GenESyS User Documentation

Generated by Doxygen 1.9.8

1 Editing an EFSM Network in the graphical interface 1

1.1 Create or attach a Network . . . 1
1.2 Add states and transitions . . . 1
1.3 Edit adapter bindings . . . 2
1.4 Save and reopen . . . 2
1.5 Current scope . . . 2

2 Cellular Automata Viewer 3

3 GenESyS Launcher and Per-User Runtime Dispatcher 5

3.1 Purpose . . . 5
3.2 Architecture . . . 5
3.3 CMake targets and preset . . . 6
3.4 Install contract for future packaging . . . 6
3.5 XDG directories . . . 7
3.6 Configuration and precedence . . . 7
3.7 Application selection . . . 8
3.8 Active runtime validation . . . 8
3.9 <tt>genesys-worker</tt> and legacy <tt>genesys-web</tt> . . . 8
3.10 MCP . . . 9
3.11 Version rules . . . 9
3.12 Platform detection . . . 9
3.13 Remote manifest schema . . . 9
3.14 Network behavior . . . 10
3.15 Integrity and signature verification . . . 10
3.16 Secure archive extraction . . . 11
3.17 Runtime validation and atomic activation . . . 11
3.18 Concurrency and retention . . . 12
3.19 Logging . . . 12
3.20 Launcher CLI . . . 12
3.21 Failure and fallback behavior . . . 12
3.22 Tests . . . 13
3.23 Known limitations and future Debian integration . . . 13

4 Genesys MCP Connector 15

4.1 Prerequisites . . . 15
4.2 Install . . . 15
4.3 Run . . . 15
4.4 Claude Desktop integration . . . 15
4.5 Claude Code integration . . . 16
4.6 Workflow . . . 16
4.7 Available tools (18) . . . 16

5 Genesys Worker Application 17

5.1 Current scope . . . 17
5.2 Worker cycle Stage 1 (new cycle) . . . 17
5.3 Worker cycle Stage 2 . . . 18
5.4 Worker cycle Stage 3 . . . 18
5.5 Worker cycle Stage 4 . . . 18
5.6 Worker cycle Stage 5 . . . 19
5.7 Worker cycle Stage 6 . . . 19
5.8 How to run . . . 19
5.9 Security notice . . . 20

6 Customization Points **21**
6.1 Header <tt>gtest.h</tt> . . . 21
6.1.1 The following macros can be defined: . . . 21
6.2 Header <tt>gtest-port.h</tt> . . . 21
6.2.1 Logging: . . . 21
6.2.2 Threading: . . . 21
6.2.3 Underlying library support features . . . 22
6.2.4 Exporting API symbols: . . . 22
6.3 Header <tt>gtest-printers.h</tt> . . . 22

7 Análise técnica do parser (Bison/Flex) **23**
7.1 Audit Status (WiP20261) . . . 23
7.2 Escopo . . . 23
7.3 Registro histórico (pré-reauditoria) . . . 23
7.4 Reclassificação dos achados históricos . . . 23
7.4.1 Conversão hexadecimal . . . 23
7.4.2 Audit status . . . 23
7.4.3 Evidence . . . 24
7.4.4 Remaining gaps . . . 24
7.4.5 Tokenização de <tt>min</tt> / <tt>max</tt> . . . 24
7.4.6 Audit status . . . 24
7.4.7 Evidence . . . 24
7.4.8 Remaining gaps . . . 24
7.4.9 Regex de <tt>EntitiesWIP</tt> . . . 24
7.4.10 Audit status . . . 24
7.4.11 Evidence . . . 24
7.4.12 Remaining gaps . . . 24
7.4.13 Regra isolada <tt>T</tt> no lexer . . . 24
7.4.14 Audit status . . . 24
7.4.15 Evidence . . . 25
7.4.16 Remaining gaps . . . 25
7.4.17 Token <tt>ILLEGAL</tt> antes inútil . . . 25
7.4.18 Audit status . . . 25

7.4.19 Evidence . . . 25
7.4.20 Remaining gaps . . . 25
7.4.21 Estrutura de precedência/associatividade da gramática . . . 25
7.4.22 Audit status . . . 25
7.4.23 Evidence . . . 25
7.4.24 Remaining gaps . . . 25
7.5 Pontos ainda pendentes (ou parcialmente mitigados) . . . 26
7.5.1 Funções semânticas não implementadas totalmente (<tt>fDISC</tt>, <tt>fLASTINQ</tt>, <tt>fRESSEIZES</tt>) . . . 26
7.5.2 Audit status . . . 26
7.5.3 Evidence . . . 26
7.5.4 Remaining gaps . . . 26
7.5.5 Avaliação de <tt>FORM</tt> . . . 26
7.5.6 Audit status . . . 26
7.5.7 Evidence . . . 26
7.5.8 Remaining gaps . . . 26
7.5.9 Risco de null-deref em atribuições/leituras ligadas a evento atual . . . 26
7.5.10 Audit status . . . 26
7.5.11 Evidence . . . 27
7.5.12 Remaining gaps . . . 27
7.5.13 Conflitos LR atuais . . . 27
7.5.14 Audit status . . . 27
7.5.15 Evidence . . . 27
7.5.16 Remaining gaps . . . 27
7.6 Recomendações arquiteturais que seguem válidas . . . 27
7.7 Remaining Work . . . 27

8 Kernel Simulator Unit Tests - Build & Run Guide **29**
8.1 What to use (recommended) . . . 29
8.2 CLion setup (single-click workflow) . . . 29
8.3 Command line equivalent . . . 30
8.4 Executables included in the run target . . . 30
8.5 Notes . . . 30

9 Architecture notes for <tt>source/tools</tt> **31**
9.1 1. Architectural overview . . . 31
9.2 2. Current package responsibilities . . . 31
9.3 3. Approved target decomposition . . . 31
9.3.1 Data analysis . . . 31
9.3.2 Fitting . . . 31
9.3.3 Hypothesis testing . . . 31
9.3.4 Distribution abstractions . . . 32
9.3.5 Numerical tools . . . 32

9.3.6 Traits/binding . . . 32
9.4 4. Legacy compatibility strategy . . . 32
9.5 5. Planned migration order . . . 32
9.6 6. AI Assistant component . . . 32
9.6.1 Role . . . 32
9.6.2 Stage 1 (complete) — Interface and implementation scaffold . . . 33
9.6.3 Stage 2 (complete) — Plugin introspection . . . 33
9.6.4 Stage 3 (complete) — AI provider HTTP clients . . . 33
9.6.5 Stage 4 (complete) — Prompt analysis and model plan generation . . . 33
9.6.6 Stage 5 (complete) — Model construction . . . 34
9.6.7 Stage 6 (complete) — Simulation execution and result collection . . . 34
9.6.8 Planned stages . . . 34
9.6.9 Dependency constraints . . . 34
9.7 7. Stability notes and non-goals for this phase . . . 34

10 tools package **35**
10.1 1. Purpose of the tools package . . . 35
10.2 2. Current major abstractions . . . 35
10.3 3. Current limitations . . . 35
10.4 4. Planned evolution . . . 35
10.5 5. Relationship with kernel/statistics . . . 36
10.6 6. AI Assistant abstraction . . . 36
10.7 7. Current status by topic . . . 36

11 Todo List **37**

12 Namespace Index **39**
12.1 Namespace List . . . 39

13 Hierarchical Index **41**
13.1 Class Hierarchy . . . 41

14 Class Index **65**
14.1 Class List . . . 65

15 File Index **93**
15.1 File List . . . 93

16 Namespace Documentation **105**
16.1 EFSMNetworkDiagramCodec Namespace Reference . . . 105
16.1.1 Detailed Description . . . 105
16.2 generate_kernel_simulator_test_stubs Namespace Reference . . . 105
16.2.1 Detailed Description . . . 106
16.3 genesys_mcp Namespace Reference . . . 106
16.3.1 Detailed Description . . . 106

16.4 genesys_mcp.__main__ Namespace Reference . . . 106
16.4.1 Detailed Description . . . 106
16.5 genesys_mcp.client Namespace Reference . . . 106
16.5.1 Detailed Description . . . 106
16.6 genesys_mcp.server Namespace Reference . . . 106
16.6.1 Detailed Description . . . 107
16.6.2 Function Documentation . . . 107
16.6.2.1 genesys_auth() . . . 107
16.6.2.2 genesys_configure_simulation() . . . 107
16.6.2.3 genesys_create_job() . . . 108
16.6.2.4 genesys_get_model() . . . 108
16.6.2.5 genesys_health() . . . 108
16.6.2.6 genesys_import_model_language() . . . 108
16.6.2.7 genesys_info() . . . 109
16.6.2.8 genesys_job_result() . . . 109
16.6.2.9 genesys_job_status() . . . 109
16.6.2.10 genesys_load_model() . . . 109
16.6.2.11 genesys_new_model() . . . 109
16.6.2.12 genesys_run_job() . . . 110
16.6.2.13 genesys_run_simulation() . . . 110
16.6.2.14 genesys_save_model() . . . 110
16.6.2.15 genesys_simulation_status() . . . 110
16.6.2.16 genesys_step_simulation() . . . 110
16.6.2.17 genesys_worker_capabilities() . . . 111
16.6.2.18 genesys_worker_info() . . . 111
16.6.3 Variable Documentation . . . 111
16.6.3.1 mcp . . . 111
16.7 GuiCrashDiagnostics Namespace Reference . . . 111
16.7.1 Detailed Description . . . 111
16.8 QCP Namespace Reference . . . 111
16.8.1 Detailed Description . . . 112
16.8.2 Enumeration Type Documentation . . . 112
16.8.2.1 AntialiasedElement . . . 112
16.8.2.2 ExportPen . . . 113
16.8.2.3 Interaction . . . 113
16.8.2.4 MarginSide . . . 114
16.8.2.5 PlottingHint . . . 114
16.8.2.6 ResolutionUnit . . . 114
16.8.2.7 SelectionRectMode . . . 115
16.8.2.8 SelectionType . . . 115
16.8.2.9 SignDomain . . . 115

17 Class Documentation **117**

17.1 Access Class Reference . . . 117
17.1.1 Detailed Description . . . 122
17.1.2 of Cells Number of contiguous conveyor cells the entity requires for . . . 122
17.1.3 Member Function Documentation . . . 122
17.1.3.1 _check() . . . 122
17.1.3.2 _loadInstance() . . . 122
17.1.3.3 _onDispatchEvent() . . . 123
17.1.3.4 _saveInstance() . . . 123
17.1.3.5 show() . . . 123
17.2 AddUndoCommand Class Reference . . . 124
17.3 AIAssistant Class Reference . . . 125
17.3.1 Member Function Documentation . . . 130
17.3.1.1 _check() . . . 130
17.3.1.2 _loadInstance() . . . 130
17.3.1.3 _onDispatchEvent() . . . 130
17.3.1.4 _saveInstance() . . . 130
17.3.1.5 show() . . . 131
17.4 AIAssistant_if Class Reference . . . 131
17.4.1 Detailed Description . . . 133
17.4.1.1 Security model . . . 134
17.4.1.2 Planned evolution . . . 134
17.4.1.3 Thread safety . . . 134
17.4.2 Member Function Documentation . . . 134
17.4.2.1 addKnowledgeItem() . . . 134
17.4.2.2 analyzePrompt() . . . 134
17.4.2.3 buildModel() . . . 134
17.4.2.4 checkReady() . . . 134
17.4.2.5 clearApiKey() . . . 135
17.4.2.6 clearDiagnostics() . . . 135
17.4.2.7 clearKnowledgeBase() . . . 135
17.4.2.8 collectResults() . . . 135
17.4.2.9 configureSimulation() . . . 135
17.4.2.10 createModelPlan() . . . 136
17.4.2.11 execute() . . . 136
17.4.2.12 exportAuditLog() . . . 136
17.4.2.13 exportKnowledgeBaseAsMarkdown() . . . 136
17.4.2.14 getApiKeyEnvironmentVariable() . . . 136
17.4.2.15 getAuditEntries() . . . 136
17.4.2.16 getAuditLogPath() . . . 137
17.4.2.17 getBaseUrl() . . . 137
17.4.2.18 getConfiguration() . . . 137

17.4.2.19 getKnowledgeBaseSummary() . . . 137
17.4.2.20 getKnowledgeItems() . . . 137
17.4.2.21 getLastDiagnostics() . . . 137
17.4.2.22 getLastError() . . . 137
17.4.2.23 getMaskedApiKey() . . . 137
17.4.2.24 getMaxOutputTokens() . . . 138
17.4.2.25 getModelName() . . . 138
17.4.2.26 getProvider() . . . 138
17.4.2.27 getProviderClient() . . . 138
17.4.2.28 getProviderName() . . . 138
17.4.2.29 getReasoningEffort() . . . 138
17.4.2.30 getSimulatorFacade() . . . 138
17.4.2.31 getState() . . . 138
17.4.2.32 getTemperature() . . . 138
17.4.2.33 getTimeoutSeconds() . . . 138
17.4.2.34 hasApiKey() . . . 139
17.4.2.35 hasProviderClient() . . . 139
17.4.2.36 hasSimulatorFacade() . . . 139
17.4.2.37 loadApiKeyFromEnvironment() . . . 139
17.4.2.38 refreshKnowledgeBaseFromSimulator() . . . 139
17.4.2.39 runSimulation() . . . 139
17.4.2.40 setApiKey() . . . 140
17.4.2.41 setApiKeyEnvironmentVariable() . . . 140
17.4.2.42 setBaseUrl() . . . 140
17.4.2.43 setConfiguration() . . . 140
17.4.2.44 setMaxOutputTokens() . . . 140
17.4.2.45 setModelName() . . . 140
17.4.2.46 setProvider() . . . 141
17.4.2.47 setProviderClient() . . . 141
17.4.2.48 setProviderName() . . . 141
17.4.2.49 setReasoningEffort() . . . 141
17.4.2.50 setSimulatorFacade() . . . 141
17.4.2.51 setTemperature() . . . 141
17.4.2.52 setTimeoutSeconds() . . . 141
17.5 AIAssistantConfiguration Struct Reference . . . 142
17.5.1 Detailed Description . . . 142
17.5.2 Member Data Documentation . . . 143
17.5.2.1 dryRun . . . 143
17.5.2.2 sandboxEnabled . . . 143
17.6 AIAssistantDefaultImpl Class Reference . . . 143
17.6.1 Detailed Description . . . 146
17.6.1.1 Security model . . . 146

17.6.1.2 Ownership . . . 146
17.6.2 Member Function Documentation . . . 147
17.6.2.1 addKnowledgeItem() . . . 147
17.6.2.2 analyzePrompt() . . . 147
17.6.2.3 buildModel() . . . 147
17.6.2.4 checkReady() . . . 147
17.6.2.5 clearApiKey() . . . 148
17.6.2.6 clearDiagnostics() . . . 148
17.6.2.7 clearKnowledgeBase() . . . 148
17.6.2.8 collectResults() . . . 148
17.6.2.9 configureSimulation() . . . 148
17.6.2.10 createAndAttachProviderClient() . . . 148
17.6.2.11 createModelPlan() . . . 149
17.6.2.12 execute() . . . 149
17.6.2.13 exportAuditLog() . . . 149
17.6.2.14 exportKnowledgeBaseAsMarkdown() . . . 149
17.6.2.15 getApiKeyEnvironmentVariable() . . . 149
17.6.2.16 getAuditEntries() . . . 150
17.6.2.17 getAuditLogPath() . . . 150
17.6.2.18 getBaseUrl() . . . 150
17.6.2.19 getConfiguration() . . . 150
17.6.2.20 getKnowledgeBaseSummary() . . . 150
17.6.2.21 getKnowledgeItems() . . . 150
17.6.2.22 getLastDiagnostics() . . . 150
17.6.2.23 getLastError() . . . 150
17.6.2.24 getMaskedApiKey() . . . 151
17.6.2.25 getMaxOutputTokens() . . . 151
17.6.2.26 getModelName() . . . 151
17.6.2.27 getProvider() . . . 151
17.6.2.28 getProviderClient() . . . 151
17.6.2.29 getProviderName() . . . 151
17.6.2.30 getReasoningEffort() . . . 151
17.6.2.31 getSimulatorFacade() . . . 151
17.6.2.32 getState() . . . 151
17.6.2.33 getTemperature() . . . 151
17.6.2.34 getTimeoutSeconds() . . . 152
17.6.2.35 hasApiKey() . . . 152
17.6.2.36 hasProviderClient() . . . 152
17.6.2.37 hasSimulatorFacade() . . . 152
17.6.2.38 loadApiKeyFromEnvironment() . . . 152
17.6.2.39 refreshKnowledgeBaseFromSimulator() . . . 152
17.6.2.40 runSimulation() . . . 153

17.6.2.41 setApiKey() . . . 153
17.6.2.42 setApiKeyEnvironmentVariable() . . . 153
17.6.2.43 setBaseUrl() . . . 153
17.6.2.44 setConfiguration() . . . 153
17.6.2.45 setMaxOutputTokens() . . . 153
17.6.2.46 setModelName() . . . 154
17.6.2.47 setProvider() . . . 154
17.6.2.48 setProviderClient() . . . 154
17.6.2.49 setProviderName() . . . 154
17.6.2.50 setReasoningEffort() . . . 154
17.6.2.51 setSimulatorFacade() . . . 154
17.6.2.52 setTemperature() . . . 154
17.6.2.53 setTimeoutSeconds() . . . 155
17.7 AIAssistantRequest Struct Reference . . . 155
17.7.1 Detailed Description . . . 155
17.7.2 Member Data Documentation . . . 155
17.7.2.1 modelPlan . . . 155
17.8 AIAssistantResponse Struct Reference . . . 156
17.8.1 Detailed Description . . . 156
17.9 AIAssistantWindow Class Reference . . . 156
17.10 AIAuditLog Class Reference . . . 157
17.10.1 Detailed Description . . . 157
17.10.2 Member Function Documentation . . . 158
17.10.2.1 exportCsv() . . . 158
17.10.2.2 loadRecentEntries() . . . 158
17.11 AIConversationConfiguration Struct Reference . . . 158
17.12 AIConversationResponse Struct Reference . . . 158
17.13 AIConversationService Class Reference . . . 159
17.14 AIProviderClient_if Class Reference . . . 159
17.14.1 Detailed Description . . . 160
17.14.1.1 Security contract . . . 160
17.14.1.2 Ownership . . . 160
17.14.2 Member Function Documentation . . . 160
17.14.2.1 clearApiKey() . . . 160
17.14.2.2 getBaseUrl() . . . 160
17.14.2.3 getProviderName() . . . 160
17.14.2.4 getTimeoutSeconds() . . . 160
17.14.2.5 hasApiKey() . . . 160
17.14.2.6 isAvailable() . . . 160
17.14.2.7 send() . . . 161
17.14.2.8 setApiKey() . . . 161
17.14.2.9 setBaseUrl() . . . 161

17.14.2.10 setTimeoutSeconds() . . . 161
17.15 Airport_Extended1 Class Reference . . . 161
17.15.1 Member Function Documentation . . . 163
17.15.1.1 main() . . . 163
17.16 AirportSecurityExample Class Reference . . . 163
17.16.1 Member Function Documentation . . . 164
17.16.1.1 main() . . . 164
17.17 AirportSecurityExampleExtended Class Reference . . . 165
17.17.1 Member Function Documentation . . . 166
17.17.1.1 main() . . . 166
17.18 AISecretStore Class Reference . . . 166
17.18.1 Detailed Description . . . 166
17.18.1.1 Usage . . . 167
17.18.2 Member Function Documentation . . . 167
17.18.2.1 isAvailable() . . . 167
17.18.2.2 load() . . . 167
17.18.2.3 remove() . . . 167
17.18.2.4 save() . . . 167
17.19 AISupport Class Reference . . . 168
17.19.1 Member Function Documentation . . . 172
17.19.1.1 _check() . . . 172
17.19.1.2 _initBetweenReplications() . . . 172
17.19.1.3 _loadInstance() . . . 172
17.19.1.4 _saveInstance() . . . 172
17.19.1.5 show() . . . 172
17.20 AND Class Reference . . . 173
17.20.1 Member Function Documentation . . . 179
17.20.1.1 _loadInstance() . . . 179
17.20.1.2 _saveInstance() . . . 179
17.20.1.3 Build() . . . 179
17.21 AnElectronicAssemblyAndTestSystem Class Reference . . . 179
17.21.1 Member Function Documentation . . . 181
17.21.1.1 main() . . . 181
17.22 AnimationAttribute Class Reference . . . 181
17.23 AnimationCounter Class Reference . . . 182
17.24 AnimationEntity Class Reference . . . 183
17.25 AnimationEvent Class Reference . . . 185
17.26 AnimationExpression Class Reference . . . 186
17.27 AnimationPlaceholder Class Reference . . . 187
17.28 AnimationPlot Class Reference . . . 188

Chapter 1

Editing an EFSM Network in the graphical interface

This guide describes the EFSM Network editor integrated into the GenESyS Qt6 GUI. Menu labels below are the English labels in the current GUI. The editor uses the model's existing `ModalModelDefault`, `EFSMNetwork`, states, and transitions; EFSM relations are not process-flow connections.

1.1 Create or attach a Network

1. Open a process model and select a `ModalModelDefault` component in its graphics view.
2. From the **Model** menu, choose **Create EFSM Network** and enter a unique Network name. Canceling the dialog leaves the model unchanged.
3. To attach an existing Network instead, choose **Select EFSM Network** and select the entry identified by its name and model ID. Selecting a new Network replaces the adapter's association; the previously registered Network remains in the model.
4. With the adapter selected, choose **Open EFSM Network**. The Network opens in a tab titled `Model > EFSM Network: NetworkName`. Adapters that refer to the same Network open the same context.

1.2 Add states and transitions

1. In the Network tab, choose **Model** > **Create EFSM State** and enter a unique state name. Repeat for each state.
2. Select one state to create a self-loop, or select two states to create a directed relation. Choose **Model** > **Create EFSM Transition**, then select the source and destination in the dialog. The same source/destination pair can have parallel transitions; a transition name may be left empty.
3. Move a state by dragging it. This changes its diagram position and updates the drawn edges.
4. Select a state and use **Model** > **Set Selected EFSM State as Initial** to change the initial state.
5. Select one state and choose **Model** > **Edit EFSM State...** to change its name, entry action, exit action, or final-state flag. Select one transition and choose **Model** > **Edit EFSM Transition...** to edit its name, guard, output, input event, priority, trigger event, or probability expression.
6. In a Network tab, the normal **Edit** > **Delete** action removes selected EFSM items. Removing a state also removes its incident transitions. Undo/redo applies to supported EFSM creation, deletion, movement, and property edits.

The expression fields are stored by the domain APIs. This editor does not add a parse-only syntax check; the current expression parser can evaluate an expression, so the GUI does not execute it merely to validate input.

1.3 Edit adapter bindings

Return to the process-model tab, select the `ModalModelDefault`, and choose **Model** > **Edit EFSM Bindings...** to edit the Network's supported input and output bindings. The binding dialog is available only when an EFSM Network is attached.

1.4 Save and reopen

Save the model using the graphical `.gui` format to keep both the mathematical model and its diagram layout. The `.gen` data remains authoritative for the Network, states, transitions, and their properties; `.gui` stores graphical positions and edge presentation. Reopen the `.gui` file and use **Open EFSM Network** again to restore the diagram. Older `.gui` files without EFSM layout data remain loadable; the editor assigns deterministic positions when saved positions are unavailable.

1.5 Current scope

The integrated editor provides a diagram editor for EFSM Networks. It does not provide a separate EFSM execution animation or a new runtime. Simulation semantics remain in the existing GenESyS kernel. The guide records the tested menu and dialog workflow; it does not claim that every possible expression is syntactically or semantically validated by the GUI.

Chapter 2

Cellular Automata Viewer

This folder contains the first standalone cellular-automata tool for the Genesys Qt GUI.

Current scope:

- 2D demo built from the existing cellular-automata plugin classes
- UI selectors for rule, neighborhood, and state preset
- Forest Fire preset with four enumerated states
- mouse editing with a selectable paint state
- discrete stepping plus timer-driven auto-run
- JSON save/load for lattice size, time, and cell states

Known limitations in this first pass:

- the viewer is intentionally demo-focused, not a universal CA builder yet
- more advanced neighborhood/radius combinations remain plugin-side follow-up work

Chapter 3

GenESyS Launcher and Per-User Runtime Dispatcher

3.1 Purpose

`source/applications/launcher` provides the stable invocation layer required for a future Debian installation to coexist with independently updated GenESyS runtimes in each user's home directory.

This directory builds two executables:

- `genesys-launcher`: interactive GUI entry point and the **only** process in this domain permitted to check for remote runtime updates;
- `genesys-dispatch`: non-interactive application dispatcher. It never checks for updates, never uses the network, never displays an update dialog, and never modifies the active runtime.

The launcher is intentionally independent of the simulator kernel, parser and plugin libraries. The focused `launcher-app` preset disables those subsystems.

3.2 Architecture

```
future Debian installation
  |
  +-- stable genesys-launcher / genesys-dispatch
  +-- stable system fallback runtime
  |     `-- <system-runtime-root>/bin/<application>
  `-- per-user runtime support
        |
        +-- $XDG_DATA_HOME/genesys/apps/<version>/
        `-- $XDG_DATA_HOME/genesys/current -> apps/<version>
```

A future package may expose public `/usr/bin/genesys-*` wrappers, but this implementation does **not** create or replace those wrappers. Debian package restructuring is a separate integration phase.

3.3 CMake targets and preset

The root option is:
`GENESYS_BUILD_LAUNCHER_APPLICATION`

Focused tests use:
`GENESYS_BUILD_LAUNCHER_TESTS`

The application CMake targets are:
```
genesys-launcher
genesys-dispatch
```

Shared internal libraries are:
```
genesys_launcher_runtime   # Qt6::Core only
genesys_launcher_update    # runtime + Qt6::Network
```

The dedicated preset is:
```
cmake --preset launcher-app
cmake --build --preset launcher-app
ctest --preset launcher-app --output-on-failure
```

The preset builds the launcher, dispatcher and focused tests without building the GenESyS kernel, parser, plugins, worker or main GUI.

3.4 Install contract for future packaging

CMake installs only the stable internal executables:
```
${CMAKE_INSTALL_LIBEXECDIR}/genesys/genesys-launcher
${CMAKE_INSTALL_LIBEXECDIR}/genesys/genesys-dispatch
```

It deliberately does **not** install public `/usr/bin` wrappers in this change.

The configurable system fallback root defaults conceptually to:
```
/usr/libexec/genesys/system/
  `-- bin/
      +-- genesys-gui
      +-- genesys-shell
      +-- genesys-worker
      `-- genesys-mcp
```

The path is centralized as the CMake cache variable `GENESYS_SYSTEM_RUNTIME_ROOT`; tests override it with temporary directories.

Other build-time integration variables are:

- `GENESYS_LAUNCHER_VERSION` — stable launcher contract version;
- `GENESYS_SYSTEM_PACKAGE_VERSION` — base installation version used for manifest compatibility checks;
- `GENESYS_SYSTEM_CONFIG_PATH` — defaults to `/etc/genesys/update.conf`;
- `GENESYS_UPDATE_KEYRING_PATH` — trusted OpenPGP keyring used by `gpgv`.

The repository currently has no canonical project-wide CMake version. Therefore these launcher/package version inputs default to `0.0.0` rather than creating a competing global version source. The future Debian/release integration must provide authoritative values at build time.

3.5 XDG directories

User paths are resolved centrally by `RuntimePaths`.

When the corresponding XDG variable is an absolute path:

```
configuration: $XDG_CONFIG_HOME/genesys/update.conf
cache:         $XDG_CACHE_HOME/genesys/
data:          $XDG_DATA_HOME/genesys/
```

Fallbacks when the XDG variable is absent are:

```
~/.config/genesys/update.conf
~/.cache/genesys/
~/.local/share/genesys/
```

Runtime layout:

```
~/.local/share/genesys/apps/<version>/
~/.local/share/genesys/current
```

Download cache:

```
~/.cache/genesys/downloads/
```

Launcher log:

```
~/.local/share/genesys/logs/launcher.log
```

If `HOME` is unavailable or unusable, per-user runtime selection/update is disabled and the dispatcher can use only the configured system fallback.

3.6 Configuration and precedence

The launcher reads:

```
/etc/genesys/update.conf
$XDG_CONFIG_HOME/genesys/update.conf
```

The user configuration is loaded first and explicitly supplied system values are applied last. Consequently the system policy wins for every key that it defines.

Supported `[updates]` keys are:

```
[updates]
enabled=true
channel=stable
allow_user_runtime=true
require_signature=true
check_on_gui_startup=true
fallback_to_system=true
minimum_check_interval_hours=12
max_user_versions=2
manifest_url=https://example.invalid/update-manifest.json
```

Remote updating is fail-safe by default: **no remote check occurs unless explicit effective policy exists and provides a valid HTTPS `manifest_url`.** A source-tree/development build therefore does not unexpectedly contact GitHub.

Invalid system security values are handled conservatively. In particular, invalid `enabled`, `allow_user_runtime`, or `require_signature` values cannot silently enable an unsafe path.

3.7 Application selection

`genesys-dispatch` requires an explicit application:

```
genesys-dispatch --app genesys-shell -- <arguments>
genesys-dispatch --app genesys-worker -- <arguments>
genesys-dispatch --app genesys-mcp -- <arguments>
```

The dispatcher preserves the subsequent argument vector; it does not construct a shell command. On Linux, `ProcessLauncher` uses `execv()` so the stable dispatcher process is replaced by the selected application and the environment/current working directory are inherited.

Selection is deterministic:

1. read effective policy;
2. if user runtimes are permitted, inspect `current`;
3. use the requested user-runtime application only when the runtime and executable satisfy validation;
4. otherwise use the system application when fallback is permitted;
5. return a controlled error if neither exists.

The dispatcher never downloads, activates, cleans, or changes `current`.

3.8 Active runtime validation

A user runtime is eligible only when:

- `current` is a symbolic link;
- it resolves to a direct child of the configured `apps` root;
- the target does not escape the authorized data tree;
- `VERSION` exists and parses as a numeric dotted version;
- `MANIFEST.json` exists and has schema version 1/product `genesys-simulator`;
- the internal manifest version matches `VERSION`;
- the requested application is declared by the internal manifest;
- the corresponding `bin/<application>` is a regular executable file;
- the executable is not a symlink and resolves inside the runtime `bin` directory.

Any failed condition causes a logged fallback rather than execution of an untrusted path.

3.9 <tt>genesys-worker</tt> and legacy <tt>genesys-web</tt>

The current CMake worker target is `genesys_worker_app` and its output is `genesys-worker`. The existing Debian tree still contains `genesys-web` naming.

The canonical application name for the launcher contract is therefore `genesys-worker`.

For a request for `genesys-web`, selection is explicitly ordered as:

```
1. genesys-web, when that executable is explicitly present and declared;
2. genesys-worker as the compatibility alias;
3. system fallback under the same ordered rule.
```

No other application receives an implicit alias.

3.10 MCP

`source/applications/mcp` is an existing Python MCP server and publishes the entry point:

```
genesys-mcp = genesys_mcp.server:main
```

The launcher does not rewrite it in C++ and does not install Python packages.

If `bin/genesys-mcp` is declared and present in an active runtime, the dispatcher executes it like any other application. Otherwise it tries the system fallback. If neither exists, `genesys-dispatch --app genesys-mcp` returns a controlled message directing the user to `genesys-gui` or to a distribution that includes MCP.

3.11 Version rules

`Version` accepts dotted non-negative numeric components, including a leading `v` when parsing a release tag:

```
2026.1.0
2026.1.2
v2026.2.0
```

Comparisons pad missing trailing components with zero (`2026.1 == 2026.1.0`). Non-numeric prerelease syntax is intentionally rejected because it is outside the current update contract.

A remote candidate older than the active/base version is rejected as a downgrade.

3.12 Platform detection

On Linux the updater reads `/etc/os-release` and combines normalized `ID`, `VERSION_ID`, and the actual CPU architecture.

Example:

```
ubuntu-24.04-x86_64
```

Linux is not assumed to mean Ubuntu. If platform identification fails or the exact key is absent from the manifest, no update is installed and normal runtime/system selection remains available.

3.13 Remote manifest schema

The parser supports schema version 1 and requires:

```
{
  "schema_version": 1,
  "product": "genesys-simulator",
  "channel": "stable",
  "version": "2026.2.1",
  "release_tag": "v2026.2.1",
  "published_at": "2026-08-20T00:00:00Z",
  "minimum_launcher_version": "2026.1.0",
  "minimum_system_package_version": "2026.1.0",
  "platforms": {
    "ubuntu-24.04-x86_64": {
      "kind": "user-runtime",
      "url": "https://example.invalid/genesys-runtime.tar.zst",
      "sha256": "<64 lowercase/uppercase hexadecimal characters>",
      "signature_url": "https://example.invalid/genesys-runtime.tar.zst.sig",
      "size": 123,
      "applications": [
        "genesys-gui",
        "genesys-shell",
        "genesys-worker",
        "genesys-mcp"
      ]
    }
  }
}
```

The parser rejects unsupported schema/product/channel/platform, invalid versions, downgrade, invalid/non-↩ HTTPS URLs, invalid SHA-256, invalid sizes, duplicate/invalid/empty application lists, and unsatisfied minimum launcher/system-package versions. GitHub HTML is never scraped.

3.14 Network behavior

Only the launcher update library links `Qt6::Network`.

`QtNetworkTransport` enforces:

- HTTPS-only requests for production update operations;
- bounded response sizes;
- finite transfer timeouts;
- a bounded redirect count;
- Qt's no-less-safe redirect policy;
- normal TLS validation (TLS errors are never ignored);
- cancellation;
- streaming downloads to a destination instead of concatenating shell commands or trusting a remote filename.

The manifest is limited to 1 MiB. Runtime bundle size is bounded by the signed manifest and currently capped at 2 GiB by the manifest parser. Signature downloads are limited to 1 MiB.

Tests use an injected `INetworkTransport`; they do not access GitHub or any public network.

3.15 Integrity and signature verification

SHA-256 verification is mandatory for every runtime bundle. The expected digest is supplied by the validated remote manifest. Digest comparison is performed over decoded fixed-size digest bytes without early exit.

When `require_signature=true`, `GpgvSignatureVerifier` invokes `gpgv` directly with an argument vector:

```
gpgv --keyring <trusted-keyring> <signature> <bundle>
```

No shell is involved. Signature-required mode fails closed when the trusted keyring, bundle/signature, `gpgv`, or a valid signature is unavailable.

This repository change does not choose or install the institutional/release signing key. Future Debian integration must install the public keyring and declare `gpgv`/archive runtime dependencies as appropriate. The code does not weaken signature-required policy while that deployment step is pending.

3.16 Secure archive extraction

Runtime archives are expected to be `tar.zst`.

`TarZstdArchiveExtractor` invokes the system `tar` directly, never through a shell. Before extraction it inspects both path and verbose listings.

The current implementation intentionally accepts only:

- regular files;
- directories.

It rejects:

- absolute paths;
- `./..` path components and traversal;
- escaped/backslash path forms in the archive listing;
- symlinks;
- hardlinks;
- device nodes;
- FIFOs and other special entries;
- setuid/setgid entries.

Extraction uses `--no-same-owner` and `--no-same-permissions`, targets a fresh `.partial` directory, and the resulting tree is scanned again for links/special entries/root escape before runtime validation.

Future Debian packaging must ensure compatible `tar` + zstd support is installed. Missing tooling causes a controlled update failure and leaves the existing runtime/system installation usable.

3.17 Runtime validation and atomic activation

The installation flow is:

```
download .part
  -> verify exact size
  -> verify SHA-256
  -> verify OpenPGP signature when required
  -> promote verified cache file
  -> extract to apps/<version>.partial
  -> validate extracted runtime
  -> rename to apps/<version>
  -> create temporary current symlink
  -> atomic rename over current
```

The extracted runtime must contain:

```
VERSION
MANIFEST.json
bin/
```

The internal manifest must match the remote version and application set. The complete runtime contract currently requires at least:

```
genesys-gui
genesys-shell
genesys-worker
genesys-mcp
```

Every declared application must exist as a non-symlink regular executable in `bin/`.

`current` is never changed before extraction and validation finish. On Unix the temporary symlink is atomically renamed over the previous `current` symlink. A non-symlink `current` entry is never overwritten.

3.18 Concurrency and retention

`UserRuntimeManager` uses `QLockFile` under the GenESyS user data root. The launcher acquires the lock before download finalization and holds it through verification, installation, activation and cache cleanup. It is released before the selected GenESyS application is executed.

Runtime cleanup is best-effort and respects `max_user_versions`. It always preserves:

- the newly active runtime;
- the previously active runtime as immediate rollback.

Therefore rollback safety can retain two versions even when an administrative `max_user_versions` value of 1 is supplied.

3.19 Logging

The default launcher log is:
`$XDG_DATA_HOME/genesys/logs/launcher.log`

Each line contains a UTC timestamp, launcher version, event and bounded diagnostic detail. Relevant events include selection/fallback, update checks, downloads, verification, extraction/activation errors, activation and retention.

The implementation does not log configuration contents, tokens, credentials or secrets. The log rotates to `.1` when it reaches approximately 1 MiB.

3.20 Launcher CLI

Supported operations are intentionally small:

```
genesys-launcher --app genesys-gui --interactive-update
genesys-launcher --check-only
genesys-launcher --no-update
genesys-launcher --version
```

`--check-only` reports through console output and never installs a runtime. `--no-update` bypasses the update path and launches according to the selector. Normal `genesys-gui` startup checks only when `check_on_gui_startup=true` and all other effective update policy requirements permit it.

The launcher refuses remote update modes for non-GUI applications. Non-interactive applications must use `genesys-dispatch`.

3.21 Failure and fallback behavior

Update failure is not application failure. Network errors, invalid manifests, checksum/signature errors, archive errors, disk/write errors, invalid runtime trees, lock contention and activation errors all leave the previously active `current` untouched.

After update handling, the launcher selects and starts the active user GUI or the system fallback. The dispatcher similarly selects user/system applications without attempting an update.

On Linux `ProcessLauncher` attempts the system fallback if execution of a selected user executable returns an execution error such as `EACCES` (including a home mounted `noexec`).

3.22 Tests

Focused Google Test coverage uses only temporary roots and local test doubles. It covers:

- version parsing/comparison/downgrade;
- user/system configuration and fail-safe defaults;
- XDG defaults/overrides/missing HOME;
- remote manifest contract and minimum versions;
- runtime selection/fallback;
- `genesys-web` compatibility and MCP;
- SHA-256 and signature-required fail-closed paths;
- unsafe archive listings;
- `.partial` installation and atomic activation;
- preservation of the previous `current` on failures;
- retention/rollback;
- dispatcher argument forwarding through an injected process launcher;
- update-check interval behavior;
- a complete local fake manifest -> download -> checksum -> signature -> extract -> validate -> activate -> select cycle.

The focused GitHub Actions workflow additionally records dynamic-link evidence showing that `genesys-dispatch` does not link `Qt6::Network` or `Qt6::Widgets`.

3.23 Known limitations and future Debian integration

This change intentionally does not:

- rewrite `debian/control` or `.install` files;
- replace `/usr/bin/genesys-gui` or create final wrappers;
- move current application binaries into the system fallback tree;
- install the OpenPGP public keyring;
- publish/sign release runtime bundles;
- convert the Python MCP server to C++;
- perform a real `dpkg` installation or laboratory test.

The next Debian phase must map the existing application outputs into the system fallback directory, install public wrappers that call this stable launcher/dispatcher, reconcile legacy `genesys-web` packaging with canonical `genesys-worker`, package the existing Python `genesys-mcp` when desired, install update policy/key material/tool dependencies, and validate the complete package lifecycle as a non-root laboratory user.

Real Debian install, user-without-sudo, `HOME` mounted `noexec`, and UFSC laboratory behavior remain `needs-local-validation` until that packaging phase exists.

Chapter 4

Genesys MCP Connector

Python MCP server that exposes GenESyS simulation capabilities to AI assistants (Claude Desktop, Claude Code, and any MCP-compatible client).

4.1 Prerequisites

- Python 3.10+
- `genesys-worker` running (see `source/applications/worker/README.md`)

4.2 Install

```
cd source/applications/mcp
pip install -e .
```

4.3 Run

```
# via entry point
genesys-mcp

# or via module
python -m genesys_mcp
```

The server communicates over stdio (default FastMCP transport). Set `GENESYS_URL` to point to a non-default worker app address:

```
GENESYS_URL=http://192.168.1.10:8080 genesys-mcp
```

4.4 Claude Desktop integration

Add to `~/.config/claude/claude_desktop_config.json` (Linux) or `~/Library/Application Support/Claude/claude_desktop_config.json` (macOS):

```
{
  "mcpServers": {
    "genesys": {
      "command": "genesys-mcp",
      "env": {
        "GENESYS_URL": "http://localhost:8080"
      }
    }
```

```
  }
}
```

If `genesys-mcp` is not on PATH (e.g. installed in a venv), use the full path:

```
{
  "mcpServers": {
    "genesys": {
      "command": "/path/to/venv/bin/genesys-mcp",
      "env": {
        "GENESYS_URL": "http://localhost:8080"
      }
    }
  }
}
```

4.5 Claude Code integration

```
claude mcp add genesys -- genesys-mcp
```

Or with a custom URL:

```
claude mcp add genesys -e GENESYS_URL=http://localhost:8080 -- genesys-mcp
```

4.6 Workflow

All tools that interact with the simulator require a session token. Call `genesys_auth` once per conversation and pass the returned token to every subsequent tool.

```
1. genesys_auth          → { token: "..." }
2. genesys_new_model     (token)
3. genesys_import_model_language  (token, model_text)
4. genesys_configure_simulation   (token, replications=10, length=480.0)
5. genesys_run_simulation         (token)
6. genesys_create_job    (token) → { jobId: "..." }
7. genesys_run_job       (token, jobId)
8. genesys_job_result    (token, jobId)
```

4.7 Available tools (18)

Tool	Auth required	Description
`genesys_health`	No	Check worker app reachability
`genesys_auth`	No	Create session, returns token
`genesys_info`	Yes	Simulator version and licence
`genesys_new_model`	Yes	Create empty model
`genesys_get_model`	Yes	Describe current model
`genesys_save_model`	Yes	Save model to workspace file
`genesys_load_model`	Yes	Load model from workspace file
`genesys_import_model_language`	Yes	Import model from text
`genesys_simulation_status`	Yes	Current simulation state
`genesys_configure_simulation`	Yes	Set replication/length/warmup params
`genesys_run_simulation`	Yes	Run simulation synchronously
`genesys_step_simulation`	Yes	Advance one event step
`genesys_worker_info`	No	Worker identity metadata
`genesys_worker_capabilities`	No	Worker capability flags
`genesys_create_job`	Yes	Create job from current model
`genesys_job_status`	Yes	Query job state
`genesys_run_job`	Yes	Execute job synchronously
`genesys_job_result`	Yes	Retrieve job result summary

Chapter 5

Genesys Worker Application

First functional implementation of the **Worker** application type for GenESyS.

5.1 Current scope

- CMake target: `genesys_worker_app` (enabled with `-DGENESYS_BUILD_WORKER_APPLICATION=ON`).
- Executable name: `genesys-worker`.
- Layered architecture for HTTP transport, API routing, session/token, and simulator service.
- Stateful session management with one `Simulator` per session and per-session workspace directories.
- Endpoints:
  - `GET /health`
  - `POST /api/v1/auth/session`
  - `GET /api/v1/simulator/info` (requires `Authorization: Bearer <token>`)
  - `POST /api/v1/models` (requires `Authorization: Bearer <token>`)
  - `GET /api/v1/models/current` (requires `Authorization: Bearer <token>`)
  - `POST /api/v1/models/save` (requires `Authorization: Bearer <token>`)
  - `POST /api/v1/models/load` (requires `Authorization: Bearer <token>`)
  - `GET /api/v1/simulation/status` (requires `Authorization: Bearer <token>`)
  - `POST /api/v1/simulation/config` (requires `Authorization: Bearer <token>`)
  - `POST /api/v1/simulation/run` (requires `Authorization: Bearer <token>`)
  - `POST /api/v1/simulation/step` (requires `Authorization: Bearer <token>`)

5.2 Worker cycle Stage 1 (new cycle)

The Worker application is now also being evolved as a **worker API** that can be discovered by a future distributed orchestrator application.

This stage adds two public worker discovery endpoints (no Bearer token required):

- `GET /api/v1/worker/info`
- `GET /api/v1/worker/capabilities`

These routes expose worker identity metadata and current implementation capability flags. They are intentionally limited to discovery only and do not include job submission, polling, or background execution in this stage.

5.3 Worker cycle Stage 2

This stage starts worker model-ingress support with one authenticated and session-scoped endpoint:

- `POST /api/v1/worker/models/import-language` (requires `Authorization: Bearer <token>`)

The request body must be plain text GenESyS model language/specification. The worker imports this text into the session simulator as the current model.

This stage still does **not** include multipart/binary upload, distributed job submission, polling, or background orchestration.

5.4 Worker cycle Stage 3

This stage introduces a minimal worker job abstraction with authenticated, session-scoped endpoints:

- `POST /api/v1/worker/jobs` (requires `Authorization: Bearer <token>`)
- `GET /api/v1/worker/jobs/{jobId}` (requires `Authorization: Bearer <token>`)

Behavior in this stage:

- job creation requires a valid current model in the session;
- each job is created in in-memory storage with state `queued`;
- job creation persists a session-workspace snapshot file (for example `job_<id>.gen`) to decouple future execution from live model mutations;
- job metadata can be queried by id from the same authenticated session.

This stage still does **not** execute jobs, provide result retrieval, add polling loops, or introduce background worker threads.

5.5 Worker cycle Stage 4

This stage adds explicit, synchronous execution of existing worker jobs:

- `POST /api/v1/worker/jobs/{jobId}/run` (requires `Authorization: Bearer <token>`)

Behavior in this stage:

- execution is triggered only for an existing job id;
- job state is updated in memory through `queued -> running -> finished|failed`;
- execution is synchronous and performed by the session simulator using the job snapshot file;
- `GET /api/v1/worker/jobs/{jobId}` remains the basic state inspection/polling mechanism after run requests.

This stage still does **not** include background execution, queue worker loops, cancellation, streaming updates, or a dedicated job result endpoint.

5.6 Worker cycle Stage 5

This stage adds terminal result retrieval for previously executed worker jobs:

- `GET /api/v1/worker/jobs/{jobId}/result` (requires `Authorization: Bearer <token>`)

Behavior in this stage:

- result retrieval is available only after the job reaches a terminal state (`finished` or `failed`);
- queued or running jobs return a conflict response because no terminal result exists yet;
- the endpoint returns a minimal structured simulation summary persisted at the end of synchronous execution;
- execution remains synchronous and non-background (`POST /run` still performs the run inline);
- cancellation is still not available;
- distributed orchestration remains out of scope.

5.7 Worker cycle Stage 6

This stage hardens HTTP transport behavior for existing worker and session APIs without changing route contracts:

- request reading is now incremental (`recv` loop) instead of single-shot reads;
- request assembly is bounded by a transport limit of **1 MiB** (larger payloads return `413 Payload Too Large`);
- socket receive/send timeouts are configured to **5 seconds** per client connection;
- when timeout happens before a complete request is assembled, the server returns `408 Request Timeout`;
- transport-level error payloads remain JSON-shaped and consistent with current server error responses.

This stage is explicitly operational hardening only. Application-layer endpoints and worker cycle stages 1-5 contracts remain unchanged.

5.8 How to run

```
cmake -S . -B build/worker-debug -G Ninja -DGENESYS_BUILD_WORKER_APPLICATION=ON
cmake --build build/worker-debug --target genesys_worker_app
./build/worker-debug/source/applications/worker/genesys-worker --port 8080
```

Optional parameters:

- `--port <N>`: HTTP port (default 8080).
- `--max-requests <N>`: exit after N requests (useful for scripted smoke tests).

5.9 Security notice

Session creation in Stage 1 is provisional and stateful in memory. Generated tokens are opaque random strings and **not** production-grade authentication.

For Stage 3 model persistence:

- Save/load operations are restricted to each session workspace directory.
- API requests accept only a `filename` basename (no paths).
- Filenames must match `[A-Za-z0-9._-]` and cannot include `..`, `/`, or `\`.

For Stage 4 simulation configuration:

- `POST /api/v1/simulation/config` currently uses a minimal contract parser without external JSON libraries.
- All configuration fields are required in the request body: `numberOfReplications`, `replicationLength`, `warmUpPeriod`, `pauseOnEvent`, `pauseOnReplication`, `initializeStatistics`, `initializeSystem`.

For Stage 5 simulation execution:

- `POST /api/v1/simulation/run` and `POST /api/v1/simulation/step` are synchronous wrappers over `ModelSimulation::start()` and `ModelSimulation::step()`.
- This stage intentionally does not introduce asynchronous/background simulation control endpoints.

Chapter 6

Customization Points

The custom directory is an injection point for custom user configurations.

6.1 Header <tt>gtest.h</tt>

6.1.1 The following macros can be defined:

- `GTEST_OS_STACK_TRACE_GETTER_` - The name of an implementation of `OsStackTraceGetter↩Interface`.
- `GTEST_CUSTOM_TEMPDIR_FUNCTION_` - An override for `testing::TempDir()`. See `testing↩::TempDir` for semantics and signature.

6.2 Header <tt>gtest-port.h</tt>

The following macros can be defined:

6.2.1 Logging:

- `GTEST_LOG_(severity)`
- `GTEST_CHECK_(condition)`
- Functions `LogToStderr()` and `FlushInfoLog()` have to be provided too.

6.2.2 Threading:

- `GTEST_HAS_NOTIFICATION_` - Enabled if Notification is already provided.
- `GTEST_HAS_MUTEX_AND_THREAD_LOCAL_` - Enabled if `Mutex` and `ThreadLocal` are already provided. Must also provide `GTEST_DECLARE_STATIC_MUTEX_(mutex)` and `GTEST_DEFINE_↩STATIC_MUTEX_(mutex)`
- `GTEST_EXCLUSIVE_LOCK_REQUIRED_(locks)`
- `GTEST_LOCK_EXCLUDED_(locks)`

6.2.3 Underlying library support features

- GTEST_HAS_CXXABI_H_

6.2.4 Exporting API symbols:

- GTEST_API_ - Specifier for exported symbols.

6.3 Header <tt>gtest-printers.h</tt>

- See documentation at gtest/gtest-printers.h for details on how to define a custom printer.

Chapter 7

Análise técnica do parser (Bison/Flex)

7.1 Audit Status (WiP20261)

- Branch audited: `WiP20261`
- Audit scope: reauditoria do lexer/gramática e ações semânticas em `source/parser/parserBison↩Flex`
- Status legend: `DONE`, `PARTIAL`, `OPEN`, `UNCERTAIN`, `SUPERSEDED`
- Data desta reauditoria documental: `2026-04-10`

7.2 Escopo

Arquivos revalidados:

- `source/parser/parserBisonFlex/bisonparser.yy`
- `source/parser/parserBisonFlex/lexerparser.ll`
- `source/parser/parserBisonFlex/bisonparser.report` (não encontrado no checkout atual)

7.3 Registro histórico (pré-reauditoria)

O texto original deste documento apontava conflitos LR elevados, erros de tokenização e lacunas semânticas. Parte desse diagnóstico foi superada por mudanças posteriores; parte ainda permanece relevante.

7.4 Reclassificação dos achados históricos

7.4.1 Conversão hexadecimal

7.4.2 Audit status

`DONE`

7.4.3 Evidence

- O lexer converte hex com `std::strtoll(yytext, &endPtr, 16)` e emite `NUMH`.

7.4.4 Remaining gaps

- Sem gap direto neste item.

7.4.5 Tokenização de <tt>min</tt> / <tt>max</tt>

7.4.6 Audit status

`DONE`

7.4.7 Evidence

- `min` retorna `mathMIN` e `max` retorna `mathMAX`.

7.4.8 Remaining gaps

- Sem gap direto neste item.

7.4.9 Regex de <tt>EntitiesWIP</tt>

7.4.10 Audit status

`DONE`

7.4.11 Evidence

- Regra atual usa padrão de palavra completa `[eE][nN][tT][iI][tT][iI][eE][sS][wW][iI][pP]`.

7.4.12 Remaining gaps

- Sem gap direto neste item.

7.4.13 Regra isolada <tt>T</tt> no lexer

7.4.14 Audit status

`SUPERSEDED`

7.4.15 Evidence

- A regra isolada não aparece mais no lexer atual.

7.4.16 Remaining gaps

- Sem gap direto neste item.

7.4.17 Token <tt>ILLEGAL</tt> antes inútil

7.4.18 Audit status

DONE

7.4.19 Evidence

- A gramática atual inclui `expression: ... | illegal { $$.valor = -1; }`, tornando o caminho alcançável.

7.4.20 Remaining gaps

- Avaliar qualidade de recuperação/diagnóstico de erro além da alcançabilidade.

7.4.21 Estrutura de precedência/associatividade da gramática

7.4.22 Audit status

DONE

7.4.23 Evidence

- Estrutura por níveis explícitos: `logicalOr -> logicalXor -> logicalAnd -> logicalNot -> relational -> additive -> multiplicative -> power -> unary -> primary`.
- Potência em `power: unary POWER power`, indicando associatividade à direita.

7.4.24 Remaining gaps

- Não foi possível revalidar numericamente conflitos LR no estado atual sem `bisonparser.report`.

7.5 Pontos ainda pendentes (ou parcialmente mitigados)

7.5.1 Funções semânticas não implementadas totalmente (<tt>fDISC</tt>, <tt>fLASTINQ</tt>, <tt>fRESSEIZES</tt>)

7.5.2 Audit status

OPEN

7.5.3 Evidence

- `fDISC` em `probFunction` contém TODO e retorno placeholder (`sampleDiscrete(0,0)`).
- `fLASTINQ` possui ação vazia com comentário de não implementado.
- `fRESSEIZES` também está com comentário de não implementado.

