WorkerJobResultInfo **jobResult**

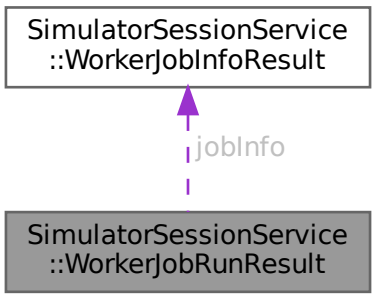
17.1173.1 Detailed Description

Contains worker job terminal result lookup output and error state.
The documentation for this struct was generated from the following file:

- applications/worker/service/SimulatorSessionService.h

17.1174 SimulatorSessionService::WorkerJobRunResult Struct Reference

Contains worker job run output and error state.
`#include <applications/worker/service/SimulatorSessionService.h>`
Collaboration diagram for SimulatorSessionService::WorkerJobRunResult:



Public Attributes

- bool **success** = false
- WorkerJobError **error** = WorkerJobError::None
- WorkerJobInfoResult **jobInfo**

17.1174.1 Detailed Description

Contains worker job run output and error state.
The documentation for this struct was generated from the following file:

- applications/worker/service/SimulatorSessionService.h

17.1175 WorkerJobTerminalResult Struct Reference

Stores the terminal simulation summary persisted for a finished or failed worker job.
`#include <applications/worker/worker/WorkerJob.h>`

Public Attributes

- double **simulatedTime** = 0.0

  Simulated time reached when the job completed.
- unsigned int **currentReplicationNumber** = 0

  Current replication number at completion.
- unsigned int **numberOfReplications** = 0

Total number of replications configured for the run.

- double **replicationLength** = 0.0

  Replication length used by the run.

- double **warmUpPeriod** = 0.0

  Warm-up period used by the run.

- std::optional< bool > **isPaused**

  Pause state when the simulator explicitly reported it.

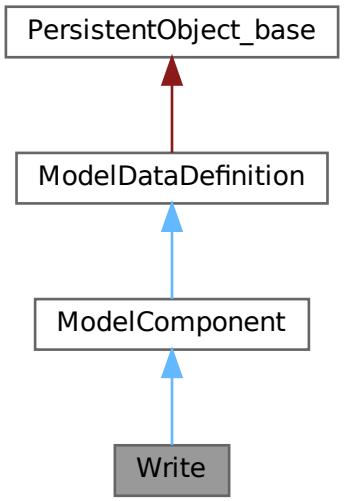
17.1175.1 Detailed Description

Stores the terminal simulation summary persisted for a finished or failed worker job.
The documentation for this struct was generated from the following file:

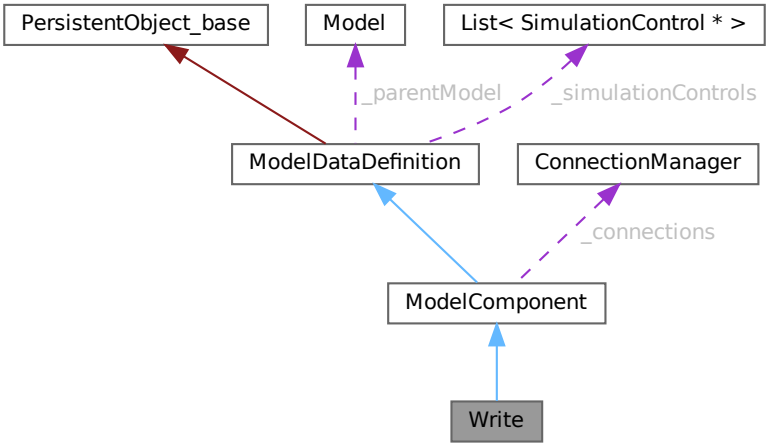
- applications/worker/worker/WorkerJob.h

17.1176 Write Class Reference

Writes one or more literal/expression text lines to the screen (trace output) or to a file.
`#include <plugins/components/InputOutput/Write.h>`
Inheritance diagram for Write:



Collaboration diagram for Write:



Public Types

- enum class **WriteToType** : int { **SCREEN** = 0 , **FILE** = 1 , **num_elements** = 2 }

Public Member Functions

- **Write** (Model ∗model, std::string name="")
- void **insertText** (std::list< std::string > texts)
- void **setFilename** (std::string _filename)
- std::string **filename** () const
- void **setWriteToType** (WriteToType _writeToType)
- Write::WriteToType **writeToType** () const
- virtual std::string show () override

  virtual public methods

Public Member Functions inherited from ModelComponent

- ModelComponent (Model ∗model, std::string componentTypename, std::string name="")

  constructors
- virtual ∼**ModelComponent** ()

  Releases component-owned resources and unregisters it from the model.
- ConnectionManager ∗ getConnectionManager () const

  new public user methods for this component
- void connectTo (ModelComponent ∗component, unsigned int inputPortNumber=0)

  Connects this component to another component.
- bool hasBreakpointAt ()

  Indicates whether a simulation breakpoint is set on this component.
- void setDescription (std::string _description)

  Updates the free-form description shown by the GUI.
- std::string getDescription () const

  Returns the free-form description associated with this component.
- void remove (ModelComponent ∗comp)

  Removes a connected component from this component.