7.5.4 Remaining gaps

- Implementar semântica real dessas funções e cobrir com testes de expressão.

7.5.5 Avaliação de <tt>FORM</tt>

7.5.6 Audit status

OPEN

7.5.7 Evidence

- Regras de `FORM` continuam comentando problema sério de reentrada e retornam `0.0`.

7.5.8 Remaining gaps

- Resolver avaliação de fórmula (reentrância/arquitetura de avaliação) para evitar retorno silencioso inválido.

7.5.9 Risco de null-deref em atribuições/leituras ligadas a evento atual

7.5.10 Audit status

PARTIAL

7.5.11 Evidence

- Há guardas em alguns caminhos (`if (getCurrentEvent() != nullptr && getCurrentEvent()->getEntity() != nullptr)`), mas ainda existem acessos diretos como `fIDENT` e outras ações usando `getCurrentEvent()->getEntity()` sem guarda uniforme.

7.5.12 Remaining gaps

- Padronizar guarda robusta em todos os pontos de acesso a evento/entidade corrente.

7.5.13 Conflitos LR atuais

7.5.14 Audit status

`UNCERTAIN`

7.5.15 Evidence

- `source/parser/parserBisonFlex/bisonparser.report` não estava disponível no checkout atual, então não houve recontagem atual de conflitos shift/reduce e reduce/reduce.

7.5.16 Remaining gaps

- Gerar novo report do Bison e atualizar números concretos de conflitos.

7.6 Recomendações arquiteturais que seguem válidas

1. Formalizar tratamento de funções não implementadas com erro explícito (em vez de `0`/placeholder silencioso).
2. Consolidar estratégia de null-safety para contexto de evento corrente.
3. Reintroduzir rotina de auditoria de conflitos LR no pipeline (geração e versionamento de report ou artefato equivalente).
4. Fortalecer testes de regressão de parser para operadores, funções de plugin e cenários de erro.

7.7 Remaining Work

- `OPEN` — Implementar semântica real de `fDISC`.
- `OPEN` — Implementar semântica real de `fLASTINQ`.
- `OPEN` — Implementar semântica real de `fRESSEIZES`.
- `OPEN` — Resolver avaliação de `FORM` sem retorno neutro silencioso.
- `PARTIAL` — Eliminar caminhos restantes de null-deref em `getCurrentEvent()->getEntity()`.
- `UNCERTAIN` — Recontar conflitos LR com novo `bisonparser.report`.

Chapter 8

Kernel Simulator Unit Tests - Build & Run Guide

This document describes a **ready-to-use CMake/CLion setup** for running all unit tests related to the Kernel Simulator package.

8.1 What to use (recommended)

Use these presets from `CMakePresets.json`:

- **Configure preset:** `tests-kernel-unit`
- **Build preset:** `tests-kernel-unit`
- **Build target (executed by the preset):** `genesys_kernel_unit_tests_run`

The `genesys_kernel_unit_tests_run` target:

1. Builds all kernel unit-test executables;
2. Runs all of them automatically (including the generated method-inventory test executable).

8.2 CLion setup (single-click workflow)

1. Open **Settings/Preferences** > **Build, Execution, Deployment** > **CMake**.
2. Enable **Load CMake presets** (if not already enabled).
3. Select **Configure preset = `tests-kernel-unit`**.
4. In the run/build target selector, choose **Build preset = `tests-kernel-unit`**.
5. Build that preset.

Expected behavior: CLion builds everything required and then runs all kernel unit-test binaries automatically in sequence.

8.3 Command line equivalent

```
cmake --preset tests-kernel-unit
cmake --build --preset tests-kernel-unit
```

This is equivalent to running the single target `genesys_kernel_unit_tests_run`.

8.4 Executables included in the run target

The run target executes the following unit-test executables:

- `genesys_test_util`
- `genesys_test_simulator_support`
- `genesys_test_simulator_runtime`
- `genesys_test_support_modelmanager`
- `genesys_test_support_persistence`
- `genesys_test_runtime_pluginmanager`
- `genesys_test_support_oneventmanager`
- `genesys_test_support_parsermanager`
- `genesys_test_support_tracemanager`
- `genesys_test_support_connectionmanager`
- `genesys_test_support_simulationscenario`
- `genesys_test_support_experimentmanager`
- `genesys_test_kernel_simulator_method_inventory` (auto-generated inventory scaffold)

8.5 Notes

- The generated inventory test executable is built from:
  - generator script: `source/tests/unit/tools/generate_kernel_simulator_test_stubs.py`
  - generated source: `source/tests/unit/generated/test_kernel_simulator_method_inventory.generated.cpp`
- If headers in `source/kernel/simulator` change, the generated inventory test file is automatically regenerated during build.

Chapter 9

Architecture notes for <tt>source/tools</tt>

9.1 1. Architectural overview

The `tools` package provides domain-support services for statistical analysis and numerical procedures. It exposes interfaces used by higher-level workflows and retains legacy implementations for compatibility.

9.2 2. Current package responsibilities

- Dataset-oriented analysis orchestration (`DataAnalyser_if`).
- Simulation result dataset loading, including Genesys `Record` text output with replication metadata.
- Distribution fitting contracts (`Fitter_if`).
- Parametric hypothesis testing (`HypothesisTester_if`, default impl 1).
- Distribution mathematical utilities and quantile inversion.
- Numerical integration and derivation utilities via legacy solver abstractions.
- Binding of abstractions to implementations through traits.

9.3 3. Approved target decomposition

9.3.1 Data analysis

- Keep façade role in `DataAnalyser_if`.
- Clarify ownership and lifecycle of returned collaborating services.

9.3.2 Fitting

- Preserve legacy fitting API.
- Transition from dummy implementation to a concrete default implementation in phased manner (FITTER-1 delivered baseline behavior, FITTER-2 added functional Beta and Weibull fitting in `FitterDefaultImpl`, and FITTER-3 promotes `TraitsTools<Fitter_if>` to `FitterDefaultImpl`).

9.3.3 Hypothesis testing

- Maintain current contract and refine implementation completeness, especially two-population methods.
- HYPTEST-1 alignment keeps the current pooled-vs-Welch heuristic, but documents it as a TODO while consolidating one-population p-value coherence and the two-proportion-difference confidence interval formula.

- HYPTEST-2 final alignment updates one-population proportion confidence intervals to the normal-approximation formulation (including finite-population correction when `N` is provided).

9.3.4 Distribution abstractions

- Introduce `Distribution_if` and specialized continuous/discrete interfaces.
- Keep legacy static façade while migration is in progress.

9.3.5 Numerical tools

- Split legacy solver responsibilities into dedicated interfaces:
  - `Quadrature_if`
  - `RootFinder_if`
  - `OdeSystem_if`
  - `OdeSolver_if`

9.3.6 Traits/binding

- Keep current traits stable.
- Expand only when safe concrete implementations exist.

9.4 4. Legacy compatibility strategy

- Do not break existing public signatures in this phase.
- Preserve compatibility by keeping legacy classes available while promoting only validated trait selections.
- Add new abstractions as header-only contracts until implementations are mature.

9.5 5. Planned migration order

1. Stabilize documentation and explicit contracts for existing headers.
2. Introduce new interface headers without forcing behavior changes.
3. Add concrete implementations incrementally behind existing traits.
4. Migrate trait bindings once implementations are production-safe.
5. Deprecate legacy conflated abstractions only after full replacement is validated.

9.6 6. AI Assistant component

9.6.1 Role

`AIAssistant_if` is a new high-level tool abstraction that will allow users to describe a simulation system in natural language and have the assistant construct, configure and run a GenESyS model automatically.

9.6.2 Stage 1 (complete) — Interface and implementation scaffold

- `AIAssistant_if`: abstract interface with enumerations (`AIProvider`, `ExecutionState`, `ReasoningEffort`), data structures (`AIAssistantConfiguration`, `AIAssistantRequest`, `AIAssistantResponse`, `GenesysKnowledgeItem`, `GenesysKnowledgeBaseSummary`) and method groups for configuration, security, SimulatorFacade integration, knowledge base, provider client, and workflow.
- `AIAssistantDefaultImpl`: concrete class implementing all interface methods.
- Security model: API key stored in memory only; no public getter; clearApiKey() overwrites the buffer before clearing; getMaskedApiKey() exposes only the last four characters. Permission flags (allowNetworkAccess, allowModelMutation, allowSimulationExecution, allowFileSystemWrites) default to false (deny-by-default).
- `TraitsTools<AIAssistant_if>` bound to `AIAssistantDefaultImpl`.

9.6.3 Stage 2 (complete) — Plugin introspection

- `refreshKnowledgeBaseFromSimulator()` populates the knowledge base with:
  - A static catalog of 15 well-known GenESyS building blocks (Create, Dispose, Queue, Seize, Release, Process, Delay, Decide, Assign, Record, Resource, Entity, Statistics, Variable).
  - Dynamic introspection via `SimulatorFacade::firstPlugin()` / `nextPlugin()`: for each loaded `Plugin`, reads `PluginInformation` fields (typename, isComponent, isSource/isSink, input/output topology, descriptionHelp, languageTemplate).
  - Duplicate entries between the static catalog and dynamic plugins are silently skipped.
- Returns `true` even when no facade is attached (static catalog is still useful).

9.6.4 Stage 3 (complete) — AI provider HTTP clients

- `AIProviderClient_if`: abstract interface for a single chat-completion HTTP call. Structures: `ChatMessage`, `ProviderRequest`, `ProviderResponse`.
- `HttpProviderClientBase`: abstract base implementing popen+curl transport. Security: API key written to a 0600 temp file (`mkstemp`), never on the command line. Shared JSON utilities: `_escapeJsonString`, `_extractJsonString`, `_extractJsonInt`, `_buildMessagesArray`, `_extractFirstArrayElement`.
- `OpenAIProviderClientImpl`: OpenAI chat completions; supports o-series reasoning models via `highReasoningMode`; optional Organization and Project headers.
- `AnthropicProviderClientImpl`: Anthropic Messages API; separates system message from conversation turns; extended-thinking budget for `highReasoningMode`.
- `LocalProviderClientImpl`: Ollama/LM Studio/llama.cpp; OpenAI-compatible format; no API key required.
- `AIAssistant_if` extended with `setProviderClient`, `getProviderClient`, `hasProviderClient`. `AIAssistantDefaultImpl` also exposes `createAndAttachProviderClient()` which creates the right client from configuration and takes ownership.

9.6.5 Stage 4 (complete) — Prompt analysis and model plan generation

- `analyzePrompt()`: builds a system prompt injecting the GenESyS knowledge base, calls the provider client, and returns the LLM's structured analysis.
- `createModelPlan()`: uses a structured system prompt requesting a Markdown model plan (entities, resources, queues, arrival, processing steps, statistics, simulation parameters) and returns it in `AIAssistantResponse::generatedPlan`.
- Both methods enforce `allowNetworkAccess == true` and check `checkReady()`.
- Diagnostics include provider name, model, input/output token counts, and HTTP status.

9.6.6 Stage 5 (complete) — Model construction

- `buildModel()`: makes an LLM call requesting a GenESyS `.gen` model language file. The system prompt includes the `.gen` format specification, a complete example, and the knowledge base. If `AIAssistantRequest::modelPlan` is non-empty it is included as the model specification. The generated `.gen` content is written to a `0600` temp file (`mkstemp`), loaded via `SimulatorFacade::loadModel()`, and then deleted. `AIAssistantResponse::generatedModelLanguage` holds the generated file text.
- `configureSimulation()`: after a model is loaded, makes a small deterministic (temperature=0) LLM call to extract simulation parameters as JSON from `AIAssistantRequest::experimentDescription`. Applies non-zero values to the current model via `simSetNumberOfReplications`, `simSetReplicationLength`, `simSetWarmUpPeriod`. Falls back gracefully when no provider is available (`.gen` parameters remain active).
- `HttpProviderClientBase` JSON utilities promoted to `public static` so that `AIAssistantDefaultImpl` can call `_extractJsonInt`, `_extractJsonDouble`, and `_extractJsonString` directly; `_extractJsonDouble` added for floating-point fields.
- `AIAssistantRequest::modelPlan` field added; `execute()` populates it from `createModelPlan()` output and passes the enriched request to `buildModel()`.

9.6.7 Stage 6 (complete) — Simulation execution and result collection

- `runSimulation()`: verifies `allowSimulationExecution` and non-null SimulatorFacade, checks not already running, then calls `SimulatorFacade::simStart()` (synchronous). Reports number of completed replications in the response.
- `collectResults()`: iterates `SimulatorFacade::modelGetResponses()` using `List<Simulation Response*>::front()/next()` and renders a Markdown table of metric name → value.
- `execute()` updated to call steps in the correct order with proper plan propagation: analyzePrompt → createModelPlan → buildModel (with enriched plan) → configureSimulation → runSimulation → collectResults.

9.6.8 Planned stages

- **Stage 7** — GUI integration: prompt panel, plan review, graphical model creation.
- **Stage 8** — Security and governance: OS secret store, sandbox, dry-run mode, audit log.

9.6.9 Dependency constraints

- `AIAssistant_if.h` uses only a forward declaration of `SimulatorFacade` to avoid pulling the full kernel chain into every including translation unit.
- `AIAssistantDefaultImpl.cpp` includes `kernel/simulator/SimulatorFacade.h` directly.
- No external libraries are introduced in Stage 1.

9.7 7. Stability notes and non-goals for this phase

- FITTER-2 consolidated additional fitting algorithms in `FitterDefaultImpl` (beta and weibull) on top of FITTER-1 families; FITTER-3 now switches the default trait binding so `TraitsTools<Fitter_if>` points to `FitterDefaultImpl`.
- `FitterDummyImpl` is intentionally preserved as a legacy/documental placeholder and is no longer the default fitter binding.
- No full completion of hypothesis-testing theory coverage.
- No numerical refactor of legacy solver internals.
- No cross-package behavior changes outside `source/tools`.

Chapter 10

tools package

10.1 1. Purpose of the tools package

The `source/tools` package hosts statistical and numerical support abstractions used by simulation and analysis flows. It provides interfaces and legacy implementations for fitting, hypothesis testing, probability utilities, and numerical solvers.

10.2 2. Current major abstractions

- `DataAnalyser_if`: high-level façade to orchestrate dataset-oriented analysis services.
- `SimulationResultsDatasetParser`: loader for numeric result files, including Genesys `Record` outputs split by replication and optional time/value columns.
- `Fitter_if`: fitting contract for distribution parameter inference from sample data.
- `HypothesisTester_if`: parametric inference API (confidence intervals and tests).
- `ProbabilityDistributionBase` / `ProbabilityDistribution`: static math façade for PDF/↩ PMF and inverse/quantile routines.
- `Solver_if`: legacy numerical contract mixing integration and derivation/advancement.
- `TraitsTools`: traits registry binding abstractions to concrete implementations.

10.3 3. Current limitations

- Fitting baseline was expanded in FITTER-2: `FitterDefaultImpl` now also provides functional Beta (scaled) and Weibull fitting, still preserving controlled-failure behavior when constraints are not met.
- `FitterDummyImpl` is preserved as a legacy placeholder/documental implementation, but it is no longer the default trait binding after FITTER-3.
- Some hypothesis-testing paths, especially two-population paths, remain partially consolidated.
- Distribution APIs are static utilities, not yet an OO hierarchy with reusable distribution objects.
- Solver abstraction conflates quadrature and ODE-like concerns.

10.4 4. Planned evolution

- Introduce cohesive interfaces for dataset, distributions, quadrature, root finding, and ODE solving.
- Continue hardening `FitterDefaultImpl` as the promoted default fitting implementation.
- Evolve traits coverage to include newly stabilized abstractions.
- Keep legacy interfaces during migration to avoid behavior breaks.

10.5 5. Relationship with kernel/statistics

source/tools consumes kernel/statistics contracts (collectors, samplers and data files) but this phase does not modify kernel or statistics code. The package remains a consumer and adapter layer over those existing contracts.

10.6 6. AI Assistant abstraction

source/tools includes an AI-assisted simulation model-building tool across four completed stages:

- AIAssistant_if: interface defining configuration, security, knowledge base, provider client injection, workflow and diagnostics contracts.
- AIAssistantDefaultImpl: concrete implementation covering all six complete stages:
  - Full configuration management and secure API key handling.
  - Knowledge base: static catalog of 15 well-known components plus dynamic plugin introspection.
  - createAndAttachProviderClient() factory for owned provider clients.
  - analyzePrompt() / createModelPlan() — LLM-backed prompt analysis and plan generation.
  - buildModel() — LLM generates a .gen file, loaded via SimulatorFacade::loadModel().
  - configureSimulation() — LLM extracts simulation parameters; applies via simSet*().
  - runSimulation() — calls SimulatorFacade::simStart() (synchronous).
  - collectResults() — formats modelGetResponses() as a Markdown results table.
  - execute() — orchestrates the full pipeline with plan propagation between steps.
- AIProviderClient_if: interface for a single HTTP chat-completion call.
- HttpProviderClientBase: abstract base with popen+curl transport; API key stored in 0600 temp file, never on command line.
- OpenAIProviderClientImpl: OpenAI chat completions with o-series reasoning support.
- AnthropicProviderClientImpl: Anthropic Messages API with extended-thinking support.
- LocalProviderClientImpl: Ollama/LM Studio/llama.cpp — no API key required.
- TraitsTools<AIAssistant_if>: binds the abstraction to AIAssistantDefaultImpl.

See source/tools/ARCHITECTURE_tools.md for the full 8-stage roadmap.

10.7 7. Current status by topic

- **Fitting**: interface defined; FitterDefaultImpl is functional for uniform/triangular/normal/exponential/erlang/beta/weibull with binary dataset loading and SSE-CDF comparison and is now the default TraitsTools<Fitter_if> binding (FITTER-3). FitterDummyImpl remains available as legacy placeholder.
- **Hypothesis testing**: functional baseline exists in HypothesisTesterDefaultImpl1, with known partial areas.
  - HYPTEST-1 alignment update: proportion-difference CI now follows the classical two-proportion formula, and one-population average/variance tests now compute p-values with Student-t/chi-square-coherent CDF paths.
  - HYPTEST-2 final alignment update: one-population proportion confidence intervals (with and without finite-population correction) now use the large-sample normal quantile formulation.
- **Simulation result datasets**: SimulationResultsDatasetParser reads text datasets and Genesys Record files, preserving replication ids and optional time columns so GUI analysis can expose pooled and per-replication scopes.
- **Probability distributions**: mathematical static base and inverse façade available, with internal numeric dependencies.
- **Numerical solvers**: legacy Solver_if + SolverDefaultImpl1 remain the compatible baseline.

Chapter 11

Todo List

Member AIAssistant_if::refreshKnowledgeBaseFromSimulator (std::string *message=nullptr)=0

(Stage 2): Implement full plugin introspection via SimulatorFacade.

Class AIAssistantDefaultImpl

annotations.

Class GraphicalConnection

Evaluate decoupling model metadata from this item to keep this class purely visual.

Member GraphicalConnection::GraphicalConnection (GraphicalComponentPort *sourceGraphicalPort, GraphicalComponentPort *destinationGraphicalPort, unsigned int portSourceConnection=0, unsigned int portDestinationConnection=0, QColor color=Qt::black, QGraphicsItem *parent=nullptr)

Extrair para método dedicado `_bindPorts()` para legibilidade.

Member ModelGraphicsScene::notifyGraphicalModelChange (GraphicalModelEvent::EventType eventType, GraphicalModelEvent::EventObjectType eventObjectType, QGraphicsItem *item)

Consider broadcasting to all attached views when multi-view editing is supported.

Member ModelGraphicsView::notifySceneGraphicalModelEventHandler (const GraphicalModelEvent &modelGraphicsEvent)

Replace callback with signal/slot to improve composability.

actualize property editor?

Member SimulationController::ensureReady (bool checkModel, bool modelChecked, const std::function< bool()> &runModelCheck, const std::function< bool()> &syncModelFromText) const

Replace callback-based contract by dedicated interfaces to improve testability.

Chapter 12

Namespace Index

12.1 Namespace List

Here is a list of all documented namespaces with brief descriptions:

EFSMNetworkDiagramCodec
: Encodes/decodes the "Graphical EFSM Network Diagrams" `.gui` overlay section 105

generate_kernel_simulator_test_stubs 105

genesys_mcp 106

genesys_mcp.__main__ 106

genesys_mcp.client 106

genesys_mcp.server 106

GuiCrashDiagnostics
: Crash diagnostics helpers for the Qt GUI process 111

QCP 111

Chapter 13

Hierarchical Index

13.1 Class Hierarchy

This inheritance list is sorted roughly, but not completely, alphabetically:

AIAssistant_if . . . 131
  AIAssistantDefaultImpl . . . 143
AIAssistantConfiguration . . . 142
AIAssistantRequest . . . 155
AIAssistantResponse . . . 156
AIAuditLog . . . 157
AIConversationConfiguration . . . 158
AIConversationResponse . . . 158
AIConversationService . . . 159
AIProviderClient_if . . . 159
  HttpProviderClientBase . . . 878
    AnthropicProviderClientImpl . . . 199
    LocalProviderClientImpl . . . 928
    OpenAIProviderClientImpl . . . 1168
AISecretStore . . . 166
AnimationQueue . . . 190

Chapter 14

Class Index

14.1 Class List

Here are the classes, structs, unions and interfaces with brief descriptions:

Access . . . 117
AddUndoCommand . . . 124
AIAssistant . . . 125
AIAssistant_if
    Abstract interface for the GenESyS AI Assistant tool . . . 131
AIAssistantConfiguration
    Full configuration record for the AI assistant . . . 142
AIAssistantDefaultImpl
    Initial concrete scaffold for the GenESyS AI Assistant . . . 143
AIAssistantRequest
    Input to a single AI assistant request . . . 155
AIAssistantResponse
    Output produced by a single AI assistant operation . . . 156
AIAssistantWindow . . . 156
AIAuditLog
    Append-only audit log for AI assistant operations . . . 157
AIConversationConfiguration . . . 158
AIConversationResponse . . . 158
AIConversationService . . . 159
AIProviderClient_if
    Abstract interface for AI provider HTTP clients . . . 159
Airport_Extended1 . . . 161
AirportSecurityExample . . . 163
AirportSecurityExampleExtended . . . 165
AISecretStore
    Static helper for storing API keys in the OS keyring . . . 166
AISupport . . . 168
AND . . . 173
AnElectronicAssemblyAndTestSystem . . . 179
AnimationAttribute . . . 181
AnimationCounter . . . 182
AnimationEntity . . . 183
AnimationEvent . . . 185
AnimationExpression . . . 186
AnimationPlaceholder . . . 187
AnimationPlot . . . 188
AnimationQueue . . . 190
AnimationQueueDisplay . . . 190
AnimationResource . . . 192
AnimationStation . . . 193

AnimationStatistics . . . 194
AnimationTimer . . . 195
AnimationTransition . . . 196
AnimationVariable . . . 198
AnthropicProviderClientImpl
AI provider client for the Anthropic Messages API . . . 199
ApiRouter
Routes HTTP requests to Web API operations . . . 203
Assembly_Line . . . 204
testing::internal::AssertHelper . . . 205
Assign
Component that evaluates one or more (destination, expression) pairs and writes each result into an Attribute or a Variable on the entity/model . . . 205
Assignment
One (destination, expression) pair used by Assign and by Sequence's per-step assignments . 212
Attribute
Data definition declaring one named, per-entity attribute (its dimensionality and sparse initial values), shared across every entity created in the model . . . 212
AuditEntry
One entry in the AI assistant audit log . . . 218
BacteriaColony
First GenESyS component for Gro-inspired bacteria colony simulation . . . 219
BacteriaColonyViewerGuiExtensionPlugin . . . 227
BacteriaSignalGrid
Reusable discrete signal-field definition for bacteria colonies . . . 229
BacteriaColony::BacteriumState . . . 233
Banking_Transactions . . . 234
BacteriaColony::BarrierSegment . . . 236
BaseGenesysTerminalApplication . . . 236
BaseGenesysWebApplication
Entry point for the standalone Worker application flavor of Genesys . . . 238
BaseMVController
Compatibility base class that binds the Qt UI and the simulator model . . . 239
yy::genesyspp_parser::basic_symbol< Base > . . . 240
Batch
Accumulates entities in an internal queue until a batch is complete, then dispatches one representative entity for the group . . . 242
testing::internal::TemplateSel< Tmpl >::Bind< T > . . . 249
ModalModelBindingsUndoCommand::Bindings . . . 249
BioCompartment
Defines a biological compartment for biochemical and whole-cell models . . . 249
BioKineticLawExpression . . . 254
BioNetwork . . . 255
BioNetworkAwareGuiExtensionPlugin . . . 260
BioNetworkEditorGuiExtensionPlugin . . . 262
BioNetworkExecutionGuiExtensionPlugin . . . 263
BioParameter . . . 264
BioParameterManagerGuiExtensionPlugin . . . 269
BioParameterSensitivityEntry . . . 271
BioReaction . . . 271
BioReactionKineticsGuiExtensionPlugin . . . 282
BioReactionRateSample . . . 283
BioReactionRateTimeCourse . . . 283
BioReactionStoichiometryGuiExtensionPlugin . . . 284
BioRunnerCommand
Component wrapper over BioSimulatorRunner command execution . . . 285
BioSBMLBridge . . . 291
BioSBMLExportResult . . . 291

BioSBMLImportResult . . . 292
BioSBMLInteroperabilityGuiExtensionPlugin . . . 292
BioSensitivityScan . . . 293
BioSimulate
Component that triggers deterministic BioNetwork simulation . . . 293
BioSimulationAnalysis . . . 300
BioSimulationResult . . . 300
BioSimulationResultsGuiExtensionPlugin . . . 301
BioSimulationSample . . . 302
BioSimulationSpeciesAmount . . . 302
BioSimulatorRunner . . . 303
BioSpecies . . . 308
BioSpeciesDerivative . . . 312
BioSpeciesManagerGuiExtensionPlugin . . . 313
BioStateProjectionComponent
Projects selected BioSpecies values into a WholeCellState . . . 314
BioSteadyState
Component that checks steady-state diagnostics over BioNetwork results . . . 320
BioSteadyStateCheck . . . 327
BioStoichiometryMatrix . . . 327
Book_Cap02_Example01 . . . 327
Boundary_Closed . . . 329
Boundary_Fixed . . . 330
BoundaryCondition . . . 332
Buffer . . . 333
BufferFIFO . . . 340
yy::genesyspp_parser::by_kind
Type access provider for token (enum) based symbols . . . 341
QCPAxisPainterPrivate::CachedLabel . . . 343
QCPLabelPainterPrivate::CachedLabel . . . 343
ModelLifecycleController::Callbacks . . . 343
SimulationEventController::Callbacks . . . 344
Capacitor . . . 344
testing::internal::CartesianProductGenerator< T > . . . 350
testing::internal::CartesianProductHolder< Gen > . . . 351
Cell . . . 352
CellCycleCheckpointComponent
Evaluates lifecycle checkpoints and advances whole-cell step time . . . 353
CellDivisionEvent . . . 360
CellFateDecisionComponent
Routes entities according to the current whole-cell lifecycle state . . . 367
CellGrowthComponent . . . 373
CellularAutomata . . . 380
CellularAutomata_1DTimed
Complete uniform CA specific for unidimensional lattices where 2nd dimension is time (usefull for elementary CA) . . . 381
CellularAutomata_Classic
Complete uniform CA . . . 382
CellularAutomataBase . . . 384
CellularAutomataComp . . . 386
CellularAutomataDemoBuilder . . . 392
CellularAutomataDemoModel . . . 393
CellularAutomataDemoSettings . . . 393
CellularAutomataEvent . . . 394
CellularAutomataGuiExtensionPlugin . . . 395
CellularAutomataLatticeWidget . . . 396
CellularAutomataStateColorMap . . . 397
CellularAutomataViewerController . . . 397

CellularAutomataViewerWindow . . . 399
ChatMessage
One message in a multi-turn conversation with an LLM . . . 399
Clone
Creates _numClonesExpression copies of the incoming entity (same EntityType and Attribute values), sending clones out port 1 and the original out port 0 . . . 400
CodeEditor . . . 406
testing::internal::CodeLocation . . . 407
Collector_if
Interface responsible for collecting observations of a stochastic variable . . . 407
CollectorDatafile_if
Collector interface specialized in file-backed value storage . . . 410
CollectorDatafileDefaultImpl1
Default file-backed implementation of CollectorDatafile_if . . . 412
CollectorDefaultImpl1
Default in-memory implementation of Collector_if . . . 415
GroProgramRuntime::ColonyMutation . . . 417
ColoredPetriNetNetwork
Pragmatic fixed-inscription Colored Petri Net subset . . . 417
ComboBoxEnum . . . 424
GroProgramIr::Command . . . 424
Util::CommandResult . . . 425
CompartmentExchangeComponent
Moves metabolite proxies between whole-cell regions . . . 425
CppCompiler::CompilationResult . . . 432
CompilerThread . . . 433
ComponentItem . . . 433
CompositeState . . . 434
CompositeStateSet . . . 435
HypothesisTester_if::ConfidenceInterval
Confidence interval [inferior, superior] and its half-width e0 . . . 437
Connection . . . 437
ConnectionChannel
Defines an input or output port that connects a ModelComponent to another . . . 438
ConnectionManager
Maintains outgoing connections from a component to downstream components . . . 438
testing::internal::ConstCharPtr . . . 443
Optimizer_if::ConstraintDefinition
Feasibility restriction represented as an expression . . . 443
testing::internal::ConstRef< T > . . . 443
testing::internal::ConstRef< T & > . . . 443
testing::internal::ContainerPrinter . . . 444
yy::genesyspp_parser::context . . . 444
ContinuousDistribution_if
Interface for continuous distributions . . . 444
ContinuousModel . . . 446
ContinuousSystemComponent
Component that advances a continuous ODE system when entities arrive . . . 447
testing::internal::ConvertibleToIntegerPrinter . . . 454
testing::internal::ConvertibleToStringViewPrinter . . . 454
Conveyor
Minimal conveyor data definition built on top of one Segment path . . . 454
CoreGuiExtensionPlugin . . . 459
Counter
Model datum used to accumulate event counts (or weighted counts) . . . 461
CountingSampler . . . 466
CPNArc
Directed bipartite arc used by ColoredPetriNetNetwork . . . 471

CPNTransition
Transition node used by ColoredPetriNetNetwork . . . 476
CppCompiler . . . 482
CppForG . . . 487
CppModelExporter
Service responsible for C++ code representation of the current simulation model . . . 493
CppSerializer . . . 494
Create
Source component that generates entities and starts them into the model, driven by a parsed inter-arrival expression, a Schedule, or a Formula . . . 497
SimulatorSessionService::CreateSessionResult
Contains session creation identifiers returned to API clients . . . 504
QtBoolPropertyManagerPrivate::Data . . . 505
QtDatePropertyManagerPrivate::Data . . . 505
QtDateTimePropertyManagerPrivate::Data . . . 505
QtDoublePropertyManagerPrivate::Data . . . 505
QtEnumPropertyManagerPrivate::Data . . . 506
QtFlagPropertyManagerPrivate::Data . . . 506
QtIntPropertyManagerPrivate::Data . . . 506
QtPointFPropertyManagerPrivate::Data . . . 507
QtRectFPropertyManagerPrivate::Data . . . 507
QtRectPropertyManagerPrivate::Data . . . 507
QtSizeFPropertyManagerPrivate::Data . . . 507
QtSizePropertyManagerPrivate::Data . . . 507
QtStringPropertyManagerPrivate::Data . . . 508
QtTimePropertyManagerPrivate::Data . . . 508
DataAnalyser_if
High-level façade for applied statistical analysis over datasets . . . 508
DataAnalyzerWindow . . . 509
DataComponentEditor . . . 510
DataComponentProperty . . . 511
DataDefinitionItem . . . 512
DataDefinitionRelationItem . . . 512
ModelInspectorController::DataDefinitionSelection . . . 513
AnimationPlot::DataSeries . . . 513
DataSet_if
Abstract view of a numeric dataset . . . 514
Decide
Routes an entity to the first output port whose parser expression evaluates truthy, or to a trailing "else" port when none do . . . 514
Delay::DEFAULT_VALUES . . . 520
ModalModelDefault::DEFAULT_VALUES . . . 520
Seize::DEFAULT_VALUES . . . 521
SourceModelComponent::DEFAULT_VALUES . . . 521
testing::internal::DefaultGlobalTestPartResultReporter . . . 521
SamplerDefaultImpl1::DefaultImpl1RNG_Parameters
Parameter bundle for the default RNG algorithm . . . 522
testing::internal::DefaultNameGenerator . . . 523
DefaultNetwork
Base class for a formalism-agnostic network model of computation (EFSM, DTMC, Coloured Petri Net, ...) that may be shared by several `ModalModel` process adapters . . . 523
DefaultNode . . . 529
DefaultNodeTransition . . . 535
testing::internal::DefaultPerThreadTestPartResultReporter . . . 536
Delay
Holds an entity in place for an evaluated expression's worth of time, crediting that time to one of five allocation categories . . . 536
DelayProbe . . . 543

DeleteUndoCommand . . . 548
dialogBreakpoint . . . 549
DialogFind . . . 550
DialogModelInformation . . . 551
DialogPluginManager . . . 552
DialogReportIssue
Modal form used to collect a user-facing issue report before relay submission . . . 553
DialogSelectCounter . . . 555
DialogSelectVariable . . . 556
DialogSimulationConfigure . . . 557
DialogSystemPreferences . . . 558
DialogTimerConfigure . . . 559
DialogUtilityController
Controller that orchestrates auxiliary dialogs and utility actions . . . 559
DiffEquations . . . 561
DiffusionField . . . 568
DiffusionMethodOfLinesSystem . . . 573
DiffusionSimulate
Component that triggers a DiffusionField solve when entities arrive . . . 575
Diode . . . 582
DirectedAcyclicGraphNetwork
Directed graph specialization that enforces the DAG invariant . . . 588
DirectedGraphNetwork
Directed mathematical graph specialization . . . 594
DiscreteDistribution_if
Interface for discrete distributions . . . 602
genesys::launcher::DispatchController . . . 603
Dispose
Sink component that ends an entity's life in the model, optionally recording its total time in system before removing it . . . 603
Distance
Data definition holding a set of direct station-to-station distances, used by free-path (non-guided) `Transporter` units to compute travel time . . . 610
DistanceEntry
One directed (from-station, to-station, length) entry of a Distance set, used to look up a free-path Transporter's travel length between two stations . . . 615
Distribution_if
Base abstraction for a theoretical probability distribution . . . 615
DataAnalyzerWindow::DoePreviewPlot . . . 616
DormandPrince54OdeSolver . . . 617
testing::internal::DoubleSequence< plus_one, T, sizeofT > . . . 618
testing::internal::DoubleSequence< false, IndexSequence< I... >, sizeofT > . . . 618
testing::internal::DoubleSequence< true, IndexSequence< I... >, sizeofT > . . . 619
genesys::launcher::DownloadResult . . . 619
DrawingItem . . . 619
DropOff
Placeholder for releasing a subset of a batched group's members . . . 619
DummyComponent . . . 625
DummyElement . . . 631
EditCommandController
Controller for edit/clipboard/grouping command orchestration in the scene . . . 636
EditorFactoryPrivate< Editor > . . . 637
EFSMInitialStateUndoCommand . . . 637
EFSMNetwork
Extended finite-state-machine network specialization . . . 638
EFSMNetworkDiagramLayout
GUI-only presentation layout for one EFSMNetwork diagram . . . 644
EFSMStateMembershipUndoCommand . . . 645

EFSMStatePropertiesUndoCommand . . . 646
EFSMTransition . . . 647
EFSMTransitionGraphicsItem
Read-only graphical projection of one mathematical EFSM transition . . . 649
EFSMTransitionPropertiesUndoCommand . . . 650
EFSMTransitionUndoCommand . . . 651
testing::internal::ElemFromList< N, T > . . . 652
testing::internal::ElemFromListImpl< typename > . . . 652
testing::internal::ElemFromListImpl< IndexSequence< I... > > . . . 652
testing::EmptyTestEventListener . . . 653
Enter . . . 655
Entity
Runtime entity (token) flowing through the model during simulation . . . 662
EntityGroup . . . 669
EntityType
Data definition describing one class of entity that Create-family components may instantiate at simulation time . . . 674
PersistenceRecord::Entry
"Raw" entry, users should treat this as an opaque type since payloads could be in any format . 679
testing::Environment . . . 680
EukaryoticCellCycleComponent
Coordinates a didactic eukaryotic cell cycle over a shared WholeCellState . . . 680
Event . . . 688
Exact . . . 689
Example_BasicOrderShipping . . . 690
Example_PortModel . . . 692
Example_PublicTransport . . . 694
CompartmentExchangeComponent::ExchangeRule . . . 695
GroProgramRuntime::ExecutionResult . . . 696
Exit . . . 696
ExperimentManager
Manages higher-level simulation experiments . . . 702
ExperimentManager_if
Interface that coordinates execution of scenario-based simulation experiments . . . 703
ExperimentManagerDefaultImpl1 . . . 704
ExpressionBuilder . . . 706
ExpressionCategory . . . 707
ExpressionParameter . . . 707
ExpressionTemplate . . . 707
genesys::launcher::ExtractionResult . . . 707
FactorialDesign . . . 707
Failure
Data definition describing a resource breakdown pattern (whole resource failure regardless of capacity) attached to one or more Resource instances . . . 710
FakeModelPersistence . . . 716
FakeModelPersistenceB . . . 718
FakeSystemCommandExecutor . . . 720
testing::internal::FallbackPrinter . . . 721
File
Data definition identifying an external file and its access mode (read/write/append/read-write), used by file-driven components and data definitions . . . 721
testing::internal::FindFirstPrinter< T, E, Printer, Printers > . . . 727
testing::internal::FindFirstPrinter< T, decltype(Printer::PrintValue(std::declval< const T & >(), nullptr)), Printer, Printers... > 727
FindLineEdit . . . 727
Fitter_if
Interface for fitting theoretical distributions to real datasets . . . 728

FitterDefaultImpl
Functional implementation of Fitter_if consolidated through FITTER-2 . . . 730
FitterDummyImpl
Placeholder implementation of Fitter_if . . . 732
testing::internal::FlatTuple< T > . . . 735
testing::internal::FlatTupleBase< Derived, Idx > . . . 736
testing::internal::FlatTupleBase< FlatTuple< T... >, IndexSequence< Idx... > > . . . 736
testing::internal::FlatTupleConstructTag . . . 737
testing::internal::FlatTupleElemBase< Derived, I > . . . 737
testing::internal::FlatTupleElemBase< FlatTuple< T... >, I > . . . 738
testing::internal::FloatingPoint< RawType > . . . 738
testing::internal::FormatForComparison< ToPrint, OtherOperand > . . . 739
testing::internal::FormatForComparison< ToPrint[N], OtherOperand > . . . 739
Formula
Data definition holding one or more named parser expressions, optionally indexed to represent a 1D/2D array of expressions . . . 740
FSMState . . . 747
FtsZPolymerizationComponent . . . 752
FullSimulationOfComplexModel . . . 759
testing::internal::FunctionPointerPrinter . . . 760
ParserManager::GenerateNewParserResult
Result bundle for parser generation requests . . . 760
testing::internal::GenerateTypeList< T > . . . 761
GenesysApplication_if . . . 762
genesys_mcp.client.GenesysClient . . . 763
genesys_mcp.client.GenesysClientError . . . 764
GenesysKnowledgeBaseSummary
Aggregate summary of the current knowledge base state . . . 765
GenesysKnowledgeItem
One entry in the GenESyS knowledge base used to inform the AI assistant . . . 765
genesyspp_driver . . . 766
yy::genesyspp_parser
A Bison parser . . . 767
GenesysPropertyDescriptor . . . 771
GenesysPropertyIntrospection . . . 772
GenesysShell . . . 772
GenesysShell_if . . . 774
GeneticCircuit . . . 775
GeneticCircuitGuiExtensionPlugin . . . 780
GeneticCircuitPart . . . 782
GeneticCircuitSimulate . . . 786
GeneticCircuitSimulationSummary . . . 793
GeneticExpressionStep . . . 793
GeneticRegulation . . . 799
GenSerializer . . . 804
genesys::launcher::GpgvSignatureVerifier . . . 807
GraphEdge
Mathematical graph edge between two GraphNode endpoints . . . 808
GraphicalAnimateExpression . . . 814
GraphicalAssociation . . . 814
GraphicalAutomaticPositioningStrategy . . . 814
GraphicalAutomaticPositioningStrategyFactory
Factory for the automatic positioning strategy selected from GUI preferences . . . 815
GraphicalComponentPort . . . 816
GraphicalConnection
Graphical edge that represents model-level component connections . . . 817
GraphicalConnectionStyle . . . 820

GraphicalContextMenuController
Builds context menus for the graphical model view using existing main-window actions 820
GraphicalDataDefinitionLayout
Pure helper that computes arc placement for graphical data definitions 821
GraphicalDiagramConnection 822
GraphicalImageAnimation 823
GraphicalModelBuilder
Service that reconstructs graphical components/connections from kernel model data 823
GraphicalModelComponent
Visual component item that extends a data definition with ports and internal data 825
GraphicalModelDataDefinition
Visual representation of a model data definition in the scene 830
GraphicalModelEvent
Lightweight event envelope used to notify GUI changes in the graphics scene 832
GraphicalModelItemRenderContext 833
GraphicalModelItemRenderer 834
GraphicalModelItemRenderStrategy 834
GraphicalModelSerializer
Persistence service for saving/loading graphical and textual model representations 834
GraphNetwork
Mathematical graph specialization of DefaultNetwork 836
GraphNode
Mathematical graph vertex used by GraphNetwork 843
GraphPathResult
Explicit graph path result 848
GraphSearchTreeEntry 848
GraphTopologicalOrderResult 849
GraphTraversalResult
Result of a deterministic graph traversal 849
GraphvizModelExporter
Service that builds DOT content and renders model images for the GUI 849
ModelGraphicsScene::GRID 851
GroProgram
Reusable Gro source program attached to a GenESyS model 851
GroProgramAst
Minimal parsed representation of a Gro source program 856
GroProgramCompiler
Converts parsed Gro AST into the first non-executable semantic IR 857
GroProgramIr
Initial semantic representation compiled from GroProgramAst 857
GroProgramParser
Plugin-side parser boundary for reusable Gro source programs 858
GroProgramRuntime
Executes the supported Gro IR commands without simulator binding 858
GroProgramRuntimeState
Mutable state used by the plugin-side Gro runtime helper 859
GroupItem 859
GroupUndoCommand 860
testing::internal::GTestFlagSaver 860
testing::internal::GTestLog 860
testing::internal::GTestMutexLock 861
GuiActionContribution 861
GuiDockContribution 861
GuiExtensionConfigurationDialog 862
GuiExtensionConfigurationGuiExtensionPlugin 863
GuiExtensionManager 864
GuiExtensionPlugin 865
GuiExtensionPluginAutoRegistrar 866

GuiExtensionPluginCatalog . . . 866
GuiExtensionPresentationMetadata . . . 866
GuiExtensionRegistry . . . 866
GuiExtensionRuntimeContext . . . 867
GuiScopeTrace
Emits a scoped trace entry for a GUI method and measures its runtime . . . 867
GuiThemeManager
Applies the visual theme used by the Qt application and model views . . . 869
GuiWindowContribution . . . 870
Half_Adder . . . 870
HarmonicOscillator . . . 872
testing::internal::HasDebugStringAndShortDebugString< T > . . . 873
DataAnalyzerWindow::HistogramPreview . . . 873
HppLatticeGasState . . . 874
HppLatticeGasStateSet . . . 876
HttpProviderClientBase
Abstract base class for HTTP-based AI provider clients . . . 878
HttpRequest
Lightweight representation of one parsed HTTP request . . . 882
HttpResponse
Minimal HTTP response payload produced by the web API router . . . 883
HypothesisTester_if
Interface for classical parametric inference . . . 884
HypothesisTesterDefaultImpl1
Current default implementation of HypothesisTester_if . . . 885
genesys::launcher::IArchiveExtractor . . . 892
testing::internal::Ignore< size_t > . . . 892
testing::internal::IgnoredValue . . . 892
testing::internal::IndexSequence< Is > . . . 892
genesys::launcher::INetworkTransport . . . 893
IntegerStateSet . . . 893
InternalEvent . . . 895
genesys::launcher::IProcessLauncher . . . 897
testing::internal::is_proxy_type_list< typename > . . . 897
testing::internal::is_proxy_type_list< ProxyTypeList< Ts... > > . . . 898
testing::internal::IsHashTable< T > . . . 899
genesys::launcher::ISignatureVerifier . . . 899
testing::internal::IsRecursiveContainer< C > . . . 900
testing::internal::IsRecursiveContainerImpl< C, bool > . . . 900
testing::internal::IsRecursiveContainerImpl< C, false > . . . 901
testing::internal::IsRecursiveContainerImpl< C, true > . . . 901
IssueReportDraft
User-authored issue report collected by the GUI form before transport . . . 902
IssueReportRelayService
HTTPS client service that sends issue reports to a secure relay endpoint . . . 902
IssueReportRuntimeContext
Runtime diagnostics captured by the GUI after the user approves submission . . . 903
IssueReportSubmissionResult
Relay submission outcome returned to the controller layer . . . 903
genesys::launcher::IUpdateUi . . . 904
Json . . . 904
JsonSerializer . . . 905
KernelAccessorProbe . . . 907
Label . . . 908
QCPLabelPainterPrivate::LabelData . . . 912
Lattice
N-dimensional lattice . . . 913
genesys::launcher::LauncherConfig . . . 914

genesys::launcher::LauncherController . . . 914
genesys::launcher::LauncherLogger . . . 915
genesys::launcher::LauncherUpdateResult . . . 915
Leave . . . 915
LicenceManager . . . 922
LineNumberArea . . . 923
List< T >
Lightweight wrapper around `std::list` with convenience helpers used by the kernel . . . 923
ListObservable< T >
Observable-oriented list variant used by kernel structures . . . 925
LocalProviderClientImpl
AI provider client for local model servers (Ollama, LM Studio, etc.) . . . 928
LocalRule . . . 932
LocalRule_CopyCurrentState . . . 934
LocalRule_Elementary . . . 935
LocalRule_FlorestalFire . . . 936
LocalRule_GameOfLife . . . 938
LocalRule_Growty . . . 939
LocalRule_HppLatticeGas . . . 940
LocalRule_SandRock_Student . . . 942
LocalRule_ShowNeighbordhood . . . 943
yy::location
Two points in a source file . . . 944
Loja01 . . . 946
testing::internal::internal_stream_operator_without_lexical_name_lookup::LookupBlocker . . . 947
LSODE . . . 947
LSODEInitialState . . . 954
LSODESample . . . 954
MainWindow
Main Qt window that composes controllers/services and preserves legacy GUI entry points . . . 954
testing::internal::MakeIndexSequenceImpl< N > . . . 956
testing::internal::MakeIndexSequenceImpl< 0 > . . . 957
genesys::launcher::ManifestParseResult . . . 958
testing::internal::MarkAsIgnored . . . 959
MarkovChain . . . 959
MarkovChainNetwork
Finite time-homogeneous Discrete-Time Markov Chain network . . . 965
MarkovState
State node used by MarkovChainNetwork DTMC models . . . 972
MarkovChainNetwork::MarkovTransition . . . 977
MassActionOdeSystem
ODE system generated from biochemical reactions using mass-action kinetics . . . 977
Match
Brings together one entity from each of several input queues, optionally requiring a matching attribute value, and releases them in sync . . . 978
testing::Message . . . 985
MetabolicFluxBalance . . . 985
MetabolicFluxBalanceSolver . . . 991
MetabolicNetwork . . . 992
MetabolicReaction . . . 997
MetabolicStateProjectionComponent
Projects flux-balance outputs into a WholeCellState . . . 1002
MetabolicSubmodelComponent . . . 1009
generate_kernel_simulator_test_stubs.MethodEntry . . . 1015
ModalModelBindingsUndoCommand . . . 1016
ModalModelDefault . . . 1016
Model . . . 1023
ModelChecker_if . . . 1031

ModelCheckerDefaultImpl1 . . . 1033
ModelComponent . . . 1035
ModelComponentManager
Owns and organizes the set of `ModelComponent` objects in a model . . . 1044
ModelDataDefinition . . . 1048
ModelDataDefinitionAssociations . . . 1060
ModelDataManager
Central registry for `ModelDataDefinition` instances owned by a model . . . 1061
ModelEvent . . . 1067
ModelGraphicsScene
Scene that owns and manipulates the graphical representation of a model . . . 1067
ModelGraphicsView . . . 1076
SimulatorSessionService::ModelImportResult
Contains model import output and error state . . . 1079
ModelInfo . . . 1080
SimulatorSessionService::ModelInfoResult
Describes the currently active model information for a session . . . 1083
ModelInspectorController
Controller for model inspection views and scene-selection synchronization . . . 1083
ModelLanguageSynchronizer
Service layer that synchronizes textual model language with kernel model state . . . 1084
ModelLifecycleController
Controller for model/application lifecycle flows delegated from MainWindow . . . 1085
ModelManager
The ModelManager class . . . 1086
SimulatorSessionService::ModelPersistenceResult
Contains save/load model operation output and error state . . . 1092
ModelPluginInspectorGuiExtensionPlugin . . . 1092
ModelSimulation
Controls the mature, currently functional simulation-execution layer of a model . . . 1094
MolecularSpecies . . . 1095
GroProgramRuntime::MotionMutation . . . 1100
Move
Minimal transporter movement component . . . 1101
MoveUndoCommand . . . 1107
testing::internal::Mutex . . . 1108
dialogBreakpoint::MVCResult . . . 1108
GroProgramAst::NamedProgram . . . 1108
GroProgramIr::NamedProgramDefinition . . . 1108
testing::internal::NameGeneratorSelector< Provided > . . . 1108
NAND . . . 1109
testing::internal::NativeArray< Element > . . . 1115
NaturalStateSet . . . 1115
Neighborhood
Defines the complete neighborhood of a cell . . . 1117
Neighborhood_Center . . . 1118
Neighborhood_Moore . . . 1120
Neighborhood_VonNeumann . . . 1122
NetworkActivationFrame
Input side of one `DefaultNetwork::activate()` call: the presence and value of every declared input port for this activation only . . . 1123
NetworkActivationResult
Output side of one `DefaultNetwork::activate()` call: the presence and value of every declared output port produced by that activation . . . 1124
NetworkPortValue
Presence/value pair carried by one network port during one activation . . . 1124
genesys::launcher::NetworkRequestOptions . . . 1125
genesys::launcher::NetworkResponse . . . 1125

ParserManager::NewParser
Paths associated with a generated parser artifact set . . . 1125
NMOS . . . 1126
testing::internal::None . . . 1132
NOR . . . 1132
NOT . . . 1139
obj_t . . . 1145
Optimizer_if::ObjectiveDefinition
Configurable objective definition . . . 1145
ObjectPropertyBrowser . . . 1146
OctaveRunner
Model data definition that executes Octave code through Rscript . . . 1149
ODEfunction . . . 1154
ODESolver . . . 1155
OdeSolver_if
ODE solver abstraction . . . 1160
OdeSolverFactory . . . 1161
OdeSystem_if
Interface for first-order ODE systems dy/dt = f(t, y) . . . 1161
OLD_ODEelement . . . 1162
OnEventManager . . . 1166
OpenAIProviderClientImpl
AI provider client for the OpenAI Chat Completions API . . . 1168
OperatingSystem02 . . . 1172
OperatingSystem03 . . . 1173
Optimizer_if::OptimizationSettings
Generic optimization settings independent of a specific algorithm . . . 1175
Optimizer_if
Interface for simulation-based optimization engines (OptQuest-like) . . . 1175
OptimizerDefaultImpl1
Initial concrete scaffold for an OptQuest-like optimizer . . . 1181
OptimizerWindow . . . 1188
OR . . . 1189
testing::internal::OsStackTraceGetter . . . 1195
testing::internal::OsStackTraceGetterInterface . . . 1196
testing::internal::ParameterizedTestFactory< TestClass > . . . 1197
testing::internal::ParameterizedTestSuiteInfo< TestSuite > . . . 1198
testing::internal::ParameterizedTestSuiteInfoBase . . . 1199
testing::internal::ParameterizedTestSuiteRegistry . . . 1200
testing::internal::ParamGenerator< T > . . . 1200
testing::internal::ParamGeneratorInterface< T > . . . 1201
testing::internal::ParamIterator< T > . . . 1201
testing::internal::ParamIteratorInterface< T > . . . 1202
Parser_if
Interface for evaluating model expressions and stochastic functions . . . 1202
ParserAttributeEventInjector . . . 1204
ParserAttributeInternalEventOwner . . . 1205
ParserAttributeProcessObserver . . . 1210
ParserChangesInformation . . . 1210
ParserDefaultImpl1 . . . 1211
ParserDefaultImpl2 . . . 1213
ParserExpressionsTest . . . 1216
ParserManager . . . 1217
PasteUndoCommand . . . 1218
PathwayStressResponseComponent
Applies sustained pathway-collapse responses to a whole-cell state . . . 1219
Persistence_if
Interface for model serialization/deserialization services . . . 1225

PersistenceDefaultImpl2 . . . 1228
PersistencePartialLoadImpl1 . . . 1230
PersistenceRecord
Serialization/Deserialization structure which behaves like an associative array . . . 1231
PersistentObject_base
Dynamic serializable interface . . . 1233
PetriPlace . . . 1235
PickableStationItem . . . 1240
PickStation . . . 1241
PickUp
Removes a consecutive run of entities from a queue, appending them to the incoming entity's group . . . 1247
genesys::launcher::PlatformInfo . . . 1253
Plugin . . . 1253
PluginCatalogController
Controller responsible for plugin catalog presentation and plugin palette behavior . . . 1257
PluginConnector_if
Interface for dynamic discovery/loading/unloading of plugin libraries . . . 1258
PluginConnectorDummyImpl1
In-memory plugin connector that resolves built-in plugin metadata . . . 1260
PluginConnectorStaticImpl1
Static plugin connector stub used by the kernel interface . . . 1263
PluginInformation . . . 1265
PluginInsertionOptions
Optional policy hooks used while inserting a plugin . . . 1266
PluginLoadIssue
Diagnostic record for a plugin candidate that could not be loaded . . . 1266
PluginManager
Manages discovery, loading, lookup and instantiation of simulation plugins . . . 1267
PMOS . . . 1270
testing::internal::PointerPrinter . . . 1276
GroProgramRuntime::PopulationMutation . . . 1276
yy::position
A point in a source file . . . 1276
testing::PrintToStringParamName . . . 1277
ProbabilityDistribution
Static façade for inverse/CDF-related distribution utilities . . . 1277
ProbabilityDistributionBase
Mathematical base library for distribution-related functions . . . 1279
MetabolicFluxBalanceSolver::Problem . . . 1282
Process
Composite component that always chains an internal Seize, Delay and Release to model "seize a resource, hold it for a while, release it" . . . 1282
genesys::launcher::ProcessLauncher . . . 1289
OptimizerWindow::ProgressPlot . . . 1290
BioStateProjectionComponent::Projection . . . 1291
MetabolicStateProjectionComponent::Projection . . . 1291
EFSMStatePropertiesUndoCommand::Properties . . . 1292
EFSMTransitionPropertiesUndoCommand::Properties . . . 1292
PropertyEditor . . . 1292
PropertyEditorController
Controller that orchestrates property editor state and scene-selection coupling . . . 1293
PropertyEditorGenesys . . . 1294
PropertyGenesys . . . 1294
PropertyGenesysBase
Base metadata for kernel-side control/response abstractions . . . 1296
testing::internal::ProtobufPrinter . . . 1298

ProviderRequest
Input to a single LLM chat-completion call . . . 1298
ProviderResponse
Output from a single LLM chat-completion call . . . 1298
testing::internal::ProxyTypeList< Ts > . . . 1299
PythonForG . . . 1300
PythonRuntime . . . 1306
QCPAbstractItem
The abstract base class for all items in a plot . . . 1311
QCPAbstractLegendItem
The abstract base class for all entries in a QCPLegend . . . 1318
QCPAbstractPaintBuffer
The abstract base class for paint buffers, which define the rendering backend . . . 1325
QCPAbstractPlottable
The abstract base class for all data representing objects in a plot . . . 1327
QCPAbstractPlottable1D< DataType >
A template base class for plottables with one-dimensional data . . . 1340
QCPAxis
Manages a single axis inside a QCustomPlot . . . 1347
QCPAxisPainterPrivate . . . 1368
QCPAxisRect
Holds multiple axes and arranges them in a rectangular shape . . . 1370
QCPAxisTicker
The base class tick generator used by QCPAxis to create tick positions and tick labels . . . 1385
QCPAxisTickerDateTime
Specialized axis ticker for calendar dates and times as axis ticks . . . 1389
QCPAxisTickerFixed
Specialized axis ticker with a fixed tick step . . . 1394
QCPAxisTickerLog
Specialized axis ticker suited for logarithmic axes . . . 1397
QCPAxisTickerPi
Specialized axis ticker to display ticks in units of an arbitrary constant, for example pi . . . 1400
QCPAxisTickerText
Specialized axis ticker which allows arbitrary labels at specified coordinates . . . 1403
QCPAxisTickerTime
Specialized axis ticker for time spans in units of milliseconds to days . . . 1407
QCPBars
A plottable representing a bar chart in a plot . . . 1411
QCPBarsData
Holds the data of one single data point (one bar) for QCPBars . . . 1421
QCPBarsGroup
Groups multiple QCPBars together so they appear side by side . . . 1423
QCPColorGradient
Defines a color gradient for use with e.g. QCPColorMap . . . 1427
QCPColorMap
A plottable representing a two-dimensional color map in a plot . . . 1433
QCPColorMapData
Holds the two-dimensional data of a QCPColorMap plottable . . . 1442
QCPColorScale
A color scale for use with color coding data such as QCPColorMap . . . 1448
QCPColorScaleAxisRectPrivate . . . 1457
QCPCurve
A plottable representing a parametric curve in a plot . . . 1463
QCPCurveData
Holds the data of one single data point for QCPCurve . . . 1473
QCPDataContainer< DataType >
The generic data container for one-dimensional plottables . . . 1475

QCPDataRange
Describes a data range given by begin and end index . . . 1482
QCPDataSelection
Describes a data set by holding multiple QCPDataRange instances . . . 1486
QCPErrorBars
A plottable that adds a set of error bars to other plottables . . . 1491
QCPErrorBarsData
Holds the data of one single error bar for QCPErrorBars . . . 1502
QCPFinancial
A plottable representing a financial stock chart . . . 1503
QCPFinancialData
Holds the data of one single data point for QCPFinancial . . . 1514
QCPGraph
A plottable representing a graph in a plot . . . 1516
QCPGraphData
Holds the data of one single data point for QCPGraph . . . 1525
QCPGrid
Responsible for drawing the grid of a QCPAxis . . . 1527
QCPItemAnchor
An anchor of an item to which positions can be attached to . . . 1531
QCPItemBracket
A bracket for referencing/highlighting certain parts in the plot . . . 1533
QCPItemCurve
A curved line from one point to another . . . 1539
QCPItemEllipse
An ellipse . . . 1544
QCPItemLine
A line from one point to another . . . 1549
QCPItemPixmap
An arbitrary pixmap . . . 1554
QCPItemPosition
Manages the position of an item . . . 1560
QCPItemRect
A rectangle . . . 1566
QCPItemStraightLine
A straight line that spans infinitely in both directions . . . 1571
QCPItemText
A text label . . . 1576
QCPItemTracer
Item that sticks to QCPGraph data points . . . 1583
QCPLabelPainterPrivate . . . 1591
QCPLayer
A layer that may contain objects, to control the rendering order . . . 1593
QCPLayerable
Base class for all drawable objects . . . 1597
QCPLayout
The abstract base class for layouts . . . 1604
QCPLayoutElement
The abstract base class for all objects that form the layout system . . . 1611
QCPLayoutGrid
A layout that arranges child elements in a grid . . . 1618
QCPLayoutInset
A layout that places child elements aligned to the border or arbitrarily positioned . . . 1630
QCPLegend
Manages a legend inside a QCustomPlot . . . 1638
QCPLineEnding
Handles the different ending decorations for line-like items . . . 1650

QCPMarginGroup
A margin group allows synchronization of margin sides if working with multiple layout elements 1653
QCPPaintBufferPixmap
A paint buffer based on QPixmap, using software raster rendering . . . 1655
QCPPainter
QPainter subclass used internally . . . 1657
QCPPlottableInterface1D
Defines an abstract interface for one-dimensional plottables . . . 1661
QCPPlottableLegendItem
A legend item representing a plottable with an icon and the plottable name . . . 1665
QCPPolarAxisAngular
The main container for polar plots, representing the angular axis as a circle . . . 1670
QCPPolarAxisRadial
The radial axis inside a radial plot . . . 1691
QCPPolarGraph
A radial graph used to display data in polar plots . . . 1710
QCPPolarGrid
The grid in both angular and radial dimensions for polar plots . . . 1719
QCPPolarLegendItem
A legend item for polar plots . . . 1722
QCPRange
Represents the range an axis is encompassing . . . 1727
QCPScatterStyle
Represents the visual appearance of scatter points . . . 1733
QCPSelectionDecorator
Controls how a plottable's data selection is drawn . . . 1739
QCPSelectionDecoratorBracket
A selection decorator which draws brackets around each selected data segment . . . 1742
QCPSelectionRect
Provides rect/rubber-band data selection and range zoom interaction . . . 1746
QCPStatisticalBox
A plottable representing a single statistical box in a plot . . . 1751
QCPStatisticalBoxData
Holds the data of one single data point for QCPStatisticalBox . . . 1761
QCPTextElement
A layout element displaying a text . . . 1763
QCPVector2D
Represents two doubles as a mathematical 2D vector . . . 1772
QCustomPlot
The central class of the library. This is the QWidget which displays the plot and interacts with the user . . . 1777
QtAbstractEditorFactory< PropertyManager > . . . 1807
QtAbstractEditorFactoryBase . . . 1811
QtAbstractPropertyBrowser . . . 1813
QtAbstractPropertyBrowserPrivate . . . 1818
QtAbstractPropertyManager . . . 1819
QtAbstractPropertyManagerPrivate . . . 1824
QtBoolEdit . . . 1824
QtBoolPropertyManager . . . 1825
QtBoolPropertyManagerPrivate . . . 1828
QtBrowserItem . . . 1828
QtBrowserItemPrivate . . . 1829
QtButtonPropertyBrowser . . . 1830
QtButtonPropertyBrowserPrivate . . . 1833
QtCharEdit . . . 1834
QtCharEditorFactory . . . 1835
QtCharEditorFactoryPrivate . . . 1837
QtCharPropertyManager . . . 1838

QtCharPropertyManagerPrivate . . . 1840
QtCheckBoxFactory . . . 1841
QtCheckBoxFactoryPrivate . . . 1843
QtColorEditorFactory . . . 1844
QtColorEditorFactoryPrivate . . . 1846
QtColorEditWidget . . . 1848
QtColorPropertyManager . . . 1849
QtColorPropertyManagerPrivate . . . 1852
QtCursorDatabase . . . 1853
QtCursorEditorFactory . . . 1853
QtCursorEditorFactoryPrivate . . . 1855
QtCursorPropertyManager . . . 1856
QtCursorPropertyManagerPrivate . . . 1859
QtDateEdit . . . 1859
QtDateEditFactory . . . 1860
QtDateEditFactoryPrivate . . . 1862
QtDatePropertyManager . . . 1864
QtDatePropertyManagerPrivate . . . 1868
QtDateTimeEdit . . . 1868
QtDateTimeEditFactory . . . 1870
QtDateTimeEditFactoryPrivate . . . 1872
QtDateTimePropertyManager . . . 1873
QtDateTimePropertyManagerPrivate . . . 1875
QtDoubleEdit . . . 1876
QtDoublePropertyManager . . . 1877
QtDoublePropertyManagerPrivate . . . 1882
QtDoubleSpinBoxFactory . . . 1883
QtDoubleSpinBoxFactoryPrivate . . . 1885
QtEnumEditorFactory . . . 1886
QtEnumEditorFactoryPrivate . . . 1888
QtEnumPropertyManager . . . 1890
QtEnumPropertyManagerPrivate . . . 1894
QtEnumPropertyType . . . 1894
QtFlagPropertyManager . . . 1894
QtFlagPropertyManagerPrivate . . . 1898
QtFlagPropertyType . . . 1898
QtFontEditorFactory . . . 1899
QtFontEditorFactoryPrivate . . . 1901
QtFontEditWidget . . . 1902
QtFontPropertyManager . . . 1903
QtFontPropertyManagerPrivate . . . 1906
QtGroupBoxPropertyBrowser . . . 1907
QtGroupBoxPropertyBrowserPrivate . . . 1909
QtGroupPropertyManager . . . 1910
QtGroupPropertyType . . . 1912
QtIntEdit . . . 1912
QtIntPropertyManager . . . 1913
QtIntPropertyManagerPrivate . . . 1917
QtKeySequenceEditorFactory . . . 1918
QtKeySequenceEditorFactoryPrivate . . . 1920
QtKeySequencePropertyManager . . . 1922
QtKeySequencePropertyManagerPrivate . . . 1924
QtLineEditFactory . . . 1925
QtLineEditFactoryPrivate . . . 1927
QtLocalePropertyManager . . . 1928
QtLocalePropertyManagerPrivate . . . 1931
QtMetaEnumProvider . . . 1931
QtMetaEnumWrapper . . . 1932

genesys::launcher::QtNetworkTransport . . . 1933
QtPointFPropertyManager . . . 1934
QtPointFPropertyManagerPrivate . . . 1938
QtPointPropertyManager . . . 1939
QtPointPropertyManagerPrivate . . . 1942
QtProperty . . . 1943
QtPropertyBrowserUtils . . . 1948
QtPropertyEditorDelegate . . . 1949
QtPropertyEditorView . . . 1950
QtPropertyPrivate . . . 1951
QtRectFPropertyManager . . . 1952
QtRectFPropertyManagerPrivate . . . 1956
QtRectPropertyManager . . . 1957
QtRectPropertyManagerPrivate . . . 1961
QtScrollBarFactory . . . 1962
QtScrollBarFactoryPrivate . . . 1964
QtSizeFPropertyManager . . . 1966
QtSizeFPropertyManagerPrivate . . . 1971
QtSizePolicyPropertyManager . . . 1972
QtSizePolicyPropertyManagerPrivate . . . 1975
QtSizePropertyManager . . . 1976
QtSizePropertyManagerPrivate . . . 1980
QtSliderFactory . . . 1981
QtSliderFactoryPrivate . . . 1983
QtSpinBoxFactory . . . 1985
QtSpinBoxFactoryPrivate . . . 1987
QtStringEdit . . . 1988
QtStringPropertyManager . . . 1989
QtStringPropertyManagerPrivate . . . 1992
QtTimeEdit . . . 1992
QtTimeEditFactory . . . 1994
QtTimeEditFactoryPrivate . . . 1996
QtTimePropertyManager . . . 1997
QtTimePropertyManagerPrivate . . . 1999
QtTreePropertyBrowser . . . 2000
QtTreePropertyBrowserPrivate . . . 2006
QtVariantEditorFactory . . . 2007
QtVariantEditorFactoryPrivate . . . 2009
QtVariantProperty . . . 2010
QtVariantPropertyManager . . . 2013
QtVariantPropertyManagerPrivate . . . 2019
QtVariantPropertyPrivate . . . 2021
Quadrature_if
One-dimensional numerical quadrature abstraction . . . 2021
Queue
Data definition holding waiting entities for a component (a Seize-family component, Process, Batch, etc.) and defining their ranking rule . . . 2022
QueueableItem . . . 2027
testing::internal::Random . . . 2028
testing::internal::RangeGenerator< T, IncrementT > . . . 2028
testing::internal::RawBytesPrinter . . . 2029
testing::internal::RE . . . 2030
MassActionOdeSystem::Reaction . . . 2030
RealIntervalStateSet . . . 2030
RealState . . . 2032
Record
Evaluates a parser expression each time an entity passes through and records the value into a StatisticsCollector and/or an external file . . . 2034

RecordingContinuousSystemComponent . . . 2041
RecordingLSODE . . . 2047
Rectifier . . . 2053
testing::internal::RelationToSourceCopy . . . 2054
testing::internal::RelationToSourceReference . . . 2054
Release
Gives up control of one or more previously seized resources, immediately unblocking any entity waiting for them . . . 2054
Remove
Removes one or more entities at a given rank (or rank range) from a Queue or an EntityGroup and forwards them . . . 2061
Resistor . . . 2067
Resource
Data definition representing a seizable capacity pool (equipment, staff, etc.), its costing, its optional capacity schedule, and its associated Failure definitions . . . 2073
ResourceAllocationComponent . . . 2079
ResourceTestProbe . . . 2085
GroProgramParser::Result . . . 2086
Sampler_if::RNG_Parameters
Encapsulates generator-specific configuration/state parameters . . . 2086
RootFinder_if
Root-finding abstraction for scalar equations . . . 2087
Route . . . 2087
RSimulator
Component that sends configured R commands to an internal RSimulatorRunner . . . 2094
RSimulatorRunner
Model data definition that executes R code through Rscript . . . 2100
RungeKutta4OdeSolver
Fixed-step fourth-order Runge-Kutta solver for first-order ODE systems . . . 2106
genesys::launcher::RuntimeInstallResult . . . 2107
genesys::launcher::RuntimePaths . . . 2107
genesys::launcher::RuntimeSelection . . . 2108
genesys::launcher::RuntimeSelector . . . 2108
Sample . . . 2109
Sampler_if
Abstraction for random-number generation and probability-distribution sampling . . . 2109
SamplerDefaultImpl1
Default pseudo-random sampler implementation used by the kernel . . . 2113
ScenarioExperiment_if . . . 2118
SceneToolController
Controller for scene visualization, drawing tools, alignment, and zoom orchestration . . . 2118
SchedulableItem
One (expression, duration, rule) triple inside a Schedule . . . 2121
Schedule . . . 2122
testing::ScopedTrace . . . 2127
Search
Scans a Queue or an EntityGroup rank range for the first entity satisfying a condition, saving the found rank (or 0) to an attribute . . . 2127
Segment
Data definition holding the ordered sequence of stations (and the length between consecutive stations) that make up one Conveyor's physical path . . . 2134
SegmentStep
One (station, length-to-next-station) step of a Segment's ordered conveyor path . . . 2138
SeizableItem . . . 2139
Seize
Allocates one or more resources (or resource-set members) to an entity, queueing it if they are not simultaneously available . . . 2140

Separate
Releases the original member entities of a temporary Batch group back into the model 2147
Sequence
Data definition holding an ordered list of visitation steps (SequenceStep), each naming a Station or Label an entity should reach next, with optional attribute/variable assignments per step 2153
SequenceStep 2158
Serializer
Serialization/Deserialization interface for simulation models 2159
SessionContext
Owns the state that belongs to one authenticated web session 2163
SessionManager
Creates, stores and resolves authenticated web sessions 2163
Set
Data definition grouping an ordered list of ModelDataDefinition members of one concrete type, used by selection-rule-based components (e.g. Resource sets consumed by Seize-family components) 2165
Signal
Broadcasts a signal value, releasing up to _limitExpression entities waiting at any Wait (Arena Hold) component in WaitForSignal mode with a matching signal 2171
SignalData 2177
GroProgramRuntime::SignalMutation 2181
SimpleHttpServer
Minimal blocking HTTP/1.1 server for single-request-per-connection handling 2182
SimulatorSessionService::SimulationActionResult
Contains the result of a simulation action such as run or step 2183
SimulationCommandController
Controller that orchestrates UI simulation commands over SimulationController guards 2183
SimulatorSessionService::SimulationConfigInput
Defines user-provided simulation parameters to apply to the current model 2184
SimulatorSessionService::SimulationConfigResult
Contains the result of applying simulation configuration 2185
SimulationControl
Read/write kernel-side simulation control abstraction 2185
SimulationControlBool 2189
SimulationControlDouble 2192
SimulationControlGeneric< T > 2195
SimulationControlGenericClass< T, M, C > 2198
SimulationControlGenericClassNotDC< T, M, C > 2202
SimulationControlGenericEnum< T, E > 2206
SimulationControlGenericList< T, M, C > 2209
SimulationControlGenericListPointer< T, M, C > 2213
SimulationControlInt 2217
SimulationController
Controller that validates simulation command readiness for MainWindow wrappers 2220
SimulationControlSourceCodeString 2222
SimulationControlString 2225
SimulationControlTimeUnit 2228
SimulationControlUInt 2231
SimulationControlUShort 2234
SimulationEvent 2237
SimulationEventController
Controller for simulation event callbacks, UI updates, and handler wiring 2238
SimulationExperiment
Represents a higher-level simulation experiment definition 2239
SimulationReporter_if
Interface for reporting simulation results and experiment-facing outputs 2239
SimulationReporterDefaultImpl1 2240

SimulationResponse
Read-only kernel-side simulation response abstraction . . . 2242
SimulationResponseDouble . . . 2244
SimulationResultsDataset . . . 2246
SimulationResultsDatasetParser . . . 2247
SimulationResultsObservation . . . 2247
SimulationScenario
Represents a candidate simulation scenario within the unfinished experiment layer . . . 2247
SimulatorSessionService::SimulationStatusResult
Captures the current simulation execution state . . . 2248
Simulator . . . 2249
SimulatorFacade
High-level non-owning facade over Simulator and its main composed services . . . 2251
SimulatorSessionService::SimulatorInfoResult
Describes simulator identity metadata for a token-scoped session . . . 2257
SimulatorSessionService
Encapsulates session-scoped simulator operations exposed by the Web API . . . 2257
SinkModelComponent . . . 2264
yy::genesyspp_parser::stack< T, S >::slice
Present a slice of the top of a stack . . . 2270
Smart_AddingResource . . . 2271
Smart_AlternatingEntityCreation . . . 2272
Smart_ArrivalsElementStopsEntitiesArrivingAfterASetTime . . . 2274
Smart_ArrivalsEntityTypeVsAttribute . . . 2276
Smart_AssignExample . . . 2278
Smart_AssignWriteSeizes . . . 2280
Smart_Attribute_Variable . . . 2281
Smart_AutomaticStatisticsCollection . . . 2283
Smart_BacteriaColony_GRO . . . 2285
Smart_BasicModeling . . . 2287
Smart_BatchAndSeparate . . . 2288
Smart_BatchSeparate . . . 2290
Smart_BioKineticLawRegulation . . . 2292
Smart_BioNetworkAnalysis . . . 2293
Smart_BioReversibleKineticLaw . . . 2295
Smart_BioReversibleMassAction . . . 2297
Smart_Buffer . . . 2298
Smart_CellularAutomata . . . 2300
Smart_CellularAutomata1 . . . 2302
Smart_Clone . . . 2303
Smart_ContinuousFlowEntities . . . 2305
Smart_CppForG . . . 2307
Smart_Create . . . 2308
Smart_DecideNWayByChance . . . 2310
Smart_DefaultModalModel . . . 2312
Smart_DefiningAttributesAsStrings . . . 2313
Smart_DefiningControlLogic . . . 2315
Smart_DefiningResourceCapacity . . . 2317
Smart_Delay . . . 2318
Smart_DelayBasedOnReplication . . . 2320
Smart_Dummy . . . 2322
Smart_EntitiesProcessedByPriority . . . 2324
Smart_EvaluatingConditionsBeforeEnteringQueue . . . 2326
Smart_Expression . . . 2328
Smart_Failures . . . 2330
Smart_FSMState . . . 2331
Smart_GroColonyGrowth . . . 2333
Smart_GroColonyLifecycle . . . 2335

Smart_HoldSearchRemove . . . 2336
Smart_InventoryAndHoldingCosts . . . 2338
Smart_LSODE . . . 2340
Smart_MarkovChain . . . 2342
Smart_MaxArrivalsField . . . 2343
Smart_ModalModel . . . 2345
Smart_ModalModelDefaultNetwork . . . 2347
Smart_ModalModelFSM . . . 2348
Smart_ModalModelPetriNet . . . 2350
Smart_ModelInfoModelSimulation . . . 2352
Smart_ModelRunUntil1000Parts . . . 2353
Smart_ModuleDisplayVariables . . . 2355
Smart_ODE . . . 2357
Smart_OnEvent . . . 2358
Smart_OverlappingResources . . . 2361
Smart_ParallelProcessingOfEntities . . . 2363
Smart_Parser . . . 2365
Smart_ParserModelFunctions . . . 2367
Smart_PetriPlace . . . 2368
Smart_PlacingEntitiesInQueueSets . . . 2370
Smart_Plugin . . . 2372
Smart_PriorityExample . . . 2373
Smart_Process . . . 2375
Smart_ProcessArena . . . 2377
Smart_ProcessSet . . . 2378
Smart_PythonForG . . . 2380
Smart_R_Simulator
Builds a minimal Create -> RSimulator -> Dispose model . . . 2381
Smart_Record . . . 2384
Smart_Record_Arena . . . 2385
Smart_RemovingAndReorderingEntitiesInAQueue . . . 2387
Smart_ResourceCosting . . . 2389
Smart_ResourceScheduleCosting . . . 2391
Smart_ResourceSets . . . 2392
Smart_RouteStation . . . 2394
Smart_SeizeDelayRelease . . . 2396
Smart_SeizeDelayReleaseMany . . . 2397
Smart_SeizeDelayReleaseNoDataDefs . . . 2399
Smart_SeizingMultipleSimultaneosly . . . 2401
Smart_SelectingRouteBasedOnProbability . . . 2403
Smart_SelectingShorterQueue . . . 2404
Smart_Sequence . . . 2406
Smart_SimulationControlResponse . . . 2408
Smart_SynchronizingParallelEntities . . . 2409
Smart_ValueAdded . . . 2411
Smart_WaitForSignal . . . 2413
Smart_WaitScanCondition . . . 2414
Smart_WaitSignal . . . 2416
WebWorkerRuntime::Snapshot
Captures a thread-safe snapshot of the worker state . . . 2417
MetabolicFluxBalanceSolver::Solution . . . 2418
Optimizer_if::SolutionSummary
Captures one candidate or best-known optimization solution . . . 2418
Solver_if
Legacy compatibility interface for numerical routines . . . 2419
SolverDefaultImpl1
Legacy default implementation of Solver_if . . . 2420

SortFile
Utility class that sorts numeric values persisted in a data file . . . 2423
SourceCodeString . . . 2424
SourceModelComponent
Kernel base class for components that inject entities into the model (only Create derives from it so far), generalizing the fields Arena exposes on its "Create module" (Rockwell Automation, *Getting Started with Arena*, "The Basic Process Panel", pp. 31-32): Entity Type (_entityType), First Creation (_firstCreation), Entities per Arrival (_entitiesPerCreation), Max Arrivals (_maxCreationsExpression, a parsed expression rather than a static integer) and the time-between-creations expression/time unit . . . 2424
SparseValueStore
Sparse N-dimensional numeric store using GenESyS textual index keys . . . 2434
MassActionOdeSystem::Species . . . 2435
SPICECircuit . . . 2435
SPICENode . . . 2441
SPICERunner . . . 2447
Start . . . 2452
StartAIAssistant . . . 2458
State . . . 2460
GroProgramAst::Statement . . . 2461
EFSMNetworkDiagramLayout::StatePosition . . . 2461
StateSet . . . 2461
StateSet_Enumerable . . . 2463
Station
Data definition representing one physical/logical processing location, tracking the entities currently in it and their sojourn time . . . 2465
StationTestProbe . . . 2470
Statistics_if
Interface for statistical synthesis over values provided by a Collector_if . . . 2474
StatisticsCollector . . . 2478
StatisticsDatafile_if
Extension of Statistics_if for metrics that require full data access . . . 2483
StatisticsDatafileDefaultImpl1
Default implementation of StatisticsDatafile_if for file-backed samples . . . 2487
StatisticsDefaultImpl1
Default online statistics implementation over a Collector_if source . . . 2492
StochasticReactionComponent . . . 2495
StochasticReactionRule . . . 2501
StochasticTranscription . . . 2506
StochasticTranslation . . . 2513
BioReaction::StoichiometricTerm . . . 2520
MassActionOdeSystem::StoichiometricTerm . . . 2520
MetabolicReaction::StoichiometricTerm . . . 2520
StochasticReactionRule::StoichiometricTerm . . . 2521
Stop . . . 2521
Storage
Data definition representing a named storage location with explicit area/capacity/density accounting . . . 2527
Store
Placeholder for adding an entity to a Storage (§5.11) . . . 2532
testing::internal::internal_stream_operator_without_lexical_name_lookup::StreamPrinter . . . 2539
testing::internal::String . . . 2539
Submodel . . . 2539
testing::internal::SuiteApiResolver< T > . . . 2546
yy::genesyspp_parser::symbol_kind
Symbol kinds . . . 2546
yy::genesyspp_parser::symbol_type
"External" symbols: returned by the scanner . . . 2547

yy::genesyspp_parser::syntax_error
Syntax errors thrown from user actions . . . 2550
SystemCommandExecutor_if
Minimal command execution interface used to make system dependency checks testable . . . 2551
SystemCommandResult
Captures the result of executing a system command used by dependency checks . . . 2552
SystemDependency . . . 2553
SystemDependencyCheckEntry
One dependency entry produced by a system dependency preflight . . . 2553
SystemDependencyCheckResult
Full preflight result for the system dependencies declared by one plugin . . . 2554
SystemDependencyInstallEntry
One command result from an attempted system dependency installation . . . 2554
SystemDependencyInstallResult
Aggregates commands executed while trying to satisfy missing system dependencies . . . 2555
SystemDependencyResolver
Evaluates and optionally installs plugin system dependencies . . . 2555
SystemPreferences
Persistent application preferences used by the Qt GUI . . . 2556
SystemShellCommandExecutor
Shell-based executor used by production plugin dependency preflight . . . 2558
genesys::launcher::TarZstdArchiveExtractor . . . 2560
testing::internal::Templates< Head_, Tail_ > . . . 2561
testing::internal::Templates< Head_ > . . . 2561
testing::internal::TemplateSel< Tmpl > . . . 2561
testing::Test . . . 2561
testing::TestEventListener . . . 2562
testing::TestEventListeners . . . 2563
testing::internal::TestFactoryBase . . . 2563
testing::internal::TestFactoryImpl< TestClass > . . . 2564
testing::TestInfo . . . 2565
testing::internal::TestMetaFactory< TestSuite > . . . 2565
testing::internal::TestMetaFactoryBase< ParamType > . . . 2566
testing::TestParamInfo< ParamType > . . . 2566
testing::TestProperty . . . 2567
testing::internal::TestPropertyKeyIs . . . 2567
HypothesisTester_if::TestResult
Result of a parametric hypothesis test . . . 2567
testing::TestResult . . . 2568
testing::internal::TestResultAccessor . . . 2568
TestSimulationControl . . . 2569
TestSimulationResponse . . . 2572
testing::TestSuite . . . 2573
testing::TestWithParam< T > . . . 2574
testing::internal::ThreadLocal< T > . . . 2575
QCPAxisPainterPrivate::TickLabelData . . . 2575
Token . . . 2576
yy::genesyspp_parser::token
Token kinds . . . 2576
TokenService . . . 2577
TraceConsoleController
Controller that routes simulator trace events to GUI text widgets . . . 2577
TraceErrorEvent . . . 2578
TraceEvent . . . 2579
testing::internal::TraceInfo . . . 2579
TraceManager . . . 2579
TraceSimulationEvent . . . 2584
TraceSimulationProcess . . . 2584

TraitsGUI< T >
GUI-specific trait constants used to tune default rendering behavior . . . 2585
TraitsGUI< GAssociation > . . . 2586
TraitsGUI< GComponentPort > . . . 2586
TraitsGUI< GConnection > . . . 2586
TraitsGUI< GMainWindow > . . . 2587
TraitsGUI< GModelComponent > . . . 2587
TraitsGUI< GModelDataDefinition > . . . 2587
TraitsGUI< GModelGraphicPic > . . . 2588
TraitsGUI< GScene > . . . 2588
TraitsGUI< GView > . . . 2588
TraitsKernel< T > . . . 2588
TraitsKernel< Collector_if > . . . 2589
TraitsKernel< Model > . . . 2589
TraitsKernel< ModelChecker_if > . . . 2589
TraitsKernel< ModelComponent > . . . 2589
TraitsKernel< ModelDataDefinition > . . . 2589
TraitsKernel< Parser_if > . . . 2590
TraitsKernel< Persistence_if > . . . 2590
TraitsKernel< PluginConnector_if > . . . 2590
TraitsKernel< Sampler_if > . . . 2590
TraitsKernel< SimulationReporter_if > . . . 2590
TraitsKernel< Simulator > . . . 2591
TraitsKernel< Statistics_if > . . . 2591
TraitsKernel< StatisticsDatafile_if > . . . 2591
TraitsTools< T >
Registry-like traits to bind abstractions to concrete tools classes . . . 2591
TraitsTools< AIAssistant_if > . . . 2592
TraitsTools< Fitter_if > . . . 2592
TraitsTools< HypothesisTester_if > . . . 2592
TraitsTools< Solver_if > . . . 2592
EFSMNetworkDiagramLayout::TransitionLayout . . . 2593
Transporter . . . 2593
Transporter::TravelCompletion . . . 2599
testing::internal::TrueWithString . . . 2599
std::tuple_size< testing::internal::FlatTuple< Ts... > > . . . 2600
testing::internal::TypeIdHelper< T > . . . 2600
testing::internal::TypeParameterizedTest< Fixture, TestSel, Types > . . . 2601
testing::internal::TypeParameterizedTest< Fixture, TestSel, internal::None > . . . 2601
testing::internal::TypeParameterizedTestSuite< Fixture, Tests, Types > . . . 2601
testing::internal::TypeParameterizedTestSuite< Fixture, internal::None, Types > . . . 2601
testing::internal::TypeParameterizedTestSuiteRegistry . . . 2601
testing::internal::Types< Head_, Tail_ > . . . 2602
testing::internal::Types< Head_ > . . . 2602
testing::internal::TypeWithSize< size > . . . 2602
testing::internal::TypeWithSize< 4 > . . . 2602
testing::internal::TypeWithSize< 8 > . . . 2602
UngroupUndoCommand . . . 2603
testing::UnitTest . . . 2603
testing::internal::UnitTestImpl . . . 2604
testing::internal::UnitTestOptions . . . 2606
testing::internal::UniversalPrinter< T > . . . 2606
testing::internal::UniversalPrinter< const T > . . . 2607
testing::internal::UniversalPrinter< T & > . . . 2608
testing::internal::UniversalPrinter< T[N]> . . . 2608
testing::internal::UniversalTersePrinter< T > . . . 2608
testing::internal::UniversalTersePrinter< char * > . . . 2608
testing::internal::UniversalTersePrinter< char16_t * > . . . 2609

testing::internal::UniversalTersePrinter< char32_t * > . . . 2610
testing::internal::UniversalTersePrinter< const char * > . . . 2611
testing::internal::UniversalTersePrinter< const char16_t * > . . . 2612
testing::internal::UniversalTersePrinter< const char32_t * > . . . 2612
testing::internal::UniversalTersePrinter< T & > . . . 2613
testing::internal::UniversalTersePrinter< T[N]> . . . 2613
testing::internal::UniversalTersePrinter< wchar_t * > . . . 2613
Unstore
Placeholder for removing an entity from a Storage (§5.11) . . . 2613
genesys::launcher::UpdateChecker . . . 2620
genesys::launcher::UpdateCheckResult . . . 2620
genesys::launcher::UpdateDialog . . . 2621
genesys::launcher::UpdateDownloader . . . 2622
genesys::launcher::UpdateManifest . . . 2623
genesys::launcher::UpdateManifestParser . . . 2623
genesys::launcher::UpdatePlatform . . . 2624
genesys::launcher::UpdateVerifier . . . 2624
genesys::launcher::UserRuntimeManager . . . 2624
Util . . . 2624
yy::genesyspp_parser::value_type . . . 2635
testing::internal::ValueArray< Ts > . . . 2636
testing::internal::ValuesInIteratorRangeGenerator< T > . . . 2637
Variable
Data definition for a named value (scalar or indexed array) that is global to the whole model, as opposed to Attribute's per-entity values . . . 2638
genesys::launcher::VerificationResult . . . 2644
genesys::launcher::Version . . . 2644
Vpulse . . . 2645
Vsine . . . 2651
Vsource . . . 2657
Wait
Holds an entity in a queue until a signal arrives, a condition becomes true, or it is explicitly removed elsewhere . . . 2663
Waiting . . . 2670
WaitingResource . . . 2670
WcmBioNetworkBridge
Demonstrates a minimal deterministic/stochastic whole-cell bridge . . . 2671
WcmCompartmentTransportWholeCellMvp
Whole-cell MVP with compartment-aware metabolic transport . . . 2673
WcmFluxBalanceWholeCellMvp
Whole-cell MVP driven by flux-balance metabolism . . . 2675
WcmGeneExpression . . . 2677
WcmLifecycleStress
Demonstrates starvation and death routing in a whole-cell stress scenario . . . 2679
WcmMgenitaliumKarr2012 . . . 2681
WcmPathwayStressWholeCellMvp
Whole-cell stress example driven by sustained low pathway activity . . . 2684
WcmSimpleSsa . . . 2685
WcmWholeCellMvp
Minimal whole-cell MVP combining metabolism, expression, growth, and division . . . 2687
WcmYeastDidacticWholeCellMvp
Didactic yeast-oriented whole-cell MVP built on GEM-inspired metabolism . . . 2689
WcmYeastEukaryoticWholeCellMvp
Didactic eukaryotic whole-cell MVP inspired by budding yeast . . . 2691
WebWorkerDialog
Lightweight control window for the embedded GenESyS web worker . . . 2693
WebWorkerRuntime
Owns the embedded worker runtime used by the GUI and the standalone worker app . . . 2694

WholeCellParameterReader 2696
WholeCellState 2696
QtButtonPropertyBrowserPrivate::WidgetItem 2702
QtGroupBoxPropertyBrowserPrivate::WidgetItem 2703
testing::WithParamInterface< T > 2703
SimulatorSessionService::WorkerCapabilitiesResult
Describes currently supported worker features 2704
SimulatorSessionService::WorkerInfoResult
Describes worker identity metadata for distributed discovery 2704
WorkerJob
Stores metadata for a worker job snapshot owned by the web worker 2705
SimulatorSessionService::WorkerJobCreationResult
Contains worker job creation output and error state 2706
SimulatorSessionService::WorkerJobInfoResult
Describes worker job metadata exposed by worker stage 3 endpoints 2706
WorkerJobManager
Owns worker job records in memory and assigns unique identifiers 2707
SimulatorSessionService::WorkerJobQueryResult
Contains worker job lookup output and error state 2709
SimulatorSessionService::WorkerJobResultInfo
Describes terminal worker job result data exposed by worker stage 5 endpoint 2710
SimulatorSessionService::WorkerJobResultQueryResult
Contains worker job terminal result lookup output and error state 2710
SimulatorSessionService::WorkerJobRunResult
Contains worker job run output and error state 2711
WorkerJobTerminalResult
Stores the terminal simulation summary persisted for a finished or failed worker job 2711
Write
Writes one or more literal/expression text lines to the screen (trace output) or to a file 2712
XmlSerializer 2718
XNOR 2721
XOR 2728
yy_buffer_state 2734
yy_trans_info 2734

Chapter 15

File Index

15.1 File List

Here is a list of all documented files with brief descriptions:

applications/BaseGenesysTerminalApplication.h . . . 2735
applications/GenesysApplication_if.h . . . 2736
applications/gui/ai_assistant/AIAssistantWindow.h . . . 2736
applications/gui/genesys/BaseMVController.h . . . 2748
applications/gui/genesys/GuiCrashDiagnostics.h . . . 2788
applications/gui/genesys/GuiScopeTrace.h . . . 2788
applications/gui/genesys/guithememanager.h . . . 2788
applications/gui/genesys/mainwindow.cpp
Composition-root partition of MainWindow implementation . . . 2789
applications/gui/genesys/mainwindow.h . . . 2790
applications/gui/genesys/mainwindow_controller.cpp
Controller-delegation partition of MainWindow implementation . . . 2797
applications/gui/genesys/mainwindow_modelrepresentations.cpp
Model representation/persistence wrapper partition of MainWindow implementation . . . 2798
applications/gui/genesys/mainwindow_scene.cpp
Scene callback and scene synchronization partition of MainWindow implementation . . . 2799
applications/gui/genesys/mainwindow_simulator.cpp
Simulator trace/event wrapper partition of MainWindow implementation . . . 2800
applications/gui/genesys/MovedGuiCompatibilityIncludes.h . . . 2800
applications/gui/genesys/qcustomplot.h . . . 2833
applications/gui/genesys/systempreferences.h . . . 2938
applications/gui/genesys/TraitsGUI.h . . . 2944
applications/gui/genesys/UtilGUI.h . . . 2945
applications/gui/genesys/actions/AddUndoCommand.h . . . 2737
applications/gui/genesys/actions/DeleteUndoCommand.h . . . 2738
applications/gui/genesys/actions/EFSMInitialStateUndoCommand.h . . . 2738
applications/gui/genesys/actions/EFSMStateMembershipUndoCommand.h . . . 2739
applications/gui/genesys/actions/EFSMStatePropertiesUndoCommand.h . . . 2739
applications/gui/genesys/actions/EFSMTransitionPropertiesUndoCommand.h . . . 2740
applications/gui/genesys/actions/EFSMTransitionUndoCommand.h . . . 2740
applications/gui/genesys/actions/GroupUndoCommand.h . . . 2741
applications/gui/genesys/actions/ModalModelBindingsUndoCommand.h . . . 2741
applications/gui/genesys/actions/MoveUndoCommand.h . . . 2742
applications/gui/genesys/actions/PasteUndoCommand.h . . . 2742
applications/gui/genesys/actions/UngroupUndoCommand.h . . . 2742
applications/gui/genesys/animations/AnimationCounter.h . . . 2743
applications/gui/genesys/animations/AnimationPlaceholder.h . . . 2743
applications/gui/genesys/animations/AnimationQueue.h . . . 2745
applications/gui/genesys/animations/AnimationTimer.h . . . 2746
applications/gui/genesys/animations/AnimationTransition.h . . . 2746

applications/gui/genesys/animations/AnimationVariable.h . . . 2747
applications/gui/genesys/cellular_automata/CellularAutomataDemoBuilder.h . . . 2749
applications/gui/genesys/cellular_automata/CellularAutomataLatticeWidget.h . . . 2751
applications/gui/genesys/cellular_automata/CellularAutomataStateColorMap.h . . . 2751
applications/gui/genesys/cellular_automata/CellularAutomataViewerController.h . . . 2752
applications/gui/genesys/cellular_automata/CellularAutomataViewerWindow.h . . . 2753
applications/gui/genesys/codeeditor/CodeEditor.h . . . 2753

Chapter 16

Namespace Documentation

16.1 EFSMNetworkDiagramCodec Namespace Reference

Encodes/decodes the "Graphical EFSM Network Diagrams" `.gui` overlay section.

Functions

- void **writeSection** (QTextStream &out, Simulator *simulator, const QHash< unsigned long, EFSMNetworkDiagramLayout > &layouts)

  Writes one record block per network present in `layouts` whose EFSMNetwork (and, per entry, states/transitions) still resolve against `simulator`'s current model. Entries that no longer resolve are silently skipped (not written), never causing a save failure.
- QHash< unsigned long, EFSMNetworkDiagramLayout > **parseSection** (const QStringList &lines, Model *model)

  Parses previously collected section lines (already stripped of the leading "# " comment prefix) and resolves them against the just-loaded `model`. Unknown schema versions, malformed lines and unresolved state/transition references are skipped with a trace diagnostic; no kernel object is ever created or mutated by this function.

Variables

- constexpr int **kSupportedSchemaVersion** = 1

  Current supported schema version for the diagram record.
- constexpr const char * **kSectionName** = "Graphical EFSM Network Diagrams"

  `.gui` section name, matching the existing `# <Section Name>` convention.

16.1.1 Detailed Description

Encodes/decodes the "Graphical EFSM Network Diagrams" `.gui` overlay section.
This is a bounded, formalism-specific codec deliberately kept separate from the generic `GraphicalModelSerializer` so the shared serializer stays agnostic of concrete network formalisms (EFSM, Graph, DTMC, CPN). It writes the smallest versioned record that can recover, deterministically: the identity of the associated EFSMNetwork, the identity and position of its states, and the validated sequence identity for its transitions (including an exact empty-name comparison; see `EFSMNetworkDiagramLayout`). It never reads or writes mathematical state, and it never creates kernel objects – malformed or unresolved entries are skipped, not substituted.

16.2 generate_kernel_simulator_test_stubs Namespace Reference

Classes

- class MethodEntry

Functions

- str **_sanitize_identifier** (str text)
- bool **_is_method_candidate** (str line)
- list[MethodEntry] **parse_header** (pathlib.Path path)
- str **generate_test_source** (list[MethodEntry] methods)
- None **main** ()

Variables

- **CLASS_RE** = re.compile(r"^\s*class\s+([A-Za-z_]\w*)\b")
- **METHOD_RE** = re.compile(r"\(")

16.2.1 Detailed Description

```
Generate gtest inventory tests for every method declaration found in
source/kernel/simulator headers.

The goal is to provide a scalable scaffold so each class/method has a
corresponding unit-test entry that can be progressively implemented.
```

16.3 genesys_mcp Namespace Reference

Namespaces

- namespace __main__
- namespace client
- namespace server

16.3.1 Detailed Description

```
Genesys Simulator MCP Connector.
```

16.4 genesys_mcp.__main__ Namespace Reference

16.4.1 Detailed Description

```
Allow running the MCP server with: python -m genesys_mcp
```

16.5 genesys_mcp.client Namespace Reference

Classes

- class GenesysClient
- class GenesysClientError

16.5.1 Detailed Description

```
HTTP client wrapping the Genesys Worker Application REST API.
```

16.6 genesys_mcp.server Namespace Reference

Functions

- GenesysClient **_client** (str base_url, str|None token=None)
- dict[str, str] **_err** (GenesysClientError e)
- dict[str, str] **_conn_err** (httpx.RequestError e)

- dict[str, Any] genesys_job_result (str token, str job_id, str base_url=_DEFAULT_URL)
- None **main** ()

Variables

- mcp
- **_DEFAULT_URL** = os.environ.get("GENESYS_URL", "http://localhost:8080")

16.6.1 Detailed Description

```
Genesys MCP Server -- exposes GenESyS simulation capabilities via MCP.
```

16.6.2 Function Documentation

16.6.2.1 genesys_auth()

```
dict[str, Any] genesys_mcp.server.genesys_auth (
            str  base_url = _DEFAULT_URL )

Create a new Genesys session and return the bearer token.

Returns {"token": "<bearer-token>", ...}.
Pass the token to all subsequent tools as the `token` parameter.
```

16.6.2.2 genesys_configure_simulation()

```
dict[str, Any] genesys_mcp.server.genesys_configure_simulation (
            str token,
            int number_of_replications,
            float replication_length,
            float  warm_up_period = 0.0,
            bool  pause_on_event = False,
            bool  pause_on_replication = False,
            bool  initialize_statistics = True,
            bool  initialize_system = True,
            str  base_url = _DEFAULT_URL )
```

```
Configure simulation parameters before running.

Args:
    token: Bearer token from genesys_auth.
    number_of_replications: How many independent replications to run.
    replication_length: Simulated time length of each replication.
    warm_up_period: Simulated time before statistics start being collected.
    pause_on_event: Pause simulation after each event (step-by-step mode).
    pause_on_replication: Pause between replications.
    initialize_statistics: Reset statistics counters at start of each replication.
    initialize_system: Reset system state at start of each replication.
    base_url: Genesys worker app base URL.
```

16.6.2.3 genesys_create_job()

```
dict[str, Any] genesys_mcp.server.genesys_create_job (
            str token,
            str  base_url = _DEFAULT_URL )

Create a worker job from the session's current model.

The job is created in 'queued' state. A snapshot of the model is
persisted so later execution is decoupled from live model mutations.
Returns {"jobId": "<id>", "state": "queued", ...}.
Requires a valid session token from genesys_auth.
```

16.6.2.4 genesys_get_model()

```
dict[str, Any] genesys_mcp.server.genesys_get_model (
            str token,
            str  base_url = _DEFAULT_URL )

Return a description of the session's current simulation model.

Requires a valid session token from genesys_auth.
```

16.6.2.5 genesys_health()

```
dict[str, Any] genesys_mcp.server.genesys_health (
            str  base_url = _DEFAULT_URL )

Check that the Genesys worker application is reachable.

Returns the health status object from GET /health.
No authentication required.
```

16.6.2.6 genesys_import_model_language()

```
dict[str, Any] genesys_mcp.server.genesys_import_model_language (
            str token,
            str model_text,
            str  base_url = _DEFAULT_URL )

Import a simulation model from GenESyS model language text.

`model_text` is the full plain-text GenESyS model specification.
The imported model becomes the session's current model.
Requires a valid session token from genesys_auth.
```

16.6.2.7 genesys_info()

```
dict[str, Any] genesys_mcp.server.genesys_info (
            str token,
            str  base_url = _DEFAULT_URL )
```

Return simulator version, name, and licence information.

Requires a valid session token from genesys_auth.

16.6.2.8 genesys_job_result()

```
dict[str, Any] genesys_mcp.server.genesys_job_result (
            str token,
            str job_id,
            str  base_url = _DEFAULT_URL )
```

Retrieve the simulation result summary for a finished or failed job.

Only available after the job reaches a terminal state.
Requires a valid session token from genesys_auth.

16.6.2.9 genesys_job_status()

```
dict[str, Any] genesys_mcp.server.genesys_job_status (
            str token,
            str job_id,
            str  base_url = _DEFAULT_URL )
```

Return the current state of a worker job (queued/running/finished/failed).

Requires a valid session token from genesys_auth.

16.6.2.10 genesys_load_model()

```
dict[str, Any] genesys_mcp.server.genesys_load_model (
            str token,
            str filename,
            str  base_url = _DEFAULT_URL )
```

Load a model from a file inside the session workspace.

`filename` must be a basename (no path separators).
Requires a valid session token from genesys_auth.

16.6.2.11 genesys_new_model()

```
dict[str, Any] genesys_mcp.server.genesys_new_model (
            str token,
            str  base_url = _DEFAULT_URL )
```

Create a new empty simulation model in the current session.

The new model becomes the session's current model.
Requires a valid session token from genesys_auth.

16.6.2.12 genesys_run_job()

```
dict[str, Any] genesys_mcp.server.genesys_run_job (
            str token,
            str job_id,
            str  base_url = _DEFAULT_URL )
```

Execute a worker job synchronously.

The job must be in 'queued' state. This call blocks until the simulation
finishes. Poll genesys_job_status or call genesys_job_result afterwards.
Requires a valid session token from genesys_auth.

16.6.2.13 genesys_run_simulation()

```
dict[str, Any] genesys_mcp.server.genesys_run_simulation (
            str token,
            str  base_url = _DEFAULT_URL )
```

Run the current simulation synchronously and return a summary.

Configure simulation parameters first with genesys_configure_simulation.
Requires a valid session token from genesys_auth.

16.6.2.14 genesys_save_model()

```
dict[str, Any] genesys_mcp.server.genesys_save_model (
            str token,
            str filename,
            str  base_url = _DEFAULT_URL )
```

Save the current model to a file inside the session workspace.

`filename` must be a basename (no path separators). Only alphanumeric
characters, dots, hyphens, and underscores are allowed.
Requires a valid session token from genesys_auth.

16.6.2.15 genesys_simulation_status()

```
dict[str, Any] genesys_mcp.server.genesys_simulation_status (
            str token,
            str  base_url = _DEFAULT_URL )
```

Return the current simulation status (state, replication, clock, etc.).

Requires a valid session token from genesys_auth.

16.6.2.16 genesys_step_simulation()

```
dict[str, Any] genesys_mcp.server.genesys_step_simulation (
            str token,
            str  base_url = _DEFAULT_URL )
```

Advance the simulation by one event step.

Useful for step-by-step inspection. Configure with pause_on_event=True first.
Requires a valid session token from genesys_auth.

16.6.2.17 genesys_worker_capabilities()

```
dict[str, Any] genesys_mcp.server.genesys_worker_capabilities (
            str  base_url = _DEFAULT_URL )

Return the current worker's capability flags.

Describes what simulation features this worker instance supports.
No authentication required.
```

16.6.2.18 genesys_worker_info()

```
dict[str, Any] genesys_mcp.server.genesys_worker_info (
            str  base_url = _DEFAULT_URL )

Return worker identity metadata (id, version, role).

No authentication required.
```

16.6.3 Variable Documentation

16.6.3.1 mcp

```
genesys_mcp.server.mcp
```

Initial value:

```
00001 =  FastMCP(
00002     "Genesys Simulator",
00003     instructions=(
00004         "Use these tools to create, configure, and run GenESyS discrete-event "
00005         "simulation models. Always call genesys_auth first to obtain a session "
00006         "token before using any other tool."
00007     ),
00008 )
```

16.7 GuiCrashDiagnostics Namespace Reference

Crash diagnostics helpers for the Qt GUI process.

Functions

- void **installFatalSignalHandlers** ()

  Installs temporary fatal-signal handlers that print a crash backtrace.

16.7.1 Detailed Description

Crash diagnostics helpers for the Qt GUI process.
This namespace keeps temporary signal-handling utilities isolated from the rest of the GUI runtime so they can be installed only when needed during crash investigation.

16.8 QCP Namespace Reference

Enumerations

- enum ResolutionUnit { ruDotsPerMeter , ruDotsPerCentimeter , ruDotsPerInch }
- enum ExportPen { epNoCosmetic , epAllowCosmetic }
- enum SignDomain { sdNegative , sdBoth , sdPositive }
- enum MarginSide {
  msLeft = 0x01 , msRight = 0x02 , msTop = 0x04 , msBottom = 0x08 ,
  msAll = 0xFF , msNone = 0x00 }

- enum AntialiasedElement {
  aeAxes = 0x0001 , aeGrid = 0x0002 , aeSubGrid = 0x0004 , aeLegend = 0x0008 ,
  aeLegendItems = 0x0010 , aePlottables = 0x0020 , aeItems = 0x0040 , aeScatters = 0x0080 ,
  aeFills = 0x0100 , aeZeroLine = 0x0200 , aeOther = 0x8000 , aeAll = 0xFFFF ,
  aeNone = 0x0000 }
- enum PlottingHint { phNone = 0x000 , phFastPolylines = 0x001 , phImmediateRefresh = 0x002 , phCacheLabels = 0x004 }
- enum Interaction {
  iNone = 0x000 , iRangeDrag = 0x001 , iRangeZoom = 0x002 , iMultiSelect = 0x004 ,
  iSelectPlottables = 0x008 , iSelectAxes = 0x010 , iSelectLegend = 0x020 , iSelectItems = 0x040 ,
  iSelectOther = 0x080 , iSelectPlottablesBeyondAxisRect = 0x100 }
- enum SelectionRectMode { srmNone , srmZoom , srmSelect , srmCustom }
- enum SelectionType {
  stNone , stWhole , stSingleData , stDataRange ,
  stMultipleDataRanges }

Functions

- bool **isInvalidData** (double value)
- bool **isInvalidData** (double value1, double value2)
- void **setMarginValue** (QMargins &margins, QCP::MarginSide side, int value)
- int **getMarginValue** (const QMargins &margins, QCP::MarginSide side)

Variables

- const QMetaObject **staticMetaObject**

16.8.1 Detailed Description

The QCP Namespace contains general enums, QFlags and functions used throughout the QCustomPlot library.
It provides QMetaObject-based reflection of its enums and flags via *QCP::staticMetaObject*.