Public Member Functions inherited from ModelDataDefinition

- ModelDataDefinition (Model *model, std::string datadefinitionTypename, std::string name="", bool insertIntoModel=true)

  Creates a model data definition and optionally inserts it into the model.
- virtual ~**ModelDataDefinition** ()

  Releases resources owned by this data definition.
- Util::identification getId () const

  Returns the unique identifier of this instance.
- void setName (const std::string &name)

  Updates the logical name of this instance.
- const std::string & getName () const

  Returns the logical name of this instance.
- void setLabel (const std::string &label)

  Updates the user-visible label of this instance.
- const std::string & getLabel () const

  Returns the user-visible label of this instance.
- const std::string & getClassname () const

  Returns the runtime class name used by the plugin system.
- Model * getParentModel () const

  Returns the parent model that owns this definition.
- bool isReportStatistics () const

  Indicates whether this data definition contributes report statistics.
- void setReportStatistics (bool reportStatistics)

  Enables or disables report-statistics generation for this definition.
- ModelDataDefinition * getInternalData (const std::string &name) const

  Looks up a named internal child data definition.
- std::map< std::string, ModelDataDefinition * > * getInternalData () const

  Returns the full map of internal child data definitions.
- std::map< std::string, ModelDataDefinition * > * getAttachedData () const

  Returns the full map of attached data definitions.
- bool hasChanged () const

  Indicates whether this instance has been modified since the last reset.
- void setHasChanged (bool hasChanged)

  Updates the changed flag for this data definition.
- unsigned int getLevel () const

  Returns the hierarchical editing context containing this element.
- void setModelLevel (unsigned int _modelLevel)

  Sets this element's hierarchical editing context.
- List< SimulationControl * > * getSimulationControls () const

  Returns the simulation controls owned by this data definition.
- TraceManager::Level getTraceLevelSpecific () const

  Returns the trace level that applies specifically to this definition.
- void setTraceLevelSpecific (TraceManager::Level level)

  Updates the trace level used by this definition.
- void defineTraceLevelSpecific (TraceManager::Level traceLevelspecific, bool traceLevelSpecificEnabled=true)

  Defines the specific trace level and optionally enables it immediately.
- bool isTraceLevelSpecificEnabled () const

  Indicates whether the specific trace level is enabled.
- void setTraceLevelSpecificEnabled (bool traceLevelSpecificEnabled)

  Enables or disables the specific trace level.

Static Public Member Functions

- static std::string **convertEnumToStr** (WriteToType type)
- static PluginInformation * **GetPluginInformation** ()
- static ModelComponent * **LoadInstance** (Model *model, PersistenceRecord *fields)
- static ModelDataDefinition * **NewInstance** (Model *model, std::string name="")

Static Public Member Functions inherited from ModelComponent

- static ModelComponent * LoadInstance (Model *model, PersistenceRecord *fields)

  static public methods that must have implementations (Load and New just the same. GetInformation must provide specific infos for the new component
- static bool Check (ModelComponent *component)

  Validates a component instance.
- static void CreateInternalData (ModelComponent *component)

  Creates internal data required by a component instance.
- static void SaveInstance (PersistenceRecord *fields, ModelComponent *component)

  Serializes a component instance into a persistence record.
- static void DispatchEvent (Event *event)

  Dispatches a simulation event to the target component.

Static Public Member Functions inherited from ModelDataDefinition

- static ModelDataDefinition * LoadInstance (Model *model, PersistenceRecord *fields, bool insertIntoModel)

  Loads a model data definition instance from serialized fields.
- static ModelDataDefinition * NewInstance (Model *model, std::string name="")

  Creates a new instance of a data definition using the plugin registry.
- static void SaveInstance (PersistenceRecord *fields, ModelDataDefinition *modeldatum)

  Serializes a data definition instance into a persistence record.
- static bool Check (ModelDataDefinition *modeldatum, std::string &errorMessage)

  Validates a data definition instance.
- static void InitBetweenReplications (ModelDataDefinition *modeldatum)

  Resets simulation-time state between replications.
- static void CreateInternalData (ModelDataDefinition *modeldatum)

  Creates internal and attached data required by this instance.
- static bool CreateRelatedDataElements (ModelDataDefinition *modeldatum, std::string &errorMessage)

  Creates related data and validates the instance in a single call.

Protected Member Functions

- virtual void _onDispatchEvent (Entity *entity, unsigned int inputPortNumber) override

  Handles a dispatched event for this component type.
- virtual bool _loadInstance (PersistenceRecord *fields) override

  virtual protected method that must be overriden
- virtual void _saveInstance (PersistenceRecord *fields, bool saveDefaultValues) override

  Saves object fields into a serialization structure.
- virtual bool _check (std::string &errorMessage) override

  could be overriden by derived classes
- virtual void _initBetweenReplications () override

Protected Member Functions inherited from ModelDataDefinition

- bool _getSaveDefaultsOption ()
- virtual ParserChangesInformation * _getParserChangesInformation ()

17.1176.1 Detailed Description

Writes one or more literal/expression text lines to the screen (trace output) or to a file.
Arena correspondence: the write-only slice of Arena's "ReadWrite module" (Rockwell Automation, *Getting Started with Arena*, "The Advanced Process Panel", p. 58). `WriteToType` (`SCREEN/FILE`) matches Arena's corresponding output destinations.
Known difference from Arena: there is no read direction at all (no component reads a value from Screen/File/↩ Attribute/Variable back into the model), and no structured recordset integration with File (§5.10) — see `docs/ai↩ _assistants/reference/ARENA_GENESYS_COMPATIBILITY.md` §6.16.

17.1176.2 Member Function Documentation

17.1176.2.1 _check()

```
bool Write::_check (
            std::string & errorMessage )  [override], [protected], [virtual]
```

could be overriden by derived classes
Reimplemented from ModelDataDefinition.

17.1176.2.2 _initBetweenReplications()

```
void Write::_initBetweenReplications ( )  [override], [protected], [virtual]
```

Reimplemented from ModelDataDefinition.

17.1176.2.3 _loadInstance()

```
bool Write::_loadInstance (
            PersistenceRecord * fields )  [override], [protected], [virtual]
```

virtual protected method that must be overriden
Reimplemented from ModelComponent.

17.1176.2.4 _onDispatchEvent()

```
void Write::_onDispatchEvent (
            Entity * entity,
            unsigned int inputPortNumber )  [override], [protected], [virtual]
```

Handles a dispatched event for this component type.
This method is only for ModelComponents, not for ModelDataElements.

Parameters

entity	Entity being processed.
inputPortNumber	Input port where the entity arrived.

Implements ModelComponent.

17.1176.2.5 _saveInstance()

```
void Write::_saveInstance (
            PersistenceRecord * fields,
            bool saveDefaultValues )  [override], [protected], [virtual]
```

Saves object fields into a serialization structure.

Parameters

fields	a table-like structure used for serialization.
saveDefaultValues	indicates whether or not to save fields which are set to their default value.

Reimplemented from ModelComponent.

17.1176.2.6 show()

```
std::string Write::show ( )  [override], [virtual]
```

virtual public methods
Returns a textual representation of this component.

Returns

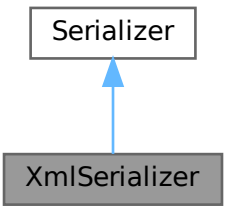
Human-readable description used for tracing and debugging.

Reimplemented from ModelComponent.
The documentation for this class was generated from the following files:

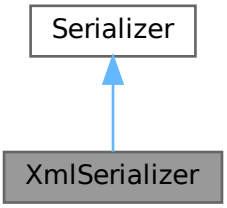
- plugins/components/InputOutput/Write.h
- plugins/components/InputOutput/Write.cpp

17.1177 XmlSerializer Class Reference

Inheritance diagram for XmlSerializer:



Collaboration diagram for XmlSerializer:



Public Member Functions

- **XmlSerializer** (Model *model)
- PersistenceRecord * newPersistenceRecord () override

  Creates an empty persistence record.
- bool dump (std::ostream &output) override

  Writes formatted contents to a given output stream.
- bool load (std::istream &input) override

  Attempts to load contents from a given input stream.
- bool get (const std::string &name, PersistenceRecord *entry) override

  Tries to fetch an entry with the given label as a key.
- bool put (const std::string name, const std::string type, const Util::identification id, PersistenceRecord *fields) override

  Upserts an entry into this structure.
- int for_each (std::function< int(const std::string &) > delegate) override

  Iterates over this structure's entries, ordered by ID.

17.1177.1 Member Function Documentation

17.1177.1.1 dump()

```
bool XmlSerializer::dump (
            std::ostream & output )  [override], [virtual]
```

Writes formatted contents to a given output stream.

Parameters

output	output stream to write to.

Returns

whether the current state of this structure's contents was deemed valid for serialization.

Implements Serializer.

17.1177.1.2 for_each()

```
int XmlSerializer::for_each (
            std::function< int(const std::string &) > delegate )  [override], [virtual]
```

Iterates over this structure's entries, ordered by ID.

Parameters

delegate	delegate which is applied to every entry-identifying key, until it returns a non-zero value.

Returns

either zero, or the first non-zero value returned by the delegate.

Implements Serializer.

17.1177.1.3 get()

```
bool XmlSerializer::get (
            const std::string & name,
            PersistenceRecord * entry )  [override], [virtual]
```

Tries to fetch an entry with the given label as a key.

Parameters

name	a label which uniquely identifies an entry.
entry	(out-param) a pointer to a caller-owned entry, which is filled on success.

Returns

whether the entry was found and the out-param was actually written to.

Implements Serializer.

17.1177.1.4 load()

```
bool XmlSerializer::load (
            std::istream & input )  [override], [virtual]
```

Attempts to load contents from a given input stream.

Returns

whether the input was well-formatted and loading was successful.

Implements Serializer.

17.1177.1.5 newPersistenceRecord()

```
PersistenceRecord * XmlSerializer::newPersistenceRecord ( )  [override], [virtual]
```

Creates an empty persistence record.
Although the returned record can be freed normally with `delete`, care must be taken to only use records which come from a implementation, when configuring that implementation's contents.
Implements Serializer.

17.1177.1.6 put()

```
bool XmlSerializer::put (
            const std::string name,
            const std::string type,
            const Util::identification id,
            PersistenceRecord * fields )  [override], [virtual]
```

Upserts an entry into this structure.

Parameters

name	a label which uniquely identifies the entry.

Parameters

type	a type name.
id	a component/datadef ID number.
fields	a persistence record for the entry, whose contents will be copied if valid.

Returns

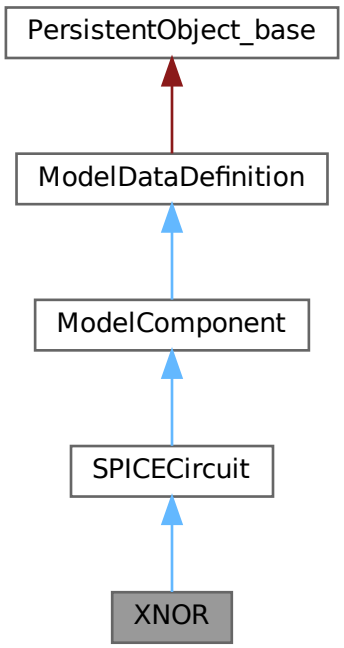
whether the entry was valid and was actually copied into this structure.