16.8.2 Enumeration Type Documentation

16.8.2.1 AntialiasedElement

`enum QCP::AntialiasedElement`

Defines what objects of a plot can be forcibly drawn antialiased/not antialiased. If an object is neither forcibly drawn antialiased nor forcibly drawn not antialiased, it is up to the respective element how it is drawn. Typically it provides a *setAntialiased* function for this.
`AntialiasedElements` is a flag of or-combined elements of this enum type.

See also

QCustomPlot::setAntialiasedElements, QCustomPlot::setNotAntialiasedElements

Enumerator

aeAxes	`0x0001` Axis base line and tick marks
aeGrid	`0x0002` Grid lines
aeSubGrid	`0x0004` Sub grid lines
aeLegend	`0x0008` Legend box
aeLegendItems	`0x0010` Legend items
aePlottables	`0x0020` Main lines of plottables
aeItems	`0x0040` Main lines of items
aeScatters	`0x0080` Scatter symbols of plottables (excluding scatter symbols of type ssPixmap)
aeFills	`0x0100` Borders of fills (e.g. under or between graphs)

Enumerator

aeZeroLine	0x0200 Zero-lines, see QCPGrid::setZeroLinePen
aeOther	0x8000 Other elements that don't fit into any of the existing categories
aeAll	0xFFFF All elements
aeNone	0x0000 No elements

16.8.2.2 ExportPen

enum QCP::ExportPen

Defines how cosmetic pens (pens with numerical width 0) are handled during export.

See also

QCustomPlot::savePdf

Enumerator

epNoCosmetic	Cosmetic pens are converted to pens with pixel width 1 when exporting.
epAllowCosmetic	Cosmetic pens are exported normally (e.g. in PDF exports, cosmetic pens always appear as 1 pixel on screen, independent of viewer zoom level)

16.8.2.3 Interaction

enum QCP::Interaction

Defines the mouse interactions possible with QCustomPlot.
Interactions is a flag of or-combined elements of this enum type.

See also

QCustomPlot::setInteractions

Enumerator

iNone	0x000 None of the interactions are possible
iRangeDrag	0x001 Axis ranges are draggable (see QCPAxisRect::setRangeDrag, QCPAxisRect::setRangeDragAxes)
iRangeZoom	0x002 Axis ranges are zoomable with the mouse wheel (see QCPAxisRect::setRangeZoom, QCPAxisRect::setRangeZoomAxes)
iMultiSelect	0x004 The user can select multiple objects by holding the modifier set by QCustomPlot::setMultiSelectModifier while clicking
iSelectPlottables	0x008 Plottables are selectable (e.g. graphs, curves, bars,... see QCPAbstractPlottable)
iSelectAxes	0x010 Axes are selectable (or parts of them, see QCPAxis::setSelectableParts)
iSelectLegend	0x020 Legends are selectable (or their child items, see QCPLegend::setSelectableParts)
iSelectItems	0x040 Items are selectable (Rectangles, Arrows, Textitems, etc. see QCPAbstractItem)
iSelectOther	0x080 All other objects are selectable (e.g. your own derived layerables, other layout elements,...)
iSelectPlottablesBeyondAxisRect	0x100 When performing plottable selection/hit tests, this flag extends the sensitive area beyond the axis rect

16.8.2.4 MarginSide

enum QCP::MarginSide

Defines the sides of a rectangular entity to which margins can be applied.

See also

QCPLayoutElement::setAutoMargins, QCPAxisRect::setAutoMargins

Enumerator

msLeft	0x01 left margin
msRight	0x02 right margin
msTop	0x04 top margin
msBottom	0x08 bottom margin
msAll	0xFF all margins
msNone	0x00 no margin

16.8.2.5 PlottingHint

enum QCP::PlottingHint

Defines plotting hints that control various aspects of the quality and speed of plotting.

See also

QCustomPlot::setPlottingHints

Enumerator

phNone	0x000 No hints are set
phFastPolylines	joins, thus is most effective for pen sizes larger than 1. It is only used for solid line pens. 0x001 Graph/Curve lines are drawn with a faster method. This reduces the quality especially of the line segment
phImmediateRefresh	This is set by default to prevent the plot from freezing on fast consecutive replots (e.g. user drags ranges with mouse). 0x002 causes an immediate repaint() instead of a soft update() when QCustomPlot::replot() is called with parameter QCustomPlot::rpRefreshHint.
phCacheLabels	0x004 axis (tick) labels will be cached as pixmaps, increasing replot performance.

16.8.2.6 ResolutionUnit

enum QCP::ResolutionUnit

Defines the different units in which the image resolution can be specified in the export functions.

See also

QCustomPlot::savePng, QCustomPlot::saveJpg, QCustomPlot::saveBmp, QCustomPlot::saveRastered

Enumerator

ruDotsPerMeter	Resolution is given in dots per meter (dpm)
ruDotsPerCentimeter	Resolution is given in dots per centimeter (dpcm)
ruDotsPerInch	Resolution is given in dots per inch (DPI/PPI)

16.8.2.7 SelectionRectMode

`enum QCP::SelectionRectMode`

Defines the behaviour of the selection rect.

See also

QCustomPlot::setSelectionRectMode, QCustomPlot::selectionRect, QCPSelectionRect

Enumerator

srmNone	The selection rect is disabled, and all mouse events are forwarded to the underlying objects, e.g. for axis range dragging.
srmZoom	When dragging the mouse, a selection rect becomes active. Upon releasing, the axes that are currently set as range zoom axes (QCPAxisRect::setRangeZoomAxes) will have their ranges zoomed accordingly.
srmSelect	When dragging the mouse, a selection rect becomes active. Upon releasing, plottable data points that were within the selection rect are selected, if the plottable's selectability setting permits. (See data selection mechanism for details.)
srmCustom	When dragging the mouse, a selection rect becomes active. It is the programmer's responsibility to connect according slots to the selection rect's signals (e.g. QCPSelectionRect::accepted) in order to process the user interaction.

16.8.2.8 SelectionType

`enum QCP::SelectionType`

Defines the different ways a plottable can be selected. These images show the effect of the different selection types, when the indicated selection rect was dragged:

td	td	td	td	td

See also

QCPAbstractPlottable::setSelectable, QCPDataSelection::enforceType

Enumerator

stNone	The plottable is not selectable.
stWhole	Selection behaves like stMultipleDataRanges, but if there are any data points selected, the entire plottable is drawn as selected.
stSingleData	One individual data point can be selected at a time.
stDataRange	Multiple contiguous data points (a data range) can be selected.
stMultipleDataRanges	Any combination of data points/ranges can be selected.

16.8.2.9 SignDomain

`enum QCP::SignDomain`

Represents negative and positive sign domain, e.g. for passing to QCPAbstractPlottable::getKeyRange and QCPAbstractPlottable::getValueRange.

This is primarily needed when working with logarithmic axis scales, since only one of the sign domains can be visible at a time.

Enumerator

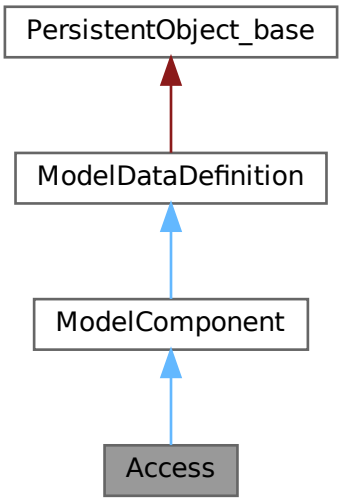
sdNegative	The negative sign domain, i.e. numbers smaller than zero.
sdBoth	Both sign domains, including zero, i.e. all numbers.
sdPositive	The positive sign domain, i.e. numbers greater than zero.

Chapter 17

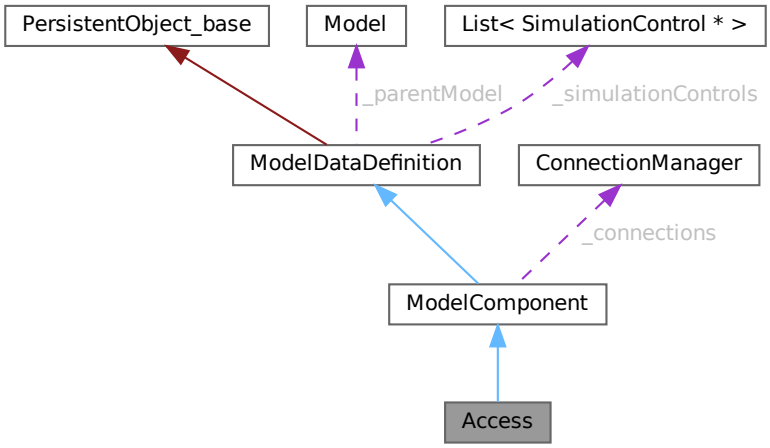
Class Documentation

17.1 Access Class Reference

`#include <plugins/components/MaterialHandling/Access.h>`
Inheritance diagram for Access:



Collaboration diagram for Access:



Public Member Functions

- **Access** (Model ∗model, std::string name="")
- virtual std::string show () override

  virtual public methods
- void **setConveyor** (Conveyor ∗conveyor)
- Conveyor ∗ **getConveyor** () const
- void **setQuantityExpression** (std::string quantityExpression)
- std::string **getQuantityExpression** () const

Public Member Functions inherited from ModelComponent

- ModelComponent (Model ∗model, std::string componentTypename, std::string name="")

  constructors
- virtual ∼**ModelComponent** ()

  Releases component-owned resources and unregisters it from the model.
- ConnectionManager ∗ getConnectionManager () const

  new public user methods for this component
- void connectTo (ModelComponent ∗component, unsigned int inputPortNumber=0)

  Connects this component to another component.
- bool hasBreakpointAt ()

  Indicates whether a simulation breakpoint is set on this component.
- void setDescription (std::string _description)

  Updates the free-form description shown by the GUI.
- std::string getDescription () const

  Returns the free-form description associated with this component.
- void remove (ModelComponent ∗comp)

  Removes a connected component from this component.

Public Member Functions inherited from ModelDataDefinition

- ModelDataDefinition (Model *model, std::string datadefinitionTypename, std::string name="", bool insertIntoModel=true)

  Creates a model data definition and optionally inserts it into the model.
- virtual ~**ModelDataDefinition** ()

  Releases resources owned by this data definition.
- Util::identification getId () const

  Returns the unique identifier of this instance.
- void setName (const std::string &name)

  Updates the logical name of this instance.
- const std::string & getName () const

  Returns the logical name of this instance.
- void setLabel (const std::string &label)

  Updates the user-visible label of this instance.
- const std::string & getLabel () const

  Returns the user-visible label of this instance.
- const std::string & getClassname () const

  Returns the runtime class name used by the plugin system.
- Model * getParentModel () const

  Returns the parent model that owns this definition.
- bool isReportStatistics () const

  Indicates whether this data definition contributes report statistics.
- void setReportStatistics (bool reportStatistics)

  Enables or disables report-statistics generation for this definition.
- ModelDataDefinition * getInternalData (const std::string &name) const

  Looks up a named internal child data definition.
- std::map< std::string, ModelDataDefinition * > * getInternalData () const

  Returns the full map of internal child data definitions.
- std::map< std::string, ModelDataDefinition * > * getAttachedData () const

  Returns the full map of attached data definitions.
- bool hasChanged () const

  Indicates whether this instance has been modified since the last reset.
- void setHasChanged (bool hasChanged)

  Updates the changed flag for this data definition.
- unsigned int getLevel () const

  Returns the hierarchical editing context containing this element.
- void setModelLevel (unsigned int _modelLevel)

  Sets this element's hierarchical editing context.
- List< SimulationControl * > * getSimulationControls () const

  Returns the simulation controls owned by this data definition.
- TraceManager::Level getTraceLevelSpecific () const

  Returns the trace level that applies specifically to this definition.
- void setTraceLevelSpecific (TraceManager::Level level)

  Updates the trace level used by this definition.
- void defineTraceLevelSpecific (TraceManager::Level traceLevelspecific, bool traceLevelSpecificEnabled=true)

  Defines the specific trace level and optionally enables it immediately.
- bool isTraceLevelSpecificEnabled () const

  Indicates whether the specific trace level is enabled.
- void setTraceLevelSpecificEnabled (bool traceLevelSpecificEnabled)

  Enables or disables the specific trace level.

Static Public Member Functions

- static PluginInformation * **GetPluginInformation** ()
- static ModelComponent * **LoadInstance** (Model *model, PersistenceRecord *fields)
- static ModelDataDefinition * **NewInstance** (Model *model, std::string name="")

Static Public Member Functions inherited from ModelComponent

- static ModelComponent * LoadInstance (Model *model, PersistenceRecord *fields)

  static public methods that must have implementations (Load and New just the same. GetInformation must provide specific infos for the new component
- static bool Check (ModelComponent *component)

  Validates a component instance.
- static void CreateInternalData (ModelComponent *component)

  Creates internal data required by a component instance.
- static void SaveInstance (PersistenceRecord *fields, ModelComponent *component)

  Serializes a component instance into a persistence record.
- static void DispatchEvent (Event *event)

  Dispatches a simulation event to the target component.

Static Public Member Functions inherited from ModelDataDefinition

- static ModelDataDefinition * LoadInstance (Model *model, PersistenceRecord *fields, bool insertIntoModel)

  Loads a model data definition instance from serialized fields.
- static ModelDataDefinition * NewInstance (Model *model, std::string name="")

  Creates a new instance of a data definition using the plugin registry.
- static void SaveInstance (PersistenceRecord *fields, ModelDataDefinition *modeldatum)

  Serializes a data definition instance into a persistence record.
- static bool Check (ModelDataDefinition *modeldatum, std::string &errorMessage)

  Validates a data definition instance.
- static void InitBetweenReplications (ModelDataDefinition *modeldatum)

  Resets simulation-time state between replications.
- static void CreateInternalData (ModelDataDefinition *modeldatum)

  Creates internal and attached data required by this instance.
- static bool CreateRelatedDataElements (ModelDataDefinition *modeldatum, std::string &errorMessage)

  Creates related data and validates the instance in a single call.

Protected Member Functions

- virtual void _onDispatchEvent (Entity *entity, unsigned int inputPortNumber) override

  Handles a dispatched event for this component type.
- virtual bool _loadInstance (PersistenceRecord *fields) override

  virtual protected method that must be overriden
- virtual void _saveInstance (PersistenceRecord *fields, bool saveDefaultValues) override

  Saves object fields into a serialization structure.
- virtual bool _check (std::string &errorMessage) override

  could be overriden by derived classes

Protected Member Functions inherited from ModelDataDefinition

- bool _getSaveDefaultsOption ()
- virtual ParserChangesInformation * _getParserChangesInformation ()
- virtual void _initBetweenReplications ()
- virtual void _addSimulationControl (SimulationControl *control)
- virtual void _createInternalAndAttachedData ()
- virtual void **_createInternalStatisticReporters** ()
- virtual void _createAttachedAttributes ()
- virtual void _createNonEditableDataDefinitions ()
- virtual void _createEditableDataDefinitions ()
- void **_templateCreateInternalStatisticReporters** ()
- void **_templateCreateAttachedAttributes** ()
- void **_templateCreateNonEditableDataDefinitions** ()
- void **_templateCreateEditableDataDefinitions** ()
- void **_internaStatisticReportersClear** ()

  legacy helper methods used by the granular create hooks*
- void **_internalDataClear** ()
- void **_internalDataInsert** (const std::string &key, ModelDataDefinition *child)
- void **_internalDataRemove** (const std::string &key)
- void **_attachedDataClear** ()
- void **_attachedDataInsert** (const std::string &key, ModelDataDefinition *data)
- void **_attachedDataRemove** (const std::string &key)
- void **_attachedAttributesInsert** (const std::vector< std::string > &neededNames)
- void **_statisticReporterInsert** (const std::string &key, ModelDataDefinition *data)
- void **_statisticReporterRemove** (const std::string &key)
- void **_statisticReportersClear** ()
- void **_mandatoryAttachedAttributeInsert** (const std::string &key, ModelDataDefinition *data)
- void **_mandatoryAttachedAttributeRemove** (const std::string &key)
- void **_mandatoryAttachedAttributesClear** ()
- void **_mandatoryEditableDataDefinitionInsert** (const std::string &key, ModelDataDefinition *data)
- void **_mandatoryEditableDataDefinitionRemove** (const std::string &key)
- void **_mandatoryEditableDataDefinitionsClear** ()
- void **_optionalEditableDataDefinitionInsert** (const std::string &key, ModelDataDefinition *data)
- void **_optionalEditableDataDefinitionRemove** (const std::string &key)
- void **_optionalEditableDataDefinitionsClear** ()
- void **_mandatoryNonEditableDataDefinitionInsert** (const std::string &key, ModelDataDefinition *data)
- void **_mandatoryNonEditableDataDefinitionRemove** (const std::string &key)
- void **_mandatoryNonEditableDataDefinitionsClear** ()
- void **_optionalNonEditableDataDefinitionInsert** (const std::string &key, ModelDataDefinition *data)
- void **_optionalNonEditableDataDefinitionRemove** (const std::string &key)
- void **_optionalNonEditableDataDefinitionsClear** ()
- void **_checkCreateAttachedReferencedDataDefinition** (const std::string &expression)

  method to be called to insert attached dataelements that are referenced by string expressions (detected by the parser), to avoid orphaned data definitions
- void **trace** (const std::string &text, TraceManager::Level level=TraceManager::Level::L8_detailed)

  not just an easy access to trace manager, but wrappers to check if specific trace level applies
- void **traceError** (const std::string &text, const std::exception &e)
- void **traceError** (const std::string &text, TraceManager::Level level=TraceManager::Level::L1_errorFatal)
- void **traceReport** (const std::string &text, TraceManager::Level level=TraceManager::Level::L2_results)
- void **traceSimulation** (void *thisobject, double time, Entity *entity, ModelComponent *component, const std::string &text, TraceManager::Level level=TraceManager::Level::L8_detailed)
- void traceSimulation (void *thisobject, const std::string &text, TraceManager::Level level=TraceManager::↩ Level::L8_detailed)

  Traces text to the simulation output.
- void **traceSimulation** (void *thisobject, TraceManager::Level level, const std::string &text)

Additional Inherited Members

17.1.1 Detailed Description

Access module DESCRIPTION The Access module allocates one or more cells of a conveyor to an entity for movement from one station to another. Once the entity has control of the cells on the conveyor, it may then be conveyed to the next station. When an entity arrives at an Access module, it will wait until the appropriate number of contiguous cells on the conveyor are empty and aligned with the entity's station location. TYPICAL USES Parts accessing a conveyor to be sent to a paint booth Glass accessing a conveyor to be transferred to a cutting station PROMPTS Prompt Description Name Unique name of the module that will be displayed in the flowchart. Conveyor Name Name of the conveyor that the entity desires.

17.1.2 of Cells Number of contiguous conveyor cells the entity requires for

movement on the conveyor. Queue Type Determines the type of queue used to hold the entities, either an individual Queue, a queue Set, and Internal queue or an Attribute or Expression that evaluate to the queue name. Queue Name Name of the queue that will hold the entity until it accesses the conveyor. Set Name Name of the set of queues. Set Index Defines the index into the queue set. Note that this is the index into the set and not the name of the queue in the set. For example, the only valid entries for a queue set containing three members is an expression that evaluates to 1, 2, or 3. Attribute Name Defines the name of the attribute that stores the queue name to which entities will reside. Expression Defines the name of the expression that stores the queue name to which entities will reside.

17.1.3 Member Function Documentation

17.1.3.1 _check()

```
bool Access::_check (
            std::string & errorMessage )  [override], [protected], [virtual]
```

could be overriden by derived classes
Reimplemented from ModelDataDefinition.

17.1.3.2 _loadInstance()

```
bool Access::_loadInstance (
            PersistenceRecord * fields )  [override], [protected], [virtual]
```

virtual protected method that must be overriden
Reimplemented from ModelComponent.

17.1.3.3 _onDispatchEvent()

```
void Access::_onDispatchEvent (
            Entity * entity,
            unsigned int inputPortNumber )  [override], [protected], [virtual]
```

Handles a dispatched event for this component type.
This method is only for ModelComponents, not for ModelDataElements.

Parameters

entity	Entity being processed.
inputPortNumber	Input port where the entity arrived.

Implements ModelComponent.

17.1.3.4 _saveInstance()

```
void Access::_saveInstance (
            PersistenceRecord * fields,
            bool saveDefaultValues )  [override], [protected], [virtual]
```

Saves object fields into a serialization structure.

Parameters

fields	a table-like structure used for serialization.
saveDefaultValues	indicates whether or not to save fields which are set to their default value.

Reimplemented from ModelComponent.

17.1.3.5 show()

```
std::string Access::show ( )  [override], [virtual]
```

virtual public methods
Returns a textual representation of this component.

Returns

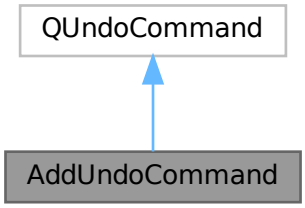
Human-readable description used for tracing and debugging.

Reimplemented from ModelComponent.
The documentation for this class was generated from the following files:

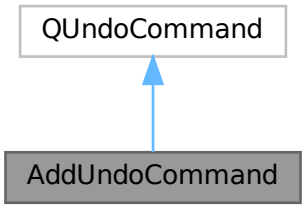
- plugins/components/MaterialHandling/Access.h
- plugins/components/MaterialHandling/Access.cpp

17.2 AddUndoCommand Class Reference

Inheritance diagram for AddUndoCommand:



Collaboration diagram for AddUndoCommand:



Public Member Functions

- **AddUndoCommand** (QGraphicsItem ∗item, ModelGraphicsScene ∗scene, QUndoCommand ∗parent=nullptr)

  virtual public methods

Public Member Functions inherited from ModelComponent

- ModelComponent (Model *model, std::string componentTypename, std::string name="")

  constructors
- virtual ~**ModelComponent** ()

  Releases component-owned resources and unregisters it from the model.
- ConnectionManager * getConnectionManager () const

  new public user methods for this component
- void connectTo (ModelComponent *component, unsigned int inputPortNumber=0)

  Connects this component to another component.
- bool hasBreakpointAt ()

  Indicates whether a simulation breakpoint is set on this component.
- void setDescription (std::string _description)

  Updates the free-form description shown by the GUI.
- std::string getDescription () const

  Returns the free-form description associated with this component.
- void remove (ModelComponent *comp)

  Removes a connected component from this component.

Public Member Functions inherited from ModelDataDefinition

- ModelDataDefinition (Model *model, std::string datadefinitionTypename, std::string name="", bool insertIntoModel=true)

  Creates a model data definition and optionally inserts it into the model.
- virtual ~**ModelDataDefinition** ()

  Releases resources owned by this data definition.
- Util::identification getId () const

  Returns the unique identifier of this instance.
- void setName (const std::string &name)

  Updates the logical name of this instance.
- const std::string & getName () const

  Returns the logical name of this instance.
- void setLabel (const std::string &label)

  Updates the user-visible label of this instance.
- const std::string & getLabel () const

  Returns the user-visible label of this instance.
- const std::string & getClassname () const

  Returns the runtime class name used by the plugin system.
- Model * getParentModel () const

  Returns the parent model that owns this definition.
- bool isReportStatistics () const

  Indicates whether this data definition contributes report statistics.
- void setReportStatistics (bool reportStatistics)

  Enables or disables report-statistics generation for this definition.
- ModelDataDefinition * getInternalData (const std::string &name) const

  Looks up a named internal child data definition.
- std::map< std::string, ModelDataDefinition * > * getInternalData () const

  Returns the full map of internal child data definitions.
- std::map< std::string, ModelDataDefinition * > * getAttachedData () const

  Returns the full map of attached data definitions.
- bool hasChanged () const

  Indicates whether this instance has been modified since the last reset.
- void setHasChanged (bool hasChanged)

  Updates the changed flag for this data definition.
- unsigned int getLevel () const

  Returns the hierarchical editing context containing this element.
- void setModelLevel (unsigned int _modelLevel)

  Sets this element's hierarchical editing context.
- List< SimulationControl * > * getSimulationControls () const

  Returns the simulation controls owned by this data definition.
- TraceManager::Level getTraceLevelSpecific () const

  Returns the trace level that applies specifically to this definition.
- void setTraceLevelSpecific (TraceManager::Level level)

  Updates the trace level used by this definition.
- void defineTraceLevelSpecific (TraceManager::Level traceLevelspecific, bool traceLevelSpecificEnabled=true)

  Defines the specific trace level and optionally enables it immediately.
- bool isTraceLevelSpecificEnabled () const

  Indicates whether the specific trace level is enabled.
- void setTraceLevelSpecificEnabled (bool traceLevelSpecificEnabled)

  Enables or disables the specific trace level.

Static Public Member Functions

- static PluginInformation * **GetPluginInformation** ()
- static ModelComponent * **LoadInstance** (Model *model, PersistenceRecord *fields)
- static ModelDataDefinition * **NewInstance** (Model *model, std::string name="")

Static Public Member Functions inherited from ModelComponent

- static ModelComponent * LoadInstance (Model *model, PersistenceRecord *fields)

  static public methods that must have implementations (Load and New just the same. GetInformation must provide specific infos for the new component
- static bool Check (ModelComponent *component)

  Validates a component instance.
- static void CreateInternalData (ModelComponent *component)

  Creates internal data required by a component instance.
- static void SaveInstance (PersistenceRecord *fields, ModelComponent *component)

  Serializes a component instance into a persistence record.
- static void DispatchEvent (Event *event)

  Dispatches a simulation event to the target component.

Static Public Member Functions inherited from ModelDataDefinition

- static ModelDataDefinition * LoadInstance (Model *model, PersistenceRecord *fields, bool insertIntoModel)

  Loads a model data definition instance from serialized fields.
- static ModelDataDefinition * NewInstance (Model *model, std::string name="")

  Creates a new instance of a data definition using the plugin registry.
- static void SaveInstance (PersistenceRecord *fields, ModelDataDefinition *modeldatum)

  Serializes a data definition instance into a persistence record.
- static bool Check (ModelDataDefinition *modeldatum, std::string &errorMessage)

  Validates a data definition instance.
- static void InitBetweenReplications (ModelDataDefinition *modeldatum)

  Resets simulation-time state between replications.
- static void CreateInternalData (ModelDataDefinition *modeldatum)

  Creates internal and attached data required by this instance.
- static bool CreateRelatedDataElements (ModelDataDefinition *modeldatum, std::string &errorMessage)

  Creates related data and validates the instance in a single call.

Protected Member Functions

- virtual bool _loadInstance (PersistenceRecord *fields) override

  virtual protected method that must be overriden
- virtual void _saveInstance (PersistenceRecord *fields, bool saveDefaultValues) override

  Saves object fields into a serialization structure.
- virtual bool _check (std::string &errorMessage) override

  could be overriden by derived classes
- virtual void _onDispatchEvent (Entity *entity, unsigned int inputPortNumber) override

  Handles a dispatched event for this component type.

Protected Member Functions inherited from ModelDataDefinition

17.3.1 Member Function Documentation

17.3.1.1 _check()

```
bool AIAssistant::_check (
            std::string & errorMessage )  [override], [protected], [virtual]
```

could be overriden by derived classes
Reimplemented from ModelDataDefinition.

17.3.1.2 _loadInstance()

```
bool AIAssistant::_loadInstance (
            PersistenceRecord * fields )  [override], [protected], [virtual]
```

virtual protected method that must be overriden
Reimplemented from ModelComponent.

17.3.1.3 _onDispatchEvent()

```
void AIAssistant::_onDispatchEvent (
            Entity * entity,
            unsigned int inputPortNumber )  [override], [protected], [virtual]
```

Handles a dispatched event for this component type.
This method is only for ModelComponents, not for ModelDataElements.

Parameters

entity	Entity being processed.
inputPortNumber	Input port where the entity arrived.

Implements ModelComponent.

17.3.1.4 _saveInstance()

```
void AIAssistant::_saveInstance (
            PersistenceRecord * fields,
            bool saveDefaultValues )  [override], [protected], [virtual]
```

Saves object fields into a serialization structure.

Parameters

fields	a table-like structure used for serialization.
saveDefaultValues	indicates whether or not to save fields which are set to their default value.

Reimplemented from ModelComponent.

17.3.1.5 show()

```
std::string AIAssistant::show ( )  [override], [virtual]
```

virtual public methods
Returns a textual representation of this component.

Returns

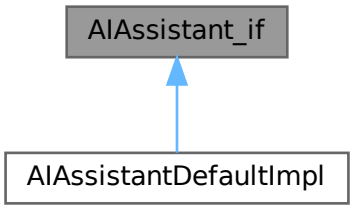
Human-readable description used for tracing and debugging.

Reimplemented from ModelComponent.
The documentation for this class was generated from the following files:

- plugins/components/AI/AIAssistant.h
- plugins/components/AI/AIAssistant.cpp

17.4 AIAssistant_if Class Reference

Abstract interface for the GenESyS AI Assistant tool.
`#include <tools/AIAssistant/AIAssistant_if.h>`
Inheritance diagram for AIAssistant_if:



Public Member Functions

- virtual void setConfiguration (const AIAssistantConfiguration &configuration)=0

  Replaces the entire configuration record.
- virtual AIAssistantConfiguration getConfiguration () const =0

  Returns a copy of the current configuration record.
- virtual void setProvider (AIProvider provider)=0

  Sets the AI backend provider.
- virtual AIProvider getProvider () const =0

  Returns the currently configured AI provider.
- virtual void setProviderName (const std::string &providerName)=0

  Sets a human-readable provider label.
- virtual std::string getProviderName () const =0

Returns the human-readable provider label.

- virtual void setModelName (const std::string &modelName)=0

  Sets the provider model identifier (e.g. "gpt-4o", "claude-opus-4-7").
- virtual std::string getModelName () const =0

  Returns the provider model identifier.
- virtual void setBaseUrl (const std::string &baseUrl)=0

  Sets the base URL; required when provider == CustomHttp.
- virtual std::string getBaseUrl () const =0

  Returns the currently configured base URL.
- virtual void setReasoningEffort (ReasoningEffort effort)=0

  Sets the desired reasoning effort hint.
- virtual ReasoningEffort getReasoningEffort () const =0

  Returns the currently configured reasoning effort.
- virtual void setTemperature (double temperature)=0

  Sets the sampling temperature (0.0 = deterministic, 1.0 = creative).
- virtual double getTemperature () const =0

  Returns the configured sampling temperature.
- virtual void setMaxOutputTokens (unsigned int maxOutputTokens)=0

  Sets the maximum number of output tokens to request.
- virtual unsigned int getMaxOutputTokens () const =0

  Returns the maximum output tokens limit.
- virtual void setTimeoutSeconds (unsigned int timeoutSeconds)=0

  Sets the HTTP request timeout in seconds.
- virtual unsigned int getTimeoutSeconds () const =0

  Returns the HTTP request timeout in seconds.
- virtual void setApiKey (const std::string &apiKey)=0

  Stores the API key in memory for the duration of the session.
- virtual void clearApiKey ()=0

  Erases the in-memory API key.
- virtual bool hasApiKey () const =0

  Returns `true` when a non-empty API key is held in memory.
- virtual std::string getMaskedApiKey () const =0

  Returns a redacted representation of the current API key.
- virtual void setApiKeyEnvironmentVariable (const std::string &variableName)=0

  Stores the name of the environment variable that holds the API key.
- virtual std::string getApiKeyEnvironmentVariable () const =0

  Returns the configured environment-variable name.
- virtual bool loadApiKeyFromEnvironment ()=0

  Reads the API key from the configured environment variable.
- virtual void setSimulatorFacade (SimulatorFacade *simulatorFacade)=0

  Attaches a non-owning SimulatorFacade pointer.
- virtual SimulatorFacade * getSimulatorFacade () const =0

  Returns the currently attached SimulatorFacade pointer, or `nullptr`.
- virtual bool hasSimulatorFacade () const =0

  Returns `true` when a non-null SimulatorFacade is attached.
- virtual void setProviderClient (AIProviderClient_if *client)=0

  Injects an external provider client (non-owning).
- virtual AIProviderClient_if * getProviderClient () const =0

  Returns the currently attached provider client, or `nullptr`.
- virtual bool hasProviderClient () const =0

  Returns `true` when a non-null provider client is attached.

- virtual void clearKnowledgeBase ()=0

  Removes all items from the knowledge base.
- virtual void addKnowledgeItem (const GenesysKnowledgeItem &item)=0

  Appends one item to the knowledge base.
- virtual std::vector< GenesysKnowledgeItem > getKnowledgeItems () const =0

  Returns a copy of all registered knowledge items.
- virtual GenesysKnowledgeBaseSummary getKnowledgeBaseSummary () const =0

  Returns an aggregate summary of the knowledge base.
- virtual std::string exportKnowledgeBaseAsMarkdown () const =0

  Renders the knowledge base as a Markdown document.
- virtual bool refreshKnowledgeBaseFromSimulator (std::string *message=nullptr)=0

  Populates the knowledge base by introspecting the attached SimulatorFacade.
- virtual bool checkReady (std::string *message=nullptr) const =0

  Checks whether the assistant has enough configuration to operate.
- virtual AIAssistantResponse analyzePrompt (const AIAssistantRequest &request)=0

  Parses and summarises a user prompt without calling any external service.
- virtual AIAssistantResponse createModelPlan (const AIAssistantRequest &request)=0

  Produces a structured plan mapping the prompt to GenESyS components.
- virtual AIAssistantResponse buildModel (const AIAssistantRequest &request)=0

  Constructs a GenESyS model via SimulatorFacade using an LLM-generated .gen file.
- virtual AIAssistantResponse configureSimulation (const AIAssistantRequest &request)=0

  Overrides ModelSimulation parameters on the current model.
- virtual AIAssistantResponse runSimulation (const AIAssistantRequest &request)=0

  Executes the configured simulation synchronously via SimulatorFacade.
- virtual AIAssistantResponse collectResults (const AIAssistantRequest &request)=0

  Collects and formats simulation results from the current model.
- virtual AIAssistantResponse execute (const AIAssistantRequest &request)=0

  High-level dispatcher that orchestrates the full pipeline based on request flags.
- virtual ExecutionState getState () const =0

  Returns the current lifecycle state.
- virtual std::string getLastError () const =0

  Returns the error message from the most recent failed operation.
- virtual std::string getLastDiagnostics () const =0

  Returns technical diagnostic output from the most recent operation.
- virtual void clearDiagnostics ()=0

  Clears both the last error and diagnostics strings.
- virtual std::vector< AuditEntry > getAuditEntries (unsigned int maxEntries=200) const =0

  Returns up to `maxEntries` most-recent audit entries (oldest first).
- virtual std::string getAuditLogPath () const =0

  Returns the absolute path of the audit log file.
- virtual unsigned int exportAuditLog (const std::string &csvPath) const =0

  Exports all audit entries to a CSV file.

17.4.1 Detailed Description

Abstract interface for the GenESyS AI Assistant tool.
The AI Assistant translates natural-language prompts into GenESyS simulation models, configures experiments and optionally executes them. This interface defines the full contract; concrete implementations supply the provider integration logic.

17.4.1.1 Security model

- API keys are accepted only through setApiKey() or loadApiKeyFromEnvironment().
- No method returns the raw key value (getApiKey() does not exist by design).
- getMaskedApiKey() exposes only the last four characters.
- All capability-affecting operations are guarded by explicit permission flags in AIAssistantConfiguration. The deny-by-default posture means nothing is sent to external services, no model is mutated, and no simulation is run unless the caller has explicitly enabled each permission.

17.4.1.2 Planned evolution

See source/tools/ARCHITECTURE_tools.md for the multi-stage roadmap.

17.4.1.3 Thread safety

Implementations are not required to be thread-safe in this version.

17.4.2 Member Function Documentation

17.4.2.1 addKnowledgeItem()

```
virtual void AIAssistant_if::addKnowledgeItem (
            const GenesysKnowledgeItem & item )  [pure virtual]
```

Appends one item to the knowledge base.
Implemented in AIAssistantDefaultImpl.

17.4.2.2 analyzePrompt()

```
virtual AIAssistantResponse AIAssistant_if::analyzePrompt (
            const AIAssistantRequest & request )  [pure virtual]
```

Parses and summarises a user prompt without calling any external service.
Stage 3 will implement actual LLM calls. Current stub returns NotImplemented.
Implemented in AIAssistantDefaultImpl.

17.4.2.3 buildModel()

```
virtual AIAssistantResponse AIAssistant_if::buildModel (
            const AIAssistantRequest & request )  [pure virtual]
```

Constructs a GenESyS model via SimulatorFacade using an LLM-generated .gen file.
Requires `allowModelMutation` == `true`, `allowNetworkAccess` == `true`, a valid SimulatorFacade, and an attached provider client.
Behaviour (Stage 5):

1. If `request.modelPlan` is non-empty, it is used as the model specification. Otherwise, the `request` description fields are used directly.
2. An LLM call is made requesting a GenESyS model language (.gen) file.
3. The generated .gen content is written to a temp file and loaded via SimulatorFacade::loadModel(). The temp file is deleted immediately after loading.
4. `AIAssistantResponse::generatedModelLanguage` holds the generated .gen text.

Implemented in AIAssistantDefaultImpl.

17.4.2.4 checkReady()

```
virtual bool AIAssistant_if::checkReady (
            std::string * message = nullptr ) const  [pure virtual]
```

Checks whether the assistant has enough configuration to operate.

Parameters

message	Optional; receives a description of the first unsatisfied condition, or a confirmation message when ready.

Returns

`true` when all minimum requirements are met for prompt analysis.

Checks performed (in order):

1. Provider is not `AIProvider::Undefined`.
2. Model name is not empty.
3. For OpenAI/Anthropic/CustomHttp: an API key is held in memory or an environment-variable name is configured.
4. For CustomHttp: baseUrl is not empty.

Note: SimulatorFacade and permission flags are checked separately when model-mutation or simulation-execution operations are requested.
Implemented in AIAssistantDefaultImpl.

17.4.2.5 clearApiKey()

```
virtual void AIAssistant_if::clearApiKey ( )  [pure virtual]
```

Erases the in-memory API key.
Implementations should overwrite the key buffer before clearing to reduce the window of exposure. Note that standard C++ provides no guarantee that the compiler will not optimise away the overwrite; platform-specific secure zeroing (explicit_bzero, SecureZeroMemory) should be used in security-critical contexts.
Implemented in AIAssistantDefaultImpl.

17.4.2.6 clearDiagnostics()

```
virtual void AIAssistant_if::clearDiagnostics ( )  [pure virtual]
```

Clears both the last error and diagnostics strings.
Implemented in AIAssistantDefaultImpl.

17.4.2.7 clearKnowledgeBase()

```
virtual void AIAssistant_if::clearKnowledgeBase ( )  [pure virtual]
```

Removes all items from the knowledge base.
Implemented in AIAssistantDefaultImpl.

17.4.2.8 collectResults()

```
virtual AIAssistantResponse AIAssistant_if::collectResults (
            const AIAssistantRequest & request )  [pure virtual]
```

Collects and formats simulation results from the current model.
Iterates SimulatorFacade::modelGetResponses() and renders them as a Markdown table in `AIAssistantResponse::message`
Implemented in AIAssistantDefaultImpl.

17.4.2.9 configureSimulation()

```
virtual AIAssistantResponse AIAssistant_if::configureSimulation (
            const AIAssistantRequest & request )  [pure virtual]
```

Overrides ModelSimulation parameters on the current model.
Requires `allowModelMutation` == `true` and a valid SimulatorFacade.
Behaviour (Stage 5):

1. Makes a small LLM call to extract structured simulation parameters from `request.experiment↩ Description` (replications, replication length, warm-up period, time units).
2. Applies the extracted values via SimulatorFacade::simSet∗() methods.
3. Parameters already set by a loaded .gen file are overridden only when the LLM extraction yields non-zero values.

Implemented in AIAssistantDefaultImpl.

17.4.2.10 createModelPlan()

```
virtual AIAssistantResponse AIAssistant_if::createModelPlan (
            const AIAssistantRequest & request ) [pure virtual]
```

Produces a structured plan mapping the prompt to GenESyS components.
Stage 4 will implement prompt-to-plan translation. Current stub returns NotImplemented.
Implemented in AIAssistantDefaultImpl.

17.4.2.11 execute()

```
virtual AIAssistantResponse AIAssistant_if::execute (
            const AIAssistantRequest & request ) [pure virtual]
```

High-level dispatcher that orchestrates the full pipeline based on request flags.
Calls analyzePrompt, createModelPlan, buildModel, configureSimulation, runSimulation and collectResults in sequence according to the enabled flags in `request`. Stops at the first failure.
Implemented in AIAssistantDefaultImpl.

17.4.2.12 exportAuditLog()

```
virtual unsigned int AIAssistant_if::exportAuditLog (
            const std::string & csvPath ) const [pure virtual]
```

Exports all audit entries to a CSV file.

Parameters

csvPath	Destination file path.

Returns

Number of data rows written (excluding the header).

Implemented in AIAssistantDefaultImpl.

17.4.2.13 exportKnowledgeBaseAsMarkdown()

```
virtual std::string AIAssistant_if::exportKnowledgeBaseAsMarkdown ( ) const [pure virtual]
```

Renders the knowledge base as a Markdown document.
Intended to be injected into the system prompt so the AI model knows which GenESyS building blocks are available.
Implemented in AIAssistantDefaultImpl.

17.4.2.14 getApiKeyEnvironmentVariable()

```
virtual std::string AIAssistant_if::getApiKeyEnvironmentVariable ( ) const [pure virtual]
```

Returns the configured environment-variable name.
Implemented in AIAssistantDefaultImpl.

17.4.2.15 getAuditEntries()

```
virtual std::vector< AuditEntry > AIAssistant_if::getAuditEntries (
            unsigned int maxEntries = 200 ) const [pure virtual]
```

Returns up to `maxEntries` most-recent audit entries (oldest first).
Reads from the persistent audit log file. Returns an empty vector when the file does not yet exist or cannot be read.
Implemented in AIAssistantDefaultImpl.

17.4.2.16 getAuditLogPath()

```
virtual std::string AIAssistant_if::getAuditLogPath ( ) const  [pure virtual]
```

Returns the absolute path of the audit log file.
Implemented in AIAssistantDefaultImpl.

17.4.2.17 getBaseUrl()

```
virtual std::string AIAssistant_if::getBaseUrl ( ) const  [pure virtual]
```

Returns the currently configured base URL.
Implemented in AIAssistantDefaultImpl.

17.4.2.18 getConfiguration()

```
virtual AIAssistantConfiguration AIAssistant_if::getConfiguration ( ) const  [pure virtual]
```

Returns a copy of the current configuration record.
The returned struct never contains the API key value.
Implemented in AIAssistantDefaultImpl.

17.4.2.19 getKnowledgeBaseSummary()

```
virtual GenesysKnowledgeBaseSummary AIAssistant_if::getKnowledgeBaseSummary ( ) const  [pure
virtual]
```

Returns an aggregate summary of the knowledge base.
Implemented in AIAssistantDefaultImpl.

17.4.2.20 getKnowledgeItems()

```
virtual std::vector< GenesysKnowledgeItem > AIAssistant_if::getKnowledgeItems ( ) const  [pure
virtual]
```

Returns a copy of all registered knowledge items.
Implemented in AIAssistantDefaultImpl.

17.4.2.21 getLastDiagnostics()

```
virtual std::string AIAssistant_if::getLastDiagnostics ( ) const  [pure virtual]
```

Returns technical diagnostic output from the most recent operation.
Never contains API key values. Safe to log for debugging.
Implemented in AIAssistantDefaultImpl.

17.4.2.22 getLastError()

```
virtual std::string AIAssistant_if::getLastError ( ) const  [pure virtual]
```

Returns the error message from the most recent failed operation.
Implemented in AIAssistantDefaultImpl.

17.4.2.23 getMaskedApiKey()

```
virtual std::string AIAssistant_if::getMaskedApiKey ( ) const  [pure virtual]
```

Returns a redacted representation of the current API key.
Only the last four characters are exposed, preceded by "****". Returns an empty string when no key is set. Example: "****abcd".
Implemented in AIAssistantDefaultImpl.

17.4.2.24 getMaxOutputTokens()

```
virtual unsigned int AIAssistant_if::getMaxOutputTokens ( ) const  [pure virtual]
```

Returns the maximum output tokens limit.
Implemented in AIAssistantDefaultImpl.

17.4.2.25 getModelName()

```
virtual std::string AIAssistant_if::getModelName ( ) const  [pure virtual]
```

Returns the provider model identifier.
Implemented in AIAssistantDefaultImpl.

17.4.2.26 getProvider()

```
virtual AIProvider AIAssistant_if::getProvider ( ) const  [pure virtual]
```

Returns the currently configured AI provider.
Implemented in AIAssistantDefaultImpl.

17.4.2.27 getProviderClient()

```
virtual AIProviderClient_if * AIAssistant_if::getProviderClient ( ) const  [pure virtual]
```

Returns the currently attached provider client, or `nullptr`.
Implemented in AIAssistantDefaultImpl.

17.4.2.28 getProviderName()

```
virtual std::string AIAssistant_if::getProviderName ( ) const  [pure virtual]
```

Returns the human-readable provider label.
Implemented in AIAssistantDefaultImpl.

17.4.2.29 getReasoningEffort()

```
virtual ReasoningEffort AIAssistant_if::getReasoningEffort ( ) const  [pure virtual]
```

Returns the currently configured reasoning effort.
Implemented in AIAssistantDefaultImpl.

17.4.2.30 getSimulatorFacade()

```
virtual SimulatorFacade * AIAssistant_if::getSimulatorFacade ( ) const  [pure virtual]
```

Returns the currently attached SimulatorFacade pointer, or `nullptr`.
Implemented in AIAssistantDefaultImpl.

17.4.2.31 getState()

```
virtual ExecutionState AIAssistant_if::getState ( ) const  [pure virtual]
```

Returns the current lifecycle state.
Implemented in AIAssistantDefaultImpl.

17.4.2.32 getTemperature()

```
virtual double AIAssistant_if::getTemperature ( ) const  [pure virtual]
```

Returns the configured sampling temperature.
Implemented in AIAssistantDefaultImpl.

17.4.2.33 getTimeoutSeconds()

```
virtual unsigned int AIAssistant_if::getTimeoutSeconds ( ) const  [pure virtual]
```

Returns the HTTP request timeout in seconds.
Implemented in AIAssistantDefaultImpl.

17.4.2.34 hasApiKey()

```
virtual bool AIAssistant_if::hasApiKey ( ) const  [pure virtual]
```

Returns `true` when a non-empty API key is held in memory.
Implemented in AIAssistantDefaultImpl.

17.4.2.35 hasProviderClient()

```
virtual bool AIAssistant_if::hasProviderClient ( ) const  [pure virtual]
```

Returns `true` when a non-null provider client is attached.
Implemented in AIAssistantDefaultImpl.

17.4.2.36 hasSimulatorFacade()

```
virtual bool AIAssistant_if::hasSimulatorFacade ( ) const  [pure virtual]
```

Returns `true` when a non-null SimulatorFacade is attached.
Implemented in AIAssistantDefaultImpl.

17.4.2.37 loadApiKeyFromEnvironment()

```
virtual bool AIAssistant_if::loadApiKeyFromEnvironment ( )  [pure virtual]
```

Reads the API key from the configured environment variable.

Returns

`true` when the variable exists and holds a non-empty value.

Does nothing and returns `false` when apiKeyEnvironmentVariable is empty or the variable is not defined in the process environment. The loaded value is kept only in memory; it is never written to disk.
Implemented in AIAssistantDefaultImpl.

17.4.2.38 refreshKnowledgeBaseFromSimulator()

```
virtual bool AIAssistant_if::refreshKnowledgeBaseFromSimulator (
            std::string * message = nullptr )  [pure virtual]
```

Populates the knowledge base by introspecting the attached SimulatorFacade.

Parameters

message	Optional; receives a human-readable status or error message.

Returns

`true` when introspection succeeded and at least one item was added.

This method is a planned feature (Stage 2). In the current implementation it is a safe stub that returns `false` with a descriptive message.
Planned behaviour (Stage 2):

- Query SimulatorFacade::getDataDefinitionPluginTypenames() for registered types.
- Enumerate ModelComponent and ModelDataDefinition subtypes.
- Build GenesysKnowledgeItem entries with typenames, descriptions, and usage examples.

Todo (Stage 2): Implement full plugin introspection via SimulatorFacade.

Implemented in AIAssistantDefaultImpl.

17.4.2.39 runSimulation()

```
virtual AIAssistantResponse AIAssistant_if::runSimulation (
            const AIAssistantRequest & request )  [pure virtual]
```

Executes the configured simulation synchronously via SimulatorFacade.
Requires `allowSimulationExecution == true` and a valid SimulatorFacade. Calls SimulatorFacade↩ ::simStart() (blocking) and returns after all replications complete. `AIAssistantResponse::message` reports the number of replications run.
Implemented in AIAssistantDefaultImpl.

17.4.2.40 setApiKey()

```
virtual void AIAssistant_if::setApiKey (
            const std::string & apiKey )  [pure virtual]
```

Stores the API key in memory for the duration of the session.
The key is never written to disk or included in any log output. It is intentionally not retrievable via a getter.
Security guidance for production deployments:

- Prefer loadApiKeyFromEnvironment() over embedding keys in source code.
- For long-running services, consider OS keyring / secret-store integration (planned for Stage 8; not implemented in this version).

Implemented in AIAssistantDefaultImpl.

17.4.2.41 setApiKeyEnvironmentVariable()

```
virtual void AIAssistant_if::setApiKeyEnvironmentVariable (
            const std::string & variableName )  [pure virtual]
```

Stores the name of the environment variable that holds the API key.
This is the variable *name*, not the value. Call loadApiKeyFromEnvironment() to actually read the variable and load it into memory.
Implemented in AIAssistantDefaultImpl.

17.4.2.42 setBaseUrl()

```
virtual void AIAssistant_if::setBaseUrl (
            const std::string & baseUrl )  [pure virtual]
```

Sets the base URL; required when provider == CustomHttp.
The URL should point to a chat-completions-compatible endpoint. Example: "http://localhost:11434/v1" for a local Ollama server.
Implemented in AIAssistantDefaultImpl.

17.4.2.43 setConfiguration()

```
virtual void AIAssistant_if::setConfiguration (
            const AIAssistantConfiguration & configuration )  [pure virtual]
```

Replaces the entire configuration record.
Does not transfer the API key, which must be set separately via setApiKey() or loadApiKeyFromEnvironment().
Implemented in AIAssistantDefaultImpl.

17.4.2.44 setMaxOutputTokens()

```
virtual void AIAssistant_if::setMaxOutputTokens (
            unsigned int maxOutputTokens )  [pure virtual]
```

Sets the maximum number of output tokens to request.
Implemented in AIAssistantDefaultImpl.

17.4.2.45 setModelName()

```
virtual void AIAssistant_if::setModelName (
            const std::string & modelName )  [pure virtual]
```

Sets the provider model identifier (e.g. "gpt-4o", "claude-opus-4-7").
Implemented in AIAssistantDefaultImpl.

17.4.2.46 setProvider()

```
virtual void AIAssistant_if::setProvider (
            AIProvider provider )  [pure virtual]
```

Sets the AI backend provider.
Implemented in AIAssistantDefaultImpl.

17.4.2.47 setProviderClient()

```
virtual void AIAssistant_if::setProviderClient (
            AIProviderClient_if * client )  [pure virtual]
```

Injects an external provider client (non-owning).
The assistant does not take ownership; the caller is responsible for the lifetime of the injected client. The previously held client pointer (if any) is released without deletion.
To let the assistant create and own its own client based on the current AIAssistantConfiguration, use createAnd↩ AttachProviderClient() in AIAssistantDefaultImpl instead.
Implemented in AIAssistantDefaultImpl.

17.4.2.48 setProviderName()

```
virtual void AIAssistant_if::setProviderName (
            const std::string & providerName )  [pure virtual]
```

Sets a human-readable provider label.
Implemented in AIAssistantDefaultImpl.

17.4.2.49 setReasoningEffort()

```
virtual void AIAssistant_if::setReasoningEffort (
            ReasoningEffort effort )  [pure virtual]
```

Sets the desired reasoning effort hint.
Implemented in AIAssistantDefaultImpl.

17.4.2.50 setSimulatorFacade()

```
virtual void AIAssistant_if::setSimulatorFacade (
            SimulatorFacade * simulatorFacade )  [pure virtual]
```

Attaches a non-owning SimulatorFacade pointer.
The assistant does not take ownership of the facade. The caller is responsible for keeping the facade alive for the duration of any operation that uses it.
Implemented in AIAssistantDefaultImpl.

17.4.2.51 setTemperature()

```
virtual void AIAssistant_if::setTemperature (
            double temperature )  [pure virtual]
```

Sets the sampling temperature (0.0 = deterministic, 1.0 = creative).
Not all providers support this parameter; implementations may ignore it when the provider uses a fixed sampling scheme.
Implemented in AIAssistantDefaultImpl.

17.4.2.52 setTimeoutSeconds()

```
virtual void AIAssistant_if::setTimeoutSeconds (
            unsigned int timeoutSeconds )  [pure virtual]
```

Sets the HTTP request timeout in seconds.
Implemented in AIAssistantDefaultImpl.
The documentation for this class was generated from the following file:

- tools/AIAssistant/AIAssistant_if.h

17.5 AIAssistantConfiguration Struct Reference

Full configuration record for the AI assistant.
`#include <tools/AIAssistant/AIAssistant_if.h>`

Public Attributes

- AIProvider **provider** = AIProvider::Undefined
- std::string **providerName**

  Human-readable label (e.g. "OpenAI GPT-4o").
- std::string **modelName**

  Provider model identifier (e.g. "gpt-4o").
- std::string **baseUrl**

  Required when provider == CustomHttp.
- std::string **apiKeyEnvironmentVariable**

  Name of env-var holding the API key, not the key itself.
- std::string **organizationId**

  Optional; passed in request headers when non-empty.
- std::string **projectId**

  Optional; passed in request headers when non-empty.
- ReasoningEffort **reasoningEffort** = ReasoningEffort::Medium
- double **temperature** = 0.2
- unsigned int **maxOutputTokens** = 4096
- unsigned int **timeoutSeconds** = 120
- bool **allowNetworkAccess** = false

  Permit outbound HTTP calls to the AI provider.
- bool **allowModelMutation** = false

  Permit creation or modification of GenESyS models.
- bool **allowSimulationExecution** = false

  Permit starting simulation replications.
- bool **allowFileSystemWrites** = false

  Permit writing model/result files to disk.
- bool sandboxEnabled = false

  When `true`, clears the current model before every buildModel() call.
- bool dryRun = false

  When `true`, workflow methods simulate their actions without mutating the simulator state or consuming network quota beyond what is needed for planning.