Implements Serializer.
The documentation for this class was generated from the following files:

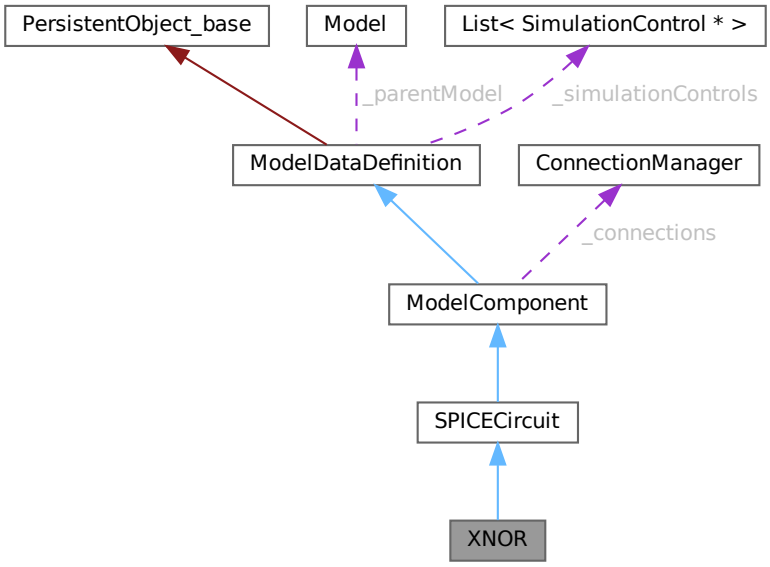
- kernel/simulator/persistence/XmlSerializer.h
- kernel/simulator/persistence/XmlSerializer.cpp

17.1178 XNOR Class Reference

Inheritance diagram for XNOR:



Collaboration diagram for XNOR:



Public Member Functions

- **XNOR** (Model ∗model, std::string name="")
- void Build () override
- void **setPMOSWidth** (float PMOSWidth)
- void **setPMOSLength** (float length)
- void **setNMOSWidth** (float NMOSWidth)
- void **setNMOSLength** (float NMOSLength)
- void **setElectricalModel** (std::string electricalModel)

Public Member Functions inherited from SPICECircuit

- **SPICECircuit** (Model ∗model, std::string name="")

  constructors
- void **setRunner** (SPICERunner ∗runner)

  new public user methods for this components
- SPICERunner ∗ **getRunner** ()
- virtual std::string show () override

  virtual public methods

Public Member Functions inherited from ModelComponent

- ModelComponent (Model ∗model, std::string componentTypename, std::string name="")

  constructors
- virtual ∼**ModelComponent** ()

  Releases component-owned resources and unregisters it from the model.
- ConnectionManager ∗ getConnectionManager () const

  new public user methods for this component
- void connectTo (ModelComponent ∗component, unsigned int inputPortNumber=0)

Connects this component to another component.

- bool hasBreakpointAt ()

  Indicates whether a simulation breakpoint is set on this component.

- void setDescription (std::string _description)

  Updates the free-form description shown by the GUI.

- std::string getDescription () const

  Returns the free-form description associated with this component.

- void remove (ModelComponent *comp)

  Removes a connected component from this component.

Public Member Functions inherited from ModelDataDefinition

- ModelDataDefinition (Model *model, std::string datadefinitionTypename, std::string name="", bool insert↩ IntoModel=true)

  Creates a model data definition and optionally inserts it into the model.

- virtual ~**ModelDataDefinition** ()

  Releases resources owned by this data definition.

- Util::identification getId () const

  Returns the unique identifier of this instance.

- void setName (const std::string &name)

  Updates the logical name of this instance.

- const std::string & getName () const

  Returns the logical name of this instance.

- void setLabel (const std::string &label)

  Updates the user-visible label of this instance.

- const std::string & getLabel () const

  Returns the user-visible label of this instance.

- const std::string & getClassname () const

  Returns the runtime class name used by the plugin system.

- Model * getParentModel () const

  Returns the parent model that owns this definition.

- bool isReportStatistics () const

  Indicates whether this data definition contributes report statistics.

- void setReportStatistics (bool reportStatistics)

  Enables or disables report-statistics generation for this definition.

- ModelDataDefinition * getInternalData (const std::string &name) const

  Looks up a named internal child data definition.

- std::map< std::string, ModelDataDefinition * > * getInternalData () const

  Returns the full map of internal child data definitions.

- std::map< std::string, ModelDataDefinition * > * getAttachedData () const

  Returns the full map of attached data definitions.

- bool hasChanged () const

  Indicates whether this instance has been modified since the last reset.

- void setHasChanged (bool hasChanged)

  Updates the changed flag for this data definition.

- unsigned int getLevel () const

  Returns the hierarchical editing context containing this element.

- void setModelLevel (unsigned int _modelLevel)

  Sets this element's hierarchical editing context.

- List< SimulationControl * > * getSimulationControls () const

  Returns the simulation controls owned by this data definition.