17.5.1 Detailed Description

Full configuration record for the AI assistant.
Security contract:

- `apiKeyEnvironmentVariable` holds only the *name* of an environment variable, never the secret value itself.
- The actual API key must be supplied via AIAssistant_if::setApiKey() or loaded at runtime via AIAssistant_if::loadApiKeyFromEnvironment().
- This struct must not be serialised to disk without first redacting the providerName field if it could be confused with a secret, and ensuring no key value has been stored here.

Permission flags default to `false` (deny-by-default). Each capability that touches external systems or mutates simulator state must be explicitly enabled before use.

17.5.2 Member Data Documentation

17.5.2.1 dryRun

`bool AIAssistantConfiguration::dryRun = false`
When `true`, workflow methods simulate their actions without mutating the simulator state or consuming network quota beyond what is needed for planning.

- buildModel() — generates the .gen text via LLM but does NOT load it.
- configureSimulation() — extracts parameters via LLM but does NOT apply them.
- runSimulation() — reports what would run without calling simStart().
- collectResults() — reports the count of available responses without rendering.
- analyzePrompt() / createModelPlan() — always execute regardless of this flag.

Use dry-run to verify the LLM output before committing changes.

17.5.2.2 sandboxEnabled

`bool AIAssistantConfiguration::sandboxEnabled = false`
When `true`, clears the current model before every buildModel() call.
Sandbox mode provides a clean-room environment: any existing model elements are discarded so the LLM always starts from an empty canvas. This prevents the AI from accidentally inheriting components from a model the user was editing. The cleared state is permanent; no undo is provided.
The documentation for this struct was generated from the following file:

- tools/AIAssistant/AIAssistant_if.h

17.6 AIAssistantDefaultImpl Class Reference

Initial concrete scaffold for the GenESyS AI Assistant.
`#include <tools/AIAssistant/AIAssistantDefaultImpl.h>`
Inheritance diagram for AIAssistantDefaultImpl:

Public Member Functions

- **AIAssistantDefaultImpl** (const AIAssistantDefaultImpl &)=delete
- AIAssistantDefaultImpl & **operator=** (const AIAssistantDefaultImpl &)=delete
- virtual void setConfiguration (const AIAssistantConfiguration &configuration) override

  Replaces the entire configuration record.
- virtual AIAssistantConfiguration getConfiguration () const override

  Returns a copy of the current configuration record.
- virtual void setProvider (AIProvider provider) override

  Sets the AI backend provider.
- virtual AIProvider getProvider () const override

  Returns the currently configured AI provider.
- virtual void setProviderName (const std::string &providerName) override

  Sets a human-readable provider label.
- virtual std::string getProviderName () const override

  Returns the human-readable provider label.
- virtual void setModelName (const std::string &modelName) override

  Sets the provider model identifier (e.g. "gpt-4o", "claude-opus-4-7").
- virtual std::string getModelName () const override

  Returns the provider model identifier.
- virtual void setBaseUrl (const std::string &baseUrl) override

  Sets the base URL; required when provider == CustomHttp.
- virtual std::string getBaseUrl () const override

  Returns the currently configured base URL.
- virtual void setReasoningEffort (ReasoningEffort effort) override

  Sets the desired reasoning effort hint.
- virtual ReasoningEffort getReasoningEffort () const override

  Returns the currently configured reasoning effort.
- virtual void setTemperature (double temperature) override

  Sets the sampling temperature (0.0 = deterministic, 1.0 = creative).
- virtual double getTemperature () const override

  Returns the configured sampling temperature.
- virtual void setMaxOutputTokens (unsigned int maxOutputTokens) override

  Sets the maximum number of output tokens to request.
- virtual unsigned int getMaxOutputTokens () const override

  Returns the maximum output tokens limit.

- virtual void setTimeoutSeconds (unsigned int timeoutSeconds) override

  Sets the HTTP request timeout in seconds.
- virtual unsigned int getTimeoutSeconds () const override

  Returns the HTTP request timeout in seconds.
- virtual void setApiKey (const std::string &apiKey) override

  Stores the API key in memory for the duration of the session.
- virtual void clearApiKey () override

  Erases the in-memory API key.
- virtual bool hasApiKey () const override

  Returns `true` when a non-empty API key is held in memory.
- virtual std::string getMaskedApiKey () const override

  Returns a redacted representation of the current API key.
- virtual void setApiKeyEnvironmentVariable (const std::string &variableName) override

  Stores the name of the environment variable that holds the API key.
- virtual std::string getApiKeyEnvironmentVariable () const override

  Returns the configured environment-variable name.
- virtual bool loadApiKeyFromEnvironment () override

  Reads the API key from the configured environment variable.
- virtual void setSimulatorFacade (SimulatorFacade ∗simulatorFacade) override

  Attaches a non-owning SimulatorFacade pointer.
- virtual SimulatorFacade ∗ getSimulatorFacade () const override

  Returns the currently attached SimulatorFacade pointer, or `nullptr`.
- virtual bool hasSimulatorFacade () const override

  Returns `true` when a non-null SimulatorFacade is attached.
- virtual void setProviderClient (AIProviderClient_if ∗client) override

  Injects an external provider client (non-owning).
- virtual AIProviderClient_if ∗ getProviderClient () const override

  Returns the currently attached provider client, or `nullptr`.
- virtual bool hasProviderClient () const override

  Returns `true` when a non-null provider client is attached.
- bool createAndAttachProviderClient ()

  Creates an owned provider client from the current configuration and attaches it, replacing any previously held client pointer.
- virtual void clearKnowledgeBase () override

  Removes all items from the knowledge base.
- virtual void addKnowledgeItem (const GenesysKnowledgeItem &item) override

  Appends one item to the knowledge base.
- virtual std::vector< GenesysKnowledgeItem > getKnowledgeItems () const override

  Returns a copy of all registered knowledge items.
- virtual GenesysKnowledgeBaseSummary getKnowledgeBaseSummary () const override

  Returns an aggregate summary of the knowledge base.
- virtual std::string exportKnowledgeBaseAsMarkdown () const override

  Renders the knowledge base as a Markdown document.
- virtual bool refreshKnowledgeBaseFromSimulator (std::string ∗message=nullptr) override

  Populates the knowledge base by introspecting the attached SimulatorFacade.
- virtual bool checkReady (std::string ∗message=nullptr) const override

  Checks whether the assistant has enough configuration to operate.
- virtual AIAssistantResponse analyzePrompt (const AIAssistantRequest &request) override

  Parses and summarises a user prompt without calling any external service.
- virtual AIAssistantResponse createModelPlan (const AIAssistantRequest &request) override

  Produces a structured plan mapping the prompt to GenESyS components.

- virtual AIAssistantResponse buildModel (const AIAssistantRequest &request) override

  Constructs a GenESyS model via SimulatorFacade using an LLM-generated .gen file.
- virtual AIAssistantResponse configureSimulation (const AIAssistantRequest &request) override

  Overrides ModelSimulation parameters on the current model.
- virtual AIAssistantResponse runSimulation (const AIAssistantRequest &request) override

  Executes the configured simulation synchronously via SimulatorFacade.
- virtual AIAssistantResponse collectResults (const AIAssistantRequest &request) override

  Collects and formats simulation results from the current model.
- virtual AIAssistantResponse execute (const AIAssistantRequest &request) override

  High-level dispatcher that orchestrates the full pipeline based on request flags.
- virtual ExecutionState getState () const override

  Returns the current lifecycle state.
- virtual std::string getLastError () const override

  Returns the error message from the most recent failed operation.
- virtual std::string getLastDiagnostics () const override

  Returns technical diagnostic output from the most recent operation.
- virtual void clearDiagnostics () override

  Clears both the last error and diagnostics strings.
- virtual std::vector< AuditEntry > getAuditEntries (unsigned int maxEntries) const override

  Returns up to `maxEntries` most-recent audit entries (oldest first).
- virtual std::string getAuditLogPath () const override

  Returns the absolute path of the audit log file.
- virtual unsigned int exportAuditLog (const std::string &csvPath) const override

  Exports all audit entries to a CSV file.

17.6.1 Detailed Description

Initial concrete scaffold for the GenESyS AI Assistant.
This class implements AIAssistant_if and provides:

- Full configuration management including secure API key handling.
- A knowledge base backed by a simple in-memory vector.
- A checkReady() implementation that validates minimum configuration.
- Safe stubs for all workflow methods (analyzePrompt, buildModel, etc.) that return ExecutionState::Not↩ Implemented until the corresponding stage is implemented.

Current status:

- Stage 1: configuration, security, knowledge base, diagnostics — complete.
- Stage 2 and above: intentionally deferred; see

  Todo annotations.

17.6.1.1 Security model

- The API key is held in a private `std::string` member, never written to disk or included in trace output.
- No getter exposes the key value; only getMaskedApiKey() is available.
- Copy construction and copy assignment are deleted to prevent accidental key propagation through object copying.

17.6.1.2 Ownership

- The SimulatorFacade pointer is non-owning; this class does not delete it.

17.6.2 Member Function Documentation

17.6.2.1 addKnowledgeItem()

```
void AIAssistantDefaultImpl::addKnowledgeItem (
            const GenesysKnowledgeItem & item )  [override], [virtual]
```

Appends one item to the knowledge base.
Implements AIAssistant_if.

17.6.2.2 analyzePrompt()

```
AIAssistantResponse AIAssistantDefaultImpl::analyzePrompt (
            const AIAssistantRequest & request )  [override], [virtual]
```

Parses and summarises a user prompt without calling any external service.
Stage 3 will implement actual LLM calls. Current stub returns NotImplemented.
Implements AIAssistant_if.

17.6.2.3 buildModel()

```
AIAssistantResponse AIAssistantDefaultImpl::buildModel (
            const AIAssistantRequest & request )  [override], [virtual]
```

Constructs a GenESyS model via SimulatorFacade using an LLM-generated .gen file.
Requires `allowModelMutation` == `true`, `allowNetworkAccess` == `true`, a valid SimulatorFacade, and an attached provider client.
Behaviour (Stage 5):

1. If `request.modelPlan` is non-empty, it is used as the model specification. Otherwise, the `request` description fields are used directly.
2. An LLM call is made requesting a GenESyS model language (.gen) file.
3. The generated .gen content is written to a temp file and loaded via SimulatorFacade::loadModel(). The temp file is deleted immediately after loading.
4. `AIAssistantResponse::generatedModelLanguage` holds the generated .gen text.

Implements AIAssistant_if.

17.6.2.4 checkReady()

```
bool AIAssistantDefaultImpl::checkReady (
            std::string * message = nullptr ) const  [override], [virtual]
```

Checks whether the assistant has enough configuration to operate.

Parameters

message	Optional; receives a description of the first unsatisfied condition, or a confirmation message when ready.

Returns

`true` when all minimum requirements are met for prompt analysis.

Checks performed (in order):

1. Provider is not `AIProvider::Undefined`.
2. Model name is not empty.
3. For OpenAI/Anthropic/CustomHttp: an API key is held in memory or an environment-variable name is configured.
4. For CustomHttp: baseUrl is not empty.

Note: SimulatorFacade and permission flags are checked separately when model-mutation or simulation-execution operations are requested.
Implements AIAssistant_if.

17.6.2.5 clearApiKey()

```
void AIAssistantDefaultImpl::clearApiKey ( )  [override], [virtual]
```

Erases the in-memory API key.
Implementations should overwrite the key buffer before clearing to reduce the window of exposure. Note that standard C++ provides no guarantee that the compiler will not optimise away the overwrite; platform-specific secure zeroing (explicit_bzero, SecureZeroMemory) should be used in security-critical contexts.
Implements AIAssistant_if.

17.6.2.6 clearDiagnostics()

```
void AIAssistantDefaultImpl::clearDiagnostics ( )  [override], [virtual]
```

Clears both the last error and diagnostics strings.
Implements AIAssistant_if.

17.6.2.7 clearKnowledgeBase()

```
void AIAssistantDefaultImpl::clearKnowledgeBase ( )  [override], [virtual]
```

Removes all items from the knowledge base.
Implements AIAssistant_if.

17.6.2.8 collectResults()

```
AIAssistantResponse AIAssistantDefaultImpl::collectResults (
            const AIAssistantRequest & request )  [override], [virtual]
```

Collects and formats simulation results from the current model.
Iterates SimulatorFacade::modelGetResponses() and renders them as a Markdown table in `AIAssistantResponse::message`
Implements AIAssistant_if.

17.6.2.9 configureSimulation()

```
AIAssistantResponse AIAssistantDefaultImpl::configureSimulation (
            const AIAssistantRequest & request )  [override], [virtual]
```

Overrides ModelSimulation parameters on the current model.
Requires `allowModelMutation` == `true` and a valid SimulatorFacade.
Behaviour (Stage 5):

1. Makes a small LLM call to extract structured simulation parameters from `request.experiment↩ Description` (replications, replication length, warm-up period, time units).
2. Applies the extracted values via SimulatorFacade::simSet∗() methods.
3. Parameters already set by a loaded .gen file are overridden only when the LLM extraction yields non-zero values.

Implements AIAssistant_if.

17.6.2.10 createAndAttachProviderClient()

```
bool AIAssistantDefaultImpl::createAndAttachProviderClient ( )
```

Creates an owned provider client from the current configuration and attaches it, replacing any previously held client pointer.

Returns

`true` when a suitable client was created and attached.

The assistant takes ownership of the created client and deletes it in the destructor or on the next call to createAndAttachProviderClient(). Clients injected via setProviderClient() are never deleted by the assistant.
Provider selection is based on AIAssistantConfiguration::provider:

- AIProvider::OpenAI → OpenAIProviderClientImpl
- AIProvider::Anthropic → AnthropicProviderClientImpl
- AIProvider::Local → LocalProviderClientImpl
- AIProvider::CustomHttp → LocalProviderClientImpl with custom base URL
- AIProvider::Undefined → returns false, no client created

17.6.2.11 createModelPlan()

```
AIAssistantResponse AIAssistantDefaultImpl::createModelPlan (
            const AIAssistantRequest & request )  [override], [virtual]
```

Produces a structured plan mapping the prompt to GenESyS components.
Stage 4 will implement prompt-to-plan translation. Current stub returns NotImplemented.
Implements AIAssistant_if.

17.6.2.12 execute()

```
AIAssistantResponse AIAssistantDefaultImpl::execute (
            const AIAssistantRequest & request )  [override], [virtual]
```

High-level dispatcher that orchestrates the full pipeline based on request flags.
Calls analyzePrompt, createModelPlan, buildModel, configureSimulation, runSimulation and collectResults in sequence according to the enabled flags in `request`. Stops at the first failure.
Implements AIAssistant_if.

17.6.2.13 exportAuditLog()

```
unsigned int AIAssistantDefaultImpl::exportAuditLog (
            const std::string & csvPath ) const  [override], [virtual]
```

Exports all audit entries to a CSV file.

Parameters

csvPath	Destination file path.

Returns

Number of data rows written (excluding the header).

Implements AIAssistant_if.

17.6.2.14 exportKnowledgeBaseAsMarkdown()

```
std::string AIAssistantDefaultImpl::exportKnowledgeBaseAsMarkdown ( ) const  [override], [virtual]
```

Renders the knowledge base as a Markdown document.
Intended to be injected into the system prompt so the AI model knows which GenESyS building blocks are available.
Implements AIAssistant_if.

17.6.2.15 getApiKeyEnvironmentVariable()

```
std::string AIAssistantDefaultImpl::getApiKeyEnvironmentVariable ( ) const  [override], [virtual]
```

Returns the configured environment-variable name.
Implements AIAssistant_if.

17.6.2.16 getAuditEntries()

```
std::vector< AuditEntry > AIAssistantDefaultImpl::getAuditEntries (
            unsigned int maxEntries ) const  [override], [virtual]
```

Returns up to `maxEntries` most-recent audit entries (oldest first).
Reads from the persistent audit log file. Returns an empty vector when the file does not yet exist or cannot be read.
Implements AIAssistant_if.

17.6.2.17 getAuditLogPath()

```
std::string AIAssistantDefaultImpl::getAuditLogPath ( ) const  [override], [virtual]
```

Returns the absolute path of the audit log file.
Implements AIAssistant_if.

17.6.2.18 getBaseUrl()

```
std::string AIAssistantDefaultImpl::getBaseUrl ( ) const  [override], [virtual]
```

Returns the currently configured base URL.
Implements AIAssistant_if.

17.6.2.19 getConfiguration()

```
AIAssistantConfiguration AIAssistantDefaultImpl::getConfiguration ( ) const  [override], [virtual]
```

Returns a copy of the current configuration record.
The returned struct never contains the API key value.
Implements AIAssistant_if.

17.6.2.20 getKnowledgeBaseSummary()

```
GenesysKnowledgeBaseSummary AIAssistantDefaultImpl::getKnowledgeBaseSummary ( ) const  [override],
[virtual]
```

Returns an aggregate summary of the knowledge base.
Implements AIAssistant_if.

17.6.2.21 getKnowledgeItems()

```
std::vector< GenesysKnowledgeItem > AIAssistantDefaultImpl::getKnowledgeItems ( ) const  [override],
[virtual]
```

Returns a copy of all registered knowledge items.
Implements AIAssistant_if.

17.6.2.22 getLastDiagnostics()

```
std::string AIAssistantDefaultImpl::getLastDiagnostics ( ) const  [override], [virtual]
```

Returns technical diagnostic output from the most recent operation.
Never contains API key values. Safe to log for debugging.
Implements AIAssistant_if.

17.6.2.23 getLastError()

```
std::string AIAssistantDefaultImpl::getLastError ( ) const  [override], [virtual]
```

Returns the error message from the most recent failed operation.
Implements AIAssistant_if.

17.6.2.24 getMaskedApiKey()

`std::string AIAssistantDefaultImpl::getMaskedApiKey ( ) const [override], [virtual]`
Returns a redacted representation of the current API key.
Only the last four characters are exposed, preceded by "****". Returns an empty string when no key is set. Example: "****abcd".
Implements AIAssistant_if.

17.6.2.25 getMaxOutputTokens()

`unsigned int AIAssistantDefaultImpl::getMaxOutputTokens ( ) const [override], [virtual]`
Returns the maximum output tokens limit.
Implements AIAssistant_if.

17.6.2.26 getModelName()

`std::string AIAssistantDefaultImpl::getModelName ( ) const [override], [virtual]`
Returns the provider model identifier.
Implements AIAssistant_if.

17.6.2.27 getProvider()

`AIProvider AIAssistantDefaultImpl::getProvider ( ) const [override], [virtual]`
Returns the currently configured AI provider.
Implements AIAssistant_if.

17.6.2.28 getProviderClient()

`AIProviderClient_if * AIAssistantDefaultImpl::getProviderClient ( ) const [override], [virtual]`
Returns the currently attached provider client, or `nullptr`.
Implements AIAssistant_if.

17.6.2.29 getProviderName()

`std::string AIAssistantDefaultImpl::getProviderName ( ) const [override], [virtual]`
Returns the human-readable provider label.
Implements AIAssistant_if.

17.6.2.30 getReasoningEffort()

`ReasoningEffort AIAssistantDefaultImpl::getReasoningEffort ( ) const [override], [virtual]`
Returns the currently configured reasoning effort.
Implements AIAssistant_if.

17.6.2.31 getSimulatorFacade()

`SimulatorFacade * AIAssistantDefaultImpl::getSimulatorFacade ( ) const [override], [virtual]`
Returns the currently attached SimulatorFacade pointer, or `nullptr`.
Implements AIAssistant_if.

17.6.2.32 getState()

`ExecutionState AIAssistantDefaultImpl::getState ( ) const [override], [virtual]`
Returns the current lifecycle state.
Implements AIAssistant_if.

17.6.2.33 getTemperature()

`double AIAssistantDefaultImpl::getTemperature ( ) const [override], [virtual]`
Returns the configured sampling temperature.
Implements AIAssistant_if.

17.6.2.34 getTimeoutSeconds()

```
unsigned int AIAssistantDefaultImpl::getTimeoutSeconds ( ) const  [override], [virtual]
```

Returns the HTTP request timeout in seconds.
Implements AIAssistant_if.

17.6.2.35 hasApiKey()

```
bool AIAssistantDefaultImpl::hasApiKey ( ) const  [override], [virtual]
```

Returns `true` when a non-empty API key is held in memory.
Implements AIAssistant_if.

17.6.2.36 hasProviderClient()

```
bool AIAssistantDefaultImpl::hasProviderClient ( ) const  [override], [virtual]
```

Returns `true` when a non-null provider client is attached.
Implements AIAssistant_if.

17.6.2.37 hasSimulatorFacade()

```
bool AIAssistantDefaultImpl::hasSimulatorFacade ( ) const  [override], [virtual]
```

Returns `true` when a non-null SimulatorFacade is attached.
Implements AIAssistant_if.

17.6.2.38 loadApiKeyFromEnvironment()

```
bool AIAssistantDefaultImpl::loadApiKeyFromEnvironment ( )  [override], [virtual]
```

Reads the API key from the configured environment variable.

Returns

`true` when the variable exists and holds a non-empty value.

Does nothing and returns `false` when apiKeyEnvironmentVariable is empty or the variable is not defined in the process environment. The loaded value is kept only in memory; it is never written to disk.
Implements AIAssistant_if.

17.6.2.39 refreshKnowledgeBaseFromSimulator()

```
bool AIAssistantDefaultImpl::refreshKnowledgeBaseFromSimulator (
            std::string * message = nullptr )  [override], [virtual]
```

Populates the knowledge base by introspecting the attached SimulatorFacade.

Parameters

message	Optional; receives a human-readable status or error message.

Returns

`true` when introspection succeeded and at least one item was added.

This method is a planned feature (Stage 2). In the current implementation it is a safe stub that returns `false` with a descriptive message.
Planned behaviour (Stage 2):

- Query SimulatorFacade::getDataDefinitionPluginTypenames() for registered types.
- Enumerate ModelComponent and ModelDataDefinition subtypes.
- Build GenesysKnowledgeItem entries with typenames, descriptions, and usage examples.

Todo (Stage 2): Implement full plugin introspection via SimulatorFacade.

Implements AIAssistant_if.

17.6.2.40 runSimulation()

```
AIAssistantResponse AIAssistantDefaultImpl::runSimulation (
            const AIAssistantRequest & request )  [override], [virtual]
```

Executes the configured simulation synchronously via SimulatorFacade.
Requires `allowSimulationExecution == true` and a valid SimulatorFacade. Calls SimulatorFacade↩ ::simStart() (blocking) and returns after all replications complete. `AIAssistantResponse::message` reports the number of replications run.
Implements AIAssistant_if.

17.6.2.41 setApiKey()

```
void AIAssistantDefaultImpl::setApiKey (
            const std::string & apiKey )  [override], [virtual]
```

Stores the API key in memory for the duration of the session.
The key is never written to disk or included in any log output. It is intentionally not retrievable via a getter.
Security guidance for production deployments:

- Prefer loadApiKeyFromEnvironment() over embedding keys in source code.
- For long-running services, consider OS keyring / secret-store integration (planned for Stage 8; not implemented in this version).

Implements AIAssistant_if.

17.6.2.42 setApiKeyEnvironmentVariable()

```
void AIAssistantDefaultImpl::setApiKeyEnvironmentVariable (
            const std::string & variableName )  [override], [virtual]
```

Stores the name of the environment variable that holds the API key.
This is the variable *name*, not the value. Call loadApiKeyFromEnvironment() to actually read the variable and load it into memory.
Implements AIAssistant_if.

17.6.2.43 setBaseUrl()

```
void AIAssistantDefaultImpl::setBaseUrl (
            const std::string & baseUrl )  [override], [virtual]
```

Sets the base URL; required when provider == CustomHttp.
The URL should point to a chat-completions-compatible endpoint. Example: "http://localhost:11434/v1" for a local Ollama server.
Implements AIAssistant_if.

17.6.2.44 setConfiguration()

```
void AIAssistantDefaultImpl::setConfiguration (
            const AIAssistantConfiguration & configuration )  [override], [virtual]
```

Replaces the entire configuration record.
Does not transfer the API key, which must be set separately via setApiKey() or loadApiKeyFromEnvironment().
Implements AIAssistant_if.

17.6.2.45 setMaxOutputTokens()

```
void AIAssistantDefaultImpl::setMaxOutputTokens (
            unsigned int maxOutputTokens )  [override], [virtual]
```

Sets the maximum number of output tokens to request.
Implements AIAssistant_if.

17.6.2.46 setModelName()

```
void AIAssistantDefaultImpl::setModelName (
            const std::string & modelName )  [override], [virtual]
```

Sets the provider model identifier (e.g. "gpt-4o", "claude-opus-4-7").
Implements AIAssistant_if.

17.6.2.47 setProvider()

```
void AIAssistantDefaultImpl::setProvider (
            AIProvider provider )  [override], [virtual]
```

Sets the AI backend provider.
Implements AIAssistant_if.

17.6.2.48 setProviderClient()

```
void AIAssistantDefaultImpl::setProviderClient (
            AIProviderClient_if * client )  [override], [virtual]
```

Injects an external provider client (non-owning).
The assistant does not take ownership; the caller is responsible for the lifetime of the injected client. The previously held client pointer (if any) is released without deletion.
To let the assistant create and own its own client based on the current AIAssistantConfiguration, use createAndAttachProviderClient() in AIAssistantDefaultImpl instead.
Implements AIAssistant_if.

17.6.2.49 setProviderName()

```
void AIAssistantDefaultImpl::setProviderName (
            const std::string & providerName )  [override], [virtual]
```

Sets a human-readable provider label.
Implements AIAssistant_if.

17.6.2.50 setReasoningEffort()

```
void AIAssistantDefaultImpl::setReasoningEffort (
            ReasoningEffort effort )  [override], [virtual]
```

Sets the desired reasoning effort hint.
Implements AIAssistant_if.

17.6.2.51 setSimulatorFacade()

```
void AIAssistantDefaultImpl::setSimulatorFacade (
            SimulatorFacade * simulatorFacade )  [override], [virtual]
```

Attaches a non-owning SimulatorFacade pointer.
The assistant does not take ownership of the facade. The caller is responsible for keeping the facade alive for the duration of any operation that uses it.
Implements AIAssistant_if.

17.6.2.52 setTemperature()

```
void AIAssistantDefaultImpl::setTemperature (
            double temperature )  [override], [virtual]
```

Sets the sampling temperature (0.0 = deterministic, 1.0 = creative).
Not all providers support this parameter; implementations may ignore it when the provider uses a fixed sampling scheme.
Implements AIAssistant_if.

17.6.2.53 setTimeoutSeconds()

```
void AIAssistantDefaultImpl::setTimeoutSeconds (
            unsigned int timeoutSeconds )  [override], [virtual]
```

Sets the HTTP request timeout in seconds.
Implements AIAssistant_if.
The documentation for this class was generated from the following files:

- tools/AIAssistant/AIAssistantDefaultImpl.h
- tools/AIAssistant/AIAssistantDefaultImpl.cpp

17.7 AIAssistantRequest Struct Reference

Input to a single AI assistant request.
`#include <tools/AIAssistant/AIAssistant_if.h>`

Public Attributes

- std::string **userPrompt**

  Free-text prompt from the user.
- std::string **systemContext**

  Optional extra context to prepend to the system message.
- std::string **modelDescription**

  Description of the system to model (may be empty).
- std::string **experimentDescription**

  Description of the simulation experiment.
- std::string modelPlan

  Structured model plan (Markdown) to guide model construction.
- bool **buildModel** = false

  Request model construction via SimulatorFacade.
- bool **configureSimulation** = false

  Request ModelSimulation configuration.
- bool **runSimulation** = false

  Request simulation execution.
- bool **collectResults** = false

  Request result collection and reporting.

17.7.1 Detailed Description

Input to a single AI assistant request.
Not all fields need to be populated for every request. The assistant interprets the populated subset and ignores empty strings. Boolean flags signal intent; the assistant may reject them if the corresponding AIAssistant↩ Configuration::allow∗ flag is not set.

17.7.2 Member Data Documentation

17.7.2.1 modelPlan

```
std::string AIAssistantRequest::modelPlan
```

Structured model plan (Markdown) to guide model construction.
When non-empty, buildModel() uses this plan directly without calling the LLM a second time to produce a new plan. Populated automatically by execute() from the output of createModelPlan(). Callers may also supply a previously generated or manually written plan.
The documentation for this struct was generated from the following file:

- tools/AIAssistant/AIAssistant_if.h

17.8 AIAssistantResponse Struct Reference

Output produced by a single AI assistant operation.
`#include <tools/AIAssistant/AIAssistant_if.h>`

Public Attributes

- bool **success** = false
- ExecutionState **state** = ExecutionState::NotImplemented
- std::string **message**

  Human-readable outcome summary or error description.
- std::string **generatedPlan**

  Intermediate structured plan (Markdown or JSON fragment).
- std::string **generatedModelLanguage**

  GenESyS model language text, when generated.
- std::string **diagnostics**

  Technical detail for debugging; not shown to end users.

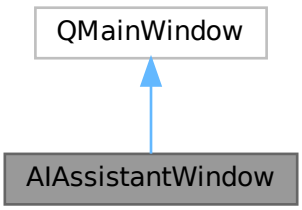
17.8.1 Detailed Description

Output produced by a single AI assistant operation.
The documentation for this struct was generated from the following file:

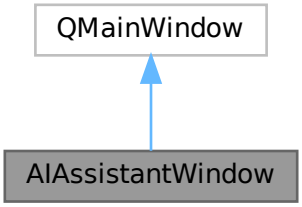
- tools/AIAssistant/AIAssistant_if.h

17.9 AIAssistantWindow Class Reference

Inheritance diagram for AIAssistantWindow:



Collaboration diagram for AIAssistantWindow:



Public Member Functions

- **AIAssistantWindow** (Simulator *simulator, QWidget *parent=nullptr)

The documentation for this class was generated from the following files:

- applications/gui/ai_assistant/AIAssistantWindow.h
- applications/gui/ai_assistant/AIAssistantWindow.cpp

17.10 AIAuditLog Class Reference

Append-only audit log for AI assistant operations.
`#include <tools/AIAssistant/AIAuditLog.h>`

Public Member Functions

- **AIAuditLog** (const std::string &logFilePath="")
- **AIAuditLog** (const AIAuditLog &)=delete
- AIAuditLog & **operator=** (const AIAuditLog &)=delete
- void **append** (const AuditEntry &entry)

  Appends one entry to the log file (creates directory if needed).
- std::vector< AuditEntry > loadRecentEntries (unsigned int maxEntries=200) const

  Reads up to `maxEntries` most-recent entries.
- std::string **logFilePath** () const

  Returns the absolute path of the log file.
- unsigned int exportCsv (const std::string &csvPath) const

  Exports all log entries to a CSV file.

Static Public Member Functions

- static std::string **defaultLogFilePath** ()

  Returns the platform-default log file path.

17.10.1 Detailed Description

Append-only audit log for AI assistant operations.
Entries are written in JSON Lines format to a file under $XDG_DATA_HOME/genesys/ (typically ~/.local/share/genesys/ai_audit.log). The log never contains API key values. The directory is created on first write.

17.10.2 Member Function Documentation

17.10.2.1 exportCsv()

```
unsigned int AIAuditLog::exportCsv (
            const std::string & csvPath ) const
```

Exports all log entries to a CSV file.

Returns

Number of rows written (excluding the header).

17.10.2.2 loadRecentEntries()

```
std::vector< AuditEntry > AIAuditLog::loadRecentEntries (
            unsigned int maxEntries = 200 ) const
```

Reads up to `maxEntries` most-recent entries.

Returns

Entries in chronological order (oldest first).

The documentation for this class was generated from the following files:

- tools/AIAssistant/AIAuditLog.h
- tools/AIAssistant/AIAuditLog.cpp

17.11 AIConversationConfiguration Struct Reference

Public Attributes

- AIConversationProvider **provider** = AIConversationProvider::Local
- std::string **model** = "llama3.2"
- std::string **baseUrl**
- std::string **apiKeyEnvironmentVariable**
- std::string **systemInstructions**
- double **temperature** = 0.2
- unsigned int **maxOutputTokens** = 512
- unsigned int **timeoutSeconds** = 120
- bool **highReasoningMode** = false
- bool **conversationEnabled** = true
- unsigned int **maxHistoryMessages** = 20

The documentation for this struct was generated from the following file:

- tools/AIAssistant/AIConversationService.h

17.12 AIConversationResponse Struct Reference

Public Attributes

- bool **success** = false
- std::string **content**
- std::string **errorMessage**
- int **httpStatusCode** = 0
- unsigned int **inputTokens** = 0
- unsigned int **outputTokens** = 0

The documentation for this struct was generated from the following file:

- tools/AIAssistant/AIConversationService.h

17.13 AIConversationService Class Reference

Public Member Functions

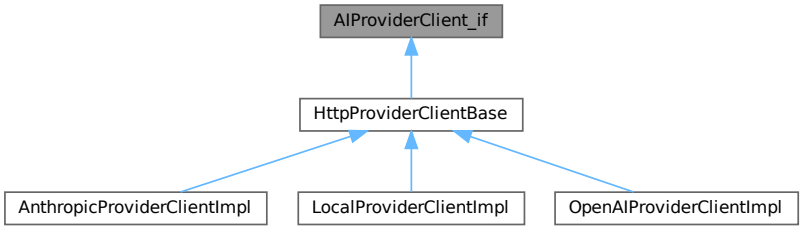
- void **setConfiguration** (const AIConversationConfiguration &configuration)
- const AIConversationConfiguration & **getConfiguration** () const
- bool **initialize** (std::string &errorMessage)
- void **setProviderClient** (std::unique_ptr< AIProviderClient_if > client)
- AIConversationResponse **send** (const std::string &conversationKey, const std::string &prompt)
- void **clearConversation** (const std::string &conversationKey)
- void **clearAllConversations** ()
- bool **isInitialized** () const

The documentation for this class was generated from the following files:

- tools/AIAssistant/AIConversationService.h
- tools/AIAssistant/AIConversationService.cpp

17.14 AIProviderClient_if Class Reference

Abstract interface for AI provider HTTP clients.
`#include <tools/AIAssistant/AIProviderClient_if.h>`
Inheritance diagram for AIProviderClient_if:



Public Member Functions

- virtual std::string getProviderName () const =0

  Returns a human-readable provider name (e.g. "OpenAI", "Anthropic").
- virtual bool isAvailable () const =0

  Returns `true` when this client can attempt to send requests.
- virtual void setBaseUrl (const std::string &url)=0

  Sets the base URL for the provider API endpoint.
- virtual std::string getBaseUrl () const =0

  Returns the currently configured base URL.
- virtual void setTimeoutSeconds (unsigned int seconds)=0

  Sets the HTTP request timeout in seconds.
- virtual unsigned int getTimeoutSeconds () const =0

  Returns the configured HTTP request timeout.
- virtual void setApiKey (const std::string &apiKey)=0

  Stores the API key in memory.
- virtual void clearApiKey ()=0

  Overwrites (best-effort) and clears the in-memory API key.
- virtual bool hasApiKey () const =0

Returns `true` when a non-empty API key is held.

- virtual ProviderResponse send (const ProviderRequest &request)=0

  Sends a chat-completion request and returns the response.

17.14.1 Detailed Description

Abstract interface for AI provider HTTP clients.
A provider client wraps the HTTP call to one AI backend (OpenAI, Anthropic, a local Ollama server, etc.) and converts GenESyS-internal request/response objects to and from the provider's wire format.

17.14.1.1 Security contract

- The API key is stored in-memory only; no getter exposes it.
- clearApiKey() overwrites the buffer before releasing it.
- Implementations must not write the key to logs or trace output.

17.14.1.2 Ownership

Provider client objects do not own the assistants that use them. Callers that inject clients into AIAssistant_if are responsible for keeping the client alive for the duration of any ongoing request.

17.14.2 Member Function Documentation

17.14.2.1 clearApiKey()

```
virtual void AIProviderClient_if::clearApiKey ( )  [pure virtual]
```

Overwrites (best-effort) and clears the in-memory API key.
Implemented in HttpProviderClientBase.

17.14.2.2 getBaseUrl()

```
virtual std::string AIProviderClient_if::getBaseUrl ( ) const  [pure virtual]
```

Returns the currently configured base URL.
Implemented in HttpProviderClientBase.

17.14.2.3 getProviderName()

```
virtual std::string AIProviderClient_if::getProviderName ( ) const  [pure virtual]
```

Returns a human-readable provider name (e.g. "OpenAI", "Anthropic").
Implemented in AnthropicProviderClientImpl, LocalProviderClientImpl, and OpenAIProviderClientImpl.

17.14.2.4 getTimeoutSeconds()

```
virtual unsigned int AIProviderClient_if::getTimeoutSeconds ( ) const  [pure virtual]
```

Returns the configured HTTP request timeout.
Implemented in HttpProviderClientBase.

17.14.2.5 hasApiKey()

```
virtual bool AIProviderClient_if::hasApiKey ( ) const  [pure virtual]
```

Returns `true` when a non-empty API key is held.
Implemented in HttpProviderClientBase.

17.14.2.6 isAvailable()

```
virtual bool AIProviderClient_if::isAvailable ( ) const  [pure virtual]
```

Returns `true` when this client can attempt to send requests.
A client is considered available when it holds an API key (if required by the provider) and a reachable base URL.
Implemented in AnthropicProviderClientImpl, HttpProviderClientBase, LocalProviderClientImpl, and OpenAIProviderClientImpl.

17.14.2.7 send()

```
virtual ProviderResponse AIProviderClient_if::send (
            const ProviderRequest & request )  [pure virtual]
```

Sends a chat-completion request and returns the response.
This call is synchronous and may block for up to timeoutSeconds. On transport failure `ProviderResponse::success` is `false` and `ProviderResponse::errorMessage` is populated.
Implemented in HttpProviderClientBase.

17.14.2.8 setApiKey()

```
virtual void AIProviderClient_if::setApiKey (
            const std::string & apiKey )  [pure virtual]
```

Stores the API key in memory.
Never write the key to disk or logs. Prefer loading from an environment variable via the owning AIAssistant_if rather than embedding keys in source.
Implemented in HttpProviderClientBase.

17.14.2.9 setBaseUrl()

```
virtual void AIProviderClient_if::setBaseUrl (
            const std::string & url )  [pure virtual]
```

Sets the base URL for the provider API endpoint.
Implemented in HttpProviderClientBase.

17.14.2.10 setTimeoutSeconds()

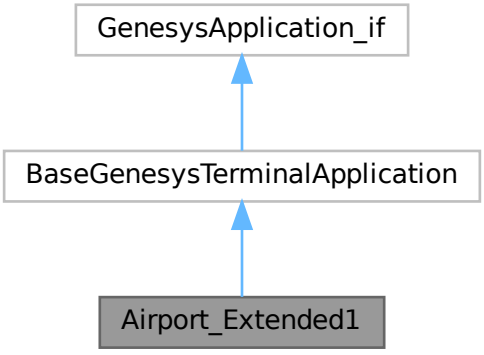
```
virtual void AIProviderClient_if::setTimeoutSeconds (
            unsigned int seconds )  [pure virtual]
```

Sets the HTTP request timeout in seconds.
Implemented in HttpProviderClientBase.
The documentation for this class was generated from the following file:

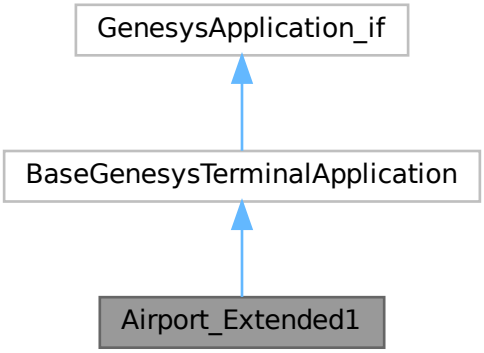
- tools/AIAssistant/AIProviderClient_if.h

17.15 Airport_Extended1 Class Reference

Inheritance diagram for Airport_Extended1:



Collaboration diagram for Airport_Extended1:



Public Member Functions

- virtual int main (int argc, char **argv) override

Public Member Functions inherited from BaseGenesysTerminalApplication

- virtual void **Simulate** (Simulator *genesys, Model *model, PluginManager *plugins)
- void **setDefaultTraceHandlers** (TraceManager *tm)
- void setDefaultEventHandlers (OnEventManager *oem)

Additional Inherited Members

Protected Member Functions inherited from BaseGenesysTerminalApplication

- virtual void **traceHandler** (TraceEvent e)
- virtual void **traceErrorHandler** (TraceErrorEvent e)
- virtual void **traceReportHandler** (TraceEvent e)
- virtual void **traceSimulationHandler** (TraceSimulationEvent e)
- virtual void **onAfterProcessEventHandler** (SimulationEvent *re)
- virtual void **onBreakpointHandler** (SimulationEvent *re)
- virtual void **onEntityCreateHandler** (SimulationEvent *re)

- virtual void **onSimulationEndHandler** (SimulationEvent *re)
- virtual void **onSimulationPausedHandler** (SimulationEvent *re)
- virtual void **onSimulationResumeHandler** (SimulationEvent *re)
- virtual void **onEntityRemoveHandler** (SimulationEvent *re)

17.15.1 Member Function Documentation

17.15.1.1 main()

```
int Airport_Extended1::main (
            int argc,
            char ** argv )  [override], [virtual]
```

This is the main function of the application. It instanciates the simulator, builds a simulation model and then simulate that model.
Reimplemented from BaseGenesysTerminalApplication.
The documentation for this class was generated from the following files:

- applications/modelSpecific/arenaExamples/Airport_Extended1.h
- applications/modelSpecific/arenaExamples/Airport_Extended1.cpp

17.16 AirportSecurityExample Class Reference

Inheritance diagram for AirportSecurityExample:

17.18 AISecretStore Class Reference

Static helper for storing API keys in the OS keyring.

`#include <tools/AIAssistant/AISecretStore.h>`

Static Public Member Functions

- static bool isAvailable ()

  Returns `true` if the keyring backend is reachable on this system.
- static bool save (const std::string &service, const std::string &account, const std::string &secret)

  Saves `secret` under the given `service` and `account` labels.
- static std::optional< std::string > load (const std::string &service, const std::string &account)

  Loads the secret stored under `service` and `account`.
- static bool remove (const std::string &service, const std::string &account)

  Removes the stored secret.

17.18.1 Detailed Description

Static helper for storing API keys in the OS keyring.

On Linux, uses the `secret-tool` command-line utility (part of the `libsecret-tools` package) to access the GNOME Keyring / KWallet service via the freedesktop Secret Service protocol.

All methods return a failure indicator (`false` or `std::nullopt`) when `secret-tool` is not installed; callers should fall back to env-var loading.

API keys are never written to disk in plaintext; they live only in the session keyring managed by the OS.

17.18.1.1 Usage

```
const std::string svc = "genesys-ai-assistant";
const std::string acct = "openai";
if (AISecretStore::isAvailable()) {
    AISecretStore::save(svc, acct, rawKey);
    auto loaded = AISecretStore::load(svc, acct);
}
```

17.18.2 Member Function Documentation

17.18.2.1 isAvailable()

```
bool AISecretStore::isAvailable ( )  [static]
```

Returns `true` if the keyring backend is reachable on this system.
Checks that `secret-tool` is on PATH and that the D-Bus session bus is available (required by the Secret Service protocol).

17.18.2.2 load()

```
std::optional< std::string > AISecretStore::load (
            const std::string & service,
            const std::string & account )  [static]
```

Loads the secret stored under `service` and `account`.

Returns

The secret, or `std::nullopt` when not found or unavailable.

17.18.2.3 remove()

```
bool AISecretStore::remove (
            const std::string & service,
            const std::string & account )  [static]
```

Removes the stored secret.

Returns

`true` on success.

17.18.2.4 save()

```
bool AISecretStore::save (
            const std::string & service,
            const std::string & account,
            const std::string & secret )  [static]
```

Saves `secret` under the given `service` and `account` labels.

Returns

`true` on success, `false` if the keyring is unavailable or the operation failed.

The documentation for this class was generated from the following files:

- void **setClearHistoryBetweenReplications** (bool value)
- bool **isClearHistoryBetweenReplications** () const
- unsigned long **getCallCount** () const
- unsigned long **getFailureCount** () const
- virtual std::string show () override

  Returns a textual representation of this data definition.

Public Member Functions inherited from ModelDataDefinition

- ModelDataDefinition (Model *model, std::string datadefinitionTypename, std::string name="", bool insert↩ IntoModel=true)

  Creates a model data definition and optionally inserts it into the model.
- virtual ~**ModelDataDefinition** ()

  Releases resources owned by this data definition.
- Util::identification getId () const

  Returns the unique identifier of this instance.
- void setName (const std::string &name)

  Updates the logical name of this instance.
- const std::string & getName () const

  Returns the logical name of this instance.
- void setLabel (const std::string &label)

  Updates the user-visible label of this instance.
- const std::string & getLabel () const

  Returns the user-visible label of this instance.
- const std::string & getClassname () const

  Returns the runtime class name used by the plugin system.
- Model * getParentModel () const

  Returns the parent model that owns this definition.
- bool isReportStatistics () const

  Indicates whether this data definition contributes report statistics.
- void setReportStatistics (bool reportStatistics)

  Enables or disables report-statistics generation for this definition.
- ModelDataDefinition * getInternalData (const std::string &name) const

  Looks up a named internal child data definition.
- std::map< std::string, ModelDataDefinition * > * getInternalData () const

  Returns the full map of internal child data definitions.
- std::map< std::string, ModelDataDefinition * > * getAttachedData () const

  Returns the full map of attached data definitions.
- bool hasChanged () const

  Indicates whether this instance has been modified since the last reset.

- void setHasChanged (bool hasChanged)

  Updates the changed flag for this data definition.
- unsigned int getLevel () const

  Returns the hierarchical editing context containing this element.
- void setModelLevel (unsigned int _modelLevel)

  Sets this element's hierarchical editing context.
- List< SimulationControl * > * getSimulationControls () const

  Returns the simulation controls owned by this data definition.
- TraceManager::Level getTraceLevelSpecific () const

  Returns the trace level that applies specifically to this definition.
- void setTraceLevelSpecific (TraceManager::Level level)

  Updates the trace level used by this definition.
- void defineTraceLevelSpecific (TraceManager::Level traceLevelspecific, bool traceLevelSpecific↩ Enabled=true)

  Defines the specific trace level and optionally enables it immediately.
- bool isTraceLevelSpecificEnabled () const

  Indicates whether the specific trace level is enabled.
- void setTraceLevelSpecificEnabled (bool traceLevelSpecificEnabled)

  Enables or disables the specific trace level.

Static Public Member Functions

- static PluginInformation * **GetPluginInformation** ()
- static ModelDataDefinition * **LoadInstance** (Model *model, PersistenceRecord *fields)
- static ModelDataDefinition * **NewInstance** (Model *model, std::string name="")

Static Public Member Functions inherited from ModelDataDefinition

- static ModelDataDefinition * LoadInstance (Model *model, PersistenceRecord *fields, bool insertIntoModel)

  Loads a model data definition instance from serialized fields.
- static ModelDataDefinition * NewInstance (Model *model, std::string name="")

  Creates a new instance of a data definition using the plugin registry.
- static void SaveInstance (PersistenceRecord *fields, ModelDataDefinition *modeldatum)

  Serializes a data definition instance into a persistence record.
- static bool Check (ModelDataDefinition *modeldatum, std::string &errorMessage)

  Validates a data definition instance.
- static void InitBetweenReplications (ModelDataDefinition *modeldatum)

  Resets simulation-time state between replications.
- static void CreateInternalData (ModelDataDefinition *modeldatum)

  Creates internal and attached data required by this instance.
- static bool CreateRelatedDataElements (ModelDataDefinition *modeldatum, std::string &errorMessage)

  Creates related data and validates the instance in a single call.

Protected Member Functions

- virtual bool _loadInstance (PersistenceRecord *fields) override

  must be overriden by derived classes
- virtual void _saveInstance (PersistenceRecord *fields, bool saveDefaultValues) override

  Saves object fields into a serialization structure.
- virtual bool _check (std::string &errorMessage) override

  could be overriden by derived classes
- virtual void _initBetweenReplications () override

Protected Member Functions inherited from ModelDataDefinition

- bool _getSaveDefaultsOption ()

17.19.1 Member Function Documentation

17.19.1.1 _check()

```
bool AISupport::_check (
            std::string & errorMessage )  [override], [protected], [virtual]
```

could be overriden by derived classes
Reimplemented from ModelDataDefinition.

17.19.1.2 _initBetweenReplications()

```
void AISupport::_initBetweenReplications ( )  [override], [protected], [virtual]
```

Reimplemented from ModelDataDefinition.

17.19.1.3 _loadInstance()

```
bool AISupport::_loadInstance (
            PersistenceRecord * fields )  [override], [protected], [virtual]
```

must be overriden by derived classes
Reimplemented from ModelDataDefinition.

17.19.1.4 _saveInstance()

```
void AISupport::_saveInstance (
            PersistenceRecord * fields,
            bool saveDefaultValues )  [override], [protected], [virtual]
```

Saves object fields into a serialization structure.

Parameters

fields	a table-like structure used for serialization.
saveDefaultValues	indicates whether or not to save fields which are set to their default value.

Reimplemented from ModelDataDefinition.

17.19.1.5 show()

```
std::string AISupport::show ( )  [override], [virtual]
```

Returns a textual representation of this data definition.
Returns the keys of internal ModelDataDefinitions such as counters, statistics collectors and other children needed before model checking.

Returns

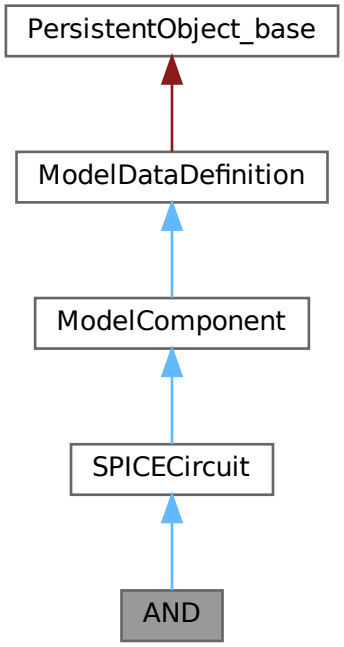
Human-readable summary used by traces and debug output.

Reimplemented from ModelDataDefinition.
The documentation for this class was generated from the following files:

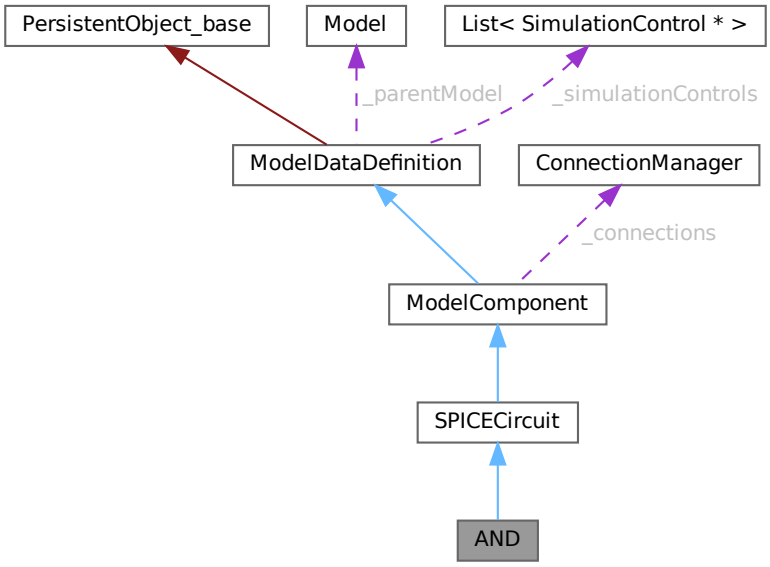
- plugins/data/AI/AISupport.h
- plugins/data/AI/AISupport.cpp

17.20 AND Class Reference

Inheritance diagram for AND:



Collaboration diagram for AND:



Public Member Functions

- **AND** (Model *model, std::string name="")
- void Build () override
- void **setPMOSWidth** (float PMOSWidth)
- void **setPMOSLength** (float length)
- void **setNMOSWidth** (float NMOSWidth)
- void **setNMOSLength** (float NMOSLength)
- void **setElectricalModel** (std::string electricalModel)

Public Member Functions inherited from SPICECircuit

- **SPICECircuit** (Model *model, std::string name="")

  constructors
- void **setRunner** (SPICERunner *runner)

  new public user methods for this components
- SPICERunner * **getRunner** ()
- virtual std::string show () override

  virtual public methods

Public Member Functions inherited from ModelComponent

- ModelComponent (Model *model, std::string componentTypename, std::string name="")

  constructors
- virtual ~**ModelComponent** ()

  Releases component-owned resources and unregisters it from the model.
- ConnectionManager * getConnectionManager () const

  new public user methods for this component
- void connectTo (ModelComponent *component, unsigned int inputPortNumber=0)

Connects this component to another component.

- bool hasBreakpointAt ()

  Indicates whether a simulation breakpoint is set on this component.

- void setDescription (std::string _description)

  Updates the free-form description shown by the GUI.

- std::string getDescription () const

  Returns the free-form description associated with this component.

- void remove (ModelComponent *comp)

  Removes a connected component from this component.

Public Member Functions inherited from ModelDataDefinition

- ModelDataDefinition (Model *model, std::string datadefinitionTypename, std::string name="", bool insert↩ IntoModel=true)

  Creates a model data definition and optionally inserts it into the model.