- TraceManager::Level getTraceLevelSpecific () const

  Returns the trace level that applies specifically to this definition.
- void setTraceLevelSpecific (TraceManager::Level level)

  Updates the trace level used by this definition.
- void defineTraceLevelSpecific (TraceManager::Level traceLevelspecific, bool traceLevelSpecific↩ Enabled=true)

  Defines the specific trace level and optionally enables it immediately.
- bool isTraceLevelSpecificEnabled () const

  Indicates whether the specific trace level is enabled.
- void setTraceLevelSpecificEnabled (bool traceLevelSpecificEnabled)

  Enables or disables the specific trace level.

Static Public Member Functions

- static PluginInformation * **GetPluginInformation** ()
- static ModelComponent * **LoadInstance** (Model *model, PersistenceRecord *fields)
- static ModelDataDefinition * **NewInstance** (Model *model, std::string name="")

Static Public Member Functions inherited from SPICECircuit

- static PluginInformation * **GetPluginInformation** ()

  static public methods that must have implementations (Load and New just the same. GetInformation must provide specific infos for the new component
- static ModelComponent * **LoadInstance** (Model *model, PersistenceRecord *fields)
- static ModelDataDefinition * **NewInstance** (Model *model, std::string name="")
- static std::vector< std::string > **split** (std::string word, char split_char)

  Externalize function GetPluginInformation to be accessible throught dynamic linked library.

Static Public Member Functions inherited from ModelComponent

- static ModelComponent * LoadInstance (Model *model, PersistenceRecord *fields)

  static public methods that must have implementations (Load and New just the same. GetInformation must provide specific infos for the new component
- static bool Check (ModelComponent *component)

  Validates a component instance.
- static void CreateInternalData (ModelComponent *component)

  Creates internal data required by a component instance.
- static void SaveInstance (PersistenceRecord *fields, ModelComponent *component)

  Serializes a component instance into a persistence record.
- static void DispatchEvent (Event *event)

  Dispatches a simulation event to the target component.

Static Public Member Functions inherited from ModelDataDefinition

- static ModelDataDefinition * LoadInstance (Model *model, PersistenceRecord *fields, bool insertIntoModel)

  Loads a model data definition instance from serialized fields.
- static ModelDataDefinition * NewInstance (Model *model, std::string name="")

  Creates a new instance of a data definition using the plugin registry.
- static void SaveInstance (PersistenceRecord *fields, ModelDataDefinition *modeldatum)

  Serializes a data definition instance into a persistence record.
- static bool Check (ModelDataDefinition *modeldatum, std::string &errorMessage)

  Validates a data definition instance.
- static void InitBetweenReplications (ModelDataDefinition *modeldatum)

Resets simulation-time state between replications.

- static void CreateInternalData (ModelDataDefinition *modeldatum)

  Creates internal and attached data required by this instance.

- static bool CreateRelatedDataElements (ModelDataDefinition *modeldatum, std::string &errorMessage)

  Creates related data and validates the instance in a single call.

Protected Member Functions

- virtual bool _loadInstance (PersistenceRecord *fields) override

  virtual protected method that must be overriden

- virtual void _saveInstance (PersistenceRecord *fields, bool saveDefaultValues) override

  Saves object fields into a serialization structure.

Protected Member Functions inherited from SPICECircuit

- void **BuildCircuit** (std::string description, unsigned int id, std::vector< std::string > the_params={""}, std::string the_model="", std::string the_model_file="")

  virtual protected method that must be overriden

- void **UpdateConnections** ()
- virtual void _onDispatchEvent (Entity *entity, unsigned int inputPortNumber) override

  This method is only for ModelComponents, not ModelDataElements.

- virtual void _createNonEditableDataDefinitions () override

  virtual protected methods that could be overriden by derived classes, if needed

Protected Member Functions inherited from ModelDataDefinition

- bool _getSaveDefaultsOption ()
- virtual bool _check (std::string &errorMessage)

  could be overriden by derived classes

- virtual ParserChangesInformation * _getParserChangesInformation ()
- virtual void _initBetweenReplications ()
- virtual void _addSimulationControl (SimulationControl *control)
- virtual void _createInternalAndAttachedData ()
- virtual void **_createInternalStatisticReporters** ()
- virtual void _createAttachedAttributes ()
- virtual void _createEditableDataDefinitions ()
- void **_templateCreateInternalStatisticReporters** ()
- void **_templateCreateAttachedAttributes** ()
- void **_templateCreateNonEditableDataDefinitions** ()
- void **_templateCreateEditableDataDefinitions** ()
- void **_internaStatisticReportersClear** ()

  legacy helper methods used by the granular create hooks*

- void **_internalDataClear** ()
- void **_internalDataInsert** (const std::string &key, ModelDataDefinition *child)
- void **_internalDataRemove** (const std::string &key)
- void **_attachedDataClear** ()
- void **_attachedDataInsert** (const std::string &key, ModelDataDefinition *data)
- void **_attachedDataRemove** (const std::string &key)
- void **_attachedAttributesInsert** (const std::vector< std::string > &neededNames)
- void **_statisticReporterInsert** (const std::string &key, ModelDataDefinition *data)
- void **_statisticReporterRemove** (const std::string &key)
- void **_statisticReportersClear** ()
- void **_mandatoryAttachedAttributeInsert** (const std::string &key, ModelDataDefinition *data)
- void **_mandatoryAttachedAttributeRemove** (const std::string &key)

- void **_mandatoryAttachedAttributesClear** ()
- void **_mandatoryEditableDataDefinitionInsert** (const std::string &key, ModelDataDefinition *data)
- void **_mandatoryEditableDataDefinitionRemove** (const std::string &key)
- void **_mandatoryEditableDataDefinitionsClear** ()
- void **_optionalEditableDataDefinitionInsert** (const std::string &key, ModelDataDefinition *data)
- void **_optionalEditableDataDefinitionRemove** (const std::string &key)
- void **_optionalEditableDataDefinitionsClear** ()
- void **_mandatoryNonEditableDataDefinitionInsert** (const std::string &key, ModelDataDefinition *data)
- void **_mandatoryNonEditableDataDefinitionRemove** (const std::string &key)
- void **_mandatoryNonEditableDataDefinitionsClear** ()
- void **_optionalNonEditableDataDefinitionInsert** (const std::string &key, ModelDataDefinition *data)
- void **_optionalNonEditableDataDefinitionRemove** (const std::string &key)
- void **_optionalNonEditableDataDefinitionsClear** ()
- void **_checkCreateAttachedReferencedDataDefinition** (const std::string &expression)

  method to be called to insert attached dataelements that are referenced by string expressions (detected by the parser), to avoid orphaned data definitions
- void **trace** (const std::string &text, TraceManager::Level level=TraceManager::Level::L8_detailed)

  not just an easy access to trace manager, but wrappers to check if specific trace level applies
- void **traceError** (const std::string &text, const std::exception &e)
- void **traceError** (const std::string &text, TraceManager::Level level=TraceManager::Level::L1_errorFatal)
- void **traceReport** (const std::string &text, TraceManager::Level level=TraceManager::Level::L2_results)
- void **traceSimulation** (void *thisobject, double time, Entity *entity, ModelComponent *component, const std::string &text, TraceManager::Level level=TraceManager::Level::L8_detailed)
- void traceSimulation (void *thisobject, const std::string &text, TraceManager::Level level=TraceManager::↩ Level::L8_detailed)

  Traces text to the simulation output.
- void **traceSimulation** (void *thisobject, TraceManager::Level level, const std::string &text)

Additional Inherited Members

Protected Attributes inherited from SPICECircuit

- unsigned int **id**
- std::function< void()> **build**

Protected Attributes inherited from ModelComponent

- ConnectionManager * _connections = new ConnectionManager()

17.1178.1 Member Function Documentation

17.1178.1.1 _loadInstance()

```
bool XNOR::_loadInstance (
            PersistenceRecord * fields )  [override], [protected], [virtual]
```

virtual protected method that must be overriden
Reimplemented from SPICECircuit.

17.1178.1.2 _saveInstance()

```
void XNOR::_saveInstance (
            PersistenceRecord * fields,
            bool saveDefaultValues )  [override], [protected], [virtual]
```

Saves object fields into a serialization structure.

Parameters

fields	a table-like structure used for serialization.
saveDefaultValues	indicates whether or not to save fields which are set to their default value.

Reimplemented from SPICECircuit.

17.1178.1.3 Build()

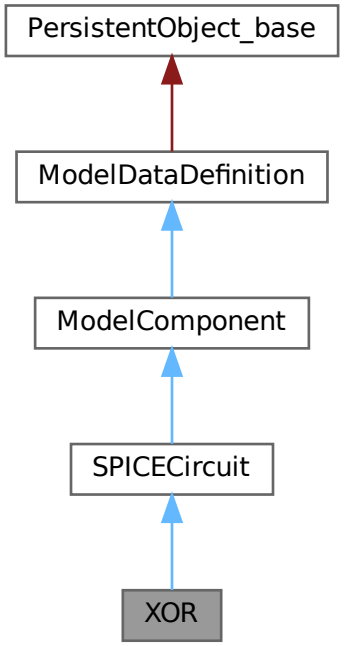
```
void XNOR::Build ( )  [override], [virtual]
```

Reimplemented from SPICECircuit.
The documentation for this class was generated from the following files:

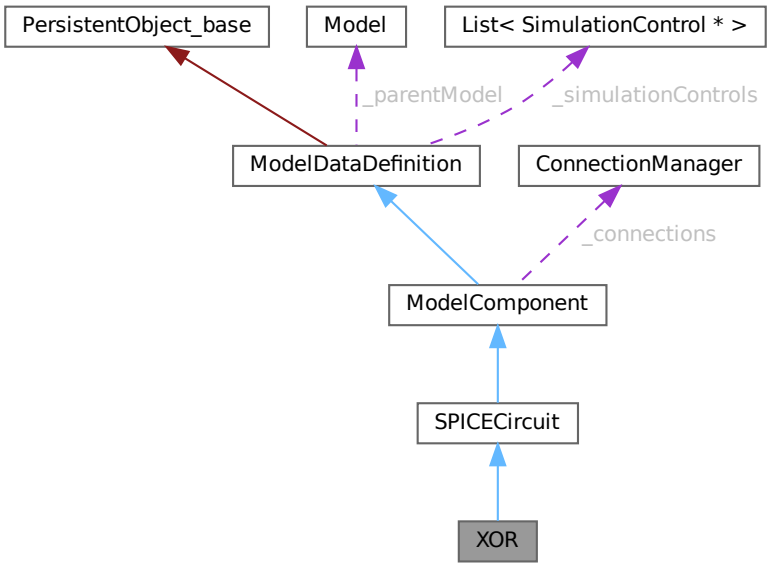
- plugins/components/ElectronicsSimulation/SPICECircuit.h
- plugins/components/ElectronicsSimulation/SPICECircuit.cpp