- virtual ~**ModelDataDefinition** ()

  Releases resources owned by this data definition.

- Util::identification getId () const

  Returns the unique identifier of this instance.

- void setName (const std::string &name)

  Updates the logical name of this instance.

- const std::string & getName () const

  Returns the logical name of this instance.

- void setLabel (const std::string &label)

  Updates the user-visible label of this instance.

- const std::string & getLabel () const

  Returns the user-visible label of this instance.

- const std::string & getClassname () const

  Returns the runtime class name used by the plugin system.

- Model * getParentModel () const

  Returns the parent model that owns this definition.

- bool isReportStatistics () const

  Indicates whether this data definition contributes report statistics.

- void setReportStatistics (bool reportStatistics)

  Enables or disables report-statistics generation for this definition.

- ModelDataDefinition * getInternalData (const std::string &name) const

  Looks up a named internal child data definition.

- std::map< std::string, ModelDataDefinition * > * getInternalData () const

  Returns the full map of internal child data definitions.

- std::map< std::string, ModelDataDefinition * > * getAttachedData () const

  Returns the full map of attached data definitions.

- bool hasChanged () const

  Indicates whether this instance has been modified since the last reset.

- void setHasChanged (bool hasChanged)

  Updates the changed flag for this data definition.

- unsigned int getLevel () const

  Returns the hierarchical editing context containing this element.

- void setModelLevel (unsigned int _modelLevel)

  Sets this element's hierarchical editing context.

- List< SimulationControl * > * getSimulationControls () const

  Returns the simulation controls owned by this data definition.

- TraceManager::Level getTraceLevelSpecific () const

  Returns the trace level that applies specifically to this definition.
- void setTraceLevelSpecific (TraceManager::Level level)

  Updates the trace level used by this definition.
- void defineTraceLevelSpecific (TraceManager::Level traceLevelspecific, bool traceLevelSpecific↩ Enabled=true)

  Defines the specific trace level and optionally enables it immediately.
- bool isTraceLevelSpecificEnabled () const

  Indicates whether the specific trace level is enabled.
- void setTraceLevelSpecificEnabled (bool traceLevelSpecificEnabled)

  Enables or disables the specific trace level.

Static Public Member Functions

- static PluginInformation * **GetPluginInformation** ()
- static ModelComponent * **LoadInstance** (Model *model, PersistenceRecord *fields)
- static ModelDataDefinition * **NewInstance** (Model *model, std::string name="")

Static Public Member Functions inherited from SPICECircuit

- static PluginInformation * **GetPluginInformation** ()

  static public methods that must have implementations (Load and New just the same. GetInformation must provide specific infos for the new component
- static ModelComponent * **LoadInstance** (Model *model, PersistenceRecord *fields)
- static ModelDataDefinition * **NewInstance** (Model *model, std::string name="")
- static std::vector< std::string > **split** (std::string word, char split_char)

  Externalize function GetPluginInformation to be accessible throught dynamic linked library.

Static Public Member Functions inherited from ModelComponent

- static ModelComponent * LoadInstance (Model *model, PersistenceRecord *fields)

  static public methods that must have implementations (Load and New just the same. GetInformation must provide specific infos for the new component
- static bool Check (ModelComponent *component)

  Validates a component instance.
- static void CreateInternalData (ModelComponent *component)

  Creates internal data required by a component instance.
- static void SaveInstance (PersistenceRecord *fields, ModelComponent *component)

  Serializes a component instance into a persistence record.
- static void DispatchEvent (Event *event)

  Dispatches a simulation event to the target component.

Static Public Member Functions inherited from ModelDataDefinition

- static ModelDataDefinition * LoadInstance (Model *model, PersistenceRecord *fields, bool insertIntoModel)

  Loads a model data definition instance from serialized fields.
- static ModelDataDefinition * NewInstance (Model *model, std::string name="")

  Creates a new instance of a data definition using the plugin registry.
- static void SaveInstance (PersistenceRecord *fields, ModelDataDefinition *modeldatum)

  Serializes a data definition instance into a persistence record.
- static bool Check (ModelDataDefinition *modeldatum, std::string &errorMessage)

  Validates a data definition instance.
- static void InitBetweenReplications (ModelDataDefinition *modeldatum)

Resets simulation-time state between replications.

- static void CreateInternalData (ModelDataDefinition *modeldatum)

  Creates internal and attached data required by this instance.

- static bool CreateRelatedDataElements (ModelDataDefinition *modeldatum, std::string &errorMessage)

  Creates related data and validates the instance in a single call.

Protected Member Functions

- virtual bool _loadInstance (PersistenceRecord *fields) override

  virtual protected method that must be overriden

- virtual void _saveInstance (PersistenceRecord *fields, bool saveDefaultValues) override

  Saves object fields into a serialization structure.

Protected Member Functions inherited from SPICECircuit

- void **BuildCircuit** (std::string description, unsigned int id, std::vector< std::string > the_params={""}, std::string the_model="", std::string the_model_file="")

  virtual protected method that must be overriden

- void **UpdateConnections** ()
- virtual void _onDispatchEvent (Entity *entity, unsigned int inputPortNumber) override

  This method is only for ModelComponents, not ModelDataElements.

- virtual void _createNonEditableDataDefinitions () override

  virtual protected methods that could be overriden by derived classes, if needed

Protected Member Functions inherited from ModelDataDefinition

- bool _getSaveDefaultsOption ()
- virtual bool _check (std::string &errorMessage)

  could be overriden by derived classes

17.20.1 Member Function Documentation

17.20.1.1 _loadInstance()

```
bool AND::_loadInstance (
            PersistenceRecord * fields )  [override], [protected], [virtual]
```

virtual protected method that must be overriden
Reimplemented from SPICECircuit.

17.20.1.2 _saveInstance()

```
void AND::_saveInstance (
            PersistenceRecord * fields,
            bool saveDefaultValues )  [override], [protected], [virtual]
```

Saves object fields into a serialization structure.

Parameters

fields	a table-like structure used for serialization.
saveDefaultValues	indicates whether or not to save fields which are set to their default value.

Reimplemented from SPICECircuit.

17.20.1.3 Build()

```
void AND::Build ( )  [override], [virtual]
```

Reimplemented from SPICECircuit.

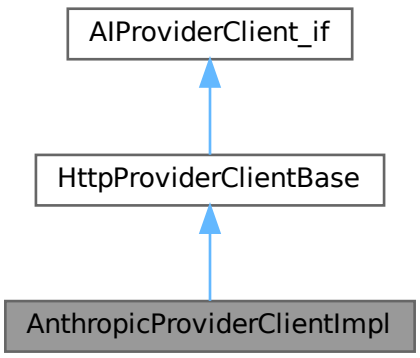
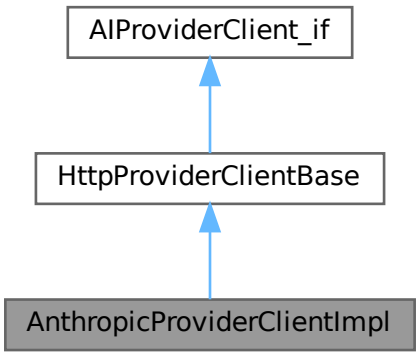
17.37 AnthropicProviderClientImpl Class Reference

AI provider client for the Anthropic Messages API.
`#include <tools/AIAssistant/AnthropicProviderClientImpl.h>`
Inheritance diagram for AnthropicProviderClientImpl:



Collaboration diagram for AnthropicProviderClientImpl:



Public Member Functions

- **AnthropicProviderClientImpl** ()

  Constructs the client with the standard Anthropic base URL.
- std::string getProviderName () const override

  Returns a human-readable provider name (e.g. "OpenAI", "Anthropic").
- bool isAvailable () const override

  Returns `true` when an API key is set and a base URL is configured.
- void setApiVersion (const std::string &version)

  Sets the Anthropic API version header value.
- std::string **getApiVersion** () const

  Returns the configured Anthropic API version string.
- void setThinkingBudgetTokens (unsigned int budget)

  Sets the extended-thinking budget in tokens (default: 10000).
- unsigned int **getThinkingBudgetTokens** () const

  Returns the thinking budget in tokens.

Public Member Functions inherited from HttpProviderClientBase

- **HttpProviderClientBase** (const HttpProviderClientBase &)=delete
- HttpProviderClientBase & **operator=** (const HttpProviderClientBase &)=delete
- bool isAvailable () const override

  Returns `true` when this client can attempt to send requests.
- void setBaseUrl (const std::string &url) override

  Sets the base URL for the provider API endpoint.
- std::string getBaseUrl () const override

  Returns the currently configured base URL.
- void setTimeoutSeconds (unsigned int seconds) override

  Sets the HTTP request timeout in seconds.
- unsigned int getTimeoutSeconds () const override

  Returns the configured HTTP request timeout.
- void setApiKey (const std::string &apiKey) override

  Stores the API key in memory.
- void clearApiKey () override

  Overwrites (best-effort) and clears the in-memory API key.
- bool hasApiKey () const override

  Returns `true` when a non-empty API key is held.
- ProviderResponse send (const ProviderRequest &request) override

  Executes the HTTP request via curl and returns the provider response.

Protected Member Functions

- std::string _buildRequestBody (const ProviderRequest &request) const override

  Serialises `request` to the provider's JSON wire format.
- ProviderResponse _parseResponseBody (const std::string &rawBody, int httpStatus) const override

  Deserialises `rawBody` (the full curl stdout) into a ProviderResponse.
- std::string _authorizationHeader () const override

  Returns the Authorization header line without the "header = " prefix.
- std::vector< std::string > _extraRequestHeaders () const override

  Returns additional HTTP headers to send with every request.

Additional Inherited Members

Static Public Member Functions inherited from HttpProviderClientBase

- static std::string **_escapeJsonString** (const std::string &s)

  Escapes a plain string for safe embedding inside a JSON string value.
- static std::string **_extractJsonString** (const std::string &json, const std::string &key)

  Extracts the value of a top-level JSON string field by key. Returns an empty string when not found or value is not a quoted string.
- static int **_extractJsonInt** (const std::string &json, const std::string &key)

  Extracts the value of a top-level JSON integer field by key. Returns 0 when not found.
- static double **_extractJsonDouble** (const std::string &json, const std::string &key)

  Extracts the value of a top-level JSON number field (int or float) by key. Returns 0.0 when not found.
- static std::string **_buildMessagesArray** (const std::vector< ChatMessage > &messages)

  Serialises a vector of ChatMessage objects to a JSON array string.
- static std::string **_extractFirstArrayElement** (const std::string &json, const std::string &arrayKey)

  Extracts the raw substring of the first element of a named JSON array. Returns an empty string when not found.

Protected Attributes inherited from HttpProviderClientBase

- std::string **_baseUrl**
- unsigned int **_timeoutSeconds** = 30
- std::string _apiKey

  In-memory API key.

17.37.1 Detailed Description

AI provider client for the Anthropic Messages API.
Wraps the Anthropic `/v1/messages` endpoint (Claude 3/4 model family). Default base URL: `https://api.anthropic.com/v1/messages`
Wire format differences from the OpenAI schema:

- Auth header: `x-api-key: <key>` (not `Authorization: Bearer`).
- Required extra header: `anthropic-version: 2023-06-01`.
- Request body: `max_tokens` (required), `system` is a top-level field (not a message in the array), `messages` contains only user/assistant turns.
- Response: content is in `content[0].text`, tokens in `usage.input_tokens` / `usage.output_tokens`.
- Extended thinking: when `highReasoningMode` is true, a `thinking.type=enabled` budget block is added to the request and the text is extracted from the first content block whose `type` is `"text"`.

17.37.1.1 API key

Sent as `x-api-key: <key>`. Written to the curl config file at mode 0600; never placed on the command line.

17.37.2 Member Function Documentation

17.37.2.1 _authorizationHeader()

`std::string AnthropicProviderClientImpl::_authorizationHeader ( ) const [override], [protected], [virtual]`
Returns the Authorization header line without the "header = " prefix.
Example return values:

- "Authorization: Bearer sk-..." (OpenAI, LocalProvider)

- "x-api-key: sk-ant-..." (Anthropic)

Called only from within send(); the value is written to a 0600 temp file and never logged.
Implements HttpProviderClientBase.

17.37.2.2 _buildRequestBody()

```
std::string AnthropicProviderClientImpl::_buildRequestBody (
            const ProviderRequest & request ) const  [override], [protected], [virtual]
```

Serialises `request` to the provider's JSON wire format.
Implements HttpProviderClientBase.

17.37.2.3 _extraRequestHeaders()

```
std::vector< std::string > AnthropicProviderClientImpl::_extraRequestHeaders ( ) const  [override],
[protected], [virtual]
```

Returns additional HTTP headers to send with every request.
Default implementation returns an empty vector. Anthropic overrides to add "anthropic-version: 2023-06-01".
Each element must be a complete header line, e.g. "anthropic-version: 2023-06-01".
Reimplemented from HttpProviderClientBase.

17.37.2.4 _parseResponseBody()

```
ProviderResponse AnthropicProviderClientImpl::_parseResponseBody (
            const std::string & rawBody,
            int httpStatus ) const  [override], [protected], [virtual]
```

Deserialises `rawBody` (the full curl stdout) into a ProviderResponse.

Parameters

rawBody	Complete HTTP response body as received from curl.
httpStatus	HTTP status code captured from curl exit / response line, or 0 when unavailable.

Implements HttpProviderClientBase.

17.37.2.5 getProviderName()

```
std::string AnthropicProviderClientImpl::getProviderName ( ) const  [override], [virtual]
```

Returns a human-readable provider name (e.g. "OpenAI", "Anthropic").
Implements AIProviderClient_if.

17.37.2.6 isAvailable()

```
bool AnthropicProviderClientImpl::isAvailable ( ) const  [override], [virtual]
```

Returns `true` when an API key is set and a base URL is configured.
Implements AIProviderClient_if.

17.37.2.7 setApiVersion()

```
void AnthropicProviderClientImpl::setApiVersion (
            const std::string & version )
```

Sets the Anthropic API version header value.
Defaults to "2023-06-01" which is the stable version as of mid-2026. Override only when Anthropic releases a newer stable version that changes the wire format.

17.37.2.8 setThinkingBudgetTokens()

```
void AnthropicProviderClientImpl::setThinkingBudgetTokens (
            unsigned int budget )
```

Sets the extended-thinking budget in tokens (default: 10000).
Used only when ProviderRequest::highReasoningMode is true. Must be less than ProviderRequest::maxTokens.
The documentation for this class was generated from the following files:

- tools/AIAssistant/AnthropicProviderClientImpl.h
- tools/AIAssistant/AnthropicProviderClientImpl.cpp

17.38 ApiRouter Class Reference

Routes HTTP requests to Web API operations.
`#include <applications/worker/api/ApiRouter.h>`

Public Member Functions

- ApiRouter (SimulatorSessionService &simulatorService)

  Creates an API router bound to the simulator session service.
- HttpResponse handle (const HttpRequest &request) const

  Handles one HTTP request and returns the corresponding response.

17.38.1 Detailed Description

Routes HTTP requests to Web API operations.

17.38.2 Constructor & Destructor Documentation

17.38.2.1 ApiRouter()

```
ApiRouter::ApiRouter (
            SimulatorSessionService & simulatorService )  [explicit]
```

Creates an API router bound to the simulator session service.
Dispatches HTTP routes for the Genesys web API.

Parameters

simulatorService	Service used to execute API operations.

The router keeps request parsing, token extraction, payload decoding and JSON formatting in one place so the HTTP server can stay transport-only.

17.38.3 Member Function Documentation

17.38.3.1 handle()

```
HttpResponse ApiRouter::handle (
            const HttpRequest & request ) const
```

Handles one HTTP request and returns the corresponding response.
Resolves a request into one of the public API operations.

Parameters

request	HTTP request containing method, path, headers, and body.

Returns

HTTP response with status, content type, and JSON payload.

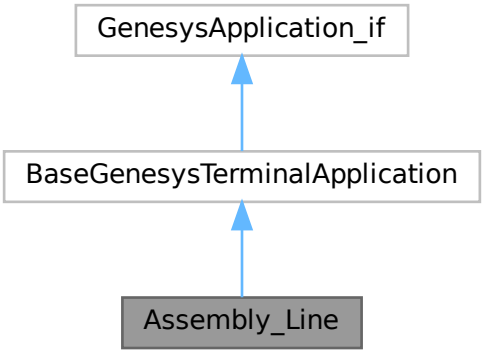
The route chain stays intentionally explicit so the generated PDF makes the supported endpoints and their validation rules easy to audit.

The documentation for this class was generated from the following files:

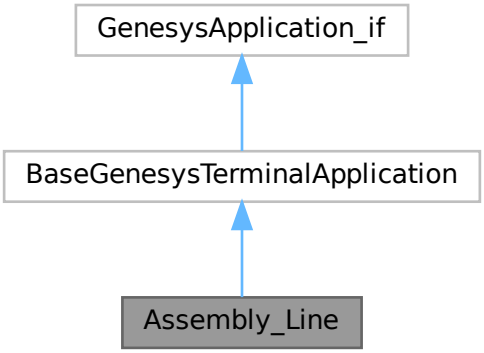
- applications/worker/api/ApiRouter.h
- applications/worker/api/ApiRouter.cpp

17.39 Assembly_Line Class Reference

Inheritance diagram for Assembly_Line:



Collaboration diagram for Assembly_Line:



Public Member Functions

- virtual int main (int argc, char **argv) override

Public Member Functions inherited from BaseGenesysTerminalApplication

- virtual void **Simulate** (Simulator *genesys, Model *model, PluginManager *plugins)
- void **setDefaultTraceHandlers** (TraceManager *tm)
- void setDefaultEventHandlers (OnEventManager *oem)

Additional Inherited Members

Protected Member Functions inherited from BaseGenesysTerminalApplication

- virtual void **traceHandler** (TraceEvent e)
- virtual void **traceErrorHandler** (TraceErrorEvent e)
- virtual void **traceReportHandler** (TraceEvent e)
- virtual void **traceSimulationHandler** (TraceSimulationEvent e)
- virtual void **onAfterProcessEventHandler** (SimulationEvent ∗re)

- virtual void **onEntityCreateHandler** (SimulationEvent ∗re)
- virtual void **onEntityMoveHandler** (SimulationEvent ∗re)
- virtual void **onSimulationStartHandler** (SimulationEvent ∗re)
- virtual void **onReplicationStepHandler** (SimulationEvent ∗re)
- virtual void **onReplicationStartHandler** (SimulationEvent ∗re)
- virtual void **onProcessEventHandler** (SimulationEvent ∗re)
- virtual void **onReplicationEndHandler** (SimulationEvent ∗re)
- virtual void **onSimulationEndHandler** (SimulationEvent ∗re)
- virtual void **onSimulationPausedHandler** (SimulationEvent ∗re)
- virtual void **onSimulationResumeHandler** (SimulationEvent ∗re)
- virtual void **onEntityRemoveHandler** (SimulationEvent ∗re)

17.39.1 Member Function Documentation

17.39.1.1 main()

```
int Assembly_Line::main (
            int argc,
            char ** argv )  [override], [virtual]
```

This is the main function of the application. It instanciates the simulator, builds a simulation model and then simulate that model.
Reimplemented from BaseGenesysTerminalApplication.
The documentation for this class was generated from the following files:

- applications/modelSpecific/arenaExamples/Assembly_Line.h
- applications/modelSpecific/arenaExamples/Assembly_Line.cpp

17.40 testing::internal::AssertHelper Class Reference

Public Member Functions

- **AssertHelper** (TestPartResult::Type type, const char ∗file, int line, const char ∗message)
- void **operator=** (const Message &message) const

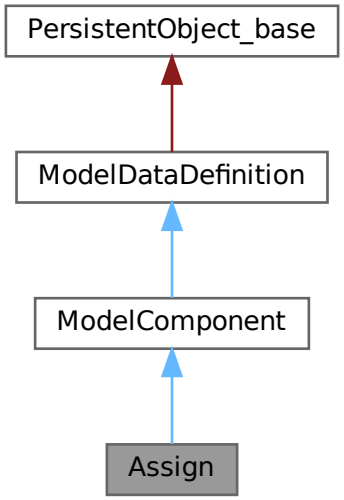
The documentation for this class was generated from the following files:

- gtest/gtest/gtest.h
- gtest/src/gtest.cc

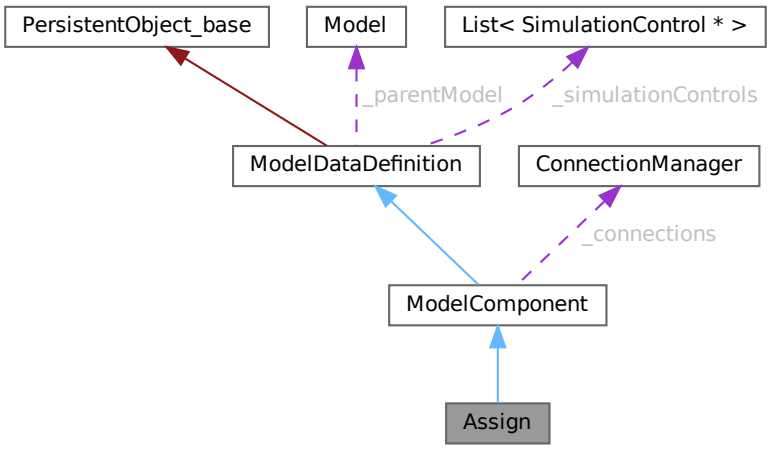
17.41 Assign Class Reference

Component that evaluates one or more (destination, expression) pairs and writes each result into an Attribute or a Variable on the entity/model.
`#include <plugins/components/Logic/Assign.h>`

Inheritance diagram for Assign:



Collaboration diagram for Assign:



Public Member Functions

- **Assign** (Model ∗model, std::string name="")
- virtual std::string show () override

  virtual public methods
- List< Assignment ∗ > ∗ **getAssignments** () const
- void **addAssignment** (Assignment ∗newAssignment)
- void **removeAssignment** (Assignment ∗assignment)

Public Member Functions inherited from ModelComponent

- ModelComponent (Model *model, std::string componentTypename, std::string name="")

  constructors
- virtual ~**ModelComponent** ()

  Releases component-owned resources and unregisters it from the model.
- ConnectionManager * getConnectionManager () const

  new public user methods for this component
- void connectTo (ModelComponent *component, unsigned int inputPortNumber=0)

  Connects this component to another component.
- bool hasBreakpointAt ()

  Indicates whether a simulation breakpoint is set on this component.
- void setDescription (std::string _description)

  Updates the free-form description shown by the GUI.
- std::string getDescription () const

  Returns the free-form description associated with this component.
- void remove (ModelComponent *comp)

  Removes a connected component from this component.

Public Member Functions inherited from ModelDataDefinition

- ModelDataDefinition (Model *model, std::string datadefinitionTypename, std::string name="", bool insert↩ IntoModel=true)

  Creates a model data definition and optionally inserts it into the model.
- virtual ~**ModelDataDefinition** ()

  Releases resources owned by this data definition.
- Util::identification getId () const

  Returns the unique identifier of this instance.
- void setName (const std::string &name)

  Updates the logical name of this instance.
- const std::string & getName () const

  Returns the logical name of this instance.
- void setLabel (const std::string &label)

  Updates the user-visible label of this instance.
- const std::string & getLabel () const

  Returns the user-visible label of this instance.
- const std::string & getClassname () const

  Returns the runtime class name used by the plugin system.
- Model * getParentModel () const

  Returns the parent model that owns this definition.
- bool isReportStatistics () const

  Indicates whether this data definition contributes report statistics.
- void setReportStatistics (bool reportStatistics)

  Enables or disables report-statistics generation for this definition.
- ModelDataDefinition * getInternalData (const std::string &name) const

  Looks up a named internal child data definition.
- std::map< std::string, ModelDataDefinition * > * getInternalData () const

  Returns the full map of internal child data definitions.
- std::map< std::string, ModelDataDefinition * > * getAttachedData () const

  Returns the full map of attached data definitions.
- bool hasChanged () const

  Indicates whether this instance has been modified since the last reset.

- void setHasChanged (bool hasChanged)

  Updates the changed flag for this data definition.
- unsigned int getLevel () const

  Returns the hierarchical editing context containing this element.
- void setModelLevel (unsigned int _modelLevel)

  Sets this element's hierarchical editing context.
- List< SimulationControl * > * getSimulationControls () const

  Returns the simulation controls owned by this data definition.
- TraceManager::Level getTraceLevelSpecific () const

  Returns the trace level that applies specifically to this definition.
- void setTraceLevelSpecific (TraceManager::Level level)

  Updates the trace level used by this definition.
- void defineTraceLevelSpecific (TraceManager::Level traceLevelspecific, bool traceLevelSpecific↩ Enabled=true)

  Defines the specific trace level and optionally enables it immediately.
- bool isTraceLevelSpecificEnabled () const

  Indicates whether the specific trace level is enabled.
- void setTraceLevelSpecificEnabled (bool traceLevelSpecificEnabled)

  Enables or disables the specific trace level.

Static Public Member Functions

- static PluginInformation * **GetPluginInformation** ()
- static ModelComponent * **LoadInstance** (Model *model, PersistenceRecord *fields)
- static ModelDataDefinition * **NewInstance** (Model *model, std::string name="")

Static Public Member Functions inherited from ModelComponent

- static ModelComponent * LoadInstance (Model *model, PersistenceRecord *fields)

  static public methods that must have implementations (Load and New just the same. GetInformation must provide specific infos for the new component
- static bool Check (ModelComponent *component)

  Validates a component instance.
- static void CreateInternalData (ModelComponent *component)

  Creates internal data required by a component instance.
- static void SaveInstance (PersistenceRecord *fields, ModelComponent *component)

  Serializes a component instance into a persistence record.
- static void DispatchEvent (Event *event)

  Dispatches a simulation event to the target component.

Static Public Member Functions inherited from ModelDataDefinition

- static ModelDataDefinition * LoadInstance (Model *model, PersistenceRecord *fields, bool insertIntoModel)

  Loads a model data definition instance from serialized fields.
- static ModelDataDefinition * NewInstance (Model *model, std::string name="")

  Creates a new instance of a data definition using the plugin registry.
- static void SaveInstance (PersistenceRecord *fields, ModelDataDefinition *modeldatum)

  Serializes a data definition instance into a persistence record.
- static bool Check (ModelDataDefinition *modeldatum, std::string &errorMessage)

  Validates a data definition instance.
- static void InitBetweenReplications (ModelDataDefinition *modeldatum)

  Resets simulation-time state between replications.
- static void CreateInternalData (ModelDataDefinition *modeldatum)

Creates internal and attached data required by this instance.

- static bool CreateRelatedDataElements (ModelDataDefinition *modeldatum, std::string &errorMessage)

  Creates related data and validates the instance in a single call.

Protected Member Functions

- virtual bool _loadInstance (PersistenceRecord *fields) override

  virtual protected method that must be overriden
- virtual void _saveInstance (PersistenceRecord *fields, bool saveDefaultValues) override

  Saves object fields into a serialization structure.
- virtual void _onDispatchEvent (Entity *entity, unsigned int inputPortNumber) override

  Handles a dispatched event for this component type.
- virtual bool _check (std::string &errorMessage) override

  could be overriden by derived classes
- virtual void _createEditableDataDefinitions () override

17.41.1 Detailed Description

Component that evaluates one or more (destination, expression) pairs and writes each result into an Attribute or a Variable on the entity/model.
Arena correspondence: the "Assign module" (Rockwell Automation, *Getting Started with Arena*, "The Basic Process Panel", pp. 40-41), which supports five assignment kinds: Attribute, Variable (optionally a 1D/2D array via Row/↩ Column), Entity Type, Entity Picture, and Other (system variables such as resource capacity or simulation end time).
Each entry in `_assignments` (see Assignment, in `plugins/data/Logic/AssignmentItem.h`) only distinguishes Attribute vs. Variable destinations; an optional `name[index]` syntax on the destination string is the closest correspondence to Arena's separate Row/Column fields.
Known difference from Arena: there is no Entity Type, Entity Picture, or Other (system-variable) assignment kind — `_onDispatchEvent()` only has Attribute and Variable branches. See `docs/ai_↩ assistants/reference/ARENA_GENESYS_COMPATIBILITY.md` §6.4.

17.41.2 Member Function Documentation

17.41.2.1 _check()

```
bool Assign::_check (
            std::string & errorMessage )  [override], [protected], [virtual]
```

could be overriden by derived classes
Reimplemented from ModelDataDefinition.

17.41.2.2 _createEditableDataDefinitions()

```
void Assign::_createEditableDataDefinitions ( )  [override], [protected], [virtual]
```

This method returns all changes in the parser that are needed by plugins of this ModelDatas. When connecting a new plugin, ParserChangesInformation are used to change parser source code, whch is after compiled and dinamically linked to to simulator kernel to reflect the changes
Reimplemented from ModelDataDefinition.

17.41.2.3 _loadInstance()

```
bool Assign::_loadInstance (
            PersistenceRecord * fields )  [override], [protected], [virtual]
```

virtual protected method that must be overriden
Reimplemented from ModelComponent.

17.41.2.4 _onDispatchEvent()

```
void Assign::_onDispatchEvent (
            Entity * entity,
            unsigned int inputPortNumber )  [override], [protected], [virtual]
```

Handles a dispatched event for this component type.
This method is only for ModelComponents, not for ModelDataElements.

Parameters

entity	Entity being processed.
inputPortNumber	Input port where the entity arrived.

Implements ModelComponent.

17.41.2.5 _saveInstance()

```
void Assign::_saveInstance (
            PersistenceRecord * fields,
            bool saveDefaultValues )  [override], [protected], [virtual]
```

Saves object fields into a serialization structure.

Parameters

fields	a table-like structure used for serialization.
saveDefaultValues	indicates whether or not to save fields which are set to their default value.

Reimplemented from ModelComponent.

17.41.2.6 show()

```
std::string Assign::show ( )  [override], [virtual]
```

virtual public methods
Returns a textual representation of this component.

Returns

Human-readable description used for tracing and debugging.

Reimplemented from ModelComponent.
The documentation for this class was generated from the following files:

- plugins/components/Logic/Assign.h
- plugins/components/Logic/Assign.cpp

17.42 Assignment Class Reference

One (destination, expression) pair used by Assign and by Sequence's per-step assignments.
`#include <plugins/data/Logic/AssignmentItem.h>`

Public Member Functions

- **Assignment** (Model *model, std::string destination, std::string expression="1", bool isAttributeNot↩ Variable=true)
- **Assignment** (std::string destination, std::string expression, bool isAttributeNotVariable=true)
- void **setDestination** (std::string _destination)
- std::string **getDestination** () const
- void **setExpression** (std::string _expression)
- std::string **getExpression** () const
- void **setAttributeNotVariable** (bool isAttributeNotVariable)
- bool **isAttributeNotVariable** () const
- void **setChangeCallback** (std::function< void(Assignment &)> callback)
- std::string **getName** () const
- List< SimulationControl * > * **getSimulationControls** () const
- void **ensureSimulationControls** (Model *model)
- void **_addSimulationControl** (SimulationControl *control)
- std::string **getTypeDC** ()
- bool **loadInstance** (PersistenceRecord *fields, unsigned int parentIndex)
- void **saveInstance** (PersistenceRecord *fields, unsigned int parentIndex, bool saveDefault)

17.42.1 Detailed Description

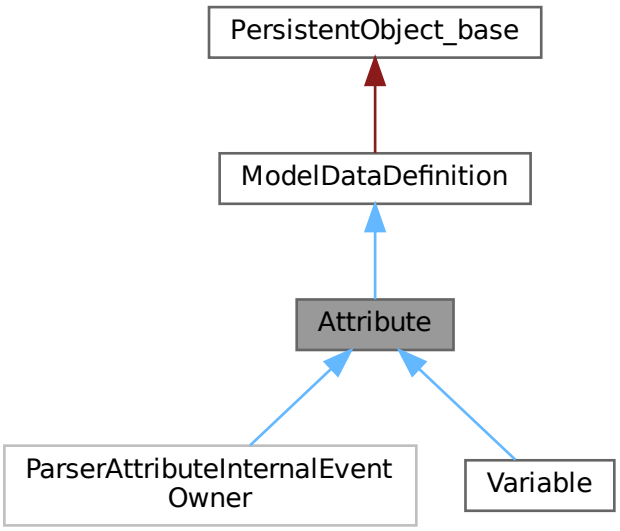
One (destination, expression) pair used by Assign and by Sequence's per-step assignments.
`destination` is a free-form name, optionally with a `[index]` suffix (parsed by the owning component, e.g. `Assign::_destinationBaseName()` / `_destinationIndex()`); `_isAttributeNotVariable` selects whether it names an Attribute or a Variable. `expression` is evaluated through the parser at dispatch time. There is no dedicated destination kind for an entity's EntityType, its picture, or an arbitrary "system variable" — see Assign for the corresponding Arena divergence.
The documentation for this class was generated from the following files:

- plugins/data/Logic/AssignmentItem.h
- plugins/data/Logic/AssignmentItem.cpp

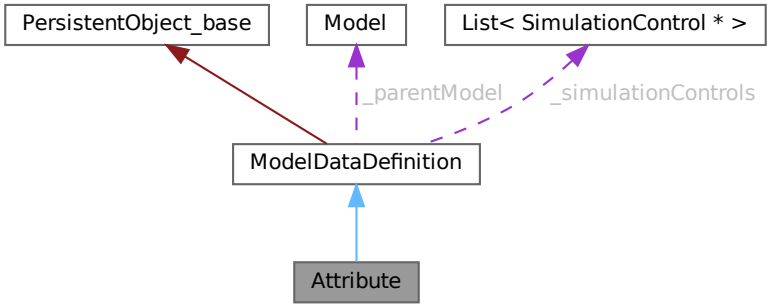
17.43 Attribute Class Reference

Data definition declaring one named, per-entity attribute (its dimensionality and sparse initial values), shared across every entity created in the model.
`#include <kernel/simulator/essentialPlugins/Attribute.h>`

Inheritance diagram for Attribute:



Collaboration diagram for Attribute:



Public Member Functions

- **Attribute** (Model *model, std::string name="", std::string dataDefinitionTypename=Util::TypeOf< Attribute >())

  Creates an entity attribute definition in the model.
- virtual ~**Attribute** () override

  Releases sparse initial values owned by this definition.
- virtual std::string show () override

  Returns a textual representation of this data definition.
- virtual std::string getInitialValuesText () const

  Returns the initial values serialized in bracket notation.
- virtual void setInitialValuesText (std::string valuesText)

Parses bracket notation and replaces the initial value store.

- double **getInitialValue** (std::string index="")

  Reads the initial sparse value, returning 0.0 when the index is absent.
- void **setInitialValue** (double value, std::string index="")

  Writes the initial sparse value at the scalar or indexed position.
- void **setInitialValues** (const std::vector< std::pair< std::string, double > > values)

  Replaces/extends initial sparse values from textual index/value pairs.
- void **copyInitialValuesFrom** (const Attribute &source)

  Copies the full initial sparse store from another attribute.
- void **insertDimentionSize** (unsigned int size)

  Appends one dimension size to the attribute definition.
- std::list< unsigned int > * **getDimensionSizes** () const

  Returns dimension sizes for compatibility with existing callers.
- std::map< std::string, double > * **getInitialValues** () const

  Returns mutable initial sparse values for compatibility with existing callers.
- SparseValueStore * **getInitialValueStore** ()

  Returns the sparse initial value store used by this attribute.
- bool **isInitialValuesTextValid** () const

  Returns whether the last textual initial value is syntactically valid.

Public Member Functions inherited from ModelDataDefinition

- ModelDataDefinition (Model *model, std::string datadefinitionTypename, std::string name="", bool insert↩ IntoModel=true)

  Creates a model data definition and optionally inserts it into the model.
- virtual ~**ModelDataDefinition** ()

  Releases resources owned by this data definition.
- Util::identification getId () const

  Returns the unique identifier of this instance.
- void setName (const std::string &name)

  Updates the logical name of this instance.
- const std::string & getName () const

  Returns the logical name of this instance.
- void setLabel (const std::string &label)

  Updates the user-visible label of this instance.
- const std::string & getLabel () const

  Returns the user-visible label of this instance.
- const std::string & getClassname () const

  Returns the runtime class name used by the plugin system.
- Model * getParentModel () const

  Returns the parent model that owns this definition.
- bool isReportStatistics () const

  Indicates whether this data definition contributes report statistics.
- void setReportStatistics (bool reportStatistics)

  Enables or disables report-statistics generation for this definition.
- ModelDataDefinition * getInternalData (const std::string &name) const

  Looks up a named internal child data definition.
- std::map< std::string, ModelDataDefinition * > * getInternalData () const

  Returns the full map of internal child data definitions.
- std::map< std::string, ModelDataDefinition * > * getAttachedData () const

  Returns the full map of attached data definitions.

- bool hasChanged () const

  Indicates whether this instance has been modified since the last reset.
- void setHasChanged (bool hasChanged)

  Updates the changed flag for this data definition.
- unsigned int getLevel () const

  Returns the hierarchical editing context containing this element.
- void setModelLevel (unsigned int _modelLevel)

  Sets this element's hierarchical editing context.
- List< SimulationControl * > * getSimulationControls () const

  Returns the simulation controls owned by this data definition.
- TraceManager::Level getTraceLevelSpecific () const

  Returns the trace level that applies specifically to this definition.
- void setTraceLevelSpecific (TraceManager::Level level)

  Updates the trace level used by this definition.
- void defineTraceLevelSpecific (TraceManager::Level traceLevelspecific, bool traceLevelSpecific↩ Enabled=true)

  Defines the specific trace level and optionally enables it immediately.
- bool isTraceLevelSpecificEnabled () const

  Indicates whether the specific trace level is enabled.
- void setTraceLevelSpecificEnabled (bool traceLevelSpecificEnabled)

  Enables or disables the specific trace level.

Static Public Member Functions

17.43.1 Detailed Description

Data definition declaring one named, per-entity attribute (its dimensionality and sparse initial values), shared across every entity created in the model.
Arena correspondence: the "Attribute module" (Rockwell Automation, *Getting Started with Arena*, "The Basic Process Panel", p. 43), which defines an attribute's rows/columns, data type and initial value(s). Attribute values are per-entity (each Entity instance holds its own store), which is the same distinction Arena makes between per-entity Attributes and global Variables — see Variable, which extends this class to add global (model-wide) storage.
Initial values are kept as a sparse, indexed store (SparseValueStore) addressed by a scalar or textual index, and can also be edited through the bracket-notation text form (`getInitialValuesText()`/`setInitialValuesText()`).
Known difference from Arena: only a numeric (`double`) value type is modeled; Arena's "String" data type has no equivalent here.

17.43.2 Member Function Documentation

17.43.2.1 _check()

```
bool Attribute::_check (
            std::string & errorMessage )  [override], [protected], [virtual]
```

could be overriden by derived classes
Reimplemented from ModelDataDefinition.
Reimplemented in Variable.

17.43.2.2 _loadInstance()

```
bool Attribute::_loadInstance (
            PersistenceRecord * fields )  [override], [protected], [virtual]
```

must be overriden by derived classes
Reimplemented from ModelDataDefinition.
Reimplemented in Variable.

17.43.2.3 _saveInstance()

```
void Attribute::_saveInstance (
            PersistenceRecord * fields,
            bool saveDefaultValues )  [override], [protected], [virtual]
```

Saves object fields into a serialization structure.

Parameters

fields	a table-like structure used for serialization.
saveDefaultValues	indicates whether or not to save fields which are set to their default value.

Reimplemented from ModelDataDefinition.

Reimplemented in Variable.

17.43.2.4 getInitialValuesText()

```
std::string Attribute::getInitialValuesText ( ) const  [virtual]
```

Returns the initial values serialized in bracket notation.
Reimplemented in Variable.

17.43.2.5 setInitialValuesText()

```
void Attribute::setInitialValuesText (
            std::string valuesText )  [virtual]
```

Parses bracket notation and replaces the initial value store.
Reimplemented in Variable.

17.43.2.6 show()

```
std::string Attribute::show ( )  [override], [virtual]
```

Returns a textual representation of this data definition.
Returns the keys of internal ModelDataDefinitions such as counters, statistics collectors and other children needed before model checking.

Returns

Human-readable summary used by traces and debug output.

Reimplemented from ModelDataDefinition.
Reimplemented in Variable.
The documentation for this class was generated from the following files:

- kernel/simulator/essentialPlugins/Attribute.h
- kernel/simulator/essentialPlugins/Attribute.cpp

17.44 AuditEntry Struct Reference

One entry in the AI assistant audit log.
`#include <tools/AIAssistant/AIAuditLog.h>`

Public Attributes

- std::chrono::system_clock::time_point **timestamp**
- std::string **operation**

  e.g. "analyzePrompt", "buildModel"
- std::string **provider**

  e.g. "OpenAI", "Anthropic", "Local"
- std::string **modelName**

  LLM model identifier.
- std::string **promptPreview**

  First 120 chars of user-visible input — no keys.
- bool **success** = false
- bool **dryRun** = false
- long long **durationMs** = 0
- std::string **errorSummary**

  Empty on success; capped at 200 chars.

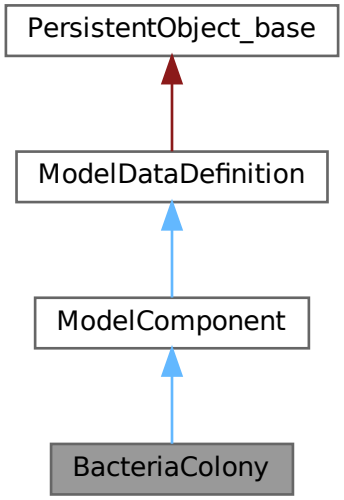
17.44.1 Detailed Description

One entry in the AI assistant audit log.
Never contains API key values. The promptPreview field is limited to the first 120 characters of the user-visible prompt text.
The documentation for this struct was generated from the following file:

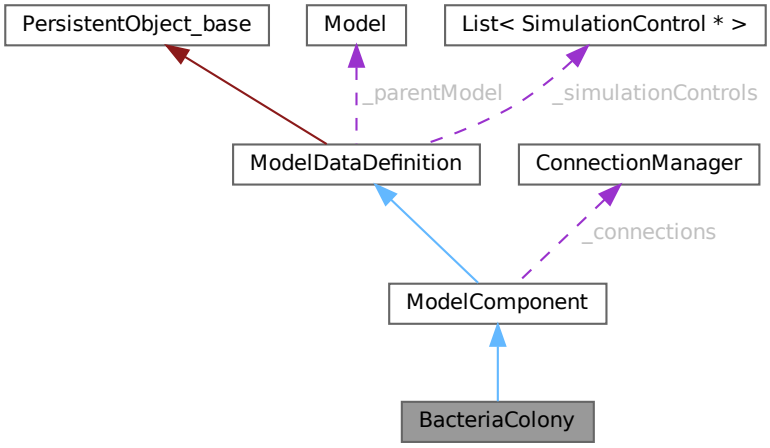
- tools/AIAssistant/AIAuditLog.h

17.45 BacteriaColony Class Reference

First GenESyS component for Gro-inspired bacteria colony simulation.
`#include <plugins/components/BiochemicalSimulation/BacteriaColony.h>`
Inheritance diagram for BacteriaColony:



Collaboration diagram for BacteriaColony:



Classes

- struct BacteriumState
- struct BarrierSegment

Public Member Functions

- **BacteriaColony** (Model *model, std::string name="")
- virtual std::string show () override

  virtual public methods
- void **setGroProgram** (GroProgram *groProgram)

  Sets the reusable Gro program used by this colony.
- GroProgram * **getGroProgram** () const

  Returns the reusable Gro program used by this colony.
- void **setSimulationStep** (double simulationStep)

  Sets the internal colony time increment used by one colony step.
- double **getSimulationStep** () const

  Returns the internal colony time increment.
- void **setNumSteps** (unsigned int numSteps)

  Sets the number of colony steps processed before forwarding one entity.
- unsigned int **getNumSteps** () const

  Returns the number of colony steps processed before forwarding one entity.
- void **setColonyTimeUnit** (Util::TimeUnit colonyTimeUnit)

  Sets the time unit used by the colony time-related attributes.
- Util::TimeUnit **getColonyTimeUnit** () const

  Returns the time unit used by the colony time-related attributes.
- double **getColonyTime** () const

  Returns the current colony time from the enclosing ModelSimulation.
- void **setInitialPopulation** (unsigned int initialPopulation)

  Sets the initial bacteria population summary for each replication.
- unsigned int **getInitialPopulation** () const

  Returns the initial bacteria population summary.

- unsigned int **getPopulationSize** () const

  Returns the current bacteria population summary.
- void **setAutomaticDivisionEnabled** (bool enabled)

  Enables optional automatic volume-threshold division.
- bool **getAutomaticDivisionEnabled** () const

  Returns whether automatic division is enabled.
- void **setDivisionThresholdVolume** (double threshold)

  Sets the volume threshold that triggers automatic division.
- double **getDivisionThresholdVolume** () const

  Returns the automatic-division volume threshold.
- void **setBioNetwork** (BioNetwork *bioNetwork)

  Sets the optional BioNetwork reused as the colony biochemical state.
- BioNetwork * **getBioNetwork** () const

  Returns the optional BioNetwork reused as the colony biochemical state.
- void **setSignalGrid** (BacteriaSignalGrid *signalGrid)

  Sets the reusable signal-grid definition used by this colony.
- BacteriaSignalGrid * **getSignalGrid** () const

  Returns the reusable signal-grid definition used by this colony.
- std::size_t **getInternalBacteriaCount** () const

  Returns the number of internal bacteria currently owned by the colony.
- const BacteriumState & **getBacteriumState** (std::size_t index) const

  Returns one internal bacterium state by zero-based index.
- double **getBacteriumAge** (std::size_t index) const

  Returns the age of one internal bacterium at the current colony time.
- double **getBacteriumPositionX** (std::size_t index) const

  Returns the continuous X coordinate used by the viewer.
- double **getBacteriumPositionY** (std::size_t index) const

  Returns the continuous Y coordinate used by the viewer.
- double **getBacteriumDirectionRadians** (std::size_t index) const

  Returns the bacterium direction in radians.
- double **getBacteriumVolume** (std::size_t index) const

  Returns the current bacterium volume.
- double **getBacteriumSize** (std::size_t index) const

  Returns the current bacterium size used for rendering.
- double **getBacteriumGfp** (std::size_t index) const

  Returns the current GFP amount used for rendering.
- double **getBacteriumRfp** (std::size_t index) const

  Returns the current RFP amount used for rendering.
- double **getBacteriumRuntimeVariableValue** (std::size_t index, const std::string &variableName) const

  Returns the last stored value for one bacterium-scoped runtime variable.
- bool **hasBacteriumRuntimeVariable** (std::size_t index, const std::string &variableName) const

  Tells whether one bacterium currently stores one runtime scalar variable.
- double **getRuntimeVariableValue** (const std::string &variableName) const

  Returns the last stored value for one runtime scalar variable.
- bool **hasRuntimeVariable** (const std::string &variableName) const

  Tells whether the colony currently stores one runtime scalar variable.
- double **getSignalValueAt** (unsigned int x, unsigned int y) const

  Returns the runtime signal value stored at one grid coordinate.
- unsigned int **getSignalChannelCount** () const

  Returns the number of currently available signal channels, including the legacy first channel.
- double **getAdditionalSignalValueAt** (unsigned int channel, unsigned int x, unsigned int y) const

Returns the runtime value for one additional (handle >= 2) signal channel at one grid coordinate.

- std::vector< std::vector< double > > **getSignalMatrix** () const

  Returns the current runtime signal field as a row-major matrix.
- std::string **getSignalMatrixDump** (std::size_t maxRows=0, std::size_t maxColumns=0) const

  Returns a textual dump of the current runtime signal field.
- double **getBacteriumLocalSignal** (std::size_t index) const

  Returns the runtime signal value seen by one bacterium at its current cell.
- void **setChemostatMode** (bool enabled)

  Enables or disables the colony chemostat mode used by Gro microfluidics.
- bool **getChemostatMode** () const

  Returns whether the colony chemostat mode is enabled.
- void **addBarrier** (double x1, double y1, double x2, double y2)

  Adds one barrier segment to the colony environment.
- const std::vector< BarrierSegment > & **getBarriers** () const

  Returns the current barrier segments used by the viewer.
- const std::vector< double > & **getMappedCellValues** () const

  Returns the latest per-cell values produced by map_to_cells, if any.
- const std::string & **getMappedCellExpression** () const

  Returns the expression used by the latest map_to_cells call, if any.
- void **setGridWidth** (unsigned int gridWidth)

  Sets the discrete spatial grid width reserved for the first colony model.
- unsigned int **getGridWidth** () const

  Returns the discrete spatial grid width.
- void **setGridHeight** (unsigned int gridHeight)

  Sets the discrete spatial grid height reserved for the first colony model.
- unsigned int **getGridHeight** () const

  Returns the discrete spatial grid height.
- GroProgramRuntime::ExecutionResult **executeGroProgram** ()

  Executes the configured Gro program once against the current colony state.

Public Member Functions inherited from ModelComponent

- ModelComponent (Model *model, std::string componentTypename, std::string name="")

  constructors
- virtual ~**ModelComponent** ()

  Releases component-owned resources and unregisters it from the model.
- ConnectionManager * getConnectionManager () const

  new public user methods for this component
- void connectTo (ModelComponent *component, unsigned int inputPortNumber=0)

  Connects this component to another component.
- bool hasBreakpointAt ()

  Indicates whether a simulation breakpoint is set on this component.
- void setDescription (std::string _description)

  Updates the free-form description shown by the GUI.
- std::string getDescription () const

  Returns the free-form description associated with this component.
- void remove (ModelComponent *comp)

  Removes a connected component from this component.

Public Member Functions inherited from ModelDataDefinition

- ModelDataDefinition (Model *model, std::string datadefinitionTypename, std::string name="", bool insertIntoModel=true)

  Creates a model data definition and optionally inserts it into the model.
- virtual ~**ModelDataDefinition** ()

  Releases resources owned by this data definition.
- Util::identification getId () const

  Returns the unique identifier of this instance.
- void setName (const std::string &name)

  Updates the logical name of this instance.
- const std::string & getName () const

  Returns the logical name of this instance.
- void setLabel (const std::string &label)

  Updates the user-visible label of this instance.
- const std::string & getLabel () const

  Returns the user-visible label of this instance.
- const std::string & getClassname () const

  Returns the runtime class name used by the plugin system.
- Model * getParentModel () const

  Returns the parent model that owns this definition.
- bool isReportStatistics () const

  Indicates whether this data definition contributes report statistics.
- void setReportStatistics (bool reportStatistics)

  Enables or disables report-statistics generation for this definition.
- ModelDataDefinition * getInternalData (const std::string &name) const

  Looks up a named internal child data definition.
- std::map< std::string, ModelDataDefinition * > * getInternalData () const

  Returns the full map of internal child data definitions.
- std::map< std::string, ModelDataDefinition * > * getAttachedData () const

  Returns the full map of attached data definitions.
- bool hasChanged () const

  Indicates whether this instance has been modified since the last reset.
- void setHasChanged (bool hasChanged)

  Updates the changed flag for this data definition.
- unsigned int getLevel () const

  Returns the hierarchical editing context containing this element.
- void setModelLevel (unsigned int _modelLevel)

  Sets this element's hierarchical editing context.
- List< SimulationControl * > * getSimulationControls () const

  Returns the simulation controls owned by this data definition.
- TraceManager::Level getTraceLevelSpecific () const

  Returns the trace level that applies specifically to this definition.
- void setTraceLevelSpecific (TraceManager::Level level)

  Updates the trace level used by this definition.
- void defineTraceLevelSpecific (TraceManager::Level traceLevelspecific, bool traceLevelSpecificEnabled=true)

  Defines the specific trace level and optionally enables it immediately.
- bool isTraceLevelSpecificEnabled () const

  Indicates whether the specific trace level is enabled.
- void setTraceLevelSpecificEnabled (bool traceLevelSpecificEnabled)

  Enables or disables the specific trace level.

Static Public Member Functions

- static PluginInformation * **GetPluginInformation** ()
- static ModelComponent * **LoadInstance** (Model *model, PersistenceRecord *fields)
- static ModelDataDefinition * **NewInstance** (Model *model, std::string name="")

Static Public Member Functions inherited from ModelComponent

- static ModelComponent * LoadInstance (Model *model, PersistenceRecord *fields)

  static public methods that must have implementations (Load and New just the same. GetInformation must provide specific infos for the new component
- static bool Check (ModelComponent *component)

  Validates a component instance.
- static void CreateInternalData (ModelComponent *component)

  Creates internal data required by a component instance.
- static void SaveInstance (PersistenceRecord *fields, ModelComponent *component)

  Serializes a component instance into a persistence record.
- static void DispatchEvent (Event *event)

  Dispatches a simulation event to the target component.

Static Public Member Functions inherited from ModelDataDefinition

- static ModelDataDefinition * LoadInstance (Model *model, PersistenceRecord *fields, bool insertIntoModel)

  Loads a model data definition instance from serialized fields.
- static ModelDataDefinition * NewInstance (Model *model, std::string name="")

  Creates a new instance of a data definition using the plugin registry.
- static void SaveInstance (PersistenceRecord *fields, ModelDataDefinition *modeldatum)

  Serializes a data definition instance into a persistence record.
- static bool Check (ModelDataDefinition *modeldatum, std::string &errorMessage)

  Validates a data definition instance.
- static void InitBetweenReplications (ModelDataDefinition *modeldatum)

  Resets simulation-time state between replications.
- static void CreateInternalData (ModelDataDefinition *modeldatum)

  Creates internal and attached data required by this instance.
- static bool CreateRelatedDataElements (ModelDataDefinition *modeldatum, std::string &errorMessage)

  Creates related data and validates the instance in a single call.

Protected Member Functions

- virtual bool _loadInstance (PersistenceRecord *fields) override

  virtual protected method that must be overriden
- virtual void _saveInstance (PersistenceRecord *fields, bool saveDefaultValues) override

  Saves object fields into a serialization structure.
- virtual bool _check (std::string &errorMessage) override

  could be overriden by derived classes
- virtual void _initBetweenReplications () override
- virtual void _onDispatchEvent (Entity *entity, unsigned int inputPortNumber) override

  Handles a dispatched event for this component type.
- virtual void _createAttachedAttributes () override

17.45.1 Detailed Description

First GenESyS component for Gro-inspired bacteria colony simulation.
BacteriaColony owns bacteria and signal-field runtime state while using the enclosing ModelSimulation time as the single colony clock. The component references a reusable GroProgram and executes the first supported runtime commands through plugin-side parser/runtime helpers.

17.45.2 Member Function Documentation

17.45.2.1 _check()

```
bool BacteriaColony::_check (
            std::string & errorMessage )  [override], [protected], [virtual]
```

could be overriden by derived classes
Reimplemented from ModelDataDefinition.

17.45.2.2 _createAttachedAttributes()

```
void BacteriaColony::_createAttachedAttributes ( )  [override], [protected], [virtual]
```

Reimplemented from ModelDataDefinition.

17.45.2.3 _initBetweenReplications()

```
void BacteriaColony::_initBetweenReplications ( )  [override], [protected], [virtual]
```

Reimplemented from ModelDataDefinition.

17.45.2.4 _loadInstance()

```
bool BacteriaColony::_loadInstance (
            PersistenceRecord * fields )  [override], [protected], [virtual]
```

virtual protected method that must be overriden
Reimplemented from ModelComponent.

17.45.2.5 _onDispatchEvent()

```
void BacteriaColony::_onDispatchEvent (
            Entity * entity,
            unsigned int inputPortNumber )  [override], [protected], [virtual]
```

Handles a dispatched event for this component type.
This method is only for ModelComponents, not for ModelDataElements.

Parameters

entity	Entity being processed.
inputPortNumber	Input port where the entity arrived.

Implements ModelComponent.

17.45.2.6 _saveInstance()

```
void BacteriaColony::_saveInstance (
            PersistenceRecord * fields,
            bool saveDefaultValues )  [override], [protected], [virtual]
```

Saves object fields into a serialization structure.

Parameters

fields	a table-like structure used for serialization.
saveDefaultValues	indicates whether or not to save fields which are set to their default value.

Reimplemented from ModelComponent.

17.45.2.7 show()

```
std::string BacteriaColony::show ( )  [override], [virtual]
```

virtual public methods
Returns a textual representation of this component.

Returns

Human-readable description used for tracing and debugging.

Reimplemented from ModelComponent.
The documentation for this class was generated from the following files:

- plugins/components/BiochemicalSimulation/BacteriaColony.h
- plugins/components/BiochemicalSimulation/BacteriaColony.cpp

- std::string **getInitialValues** () const
- unsigned int **getCellCount** () const
- bool **buildInitialField** (std::vector< double > &values, std::string &errorMessage) const

Public Member Functions inherited from ModelDataDefinition

- ModelDataDefinition (Model *model, std::string datadefinitionTypename, std::string name="", bool insertIntoModel=true)

  Creates a model data definition and optionally inserts it into the model.
- virtual ~**ModelDataDefinition** ()

  Releases resources owned by this data definition.
- Util::identification getId () const

  Returns the unique identifier of this instance.
- void setName (const std::string &name)

  Updates the logical name of this instance.
- const std::string & getName () const

  Returns the logical name of this instance.
- void setLabel (const std::string &label)

  Updates the user-visible label of this instance.
- const std::string & getLabel () const

  Returns the user-visible label of this instance.
- const std::string & getClassname () const

  Returns the runtime class name used by the plugin system.
- Model * getParentModel () const

  Returns the parent model that owns this definition.
- bool isReportStatistics () const

  Indicates whether this data definition contributes report statistics.
- void setReportStatistics (bool reportStatistics)

  Enables or disables report-statistics generation for this definition.
- ModelDataDefinition * getInternalData (const std::string &name) const

  Looks up a named internal child data definition.
- std::map< std::string, ModelDataDefinition * > * getInternalData () const

  Returns the full map of internal child data definitions.
- std::map< std::string, ModelDataDefinition * > * getAttachedData () const

  Returns the full map of attached data definitions.
- bool hasChanged () const

  Indicates whether this instance has been modified since the last reset.
- void setHasChanged (bool hasChanged)

  Updates the changed flag for this data definition.
- unsigned int getLevel () const

  Returns the hierarchical editing context containing this element.
- void setModelLevel (unsigned int _modelLevel)

  Sets this element's hierarchical editing context.
- List< SimulationControl * > * getSimulationControls () const

  Returns the simulation controls owned by this data definition.
- TraceManager::Level getTraceLevelSpecific () const

  Returns the trace level that applies specifically to this definition.
- void setTraceLevelSpecific (TraceManager::Level level)

  Updates the trace level used by this definition.

- void defineTraceLevelSpecific (TraceManager::Level traceLevelspecific, bool traceLevelSpecific↩ Enabled=true)

  Defines the specific trace level and optionally enables it immediately.
- bool isTraceLevelSpecificEnabled () const

  Indicates whether the specific trace level is enabled.
- void setTraceLevelSpecificEnabled (bool traceLevelSpecificEnabled)

  Enables or disables the specific trace level.

17.47.1 Detailed Description

Reusable discrete signal-field definition for bacteria colonies.
The data definition persists the spatial configuration and initial scalar values of one signal field. Colonies copy this configuration into their runtime state so model configuration and simulation mutation stay separated.

17.47.2 Member Function Documentation

17.47.2.1 _check()

```
bool BacteriaSignalGrid::_check (
            std::string & errorMessage )  [override], [protected], [virtual]
```

could be overriden by derived classes
Reimplemented from ModelDataDefinition.

17.47.2.2 _loadInstance()

```
bool BacteriaSignalGrid::_loadInstance (
            PersistenceRecord * fields )  [override], [protected], [virtual]
```

must be overriden by derived classes
Reimplemented from ModelDataDefinition.

17.47.2.3 _saveInstance()

```
void BacteriaSignalGrid::_saveInstance (
            PersistenceRecord * fields,
            bool saveDefaultValues )  [override], [protected], [virtual]
```

Saves object fields into a serialization structure.

Parameters

fields	a table-like structure used for serialization.
saveDefaultValues	indicates whether or not to save fields which are set to their default value.

Reimplemented from ModelDataDefinition.

17.47.2.4 show()

```
std::string BacteriaSignalGrid::show ( )  [override], [virtual]
```

Returns a textual representation of this data definition.
Returns the keys of internal ModelDataDefinitions such as counters, statistics collectors and other children needed before model checking.

Returns

Human-readable summary used by traces and debug output.

Reimplemented from ModelDataDefinition.
The documentation for this class was generated from the following files:

- plugins/data/BiochemicalSimulation/BacteriaSignalGrid.h
- plugins/data/BiochemicalSimulation/BacteriaSignalGrid.cpp

17.49.1 Member Function Documentation

17.49.1.1 main()

```
int Banking_Transactions::main (
            int argc,
            char ** argv )  [override], [virtual]
```

This is the main function of the application. It instanciates the simulator, builds a simulation model and then simulate that model.
Reimplemented from BaseGenesysTerminalApplication.
The documentation for this class was generated from the following files:

- applications/modelSpecific/arenaExamples/Banking_Transactions.h
- applications/modelSpecific/arenaExamples/Banking_Transactions.cpp

17.51.1.2 setDefaultEventHandlers()

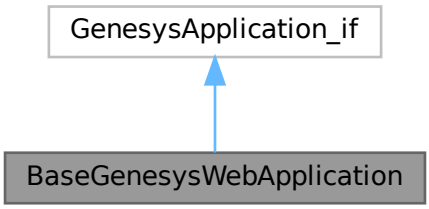
```
void BaseGenesysTerminalApplication::setDefaultEventHandlers (
            OnEventManager * oem )
```

Add default method to handle simulator events so information is plotted to output screen
The documentation for this class was generated from the following files:

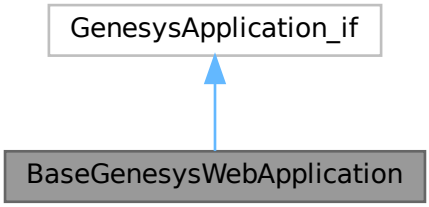
- applications/BaseGenesysTerminalApplication.h
- applications/BaseGenesysTerminalApplication.cpp

17.52 BaseGenesysWebApplication Class Reference

Entry point for the standalone Worker application flavor of Genesys.
`#include <applications/worker/BaseGenesysWebApplication.h>`
Inheritance diagram for BaseGenesysWebApplication:



Collaboration diagram for BaseGenesysWebApplication:



Public Member Functions

- int main (int argc, char **argv) override

  Parses command-line arguments, starts the HTTP server and runs the worker app.

17.52.1 Detailed Description

Entry point for the standalone Worker application flavor of Genesys.
The worker variant bootstraps a session manager, HTTP server and router, then keeps processing requests until the configured request limit is reached or a transport error occurs.

17.52.2 Member Function Documentation

17.52.2.1 main()

```
int BaseGenesysWebApplication::main (
            int argc,
            char ** argv )  [override], [virtual]
```

Parses command-line arguments, starts the HTTP server and runs the worker app.
Boots the web stack and keeps the request loop alive until shutdown.

Parameters

argc	Number of command-line arguments.
argv	Command-line argument vector.

Returns

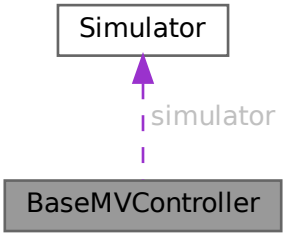
Zero on normal termination; non-zero on startup or server failure.

This entry point wires token management, session creation, worker-job storage, API routing and the embedded HTTP server into one runtime pipeline.
Implements GenesysApplication_if.
The documentation for this class was generated from the following files:

- applications/worker/BaseGenesysWebApplication.h
- applications/worker/BaseGenesysWebApplication.cpp

17.53 BaseMVController Class Reference

Compatibility base class that binds the Qt UI and the simulator model.
`#include <applications/gui/genesys/BaseMVController.h>`
Collaboration diagram for BaseMVController:



Protected Attributes

- Ui::MainWindow * **ui**

  MainWindow UI built from the Qt Designer form.
- Simulator * **simulator**

  Active simulator instance owned elsewhere by the application.

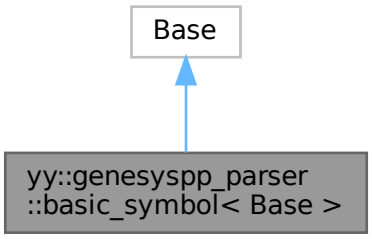
17.53.1 Detailed Description

Compatibility base class that binds the Qt UI and the simulator model.
Legacy GUI controllers in Genesys share the same two core pointers: the main window UI object and the active simulator instance. This base class keeps that pairing in one place so higher-level controllers can reuse it.
The documentation for this class was generated from the following files:

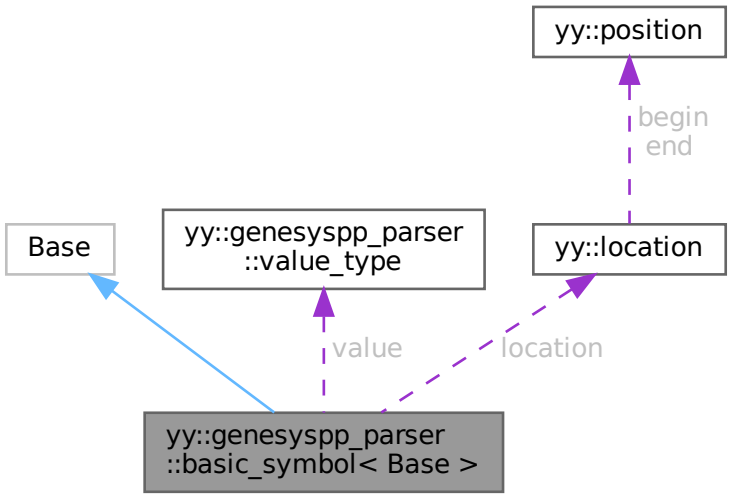
- applications/gui/genesys/BaseMVController.h
- applications/gui/genesys/BaseMVController.cpp

17.54 yy::genesyspp_parser::basic_symbol< Base > Struct Template Reference

`#include <parser/GenesysParser.h>`
Inheritance diagram for yy::genesyspp_parser::basic_symbol< Base >:



Collaboration diagram for yy::genesyspp_parser::basic_symbol< Base >:



Public Types

- typedef Base **super_type**

  Alias to Base.

Public Member Functions

- **basic_symbol** () YY_NOEXCEPT

  Default constructor.
- **basic_symbol** (const basic_symbol &that)

  Copy constructor.
- **basic_symbol** (typename Base::kind_type t, const location_type &l)

  Constructors for typed symbols.
- **basic_symbol** (typename Base::kind_type t, const obj_t &v, const location_type &l)
- **basic_symbol** (typename Base::kind_type t, const std::string &v, const location_type &l)
- ~**basic_symbol** ()

  Destroy the symbol.
- void **clear** () YY_NOEXCEPT

  Destroy contents, and record that is empty.
- std::string **name** () const YY_NOEXCEPT

  The user-facing name of this symbol.
- symbol_kind_type **type_get** () const YY_NOEXCEPT

  Backward compatibility (Bison 3.6).
- bool **empty** () const YY_NOEXCEPT

  Whether empty.
- void **move** (basic_symbol &s)

  Destructive move, s is emptied into this.

Public Attributes

- value_type **value**

  The semantic value.
- location_type **location**

  The location.

17.54.1 Detailed Description

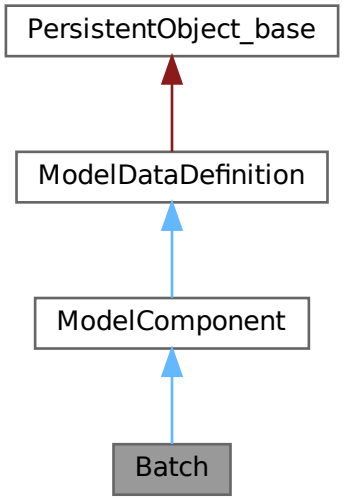
template<**typename Base**>
struct yy::genesyspp_parser::basic_symbol< **Base** >

A complete symbol.
Expects its Base type to provide access to the symbol kind via kind ().
Provide access to semantic value and location.
The documentation for this struct was generated from the following file:

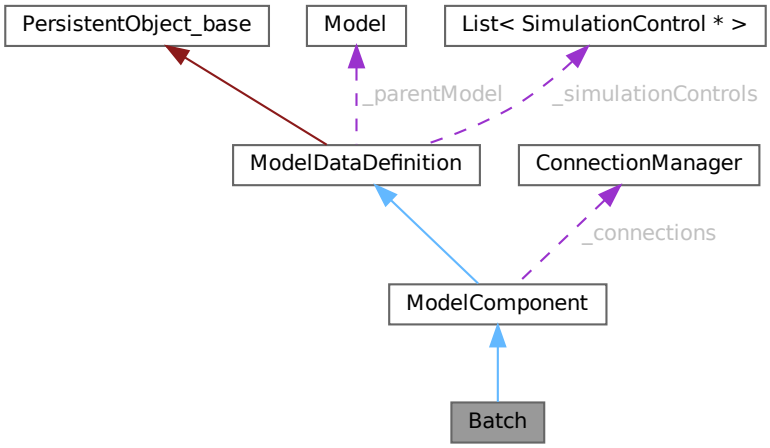
- parser/GenesysParser.h

17.55 Batch Class Reference

Accumulates entities in an internal queue until a batch is complete, then dispatches one representative entity for the group.
`#include <plugins/components/Grouping/Batch.h>`
Inheritance diagram for Batch:



Collaboration diagram for Batch:



Public Types

- enum class **BatchType** : int { **Temporary** = 0 , **Permanent** = 1 , **num_elements** = 2 }
- enum class **Rule** : int { **Any** = 0 , **ByAttribute** = 1 , **num_elements** = 2 }
- enum class **GroupedAttribs** : int { **FirstEntity** = 0 , **LastEntity** = 1 , **SumAttributes** = 2 , **num_elements** = 3 }

Public Member Functions

- **Batch** (Model ∗model, std::string name="")
- virtual std::string show () override

  virtual public methods
- void **setGroupedEntityType** (EntityType ∗groupedEntityType)
- void **setGroupedEntityTypeName** (std::string groupedEntityTypeName)
- EntityType ∗ **getGroupedEntityType** () const

- Batch::BatchType **getBatchType** () const
- void **setAttributeName** (std::string attributeName)
- std::string **getAttributeName** () const
- void **setBatchSize** (std::string batchSize)
- std::string **getBatchSize** () const
- void **setRule** (Batch::Rule _rule)
- Batch::Rule **getRule** () const
- void **setGroupedAttributes** (Batch::GroupedAttribs _groupedAttributes)
- Batch::GroupedAttribs **getGroupedAttributes** () const

Public Member Functions inherited from ModelComponent

- ModelComponent (Model ∗model, std::string componentTypename, std::string name="")

  constructors
- virtual ∼**ModelComponent** ()

  Releases component-owned resources and unregisters it from the model.
- ConnectionManager ∗ getConnectionManager () const

new public user methods for this component

- void connectTo (ModelComponent *component, unsigned int inputPortNumber=0)

  Connects this component to another component.
- bool hasBreakpointAt ()

  Indicates whether a simulation breakpoint is set on this component.
- void setDescription (std::string _description)

  Updates the free-form description shown by the GUI.
- std::string getDescription () const

  Returns the free-form description associated with this component.
- void remove (ModelComponent *comp)

  Removes a connected component from this component.

Public Member Functions inherited from ModelDataDefinition

- ModelDataDefinition (Model *model, std::string datadefinitionTypename, std::string name="", bool insert↩ IntoModel=true)

  Creates a model data definition and optionally inserts it into the model.
- virtual ~**ModelDataDefinition** ()

  Releases resources owned by this data definition.
- Util::identification getId () const

  Returns the unique identifier of this instance.
- void setName (const std::string &name)

  Updates the logical name of this instance.
- const std::string & getName () const

  Returns the logical name of this instance.
- void setLabel (const std::string &label)

  Updates the user-visible label of this instance.
- const std::string & getLabel () const

  Returns the user-visible label of this instance.
- const std::string & getClassname () const

  Returns the runtime class name used by the plugin system.
- Model * getParentModel () const

  Returns the parent model that owns this definition.
- bool isReportStatistics () const

  Indicates whether this data definition contributes report statistics.
- void setReportStatistics (bool reportStatistics)

  Enables or disables report-statistics generation for this definition.
- ModelDataDefinition * getInternalData (const std::string &name) const

  Looks up a named internal child data definition.
- std::map< std::string, ModelDataDefinition * > * getInternalData () const

  Returns the full map of internal child data definitions.
- std::map< std::string, ModelDataDefinition * > * getAttachedData () const

  Returns the full map of attached data definitions.
- bool hasChanged () const

  Indicates whether this instance has been modified since the last reset.
- void setHasChanged (bool hasChanged)

  Updates the changed flag for this data definition.
- unsigned int getLevel () const

  Returns the hierarchical editing context containing this element.
- void setModelLevel (unsigned int _modelLevel)

  Sets this element's hierarchical editing context.

- List< SimulationControl * > * getSimulationControls () const

  Returns the simulation controls owned by this data definition.
- TraceManager::Level getTraceLevelSpecific () const

  Returns the trace level that applies specifically to this definition.
- void setTraceLevelSpecific (TraceManager::Level level)

  Updates the trace level used by this definition.
- void defineTraceLevelSpecific (TraceManager::Level traceLevelspecific, bool traceLevelSpecific↩ Enabled=true)

  Defines the specific trace level and optionally enables it immediately.
- bool isTraceLevelSpecificEnabled () const

  Indicates whether the specific trace level is enabled.
- void setTraceLevelSpecificEnabled (bool traceLevelSpecificEnabled)

  Enables or disables the specific trace level.

Static Public Member Functions

- static std::string **convertEnumToStr** (BatchType type)
- static std::string **convertEnumToStr** (Rule rule)
- static std::string **convertEnumToStr** (GroupedAttribs attribs)
- static PluginInformation * **GetPluginInformation** ()
- static ModelComponent * **LoadInstance** (Model *model, PersistenceRecord *fields)
- static ModelDataDefinition * **NewInstance** (Model *model, std::string name="")

Static Public Member Functions inherited from ModelComponent

- static ModelComponent * LoadInstance (Model *model, PersistenceRecord *fields)

  static public methods that must have implementations (Load and New just the same. GetInformation must provide specific infos for the new component
- static bool Check (ModelComponent *component)

  Validates a component instance.
- static void CreateInternalData (ModelComponent *component)

  Creates internal data required by a component instance.
- static void SaveInstance (PersistenceRecord *fields, ModelComponent *component)

  Serializes a component instance into a persistence record.
- static void DispatchEvent (Event *event)

  Dispatches a simulation event to the target component.

Static Public Member Functions inherited from ModelDataDefinition

- static ModelDataDefinition * LoadInstance (Model *model, PersistenceRecord *fields, bool insertIntoModel)

  Loads a model data definition instance from serialized fields.
- static ModelDataDefinition * NewInstance (Model *model, std::string name="")

  Creates a new instance of a data definition using the plugin registry.
- static void SaveInstance (PersistenceRecord *fields, ModelDataDefinition *modeldatum)

  Serializes a data definition instance into a persistence record.
- static bool Check (ModelDataDefinition *modeldatum, std::string &errorMessage)

  Validates a data definition instance.
- static void InitBetweenReplications (ModelDataDefinition *modeldatum)

  Resets simulation-time state between replications.
- static void CreateInternalData (ModelDataDefinition *modeldatum)

  Creates internal and attached data required by this instance.
- static bool CreateRelatedDataElements (ModelDataDefinition *modeldatum, std::string &errorMessage)

  Creates related data and validates the instance in a single call.

Protected Member Functions

- virtual void _createNonEditableDataDefinitions () override
- virtual void _createEditableDataDefinitions () override
- virtual void _createAttachedAttributes () override
- virtual bool _check (std::string &errorMessage) override

  could be overriden by derived classes
- virtual void _onDispatchEvent (Entity *entity, unsigned int inputPortNumber) override

  Handles a dispatched event for this component type.
- virtual bool _loadInstance (PersistenceRecord *fields) override

  virtual protected method that must be overriden
- virtual void _saveInstance (PersistenceRecord *fields, bool saveDefaultValues) override

  Saves object fields into a serialization structure.

Protected Member Functions inherited from ModelDataDefinition

- bool _getSaveDefaultsOption ()
- virtual ParserChangesInformation * _getParserChangesInformation ()
- virtual void _initBetweenReplications ()
- virtual void _addSimulationControl (SimulationControl *control)

17.55.1 Detailed Description

Accumulates entities in an internal queue until a batch is complete, then dispatches one representative entity for the group.
Arena correspondence: the "Batch module" (Rockwell Automation, *Getting Started with Arena*, "The Basic Process Panel", p. 38). `BatchType` (Temporary/Permanent), `Rule` (Any/ByAttribute) + `_attributeName`, and `GroupedAttribs` (FirstEntity/LastEntity/ SumAttributes) map directly onto Arena's Type, Rule/Attribute Name, and Save Criterion (First/Last/Sum) fields; `_batchSize` is a parsed expression generalizing Arena's static number; `_groupedEntityType` is the Representative Entity type. A temporary batch is later split back into its original members by Separate.

17.55.2 Member Function Documentation

17.55.2.1 _check()

```
bool Batch::_check (
            std::string & errorMessage )  [override], [protected], [virtual]
```

could be overriden by derived classes
Reimplemented from ModelDataDefinition.

17.55.2.2 _createAttachedAttributes()

```
void Batch::_createAttachedAttributes ( )  [override], [protected], [virtual]
```

Reimplemented from ModelDataDefinition.

17.55.2.3 _createEditableDataDefinitions()

```
void Batch::_createEditableDataDefinitions ( )  [override], [protected], [virtual]
```

Reimplemented from ModelDataDefinition.

17.55.2.4 _createNonEditableDataDefinitions()

```
void Batch::_createNonEditableDataDefinitions ( )  [override], [protected], [virtual]
```

Reimplemented from ModelDataDefinition.

17.55.2.5 _loadInstance()

```
bool Batch::_loadInstance (
            PersistenceRecord * fields )  [override], [protected], [virtual]
```

virtual protected method that must be overriden
Reimplemented from ModelComponent.

17.55.2.6 _onDispatchEvent()

```
void Batch::_onDispatchEvent (
            Entity * entity,
            unsigned int inputPortNumber )  [override], [protected], [virtual]
```

Handles a dispatched event for this component type.
This method is only for ModelComponents, not for ModelDataElements.

Parameters

entity	Entity being processed.
inputPortNumber	Input port where the entity arrived.

Implements ModelComponent.

17.55.2.7 _saveInstance()

```
void Batch::_saveInstance (
            PersistenceRecord * fields,
            bool saveDefaultValues )  [override], [protected], [virtual]
```

Saves object fields into a serialization structure.

Parameters

fields	a table-like structure used for serialization.
saveDefaultValues	indicates whether or not to save fields which are set to their default value.

Reimplemented from ModelComponent.

17.55.2.8 show()

```
std::string Batch::show ( )  [override], [virtual]
```

virtual public methods
Returns a textual representation of this component.

Returns

Human-readable description used for tracing and debugging.

Reimplemented from ModelComponent.
The documentation for this class was generated from the following files:

- plugins/components/Grouping/Batch.h
- plugins/components/Grouping/Batch.cpp

17.56 testing::internal::TemplateSel< Tmpl >::Bind< T > Struct Template Reference

Public Types

- typedef Tmpl< T > **type**

The documentation for this struct was generated from the following file:

- std::string **getRole** () const
- virtual std::string show () override

  Returns a textual representation of this data definition.

Public Member Functions inherited from ModelDataDefinition

- ModelDataDefinition (Model *model, std::string datadefinitionTypename, std::string name="", bool insert↩ IntoModel=true)

  Creates a model data definition and optionally inserts it into the model.
- virtual ~**ModelDataDefinition** ()

  Releases resources owned by this data definition.
- Util::identification getId () const

  Returns the unique identifier of this instance.
- void setName (const std::string &name)

  Updates the logical name of this instance.
- const std::string & getName () const

  Returns the logical name of this instance.
- void setLabel (const std::string &label)

  Updates the user-visible label of this instance.
- const std::string & getLabel () const

  Returns the user-visible label of this instance.
- const std::string & getClassname () const

Returns the runtime class name used by the plugin system.

- Model * getParentModel () const

  Returns the parent model that owns this definition.
- bool isReportStatistics () const

  Indicates whether this data definition contributes report statistics.
- void setReportStatistics (bool reportStatistics)

  Enables or disables report-statistics generation for this definition.
- ModelDataDefinition * getInternalData (const std::string &name) const

  Looks up a named internal child data definition.
- std::map< std::string, ModelDataDefinition * > * getInternalData () const

  Returns the full map of internal child data definitions.
- std::map< std::string, ModelDataDefinition * > * getAttachedData () const

  Returns the full map of attached data definitions.
- bool hasChanged () const

  Indicates whether this instance has been modified since the last reset.
- void setHasChanged (bool hasChanged)

  Updates the changed flag for this data definition.
- unsigned int getLevel () const

  Returns the hierarchical editing context containing this element.
- void setModelLevel (unsigned int _modelLevel)

  Sets this element's hierarchical editing context.
- List< SimulationControl * > * getSimulationControls () const

  Returns the simulation controls owned by this data definition.
- TraceManager::Level getTraceLevelSpecific () const

  Returns the trace level that applies specifically to this definition.
- void setTraceLevelSpecific (TraceManager::Level level)

  Updates the trace level used by this definition.
- void defineTraceLevelSpecific (TraceManager::Level traceLevelspecific, bool traceLevelSpecific↩ Enabled=true)

  Defines the specific trace level and optionally enables it immediately.
- bool isTraceLevelSpecificEnabled () const

  Indicates whether the specific trace level is enabled.
- void setTraceLevelSpecificEnabled (bool traceLevelSpecificEnabled)

  Enables or disables the specific trace level.

Static Public Member Functions

- static ModelDataDefinition * **LoadInstance** (Model *model, PersistenceRecord *fields)
- static PluginInformation * **GetPluginInformation** ()
- static ModelDataDefinition * **NewInstance** (Model *model, std::string name="")

Static Public Member Functions inherited from ModelDataDefinition

- static ModelDataDefinition * LoadInstance (Model *model, PersistenceRecord *fields, bool insertIntoModel)

  Loads a model data definition instance from serialized fields.
- static ModelDataDefinition * NewInstance (Model *model, std::string name="")

  Creates a new instance of a data definition using the plugin registry.
- static void SaveInstance (PersistenceRecord *fields, ModelDataDefinition *modeldatum)

  Serializes a data definition instance into a persistence record.
- static bool Check (ModelDataDefinition *modeldatum, std::string &errorMessage)

  Validates a data definition instance.
- static void InitBetweenReplications (ModelDataDefinition *modeldatum)

Resets simulation-time state between replications.

- static void CreateInternalData (ModelDataDefinition *modeldatum)

  Creates internal and attached data required by this instance.

- static bool CreateRelatedDataElements (ModelDataDefinition *modeldatum, std::string &errorMessage)

  Creates related data and validates the instance in a single call.

Protected Member Functions

- virtual bool _loadInstance (PersistenceRecord *fields) override

  must be overriden by derived classes

- virtual void _saveInstance (PersistenceRecord *fields, bool saveDefaultValues) override

  Saves object fields into a serialization structure.

- virtual bool _check (std::string &errorMessage) override

  could be overriden by derived classes

- virtual void _createEditableDataDefinitions () override

17.58.1 Detailed Description

Defines a biological compartment for biochemical and whole-cell models.
BioCompartment represents a named physical or logical cellular region such as cytosol, nucleus, mitochondrion, bud, membrane, or extracellular medium. It is a ModelDataDefinition and therefore stores structural metadata used by other plugins, but it does not execute simulation behavior itself.
The class is intentionally generic so it can support both prokaryotic and eukaryotic cells. Parent-child relationships allow hierarchical structures such as:

- extracellular -> cell surface
- cytosol -> nucleus
- cytosol -> mitochondrion
- cytosol -> bud

17.58.2 Member Function Documentation

17.58.2.1 _check()

```
bool BioCompartment::_check (
            std::string & errorMessage )  [override], [protected], [virtual]
```

could be overriden by derived classes
Reimplemented from ModelDataDefinition.

17.58.2.2 _createEditableDataDefinitions()

```
void BioCompartment::_createEditableDataDefinitions ( )  [override], [protected], [virtual]
```

Reimplemented from ModelDataDefinition.

17.58.2.3 _loadInstance()

```
bool BioCompartment::_loadInstance (
            PersistenceRecord * fields )  [override], [protected], [virtual]
```

must be overriden by derived classes
Reimplemented from ModelDataDefinition.

17.58.2.4 _saveInstance()

```
void BioCompartment::_saveInstance (
            PersistenceRecord * fields,
            bool saveDefaultValues )  [override], [protected], [virtual]
```

Saves object fields into a serialization structure.

Parameters

fields	a table-like structure used for serialization.
saveDefaultValues	indicates whether or not to save fields which are set to their default value.

Reimplemented from ModelDataDefinition.

17.58.2.5 show()

```
std::string BioCompartment::show ( )  [override], [virtual]
```

Returns a textual representation of this data definition.
Returns the keys of internal ModelDataDefinitions such as counters, statistics collectors and other children needed before model checking.

Returns

Human-readable summary used by traces and debug output.

Reimplemented from ModelDataDefinition.
The documentation for this class was generated from the following files:

- plugins/data/WholeCellModeling/BioCompartment.h
- plugins/data/WholeCellModeling/BioCompartment.cpp

17.59 BioKineticLawExpression Class Reference

```
#include <tools/Biochemical/BioKineticLawExpression.h>
```

Public Types

- using **SymbolResolver** = std::function< bool(const std::string &name, double &value)>

Public Member Functions

- bool **evaluate** (const std::string &expression, SymbolResolver resolver, double &value, std::string &error↩ Message) const

17.59.1 Detailed Description

Small expression evaluator for biochemical kinetic laws.

The evaluator intentionally avoids the global GenESyS parser because the generated parser does not currently expose BioSpecies and BioParameter as kinetic-law symbols. Supported syntax is numeric literals, identifiers, parentheses, unary +/- operators, +, -, ∗, /, ^, and a small set of math functions.
The documentation for this class was generated from the following file:

- tools/Biochemical/BioKineticLawExpression.h

- bool **simulate** (std::string &errorMessage)
- bool **simulate** (double startTime, double stopTime, double stepSize, std::string &errorMessage)
- bool **advanceOneStep** (std::string &errorMessage)
- virtual std::string show () override

  Returns a textual representation of this data definition.

Public Member Functions inherited from ModelDataDefinition

- ModelDataDefinition (Model *model, std::string datadefinitionTypename, std::string name="", bool insertIntoModel=true)

  Creates a model data definition and optionally inserts it into the model.
- virtual ~**ModelDataDefinition** ()

  Releases resources owned by this data definition.
- Util::identification getId () const

  Returns the unique identifier of this instance.
- void setName (const std::string &name)

  Updates the logical name of this instance.
- const std::string & getName () const

  Returns the logical name of this instance.
- void setLabel (const std::string &label)

  Updates the user-visible label of this instance.
- const std::string & getLabel () const

  Returns the user-visible label of this instance.
- const std::string & getClassname () const

  Returns the runtime class name used by the plugin system.
- Model * getParentModel () const

Returns the parent model that owns this definition.

- bool isReportStatistics () const

  Indicates whether this data definition contributes report statistics.
- void setReportStatistics (bool reportStatistics)

  Enables or disables report-statistics generation for this definition.
- ModelDataDefinition * getInternalData (const std::string &name) const

  Looks up a named internal child data definition.
- std::map< std::string, ModelDataDefinition * > * getInternalData () const

  Returns the full map of internal child data definitions.
- std::map< std::string, ModelDataDefinition * > * getAttachedData () const

  Returns the full map of attached data definitions.
- bool hasChanged () const

  Indicates whether this instance has been modified since the last reset.
- void setHasChanged (bool hasChanged)

  Updates the changed flag for this data definition.
- unsigned int getLevel () const

  Returns the hierarchical editing context containing this element.
- void setModelLevel (unsigned int _modelLevel)

  Sets this element's hierarchical editing context.
- List< SimulationControl * > * getSimulationControls () const

  Returns the simulation controls owned by this data definition.
- TraceManager::Level getTraceLevelSpecific () const

  Returns the trace level that applies specifically to this definition.
- void setTraceLevelSpecific (TraceManager::Level level)

  Updates the trace level used by this definition.
- void defineTraceLevelSpecific (TraceManager::Level traceLevelspecific, bool traceLevelSpecific↩ Enabled=true)

  Defines the specific trace level and optionally enables it immediately.
- bool isTraceLevelSpecificEnabled () const

  Indicates whether the specific trace level is enabled.
- void setTraceLevelSpecificEnabled (bool traceLevelSpecificEnabled)

  Enables or disables the specific trace level.

17.60.1 Detailed Description

Native deterministic biochemical network runner.
BioNetwork advances BioSpecies with fixed-step RK4 over a mass-action ODE system. Networks may define explicit BioSpecies and BioReaction membership by name; when a membership list is empty, the runner falls back to discovering every registered definition of that type in the owning model for compatibility with existing models.

17.60.2 Member Function Documentation

17.60.2.1 _check()

```
bool BioNetwork::_check (
            std::string & errorMessage )  [override], [protected], [virtual]
```

could be overriden by derived classes
Reimplemented from ModelDataDefinition.

17.60.2.2 _createEditableDataDefinitions()

```
void BioNetwork::_createEditableDataDefinitions ( )  [override], [protected], [virtual]
```

Refreshes editable associations to referenced biochemical definitions.
BioNetwork stores model membership by name for persistence. During model checking these associations keep referenced species, reactions, and parameters from being pruned as orphan ModelDataDefinitions.
Reimplemented from ModelDataDefinition.

17.60.2.3 _initBetweenReplications()

```
void BioNetwork::_initBetweenReplications ( )  [override], [protected], [virtual]
```

Reimplemented from ModelDataDefinition.

17.60.2.4 _loadInstance()

```
bool BioNetwork::_loadInstance (
            PersistenceRecord * fields )  [override], [protected], [virtual]
```

must be overriden by derived classes
Reimplemented from ModelDataDefinition.

17.60.2.5 _saveInstance()

```
void BioNetwork::_saveInstance (
            PersistenceRecord * fields,
            bool saveDefaultValues )  [override], [protected], [virtual]
```

Saves object fields into a serialization structure.

Parameters

fields	a table-like structure used for serialization.
saveDefaultValues	indicates whether or not to save fields which are set to their default value.

Reimplemented from ModelDataDefinition.

17.60.2.6 show()

```
std::string BioNetwork::show ( )  [override], [virtual]
```

Returns a textual representation of this data definition.
Returns the keys of internal ModelDataDefinitions such as counters, statistics collectors and other children needed before model checking.

Returns

Human-readable summary used by traces and debug output.

Reimplemented from ModelDataDefinition.

  Returns the full map of attached data definitions.
- bool hasChanged () const

  Indicates whether this instance has been modified since the last reset.
- void setHasChanged (bool hasChanged)

  Updates the changed flag for this data definition.
- unsigned int getLevel () const

  Returns the hierarchical editing context containing this element.
- void setModelLevel (unsigned int _modelLevel)

  Sets this element's hierarchical editing context.
- List< SimulationControl * > * getSimulationControls () const

  Returns the simulation controls owned by this data definition.
- TraceManager::Level getTraceLevelSpecific () const

  Returns the trace level that applies specifically to this definition.
- void setTraceLevelSpecific (TraceManager::Level level)

  Updates the trace level used by this definition.
- void defineTraceLevelSpecific (TraceManager::Level traceLevelspecific, bool traceLevelSpecific↩ Enabled=true)

  Defines the specific trace level and optionally enables it immediately.
- bool isTraceLevelSpecificEnabled () const

  Indicates whether the specific trace level is enabled.
- void setTraceLevelSpecificEnabled (bool traceLevelSpecificEnabled)

  Enables or disables the specific trace level.

Static Public Member Functions

- static ModelDataDefinition * **LoadInstance** (Model *model, PersistenceRecord *fields)
- static PluginInformation * **GetPluginInformation** ()
- static ModelDataDefinition * **NewInstance** (Model *model, std::string name="")

Static Public Member Functions inherited from ModelDataDefinition

- static ModelDataDefinition * LoadInstance (Model *model, PersistenceRecord *fields, bool insertIntoModel)

  Loads a model data definition instance from serialized fields.
- static ModelDataDefinition * NewInstance (Model *model, std::string name="")

  Creates a new instance of a data definition using the plugin registry.
- static void SaveInstance (PersistenceRecord *fields, ModelDataDefinition *modeldatum)

  Serializes a data definition instance into a persistence record.
- static bool Check (ModelDataDefinition *modeldatum, std::string &errorMessage)

  Validates a data definition instance.
- static void InitBetweenReplications (ModelDataDefinition *modeldatum)

  Resets simulation-time state between replications.
- static void CreateInternalData (ModelDataDefinition *modeldatum)

  Creates internal and attached data required by this instance.
- static bool CreateRelatedDataElements (ModelDataDefinition *modeldatum, std::string &errorMessage)

  Creates related data and validates the instance in a single call.

Protected Member Functions

- virtual bool _loadInstance (PersistenceRecord *fields) override

  must be overriden by derived classes
- virtual void _saveInstance (PersistenceRecord *fields, bool saveDefaultValues) override

  Saves object fields into a serialization structure.

17.64.1 Detailed Description

Scalar biochemical parameter, typically used as a kinetic constant.
BioReaction may reference a BioParameter by name. Parameter lookup remains a model-data responsibility, so missing references are reported by BioReaction validation rather than by this value object.

17.64.2 Member Function Documentation

17.64.2.1 _check()

```
bool BioParameter::_check (
            std::string & errorMessage )  [override], [protected], [virtual]
```

could be overriden by derived classes
Reimplemented from ModelDataDefinition.

17.64.2.2 _loadInstance()

```
bool BioParameter::_loadInstance (
            PersistenceRecord * fields )  [override], [protected], [virtual]
```

must be overriden by derived classes
Reimplemented from ModelDataDefinition.

17.64.2.3 _saveInstance()

```
void BioParameter::_saveInstance (
            PersistenceRecord * fields,
            bool saveDefaultValues )  [override], [protected], [virtual]
```

Saves object fields into a serialization structure.

Parameters

fields	a table-like structure used for serialization.
saveDefaultValues	indicates whether or not to save fields which are set to their default value.

Reimplemented from ModelDataDefinition.

17.64.2.4 show()

```
std::string BioParameter::show ( )  [override], [virtual]
```

Returns a textual representation of this data definition.
Returns the keys of internal ModelDataDefinitions such as counters, statistics collectors and other children needed before model checking.

Returns

Human-readable summary used by traces and debug output.

Reimplemented from ModelDataDefinition.

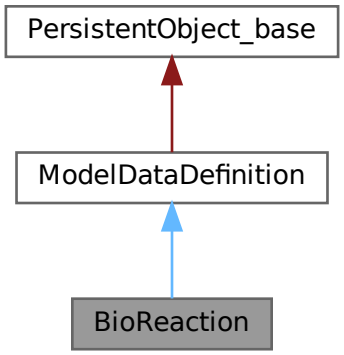
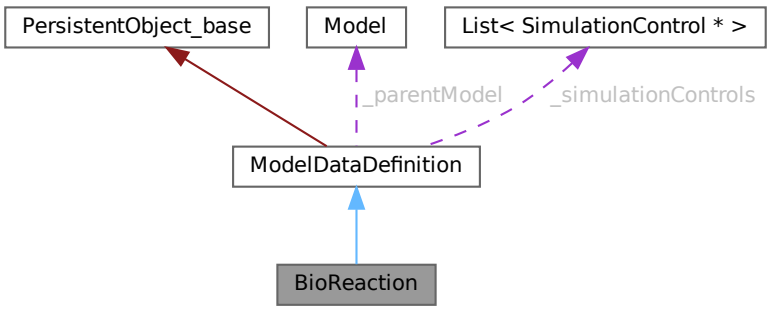
Inheritance diagram for BioReaction:



Collaboration diagram for BioReaction:



Classes

- struct StoichiometricTerm

Public Member Functions

- BioReaction (Model *model, std::string name="")

  Creates an empty biochemical reaction definition.
- virtual ~**BioReaction** () override=default

  Releases reaction-owned resources.
- void addReactant (std::string speciesName, double stoichiometry=1.0)

  Adds a reactant species to the reaction.
- void addProduct (std::string speciesName, double stoichiometry=1.0)

  Adds a product species to the reaction.
- void addModifier (std::string speciesName)

  Adds a modifier species that influences the reaction rate.
- void **clearReactants** ()

  Removes all reactants from the reaction.
- void **clearProducts** ()

  Removes all products from the reaction.
- void **clearModifiers** ()

  Removes all modifiers from the reaction.
- const std::vector< StoichiometricTerm > & getReactants () const

  Returns the registered reactants.
- const std::vector< StoichiometricTerm > & getProducts () const

  Returns the registered products.
- const std::vector< std::string > & getModifiers () const

  Returns the registered modifiers.
- void setRateConstant (double rateConstant)

  Sets the forward rate constant.
- double getRateConstant () const

  Returns the forward rate constant.
- void setRateConstantParameterName (std::string rateConstantParameterName)

  Stores the name of the parameter used for the forward rate constant.
- std::string getRateConstantParameterName () const

  Returns the forward-rate parameter name.
- double resolveRateConstant () const

  Resolves the effective forward rate constant.
- void setReverseRateConstant (double reverseRateConstant)

  Sets the reverse rate constant.
- double getReverseRateConstant () const

  Returns the reverse rate constant.
- void setReverseRateConstantParameterName (std::string reverseRateConstantParameterName)

  Stores the name of the parameter used for the reverse rate constant.
- std::string getReverseRateConstantParameterName () const

  Returns the reverse-rate parameter name.
- double resolveReverseRateConstant () const

  Resolves the effective reverse rate constant.
- void setKineticLawExpression (std::string kineticLawExpression)

  Sets the forward kinetic-law expression.
- std::string getKineticLawExpression () const

  Returns the forward kinetic-law expression.
- void setReverseKineticLawExpression (std::string reverseKineticLawExpression)

  Sets the reverse kinetic-law expression.
- std::string getReverseKineticLawExpression () const

Returns the reverse kinetic-law expression.

- void setReversible (bool reversible)

  Marks the reaction as reversible or irreversible.
- bool isReversible () const

  Indicates whether the reaction is reversible.
- virtual std::string show () override

  Returns a textual representation of the reaction.

Public Member Functions inherited from ModelDataDefinition

- ModelDataDefinition (Model *model, std::string datadefinitionTypename, std::string name="", bool insert↩ IntoModel=true)

  Creates a model data definition and optionally inserts it into the model.
- virtual ~**ModelDataDefinition** ()

  Releases resources owned by this data definition.
- Util::identification getId () const

  Returns the unique identifier of this instance.
- void setName (const std::string &name)

  Updates the logical name of this instance.
- const std::string & getName () const

  Returns the logical name of this instance.
- void setLabel (const std::string &label)

  Updates the user-visible label of this instance.
- const std::string & getLabel () const

  Returns the user-visible label of this instance.
- const std::string & getClassname () const

  Returns the runtime class name used by the plugin system.
- Model * getParentModel () const

  Returns the parent model that owns this definition.
- bool isReportStatistics () const

  Indicates whether this data definition contributes report statistics.
- void setReportStatistics (bool reportStatistics)

  Enables or disables report-statistics generation for this definition.
- ModelDataDefinition * getInternalData (const std::string &name) const

  Looks up a named internal child data definition.
- std::map< std::string, ModelDataDefinition * > * getInternalData () const

  Returns the full map of internal child data definitions.
- std::map< std::string, ModelDataDefinition * > * getAttachedData () const

  Returns the full map of attached data definitions.
- bool hasChanged () const

  Indicates whether this instance has been modified since the last reset.
- void setHasChanged (bool hasChanged)

  Updates the changed flag for this data definition.
- unsigned int getLevel () const

  Returns the hierarchical editing context containing this element.
- void setModelLevel (unsigned int _modelLevel)

  Sets this element's hierarchical editing context.
- List< SimulationControl * > * getSimulationControls () const

  Returns the simulation controls owned by this data definition.
- TraceManager::Level getTraceLevelSpecific () const

  Returns the trace level that applies specifically to this definition.

- void setTraceLevelSpecific (TraceManager::Level level)

  Updates the trace level used by this definition.
- void defineTraceLevelSpecific (TraceManager::Level traceLevelspecific, bool traceLevelSpecific↩ Enabled=true)

  Defines the specific trace level and optionally enables it immediately.
- bool isTraceLevelSpecificEnabled () const

  Indicates whether the specific trace level is enabled.
- void setTraceLevelSpecificEnabled (bool traceLevelSpecificEnabled)

  Enables or disables the specific trace level.

Static Public Member Functions

- static ModelDataDefinition * LoadInstance (Model *model, PersistenceRecord *fields)

  Loads a biochemical reaction from serialized fields.
- static PluginInformation * GetPluginInformation ()

  Returns plugin metadata for this reaction type.
- static ModelDataDefinition * NewInstance (Model *model, std::string name="")

  Creates a new empty reaction instance.

Static Public Member Functions inherited from ModelDataDefinition

- static ModelDataDefinition * LoadInstance (Model *model, PersistenceRecord *fields, bool insertIntoModel)

  Loads a model data definition instance from serialized fields.
- static ModelDataDefinition * NewInstance (Model *model, std::string name="")

  Creates a new instance of a data definition using the plugin registry.
- static void SaveInstance (PersistenceRecord *fields, ModelDataDefinition *modeldatum)

  Serializes a data definition instance into a persistence record.
- static bool Check (ModelDataDefinition *modeldatum, std::string &errorMessage)

  Validates a data definition instance.
- static void InitBetweenReplications (ModelDataDefinition *modeldatum)

  Resets simulation-time state between replications.
- static void CreateInternalData (ModelDataDefinition *modeldatum)

  Creates internal and attached data required by this instance.
- static bool CreateRelatedDataElements (ModelDataDefinition *modeldatum, std::string &errorMessage)

  Creates related data and validates the instance in a single call.

Protected Member Functions

- virtual bool _loadInstance (PersistenceRecord *fields) override

  must be overriden by derived classes

17.67.1 Detailed Description

Irreversible biochemical reaction definition.
Reactants, products, and modifiers are stored by species name so the reaction can be persisted independently from runtime pointers. Modifiers participate in kinetic laws without being consumed or produced. Reactions may omit reactants for synthesis or omit products for degradation, but must define at least one reactant or product. The current execution contract supports direct rate constants, a BioParameter reference, or an optional kinetic-law expression that resolves BioSpecies/BioParameter names at BioNetwork execution time. Reversible reactions use either a separate reverse kinetic-law expression or a reverse mass-action rate constant over the product side of the reaction.

17.67.2 Constructor & Destructor Documentation

17.67.2.1 BioReaction()

```
BioReaction::BioReaction (
            Model * model,
            std::string name = "" )
```

Creates an empty biochemical reaction definition.

Parameters

model	Parent model.
name	Initial reaction name.

17.67.3 Member Function Documentation

17.67.3.1 _check()

```
bool BioReaction::_check (
            std::string & errorMessage ) [override], [protected], [virtual]
```

could be overriden by derived classes
Reimplemented from ModelDataDefinition.

17.67.3.2 _createAttachedAttributes()

```
void BioReaction::_createAttachedAttributes ( ) [override], [protected], [virtual]
```

Reimplemented from ModelDataDefinition.

17.67.3.3 _loadInstance()

```
bool BioReaction::_loadInstance (
            PersistenceRecord * fields ) [override], [protected], [virtual]
```

must be overriden by derived classes

Reimplemented from ModelDataDefinition.

17.67.3.4 _saveInstance()

```
void BioReaction::_saveInstance (
            PersistenceRecord * fields,
            bool saveDefaultValues )  [override], [protected], [virtual]
```

Saves object fields into a serialization structure.

Parameters

fields	a table-like structure used for serialization.
saveDefaultValues	indicates whether or not to save fields which are set to their default value.

Reimplemented from ModelDataDefinition.

17.67.3.5 addModifier()

```
void BioReaction::addModifier (
            std::string speciesName )
```

Adds a modifier species that influences the reaction rate.

Parameters

speciesName	Modifier species name.

17.67.3.6 addProduct()

```
void BioReaction::addProduct (
            std::string speciesName,
            double stoichiometry = 1.0 )
```

Adds a product species to the reaction.

Parameters

speciesName	Product species name.
stoichiometry	Product stoichiometry.

17.67.3.7 addReactant()

```
void BioReaction::addReactant (
            std::string speciesName,
            double stoichiometry = 1.0 )
```

Adds a reactant species to the reaction.

Parameters

speciesName	Reactant species name.
stoichiometry	Reactant stoichiometry.

17.67.3.8 getKineticLawExpression()

```
std::string BioReaction::getKineticLawExpression ( ) const
```

Returns the forward kinetic-law expression.

Returns

Forward kinetic-law expression.

17.67.3.9 getModifiers()

```
const std::vector< std::string > & BioReaction::getModifiers ( ) const
```

Returns the registered modifiers.

Returns

Constant reference to the modifier names.

17.67.3.10 GetPluginInformation()

```
PluginInformation * BioReaction::GetPluginInformation ( )  [static]
```

Returns plugin metadata for this reaction type.

Returns

Plugin information block.

17.67.3.11 getProducts()

```
const std::vector< BioReaction::StoichiometricTerm > & BioReaction::getProducts ( ) const
```

Returns the registered products.

Returns

Constant reference to the product terms.

17.67.3.12 getRateConstant()

```
double BioReaction::getRateConstant ( ) const
```

Returns the forward rate constant.

Returns

Forward rate constant.

17.67.3.13 getRateConstantParameterName()

```
std::string BioReaction::getRateConstantParameterName ( ) const
```

Returns the forward-rate parameter name.

Returns

Parameter name used to resolve the forward rate constant.

17.67.3.14 getReactants()

```
const std::vector< BioReaction::StoichiometricTerm > & BioReaction::getReactants ( ) const
```

Returns the registered reactants.

Returns

Constant reference to the reactant terms.

17.67.3.15 getReverseKineticLawExpression()

`std::string BioReaction::getReverseKineticLawExpression ( ) const`
Returns the reverse kinetic-law expression.

Returns

Reverse kinetic-law expression.

17.67.3.16 getReverseRateConstant()

`double BioReaction::getReverseRateConstant ( ) const`
Returns the reverse rate constant.

Returns

Reverse rate constant.

17.67.3.17 getReverseRateConstantParameterName()

`std::string BioReaction::getReverseRateConstantParameterName ( ) const`
Returns the reverse-rate parameter name.

Returns

Parameter name used to resolve the reverse rate constant.

17.67.3.18 isReversible()

`bool BioReaction::isReversible ( ) const`
Indicates whether the reaction is reversible.

Returns

`true` when the reaction has a reverse branch.

17.67.3.19 LoadInstance()

```
ModelDataDefinition * BioReaction::LoadInstance (
            Model * model,
            PersistenceRecord * fields )  [static]
```
Loads a biochemical reaction from serialized fields.

Parameters

model	Parent model.
fields	Serialized fields.

Returns

Newly created reaction instance.

17.67.3.20 NewInstance()

```
ModelDataDefinition * BioReaction::NewInstance (
            Model * model,
            std::string name = "" )  [static]
```
Creates a new empty reaction instance.

Parameters

model	Parent model.
name	Initial reaction name.

Returns

Newly created reaction instance.

17.67.3.21 resolveRateConstant()

```
double BioReaction::resolveRateConstant ( ) const
```

Resolves the effective forward rate constant.

Returns

Forward rate constant after parameter resolution.