17.1179 XOR Class Reference

Inheritance diagram for XOR:



Collaboration diagram for XOR:



Public Member Functions

- **XOR** (Model *model, std::string name="")
- void Build () override
- void **setPMOSWidth** (float PMOSWidth)
- void **setPMOSLength** (float length)
- void **setNMOSWidth** (float NMOSWidth)
- void **setNMOSLength** (float NMOSLength)
- void **setElectricalModel** (std::string electricalModel)

Public Member Functions inherited from SPICECircuit

- **SPICECircuit** (Model *model, std::string name="")

  constructors
- void **setRunner** (SPICERunner *runner)

  new public user methods for this components
- SPICERunner * **getRunner** ()
- virtual std::string show () override

  virtual public methods

Public Member Functions inherited from ModelComponent

- ModelComponent (Model *model, std::string componentTypename, std::string name="")

  constructors
- virtual ~**ModelComponent** ()

  Releases component-owned resources and unregisters it from the model.
- ConnectionManager * getConnectionManager () const

  new public user methods for this component
- void connectTo (ModelComponent *component, unsigned int inputPortNumber=0)

  Connects this component to another component.
- bool hasBreakpointAt ()

  Indicates whether a simulation breakpoint is set on this component.
- void setDescription (std::string _description)

  Updates the free-form description shown by the GUI.
- std::string getDescription () const

  Returns the free-form description associated with this component.
- void remove (ModelComponent *comp)

  Removes a connected component from this component.

Public Member Functions inherited from ModelDataDefinition

- ModelDataDefinition (Model *model, std::string datadefinitionTypename, std::string name="", bool insert↩ IntoModel=true)

  Creates a model data definition and optionally inserts it into the model.
- virtual ~**ModelDataDefinition** ()

  Releases resources owned by this data definition.
- Util::identification getId () const

  Returns the unique identifier of this instance.
- void setName (const std::string &name)

  Updates the logical name of this instance.
- const std::string & getName () const

  Returns the logical name of this instance.
- void setLabel (const std::string &label)

Updates the user-visible label of this instance.

- const std::string & getLabel () const

  Returns the user-visible label of this instance.
- const std::string & getClassname () const

  Returns the runtime class name used by the plugin system.
- Model * getParentModel () const

  Returns the parent model that owns this definition.
- bool isReportStatistics () const

  Indicates whether this data definition contributes report statistics.
- void setReportStatistics (bool reportStatistics)

  Enables or disables report-statistics generation for this definition.
- ModelDataDefinition * getInternalData (const std::string &name) const

  Looks up a named internal child data definition.
- std::map< std::string, ModelDataDefinition * > * getInternalData () const

  Returns the full map of internal child data definitions.
- std::map< std::string, ModelDataDefinition * > * getAttachedData () const

  Returns the full map of attached data definitions.
- bool hasChanged () const

  Indicates whether this instance has been modified since the last reset.
- void setHasChanged (bool hasChanged)

  Updates the changed flag for this data definition.
- unsigned int getLevel () const

  Returns the hierarchical editing context containing this element.
- void setModelLevel (unsigned int _modelLevel)

  Sets this element's hierarchical editing context.
- List< SimulationControl * > * getSimulationControls () const

  Returns the simulation controls owned by this data definition.
- TraceManager::Level getTraceLevelSpecific () const

  Returns the trace level that applies specifically to this definition.
- void setTraceLevelSpecific (TraceManager::Level level)

  Updates the trace level used by this definition.
- void defineTraceLevelSpecific (TraceManager::Level traceLevelspecific, bool traceLevelSpecific↩ Enabled=true)

  Defines the specific trace level and optionally enables it immediately.
- bool isTraceLevelSpecificEnabled () const

  Indicates whether the specific trace level is enabled.
- void setTraceLevelSpecificEnabled (bool traceLevelSpecificEnabled)

  Enables or disables the specific trace level.

Static Public Member Functions

- static PluginInformation * **GetPluginInformation** ()
- static ModelComponent * **LoadInstance** (Model *model, PersistenceRecord *fields)
- static ModelDataDefinition * **NewInstance** (Model *model, std::string name="")

Static Public Member Functions inherited from SPICECircuit

- static PluginInformation * **GetPluginInformation** ()

  static public methods that must have implementations (Load and New just the same. GetInformation must provide specific infos for the new component
- static ModelComponent * **LoadInstance** (Model *model, PersistenceRecord *fields)
- static ModelDataDefinition * **NewInstance** (Model *model, std::string name="")

  Externalize function GetPluginInformation to be accessible throught dynamic linked library.

Static Public Member Functions inherited from ModelComponent

- static ModelComponent * LoadInstance (Model *model, PersistenceRecord *fields)

  static public methods that must have implementations (Load and New just the same. GetInformation must provide specific infos for the new component
- static bool Check (ModelComponent *component)

  Validates a component instance.
- static void CreateInternalData (ModelComponent *component)

  Creates internal data required by a component instance.
- static void SaveInstance (PersistenceRecord *fields, ModelComponent *component)

  Serializes a component instance into a persistence record.
- static void DispatchEvent (Event *event)

  Dispatches a simulation event to the target component.

Static Public Member Functions inherited from ModelDataDefinition

- static ModelDataDefinition * LoadInstance (Model *model, PersistenceRecord *fields, bool insertIntoModel)

  Loads a model data definition instance from serialized fields.
- static ModelDataDefinition * NewInstance (Model *model, std::string name="")

  Creates a new instance of a data definition using the plugin registry.
- static void SaveInstance (PersistenceRecord *fields, ModelDataDefinition *modeldatum)

  Serializes a data definition instance into a persistence record.
- static bool Check (ModelDataDefinition *modeldatum, std::string &errorMessage)

  Validates a data definition instance.
- static void InitBetweenReplications (ModelDataDefinition *modeldatum)

  Resets simulation-time state between replications.
- static void CreateInternalData (ModelDataDefinition *modeldatum)

  Creates internal and attached data required by this instance.
- static bool CreateRelatedDataElements (ModelDataDefinition *modeldatum, std::string &errorMessage)

  Creates related data and validates the instance in a single call.

Protected Member Functions

- virtual bool _loadInstance (PersistenceRecord *fields) override

  virtual protected method that must be overriden
- virtual void _saveInstance (PersistenceRecord *fields, bool saveDefaultValues) override

  Saves object fields into a serialization structure.

Protected Member Functions inherited from SPICECircuit

17.1179.1 Member Function Documentation

17.1179.1.1 _loadInstance()

```
bool XOR::_loadInstance (
            PersistenceRecord * fields )  [override], [protected], [virtual]
```

virtual protected method that must be overriden
Reimplemented from SPICECircuit.

17.1179.1.2 _saveInstance()

```
void XOR::_saveInstance (
            PersistenceRecord * fields,
            bool saveDefaultValues )  [override], [protected], [virtual]
```

Saves object fields into a serialization structure.

Parameters

fields	a table-like structure used for serialization.
saveDefaultValues	indicates whether or not to save fields which are set to their default value.

Reimplemented from SPICECircuit.

17.1179.1.3 Build()

```
void XOR::Build ( )  [override], [virtual]
```

Reimplemented from SPICECircuit.

```
00001 #pragma once
00002
00003 /*
00004
00005 • Para que a GUI use um novo autômato celular com nova regra local,
00006   você mexe em 3 camadas:
00007
00008   1) Implementar a regra no plugin
00009
00010   - Crie a classe da regra em source/plugins/components/ModalModel/
00011     CellularAutomata/.
00012   - Normalmente isso significa algo como:
00013       - LocalRule_MyRule.h
00014       - opcionalmente LocalRule_MyRule.cpp
00015   - A regra precisa herdar de LocalRule e sobrescrever
00016     applyRule(Cell* cell).
00017   - Se a regra precisar de vizinhança específica, ela vai ler
00018     cell->getNeighbors().
00019
00020   2) Registrar essa regra no builder da GUI
00021
00022   - O ponto de montagem do demo fica em:
00023       - source/applications/gui/genesys/cellular_automata/
00024         CellularAutomataDemoBuilder.h
00025       - source/applications/gui/genesys/cellular_automata/
00026         CellularAutomataDemoBuilder.cpp
00027   - É aqui que a GUI escolhe qual regra concreta instanciar.
00028   - Você precisa:
00029       - incluir o header da nova regra;
00030       - adicionar um valor novo no enum CellularAutomataRulePreset;
00031       - estender cellularAutomataRulePresetText(...);
00032       - atualizar makeLocalRule(...) para retornar sua classe.
00033
00034   3) Expor a escolha na janela
00035
00036   - A UI de seleção fica em:
00037       - source/applications/gui/genesys/cellular_automata/
00038         CellularAutomataViewerWindow.cpp
00039       - source/applications/gui/genesys/cellular_automata/
00040         CellularAutomataViewerWindow.h
00041   - Você precisa adicionar o novo preset ao combo de regra em
00042     _syncControlsFromController().
00043   - Se quiser salvar/restaurar essa escolha no JSON, ajuste também:
00044       - source/applications/gui/genesys/cellular_automata/
00045         CellularAutomataViewerController.cpp
00046
00047   Se a nova regra exigir outro tipo de vizinhança ou estado
00048
00049   - O ajuste continua na mesma área do builder:
00050       - CellularAutomataDemoBuilder.h/.cpp
00051   - Para vizinhança, hoje a GUI já suporta:
00052       - Moore
00053       - VonNeumann
00054   - Para tipo de estado, hoje ela expõe:
00055       - Binary
00056       - Enumerated
00057       - Numeric
00058   - Se sua regra precisar de um estado diferente, você precisa
00059     ampliar o preset de estado e o mapeamento de cores/menu.
00060
00061   Fluxo mínimo para fazer funcionar
00062
00063   1. Criar LocalRule_MyRule.
00064   2. Incluir essa classe em CellularAutomataDemoBuilder.h.
00065   3. Adicionar o preset no enum CellularAutomataRulePreset.
00066   4. Implementar a criação da regra em makeLocalRule(...).
00067   5. Adicionar o item no combo da janela em
00068      CellularAutomataViewerWindow.cpp.
00069   6. Atualizar serialização em CellularAutomataViewerController.cpp
00070      se quiser persistência.
00071
00072   Arquivos que você provavelmente vai mexer
00073
00074   - source/plugins/components/ModalModel/CellularAutomata/
00075     LocalRule_MyRule.h
00076   - source/plugins/components/ModalModel/CellularAutomata/
00077     LocalRule_MyRule.cpp se necessário
00078   - source/applications/gui/genesys/cellular_automata/
00079     CellularAutomataDemoBuilder.h
```

```
00080   - source/applications/gui/genesys/cellular_automata/