17.67.3.22 resolveReverseRateConstant()

```
double BioReaction::resolveReverseRateConstant ( ) const
```

Resolves the effective reverse rate constant.

Returns

Reverse rate constant after parameter resolution.

17.67.3.23 setKineticLawExpression()

```
void BioReaction::setKineticLawExpression (
            std::string kineticLawExpression )
```

Sets the forward kinetic-law expression.

Parameters

kineticLawExpression	Expression text.

17.67.3.24 setRateConstant()

```
void BioReaction::setRateConstant (
            double rateConstant )
```

Sets the forward rate constant.

Parameters

rateConstant	Forward rate constant value.

17.67.3.25 setRateConstantParameterName()

```
void BioReaction::setRateConstantParameterName (
            std::string rateConstantParameterName )
```

Stores the name of the parameter used for the forward rate constant.

Parameters

rateConstantParameterName	Parameter name.

17.67.3.26 setReverseKineticLawExpression()

```
void BioReaction::setReverseKineticLawExpression (
            std::string reverseKineticLawExpression )
```

Sets the reverse kinetic-law expression.

Parameters

reverseKineticLawExpression	Expression text.

17.67.3.27 setReverseRateConstant()

```
void BioReaction::setReverseRateConstant (
            double reverseRateConstant )
```

Sets the reverse rate constant.

Parameters

reverseRateConstant	Reverse rate constant value.

17.67.3.28 setReverseRateConstantParameterName()

```
void BioReaction::setReverseRateConstantParameterName (
            std::string reverseRateConstantParameterName )
```

Stores the name of the parameter used for the reverse rate constant.

Parameters

reverseRateConstantParameterName	Parameter name.

17.67.3.29 setReversible()

```
void BioReaction::setReversible (
            bool reversible )
```

Marks the reaction as reversible or irreversible.

Parameters

reversible	New reversible flag.

17.67.3.30 show()

```
std::string BioReaction::show ( )  [override], [virtual]
```

Returns a textual representation of the reaction.

Returns

Human-readable reaction summary.

Reimplemented from ModelDataDefinition.

- BioSimulatorRunner ∗ **getRunner** () const
- void **setCommand** (std::string command)
- std::string **getCommand** () const
- void **setLastSucceeded** (bool lastSucceeded)
- bool **getLastSucceeded** () const
- void **setLastStatus** (std::string lastStatus)
- std::string **getLastStatus** () const
- void **setLastMessage** (std::string lastMessage)
- std::string **getLastMessage** () const
- virtual std::string show () override

  virtual public methods

Public Member Functions inherited from ModelComponent

- ModelComponent (Model ∗model, std::string componentTypename, std::string name="")

  constructors
- virtual ∼**ModelComponent** ()

  Releases component-owned resources and unregisters it from the model.
- ConnectionManager ∗ getConnectionManager () const

  new public user methods for this component
- void connectTo (ModelComponent ∗component, unsigned int inputPortNumber=0)

  Connects this component to another component.
- bool hasBreakpointAt ()

  Indicates whether a simulation breakpoint is set on this component.
- void setDescription (std::string _description)

  Updates the free-form description shown by the GUI.
- std::string getDescription () const

  Returns the free-form description associated with this component.
- void remove (ModelComponent ∗comp)

  Removes a connected component from this component.

Public Member Functions inherited from ModelDataDefinition

- ModelDataDefinition (Model *model, std::string datadefinitionTypename, std::string name="", bool insertIntoModel=true)

  Creates a model data definition and optionally inserts it into the model.
- virtual ~**ModelDataDefinition** ()

  Releases resources owned by this data definition.
- Util::identification getId () const

  Returns the unique identifier of this instance.
- void setName (const std::string &name)

  Updates the logical name of this instance.
- const std::string & getName () const

  Returns the logical name of this instance.
- void setLabel (const std::string &label)

  Updates the user-visible label of this instance.
- const std::string & getLabel () const

  Returns the user-visible label of this instance.
- const std::string & getClassname () const

  Returns the runtime class name used by the plugin system.
- Model * getParentModel () const

  Returns the parent model that owns this definition.
- bool isReportStatistics () const

  Indicates whether this data definition contributes report statistics.
- void setReportStatistics (bool reportStatistics)

  Enables or disables report-statistics generation for this definition.
- ModelDataDefinition * getInternalData (const std::string &name) const

  Looks up a named internal child data definition.
- std::map< std::string, ModelDataDefinition * > * getInternalData () const

  Returns the full map of internal child data definitions.
- std::map< std::string, ModelDataDefinition * > * getAttachedData () const

  Returns the full map of attached data definitions.
- bool hasChanged () const

  Indicates whether this instance has been modified since the last reset.
- void setHasChanged (bool hasChanged)

  Updates the changed flag for this data definition.
- unsigned int getLevel () const

  Returns the hierarchical editing context containing this element.
- void setModelLevel (unsigned int _modelLevel)

  Sets this element's hierarchical editing context.
- List< SimulationControl * > * getSimulationControls () const

  Returns the simulation controls owned by this data definition.
- TraceManager::Level getTraceLevelSpecific () const

  Returns the trace level that applies specifically to this definition.
- void setTraceLevelSpecific (TraceManager::Level level)

  Updates the trace level used by this definition.
- void defineTraceLevelSpecific (TraceManager::Level traceLevelspecific, bool traceLevelSpecificEnabled=true)

  Defines the specific trace level and optionally enables it immediately.
- bool isTraceLevelSpecificEnabled () const

  Indicates whether the specific trace level is enabled.
- void setTraceLevelSpecificEnabled (bool traceLevelSpecificEnabled)

  Enables or disables the specific trace level.

Static Public Member Functions

- static PluginInformation * **GetPluginInformation** ()
- static ModelComponent * **LoadInstance** (Model *model, PersistenceRecord *fields)
- static ModelDataDefinition * **NewInstance** (Model *model, std::string name="")

Static Public Member Functions inherited from ModelComponent

- static ModelComponent * LoadInstance (Model *model, PersistenceRecord *fields)

  static public methods that must have implementations (Load and New just the same. GetInformation must provide specific infos for the new component
- static bool Check (ModelComponent *component)

  Validates a component instance.
- static void CreateInternalData (ModelComponent *component)

  Creates internal data required by a component instance.
- static void SaveInstance (PersistenceRecord *fields, ModelComponent *component)

  Serializes a component instance into a persistence record.
- static void DispatchEvent (Event *event)

  Dispatches a simulation event to the target component.

Static Public Member Functions inherited from ModelDataDefinition

- static ModelDataDefinition * LoadInstance (Model *model, PersistenceRecord *fields, bool insertIntoModel)

  Loads a model data definition instance from serialized fields.
- static ModelDataDefinition * NewInstance (Model *model, std::string name="")

  Creates a new instance of a data definition using the plugin registry.
- static void SaveInstance (PersistenceRecord *fields, ModelDataDefinition *modeldatum)

  Serializes a data definition instance into a persistence record.
- static bool Check (ModelDataDefinition *modeldatum, std::string &errorMessage)

  Validates a data definition instance.
- static void InitBetweenReplications (ModelDataDefinition *modeldatum)

  Resets simulation-time state between replications.
- static void CreateInternalData (ModelDataDefinition *modeldatum)

  Creates internal and attached data required by this instance.
- static bool CreateRelatedDataElements (ModelDataDefinition *modeldatum, std::string &errorMessage)

  Creates related data and validates the instance in a single call.

Protected Member Functions

- virtual bool _loadInstance (PersistenceRecord *fields) override

  virtual protected method that must be overriden
- virtual void _saveInstance (PersistenceRecord *fields, bool saveDefaultValues) override

  Saves object fields into a serialization structure.
- virtual bool _check (std::string &errorMessage) override

  could be overriden by derived classes
- virtual void _onDispatchEvent (Entity *entity, unsigned int inputPortNumber) override

  Handles a dispatched event for this component type.
- virtual void _createEditableDataDefinitions () override

Protected Member Functions inherited from ModelDataDefinition

- bool _getSaveDefaultsOption ()
- virtual ParserChangesInformation * _getParserChangesInformation ()
- virtual void _initBetweenReplications ()

- bool **_traceLevelSpecificEnabled** = false

17.72.1 Detailed Description

Component wrapper over BioSimulatorRunner command execution.
BioRunnerCommand dispatches one configured command into a referenced BioSimulatorRunner whenever an entity arrives and stores the last runner status/payload metadata for downstream model logic.

17.72.2 Member Function Documentation

17.72.2.1 _check()

```
bool BioRunnerCommand::_check (
            std::string & errorMessage )  [override], [protected], [virtual]
```

could be overriden by derived classes
Reimplemented from ModelDataDefinition.

17.72.2.2 _createEditableDataDefinitions()

```
void BioRunnerCommand::_createEditableDataDefinitions ( )  [override], [protected], [virtual]
```

Reimplemented from ModelDataDefinition.

17.72.2.3 _loadInstance()

```
bool BioRunnerCommand::_loadInstance (
            PersistenceRecord * fields )  [override], [protected], [virtual]
```

virtual protected method that must be overriden
Reimplemented from ModelComponent.

17.72.2.4 _onDispatchEvent()

```
void BioRunnerCommand::_onDispatchEvent (
            Entity * entity,
            unsigned int inputPortNumber )  [override], [protected], [virtual]
```

Handles a dispatched event for this component type.
This method is only for ModelComponents, not for ModelDataElements.

Parameters

entity	Entity being processed.
inputPortNumber	Input port where the entity arrived.

Implements ModelComponent.

17.72.2.5 _saveInstance()

```
void BioRunnerCommand::_saveInstance (
            PersistenceRecord * fields,
            bool saveDefaultValues )  [override], [protected], [virtual]
```

Saves object fields into a serialization structure.

Parameters

fields	a table-like structure used for serialization.
saveDefaultValues	indicates whether or not to save fields which are set to their default value.

Reimplemented from ModelComponent.

17.72.2.6 show()

```
std::string BioRunnerCommand::show ( )  [override], [virtual]
```

virtual public methods
Returns a textual representation of this component.

Returns

Human-readable description used for tracing and debugging.

Reimplemented from ModelComponent.

  virtual public methods

Public Member Functions inherited from ModelComponent

- ModelComponent (Model *model, std::string componentTypename, std::string name="")

  constructors
- virtual ~**ModelComponent** ()

  Releases component-owned resources and unregisters it from the model.
- ConnectionManager * getConnectionManager () const

  new public user methods for this component
- void connectTo (ModelComponent *component, unsigned int inputPortNumber=0)

  Connects this component to another component.
- bool hasBreakpointAt ()

  Indicates whether a simulation breakpoint is set on this component.
- void setDescription (std::string _description)

  Updates the free-form description shown by the GUI.
- std::string getDescription () const

  Returns the free-form description associated with this component.
- void remove (ModelComponent *comp)

  Removes a connected component from this component.

Public Member Functions inherited from ModelDataDefinition

- ModelDataDefinition (Model *model, std::string datadefinitionTypename, std::string name="", bool insert↩ IntoModel=true)

  Creates a model data definition and optionally inserts it into the model.
- virtual ~**ModelDataDefinition** ()

  Releases resources owned by this data definition.
- Util::identification getId () const

  Returns the unique identifier of this instance.
- void setName (const std::string &name)

  Updates the logical name of this instance.
- const std::string & getName () const

  Returns the logical name of this instance.
- void setLabel (const std::string &label)

  Updates the user-visible label of this instance.
- const std::string & getLabel () const

  Returns the user-visible label of this instance.
- const std::string & getClassname () const

  Returns the runtime class name used by the plugin system.
- Model * getParentModel () const

  Returns the parent model that owns this definition.
- bool isReportStatistics () const

Indicates whether this data definition contributes report statistics.

- void setReportStatistics (bool reportStatistics)

  Enables or disables report-statistics generation for this definition.
- ModelDataDefinition * getInternalData (const std::string &name) const

  Looks up a named internal child data definition.
- std::map< std::string, ModelDataDefinition * > * getInternalData () const

  Returns the full map of internal child data definitions.
- std::map< std::string, ModelDataDefinition * > * getAttachedData () const

  Returns the full map of attached data definitions.
- bool hasChanged () const

  Indicates whether this instance has been modified since the last reset.
- void setHasChanged (bool hasChanged)

  Updates the changed flag for this data definition.
- unsigned int getLevel () const

  Returns the hierarchical editing context containing this element.
- void setModelLevel (unsigned int _modelLevel)

  Sets this element's hierarchical editing context.
- List< SimulationControl * > * getSimulationControls () const

  Returns the simulation controls owned by this data definition.
- TraceManager::Level getTraceLevelSpecific () const

  Returns the trace level that applies specifically to this definition.
- void setTraceLevelSpecific (TraceManager::Level level)

  Updates the trace level used by this definition.
- void defineTraceLevelSpecific (TraceManager::Level traceLevelspecific, bool traceLevelSpecific↩ Enabled=true)

  Defines the specific trace level and optionally enables it immediately.
- bool isTraceLevelSpecificEnabled () const

  Indicates whether the specific trace level is enabled.
- void setTraceLevelSpecificEnabled (bool traceLevelSpecificEnabled)

  Enables or disables the specific trace level.

Static Public Member Functions

- static PluginInformation * **GetPluginInformation** ()

17.78.1 Detailed Description

Component that triggers deterministic BioNetwork simulation.
BioSimulate delegates simulation execution to a referenced BioNetwork. Each arriving entity can either run the network with its own configured time window or with component-provided start/stop/step values.

17.78.2 Member Function Documentation

17.78.2.1 _check()

```
bool BioSimulate::_check (
            std::string & errorMessage )  [override], [protected], [virtual]
```

could be overriden by derived classes
Reimplemented from ModelDataDefinition.

17.78.2.2 _createEditableDataDefinitions()

```
void BioSimulate::_createEditableDataDefinitions ( )  [override], [protected], [virtual]
```

Reimplemented from ModelDataDefinition.

17.78.2.3 _loadInstance()

```
bool BioSimulate::_loadInstance (
            PersistenceRecord * fields )  [override], [protected], [virtual]
```

virtual protected method that must be overriden
Reimplemented from ModelComponent.

17.78.2.4 _onDispatchEvent()

```
void BioSimulate::_onDispatchEvent (
            Entity * entity,
            unsigned int inputPortNumber )  [override], [protected], [virtual]
```

Handles a dispatched event for this component type.
This method is only for ModelComponents, not for ModelDataElements.

Parameters

entity	Entity being processed.
inputPortNumber	Input port where the entity arrived.

Implements ModelComponent.

17.78.2.5 _saveInstance()

```
void BioSimulate::_saveInstance (
            PersistenceRecord * fields,
            bool saveDefaultValues )  [override], [protected], [virtual]
```

Saves object fields into a serialization structure.

Parameters

fields	a table-like structure used for serialization.
saveDefaultValues	indicates whether or not to save fields which are set to their default value.

Reimplemented from ModelComponent.

17.78.2.6 show()

```
std::string BioSimulate::show ( )  [override], [virtual]
```

virtual public methods
Returns a textual representation of this component.

Returns

Human-readable description used for tracing and debugging.

Reimplemented from ModelComponent.

Public Member Functions inherited from ModelDataDefinition

- ModelDataDefinition (Model *model, std::string datadefinitionTypename, std::string name="", bool insert↩ IntoModel=true)

  Creates a model data definition and optionally inserts it into the model.
- virtual ~**ModelDataDefinition** ()

  Releases resources owned by this data definition.
- Util::identification getId () const

  Returns the unique identifier of this instance.
- void setName (const std::string &name)

  Updates the logical name of this instance.
- const std::string & getName () const

  Returns the logical name of this instance.
- void setLabel (const std::string &label)

  Updates the user-visible label of this instance.
- const std::string & getLabel () const

  Returns the user-visible label of this instance.
- const std::string & getClassname () const

  Returns the runtime class name used by the plugin system.
- Model * getParentModel () const

  Returns the parent model that owns this definition.
- bool isReportStatistics () const

  Indicates whether this data definition contributes report statistics.
- void setReportStatistics (bool reportStatistics)

  Enables or disables report-statistics generation for this definition.
- ModelDataDefinition * getInternalData (const std::string &name) const

  Looks up a named internal child data definition.
- std::map< std::string, ModelDataDefinition * > * getInternalData () const

  Returns the full map of internal child data definitions.
- std::map< std::string, ModelDataDefinition * > * getAttachedData () const

  Returns the full map of attached data definitions.

- bool hasChanged () const

  Indicates whether this instance has been modified since the last reset.
- void setHasChanged (bool hasChanged)

  Updates the changed flag for this data definition.
- unsigned int getLevel () const

  Returns the hierarchical editing context containing this element.
- void setModelLevel (unsigned int _modelLevel)

  Sets this element's hierarchical editing context.
- List< SimulationControl * > * getSimulationControls () const

  Returns the simulation controls owned by this data definition.
- TraceManager::Level getTraceLevelSpecific () const

  Returns the trace level that applies specifically to this definition.
- void setTraceLevelSpecific (TraceManager::Level level)

  Updates the trace level used by this definition.
- void defineTraceLevelSpecific (TraceManager::Level traceLevelspecific, bool traceLevelSpecific↩ Enabled=true)

  Defines the specific trace level and optionally enables it immediately.
- bool isTraceLevelSpecificEnabled () const

  Indicates whether the specific trace level is enabled.
- void setTraceLevelSpecificEnabled (bool traceLevelSpecificEnabled)

  Enables or disables the specific trace level.

Static Public Member Functions

17.84.1 Member Function Documentation

17.84.1.1 _check()

```
bool BioSimulatorRunner::_check (
            std::string & errorMessage )  [override], [protected], [virtual]
```

could be overriden by derived classes
Reimplemented from ModelDataDefinition.

17.84.1.2 _loadInstance()

```
bool BioSimulatorRunner::_loadInstance (
            PersistenceRecord * fields )  [override], [protected], [virtual]
```

must be overriden by derived classes
Reimplemented from ModelDataDefinition.

17.84.1.3 _saveInstance()

```
void BioSimulatorRunner::_saveInstance (
            PersistenceRecord * fields,
            bool saveDefaultValues )  [override], [protected], [virtual]
```

Saves object fields into a serialization structure.

Parameters

fields	a table-like structure used for serialization.
saveDefaultValues	indicates whether or not to save fields which are set to their default value.

Reimplemented from ModelDataDefinition.

17.84.1.4 show()

```
std::string BioSimulatorRunner::show ( )  [override], [virtual]
```

Returns a textual representation of this data definition.
Returns the keys of internal ModelDataDefinitions such as counters, statistics collectors and other children needed before model checking.

Returns

Human-readable summary used by traces and debug output.

Reimplemented from ModelDataDefinition.
The documentation for this class was generated from the following files:

17.85.1 Detailed Description

Biochemical state variable used by BioReaction and BioNetwork.
A BioSpecies stores an initial amount for replication reset and a current amount for simulation. Constant and boundary-condition flags follow SBML-like semantics: BioNetwork still uses the current amount as kinetic input, but it must not overwrite the species amount while advancing the ODE state.

17.85.2 Member Function Documentation

17.85.2.1 _check()

```
bool BioSpecies::_check (
            std::string & errorMessage )  [override], [protected], [virtual]
```

could be overriden by derived classes
Reimplemented from ModelDataDefinition.

17.85.2.2 _initBetweenReplications()

```
void BioSpecies::_initBetweenReplications ( )  [override], [protected], [virtual]
```

Reimplemented from ModelDataDefinition.

17.85.2.3 _loadInstance()

```
bool BioSpecies::_loadInstance (
            PersistenceRecord * fields )  [override], [protected], [virtual]
```

must be overriden by derived classes
Reimplemented from ModelDataDefinition.

17.85.2.4 _saveInstance()

```
void BioSpecies::_saveInstance (
            PersistenceRecord * fields,
            bool saveDefaultValues )  [override], [protected], [virtual]
```

Saves object fields into a serialization structure.

Parameters

fields	a table-like structure used for serialization.
saveDefaultValues	indicates whether or not to save fields which are set to their default value.

Reimplemented from ModelDataDefinition.

17.85.2.5 show()

```
std::string BioSpecies::show ( )  [override], [virtual]
```

Returns a textual representation of this data definition.
Returns the keys of internal ModelDataDefinitions such as counters, statistics collectors and other children needed before model checking.

Returns

Human-readable summary used by traces and debug output.

Reimplemented from ModelDataDefinition.
The documentation for this class was generated from the following files:

  virtual public methods

Public Member Functions inherited from ModelComponent

- ModelComponent (Model ∗model, std::string componentTypename, std::string name="")

  constructors
- virtual ∼**ModelComponent** ()

  Releases component-owned resources and unregisters it from the model.
- ConnectionManager ∗ getConnectionManager () const

  new public user methods for this component

- void connectTo (ModelComponent *component, unsigned int inputPortNumber=0)

  Connects this component to another component.
- bool hasBreakpointAt ()

  Indicates whether a simulation breakpoint is set on this component.
- void setDescription (std::string _description)

  Updates the free-form description shown by the GUI.
- std::string getDescription () const

  Returns the free-form description associated with this component.
- void remove (ModelComponent *comp)

  Removes a connected component from this component.

Public Member Functions inherited from ModelDataDefinition

- ModelDataDefinition (Model *model, std::string datadefinitionTypename, std::string name="", bool insert↩ IntoModel=true)

  Creates a model data definition and optionally inserts it into the model.
- virtual ~**ModelDataDefinition** ()

  Releases resources owned by this data definition.
- Util::identification getId () const

  Returns the unique identifier of this instance.
- void setName (const std::string &name)

  Updates the logical name of this instance.
- const std::string & getName () const

  Returns the logical name of this instance.
- void setLabel (const std::string &label)

  Updates the user-visible label of this instance.
- const std::string & getLabel () const

  Returns the user-visible label of this instance.
- const std::string & getClassname () const

  Returns the runtime class name used by the plugin system.
- Model * getParentModel () const

  Returns the parent model that owns this definition.
- bool isReportStatistics () const

  Indicates whether this data definition contributes report statistics.
- void setReportStatistics (bool reportStatistics)

  Enables or disables report-statistics generation for this definition.
- ModelDataDefinition * getInternalData (const std::string &name) const

  Looks up a named internal child data definition.
- std::map< std::string, ModelDataDefinition * > * getInternalData () const

  Returns the full map of internal child data definitions.
- std::map< std::string, ModelDataDefinition * > * getAttachedData () const

  Returns the full map of attached data definitions.
- bool hasChanged () const

  Indicates whether this instance has been modified since the last reset.
- void setHasChanged (bool hasChanged)

  Updates the changed flag for this data definition.
- unsigned int getLevel () const

  Returns the hierarchical editing context containing this element.
- void setModelLevel (unsigned int _modelLevel)

  Sets this element's hierarchical editing context.
- List< SimulationControl * > * getSimulationControls () const

Returns the simulation controls owned by this data definition.

- TraceManager::Level getTraceLevelSpecific () const

  Returns the trace level that applies specifically to this definition.

- void setTraceLevelSpecific (TraceManager::Level level)

  Updates the trace level used by this definition.

- void defineTraceLevelSpecific (TraceManager::Level traceLevelspecific, bool traceLevelSpecific↩ Enabled=true)

  Defines the specific trace level and optionally enables it immediately.

- bool isTraceLevelSpecificEnabled () const

  Indicates whether the specific trace level is enabled.

- void setTraceLevelSpecificEnabled (bool traceLevelSpecificEnabled)

  Enables or disables the specific trace level.

Static Public Member Functions

- static PluginInformation * **GetPluginInformation** ()

17.88.1 Detailed Description

Projects selected BioSpecies values into a WholeCellState.
BioStateProjectionComponent bridges the biochemical and whole-cell layers by copying chosen BioSpecies amounts into WholeCellState molecule counts or metabolite pools at simulation event boundaries. It is intentionally small and explicit: the caller decides which source species feed which whole-cell fields and which scale/offset transform applies to each projection.

17.88.2 Member Function Documentation

17.88.2.1 _check()

```
bool BioStateProjectionComponent::_check (
            std::string & errorMessage )  [override], [protected], [virtual]
```

could be overriden by derived classes
Reimplemented from ModelDataDefinition.

17.88.2.2 _createEditableDataDefinitions()

```
void BioStateProjectionComponent::_createEditableDataDefinitions ( )  [override], [protected],
[virtual]
```

Reimplemented from ModelDataDefinition.

17.88.2.3 _loadInstance()

```
bool BioStateProjectionComponent::_loadInstance (
            PersistenceRecord * fields )  [override], [protected], [virtual]
```

virtual protected method that must be overriden
Reimplemented from ModelComponent.

17.88.2.4 _onDispatchEvent()

```
void BioStateProjectionComponent::_onDispatchEvent (
            Entity * entity,
            unsigned int inputPortNumber )  [override], [protected], [virtual]
```

Handles a dispatched event for this component type.
This method is only for ModelComponents, not for ModelDataElements.

Parameters

entity	Entity being processed.
inputPortNumber	Input port where the entity arrived.

Implements ModelComponent.

17.88.2.5 _saveInstance()

```
void BioStateProjectionComponent::_saveInstance (
            PersistenceRecord * fields,
            bool saveDefaultValues )  [override], [protected], [virtual]
```

Saves object fields into a serialization structure.

Parameters

fields	a table-like structure used for serialization.
saveDefaultValues	indicates whether or not to save fields which are set to their default value.

Reimplemented from ModelComponent.

17.88.2.6 show()

```
std::string BioStateProjectionComponent::show ( )  [override], [virtual]
```

virtual public methods
Returns a textual representation of this component.

Returns

Human-readable description used for tracing and debugging.

Reimplemented from ModelComponent.
The documentation for this class was generated from the following files:

- plugins/components/WholeCellModeling/BioStateProjectionComponent.h
- plugins/components/WholeCellModeling/BioStateProjectionComponent.cpp

17.89.1 Detailed Description

Component that checks steady-state diagnostics over BioNetwork results.
BioSteadyState can optionally trigger one simulation run before evaluating steady-state through BioNetwork analysis helpers.

17.89.2 Member Function Documentation

17.89.2.1 _check()

```
bool BioSteadyState::_check (
            std::string & errorMessage )  [override], [protected], [virtual]
```

could be overriden by derived classes
Reimplemented from ModelDataDefinition.

17.89.2.2 _createAttachedAttributes()

```
void BioSteadyState::_createAttachedAttributes ( )  [override], [protected], [virtual]
```

Reimplemented from ModelDataDefinition.

17.89.2.3 _loadInstance()

```
bool BioSteadyState::_loadInstance (
            PersistenceRecord * fields )  [override], [protected], [virtual]
```

virtual protected method that must be overriden
Reimplemented from ModelComponent.

17.89.2.4 _onDispatchEvent()

```
void BioSteadyState::_onDispatchEvent (
            Entity * entity,
            unsigned int inputPortNumber )  [override], [protected], [virtual]
```

Handles a dispatched event for this component type.
This method is only for ModelComponents, not for ModelDataElements.

Parameters

entity	Entity being processed.
inputPortNumber	Input port where the entity arrived.

Implements ModelComponent.

17.89.2.5 _saveInstance()

```
void BioSteadyState::_saveInstance (
            PersistenceRecord * fields,
            bool saveDefaultValues )  [override], [protected], [virtual]
```

Saves object fields into a serialization structure.

Parameters

fields	a table-like structure used for serialization.
saveDefaultValues	indicates whether or not to save fields which are set to their default value.

Reimplemented from ModelComponent.

17.89.2.6 show()

```
std::string BioSteadyState::show ( )  [override], [virtual]
```

virtual public methods
Returns a textual representation of this component.

Returns

Human-readable description used for tracing and debugging.

Reimplemented from ModelComponent.

- Lattice * **getLattice** () const

Additional Inherited Members

Protected Attributes inherited from BoundaryCondition

- Lattice * **lattice**
- Neighborhood * **neighborhood**

17.94.1 Member Function Documentation

17.94.1.1 getNeighborCell()

```
virtual Cell * Boundary_Fixed::getNeighborCell (
            std::vector< int > cellPosition,
            std::vector< int > neighborCellPosition )  [inline], [override], [virtual]
```

Pure virtual method that has to be overiden by derived class, responsable for defining the missing neighbor of a cell.

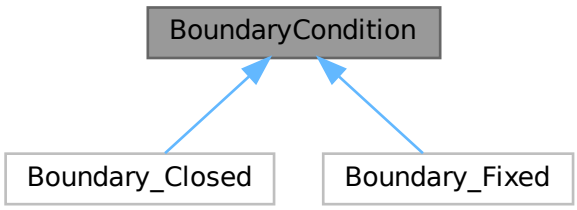
Implements BoundaryCondition.

The documentation for this class was generated from the following file:

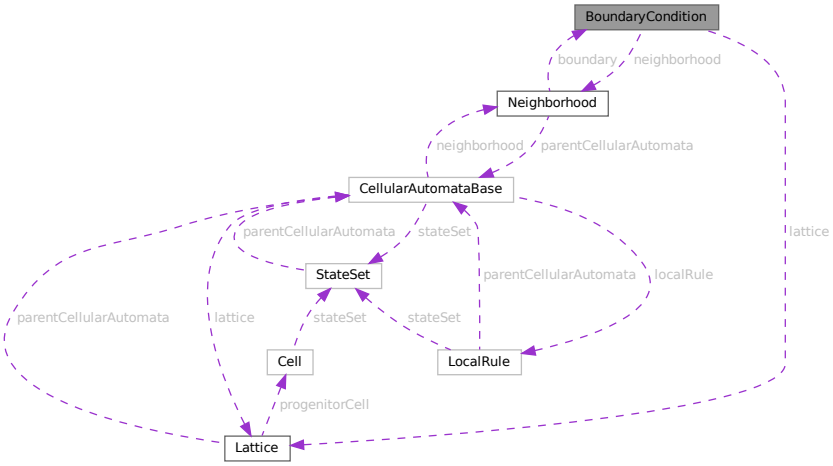
- plugins/components/ModalModel/CellularAutomata/Boundary_Fixed.h

17.95 BoundaryCondition Class Reference

Inheritance diagram for BoundaryCondition:



Collaboration diagram for BoundaryCondition:



Public Member Functions

- **BoundaryCondition** (Lattice *lattice=nullptr, Neighborhood *neighborhood=nullptr)
- **BoundaryCondition** (const BoundaryCondition &orig)
- virtual std::string **show** ()
- virtual Cell * getNeighborCell (std::vector< int > cellPosition, std::vector< int > neighborCellPosition)=0

  Pure virtual method that has to be overiden by derived class, responsable for defining the missing neighbor of a cell.
- void **setNeighborhood** (Neighborhood *neighborhood)
- Neighborhood * **getNeighborhood** () const
- void **setLattice** (Lattice *lattice)
- Lattice * **getLattice** () const

Protected Attributes

- Lattice * **lattice**
- Neighborhood * **neighborhood**

17.95.1 Member Function Documentation

17.95.1.1 getNeighborCell()

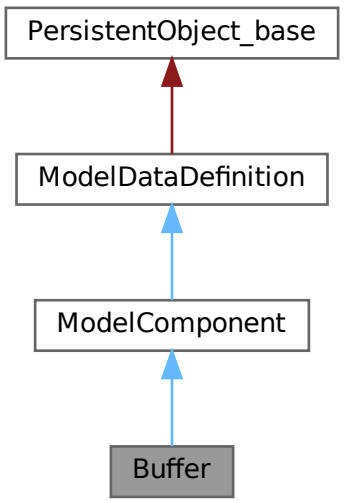
```
virtual Cell * BoundaryCondition::getNeighborCell (
            std::vector< int > cellPosition,
            std::vector< int > neighborCellPosition )  [pure virtual]
```

Pure virtual method that has to be overiden by derived class, responsable for defining the missing neighbor of a cell.
Implemented in Boundary_Closed, and Boundary_Fixed.
The documentation for this class was generated from the following file:

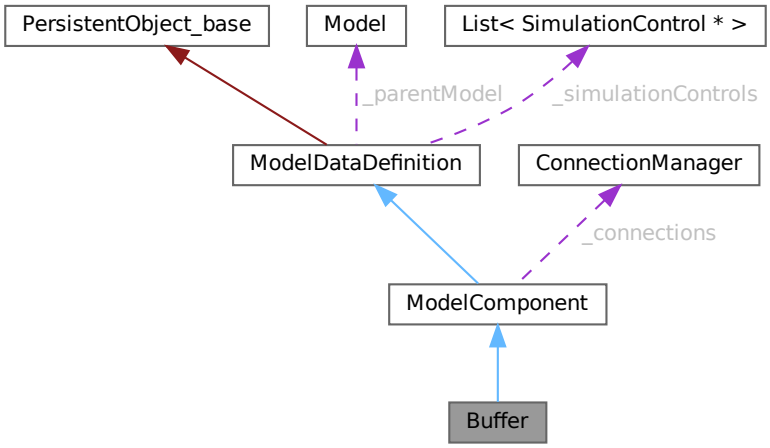
- plugins/components/ModalModel/CellularAutomata/BoundaryCondition.h

17.96 Buffer Class Reference

`#include <plugins/components/DiscreteProcessing/Buffer.h>`
Inheritance diagram for Buffer:



Collaboration diagram for Buffer:



Public Types

- enum class **AdvanceOn** : int { **NewArrivals** = 0 , **Signal** = 1 , **num_elements** = 2 }
- enum class **ArrivalOnFullBufferRule** : int { **Dispose** = 0 , **SendToBulkPort** = 1 , **ReplaceLastPosition** = 2 , **num_elements** = 3 }

Public Member Functions

- **Buffer** (Model *model, std::string name="")
- virtual std::string show () override

  virtual public methods
- Buffer::ArrivalOnFullBufferRule **getarrivalOnFullBufferRule** () const
- void **setArrivalOnFullBufferRule** (Buffer::ArrivalOnFullBufferRule newArrivalOnFullBufferRule)
- Buffer::AdvanceOn **getadvanceOn** () const
- void **setAdvanceOn** (Buffer::AdvanceOn newAdvanceOn)
- unsigned int **getcapacity** () const
- void **setCapacity** (unsigned int newCapacity)
- SignalData * **getsignal** () const
- void **setSignal** (SignalData *newSignal)

Public Member Functions inherited from ModelComponent

- ModelComponent (Model *model, std::string componentTypename, std::string name="")

  constructors
- virtual ~**ModelComponent** ()

  Releases component-owned resources and unregisters it from the model.
- ConnectionManager * getConnectionManager () const

  new public user methods for this component
- void connectTo (ModelComponent *component, unsigned int inputPortNumber=0)

  Connects this component to another component.
- bool hasBreakpointAt ()

  Indicates whether a simulation breakpoint is set on this component.
- void setDescription (std::string _description)

Updates the free-form description shown by the GUI.

- std::string getDescription () const

  Returns the free-form description associated with this component.

- void remove (ModelComponent *comp)

  Removes a connected component from this component.

Public Member Functions inherited from ModelDataDefinition

- ModelDataDefinition (Model *model, std::string datadefinitionTypename, std::string name="", bool insert↩ IntoModel=true)

  Creates a model data definition and optionally inserts it into the model.

- virtual ~**ModelDataDefinition** ()

  Releases resources owned by this data definition.

- Util::identification getId () const

  Returns the unique identifier of this instance.

- void setName (const std::string &name)

  Updates the logical name of this instance.

- const std::string & getName () const

  Returns the logical name of this instance.

- void setLabel (const std::string &label)

  Updates the user-visible label of this instance.

- const std::string & getLabel () const

  Returns the user-visible label of this instance.

- const std::string & getClassname () const

  Returns the runtime class name used by the plugin system.

- Model * getParentModel () const

  Returns the parent model that owns this definition.

- bool isReportStatistics () const

  Indicates whether this data definition contributes report statistics.

- void setReportStatistics (bool reportStatistics)

  Enables or disables report-statistics generation for this definition.

- ModelDataDefinition * getInternalData (const std::string &name) const

  Looks up a named internal child data definition.

- std::map< std::string, ModelDataDefinition * > * getInternalData () const

  Returns the full map of internal child data definitions.

- std::map< std::string, ModelDataDefinition * > * getAttachedData () const

  Returns the full map of attached data definitions.

- bool hasChanged () const

  Indicates whether this instance has been modified since the last reset.

- void setHasChanged (bool hasChanged)

  Updates the changed flag for this data definition.

- unsigned int getLevel () const

  Returns the hierarchical editing context containing this element.

- void setModelLevel (unsigned int _modelLevel)

  Sets this element's hierarchical editing context.

- List< SimulationControl * > * getSimulationControls () const

  Returns the simulation controls owned by this data definition.

- TraceManager::Level getTraceLevelSpecific () const

  Returns the trace level that applies specifically to this definition.

- void setTraceLevelSpecific (TraceManager::Level level)

  Updates the trace level used by this definition.

- void defineTraceLevelSpecific (TraceManager::Level traceLevelspecific, bool traceLevelSpecific↩ Enabled=true)

  Defines the specific trace level and optionally enables it immediately.
- bool isTraceLevelSpecificEnabled () const

  Indicates whether the specific trace level is enabled.
- void setTraceLevelSpecificEnabled (bool traceLevelSpecificEnabled)

  Enables or disables the specific trace level.

Static Public Member Functions

- static std::string **convertEnumToStr** (AdvanceOn advance)
- static std::string **convertEnumToStr** (ArrivalOnFullBufferRule arrival)
- static PluginInformation * **GetPluginInformation** ()
- static ModelComponent * **LoadInstance** (Model *model, PersistenceRecord *fields)
- static ModelDataDefinition * **NewInstance** (Model *model, std::string name="")

Static Public Member Functions inherited from ModelComponent

- static ModelComponent * LoadInstance (Model *model, PersistenceRecord *fields)

  static public methods that must have implementations (Load and New just the same. GetInformation must provide specific infos for the new component
- static bool Check (ModelComponent *component)

  Validates a component instance.
- static void CreateInternalData (ModelComponent *component)

  Creates internal data required by a component instance.
- static void SaveInstance (PersistenceRecord *fields, ModelComponent *component)

  Serializes a component instance into a persistence record.
- static void DispatchEvent (Event *event)

  Dispatches a simulation event to the target component.

Static Public Member Functions inherited from ModelDataDefinition

- static ModelDataDefinition * LoadInstance (Model *model, PersistenceRecord *fields, bool insertIntoModel)

  Loads a model data definition instance from serialized fields.
- static ModelDataDefinition * NewInstance (Model *model, std::string name="")

  Creates a new instance of a data definition using the plugin registry.
- static void SaveInstance (PersistenceRecord *fields, ModelDataDefinition *modeldatum)

  Serializes a data definition instance into a persistence record.
- static bool Check (ModelDataDefinition *modeldatum, std::string &errorMessage)

  Validates a data definition instance.
- static void InitBetweenReplications (ModelDataDefinition *modeldatum)

  Resets simulation-time state between replications.
- static void CreateInternalData (ModelDataDefinition *modeldatum)

  Creates internal and attached data required by this instance.
- static bool CreateRelatedDataElements (ModelDataDefinition *modeldatum, std::string &errorMessage)

  Creates related data and validates the instance in a single call.

Protected Member Functions

- virtual bool _loadInstance (PersistenceRecord *fields) override

  virtual protected method that must be overriden
- virtual void _saveInstance (PersistenceRecord *fields, bool saveDefaultValues) override

  Saves object fields into a serialization structure.
- virtual void _onDispatchEvent (Entity *entity, unsigned int inputPortNumber) override

  Handles a dispatched event for this component type.
- virtual bool _check (std::string &errorMessage) override

  could be overriden by derived classes
- virtual ParserChangesInformation * _getParserChangesInformation () override
- virtual void _initBetweenReplications () override
- virtual void _addSimulationControl (SimulationControl *property) override
- virtual void _createEditableDataDefinitions () override

Protected Member Functions inherited from ModelDataDefinition

- bool **_traceLevelSpecificEnabled** = false

17.96.1 Detailed Description

This component ...

17.96.2 Member Function Documentation

17.96.2.1 _addSimulationControl()

```
void Buffer::_addSimulationControl (
            SimulationControl * property )  [override], [protected], [virtual]
```

This method is necessary only for those components that instantiate internal elements that must exist before simulation starts and even before model checking. That's the case of components that have internal StatisticsCollectors, since others components may refer to them as expressions (as in "TVAG(ThisCSTAT)") and therefore the modeldatum must exist before checking such expression
Reimplemented from ModelDataDefinition.

17.96.2.2 _check()

```
bool Buffer::_check (
            std::string & errorMessage )  [override], [protected], [virtual]
```

could be overriden by derived classes
Reimplemented from ModelDataDefinition.

17.96.2.3 _createEditableDataDefinitions()

```
void Buffer::_createEditableDataDefinitions ( )  [override], [protected], [virtual]
```
Reimplemented from ModelDataDefinition.

17.96.2.4 _getParserChangesInformation()

```
ParserChangesInformation * Buffer::_getParserChangesInformation ( )  [override], [protected],
[virtual]
```
This method returns all changes in the parser that are needed by plugins of this ModelDatas. When connecting a new plugin, ParserChangesInformation are used to change parser source code, whch is after compiled and dinamically linked to to simulator kernel to reflect the changes
Reimplemented from ModelDataDefinition.

17.96.2.5 _initBetweenReplications()

```
void Buffer::_initBetweenReplications ( )  [override], [protected], [virtual]
```
Reimplemented from ModelDataDefinition.

17.96.2.6 _loadInstance()

```
bool Buffer::_loadInstance (
            PersistenceRecord * fields )  [override], [protected], [virtual]
```
virtual protected method that must be overriden
Reimplemented from ModelComponent.

17.96.2.7 _onDispatchEvent()

```
void Buffer::_onDispatchEvent (
            Entity * entity,
            unsigned int inputPortNumber )  [override], [protected], [virtual]
```
Handles a dispatched event for this component type.
This method is only for ModelComponents, not for ModelDataElements.

Parameters

entity	Entity being processed.
inputPortNumber	Input port where the entity arrived.

Implements ModelComponent.

17.96.2.8 _saveInstance()

```
void Buffer::_saveInstance (
            PersistenceRecord * fields,
            bool saveDefaultValues )  [override], [protected], [virtual]
```
Saves object fields into a serialization structure.

Parameters

fields	a table-like structure used for serialization.
saveDefaultValues	indicates whether or not to save fields which are set to their default value.

Reimplemented from ModelComponent.

17.96.2.9 show()

```
std::string Buffer::show ( )  [override], [virtual]
```
virtual public methods

Returns a textual representation of this component.

Returns

Human-readable description used for tracing and debugging.

Reimplemented from ModelComponent.
The documentation for this class was generated from the following files:

- plugins/components/DiscreteProcessing/Buffer.h
- plugins/components/DiscreteProcessing/Buffer.cpp

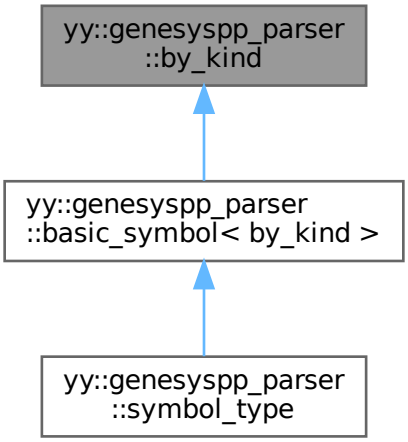
17.98 yy::genesyspp_parser::by_kind Struct Reference

Type access provider for token (enum) based symbols.
`#include <parser/GenesysParser.h>`

Inheritance diagram for yy::genesyspp_parser::by_kind:



Public Types

- typedef token_kind_type **kind_type**

  The symbol kind as needed by the constructor.

Public Member Functions

- **by_kind** () YY_NOEXCEPT

  Default constructor.
- **by_kind** (const by_kind &that) YY_NOEXCEPT

  Copy constructor.
- **by_kind** (kind_type t) YY_NOEXCEPT

  Constructor from (external) token numbers.
- void **clear** () YY_NOEXCEPT

  Record that this symbol is empty.
- void **move** (by_kind &that)

  Steal the symbol kind from that.
- symbol_kind_type kind () const YY_NOEXCEPT
- symbol_kind_type **type_get** () const YY_NOEXCEPT

  Backward compatibility (Bison 3.6).

Public Attributes

- symbol_kind_type kind_

17.98.1 Detailed Description

Type access provider for token (enum) based symbols.

17.98.2 Member Function Documentation

17.98.2.1 kind()

`genesyspp_parser::symbol_kind_type yy::genesyspp_parser::by_kind::kind ( ) const [inline]`
The (internal) type number (corresponding to *type*). *empty* when empty.

17.98.3 Member Data Documentation

17.98.3.1 kind_

`symbol_kind_type yy::genesyspp_parser::by_kind::kind_`
The symbol kind. *S_YYEMPTY* when empty.

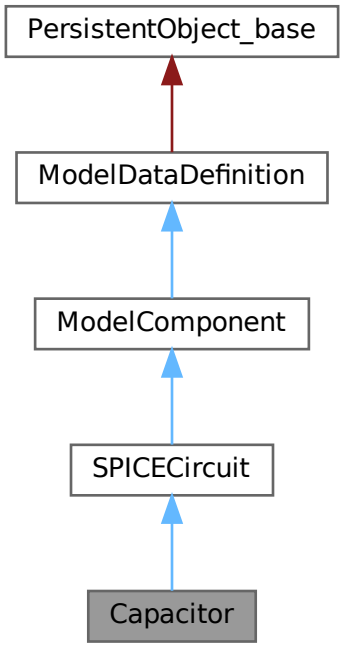
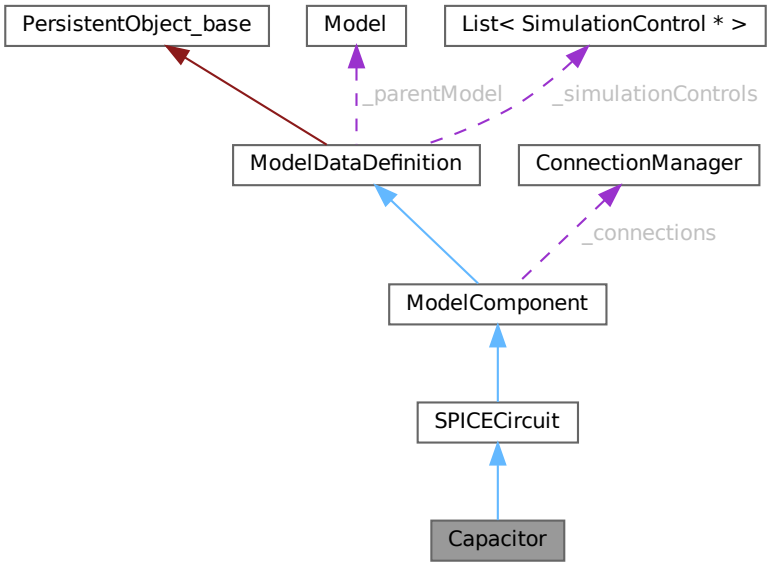
17.103 Capacitor Class Reference

Inheritance diagram for Capacitor:



Collaboration diagram for Capacitor:



Public Member Functions

- **Capacitor** (Model ∗model, std::string name="")
- void **setCapacitance** (float capacitance)
- void Build () override

Public Member Functions inherited from SPICECircuit

- **SPICECircuit** (Model ∗model, std::string name="")

  constructors
- void **setRunner** (SPICERunner ∗runner)

  new public user methods for this components
- SPICERunner ∗ **getRunner** ()
- virtual std::string show () override

  virtual public methods

Public Member Functions inherited from ModelComponent

- ModelComponent (Model ∗model, std::string componentTypename, std::string name="")

  constructors
- virtual ∼**ModelComponent** ()

  Releases component-owned resources and unregisters it from the model.
- ConnectionManager ∗ getConnectionManager () const

  new public user methods for this component
- void connectTo (ModelComponent ∗component, unsigned int inputPortNumber=0)

  Connects this component to another component.
- bool hasBreakpointAt ()

  Indicates whether a simulation breakpoint is set on this component.
- void setDescription (std::string _description)

Updates the free-form description shown by the GUI.

- std::string getDescription () const

  Returns the free-form description associated with this component.

- void remove (ModelComponent *comp)

  Removes a connected component from this component.

Public Member Functions inherited from ModelDataDefinition

- ModelDataDefinition (Model *model, std::string datadefinitionTypename, std::string name="", bool insert↩ IntoModel=true)

  Creates a model data definition and optionally inserts it into the model.

- virtual ~**ModelDataDefinition** ()

  Releases resources owned by this data definition.

- Util::identification getId () const

  Returns the unique identifier of this instance.

- void setName (const std::string &name)

  Updates the logical name of this instance.

- const std::string & getName () const

  Returns the logical name of this instance.

- void setLabel (const std::string &label)

  Updates the user-visible label of this instance.

- const std::string & getLabel () const

  Returns the user-visible label of this instance.

- const std::string & getClassname () const

  Returns the runtime class name used by the plugin system.

- Model * getParentModel () const

  Returns the parent model that owns this definition.

- bool isReportStatistics () const

  Indicates whether this data definition contributes report statistics.

- void setReportStatistics (bool reportStatistics)

  Enables or disables report-statistics generation for this definition.

- ModelDataDefinition * getInternalData (const std::string &name) const

  Looks up a named internal child data definition.

- std::map< std::string, ModelDataDefinition * > * getInternalData () const

  Returns the full map of internal child data definitions.

- std::map< std::string, ModelDataDefinition * > * getAttachedData () const

  Returns the full map of attached data definitions.

- bool hasChanged () const

  Indicates whether this instance has been modified since the last reset.

- void setHasChanged (bool hasChanged)

  Updates the changed flag for this data definition.

- unsigned int getLevel () const

  Returns the hierarchical editing context containing this element.

- void setModelLevel (unsigned int _modelLevel)

  Sets this element's hierarchical editing context.

- List< SimulationControl * > * getSimulationControls () const

  Returns the simulation controls owned by this data definition.

- TraceManager::Level getTraceLevelSpecific () const

  Returns the trace level that applies specifically to this definition.

- void setTraceLevelSpecific (TraceManager::Level level)

  Updates the trace level used by this definition.

- void defineTraceLevelSpecific (TraceManager::Level traceLevelspecific, bool traceLevelSpecific↩ Enabled=true)

  Defines the specific trace level and optionally enables it immediately.
- bool isTraceLevelSpecificEnabled () const

  Indicates whether the specific trace level is enabled.
- void setTraceLevelSpecificEnabled (bool traceLevelSpecificEnabled)

  Enables or disables the specific trace level.

Static Public Member Functions

- static PluginInformation * **GetPluginInformation** ()
- static ModelComponent * **LoadInstance** (Model *model, PersistenceRecord *fields)
- static ModelDataDefinition * **NewInstance** (Model *model, std::string name="")

Static Public Member Functions inherited from SPICECircuit

- static PluginInformation * **GetPluginInformation** ()

  static public methods that must have implementations (Load and New just the same. GetInformation must provide specific infos for the new component
- static ModelComponent * **LoadInstance** (Model *model, PersistenceRecord *fields)
- static ModelDataDefinition * **NewInstance** (Model *model, std::string name="")
- static std::vector< std::string > **split** (std::string word, char split_char)

  Externalize function GetPluginInformation to be accessible throught dynamic linked library.

Static Public Member Functions inherited from ModelComponent

- static ModelComponent * LoadInstance (Model *model, PersistenceRecord *fields)

  static public methods that must have implementations (Load and New just the same. GetInformation must provide specific infos for the new component
- static bool Check (ModelComponent *component)

  Validates a component instance.
- static void CreateInternalData (ModelComponent *component)

  Creates internal data required by a component instance.
- static void SaveInstance (PersistenceRecord *fields, ModelComponent *component)

  Serializes a component instance into a persistence record.
- static void DispatchEvent (Event *event)

  Dispatches a simulation event to the target component.

Static Public Member Functions inherited from ModelDataDefinition

- static ModelDataDefinition * LoadInstance (Model *model, PersistenceRecord *fields, bool insertIntoModel)

  Loads a model data definition instance from serialized fields.
- static ModelDataDefinition * NewInstance (Model *model, std::string name="")

  Creates a new instance of a data definition using the plugin registry.
- static void SaveInstance (PersistenceRecord *fields, ModelDataDefinition *modeldatum)

  Serializes a data definition instance into a persistence record.
- static bool Check (ModelDataDefinition *modeldatum, std::string &errorMessage)

  Validates a data definition instance.
- static void InitBetweenReplications (ModelDataDefinition *modeldatum)

  Resets simulation-time state between replications.
- static void CreateInternalData (ModelDataDefinition *modeldatum)

  Creates internal and attached data required by this instance.
- static bool CreateRelatedDataElements (ModelDataDefinition *modeldatum, std::string &errorMessage)

  Creates related data and validates the instance in a single call.

Protected Member Functions

- virtual bool _loadInstance (PersistenceRecord *fields) override

  virtual protected method that must be overriden
- virtual void _saveInstance (PersistenceRecord *fields, bool saveDefaultValues) override

  Saves object fields into a serialization structure.

Protected Member Functions inherited from SPICECircuit

- void **BuildCircuit** (std::string description, unsigned int id, std::vector< std::string > the_params={""}, std::string the_model="", std::string the_model_file="")

  virtual protected method that must be overriden
- void **UpdateConnections** ()
- virtual void _onDispatchEvent (Entity *entity, unsigned int inputPortNumber) override

  This method is only for ModelComponents, not ModelDataElements.
- virtual void _createNonEditableDataDefinitions () override

  virtual protected methods that could be overriden by derived classes, if needed

Protected Member Functions inherited from ModelDataDefinition

- bool _getSaveDefaultsOption ()
- virtual bool _check (std::string &errorMessage)

  could be overriden by derived classes

17.103.1 Member Function Documentation

17.103.1.1 _loadInstance()

```
bool Capacitor::_loadInstance (
            PersistenceRecord * fields ) [override], [protected], [virtual]
```

virtual protected method that must be overriden
Reimplemented from SPICECircuit.

17.103.1.2 _saveInstance()

```
void Capacitor::_saveInstance (
            PersistenceRecord * fields,
            bool saveDefaultValues )  [override], [protected], [virtual]
```

Saves object fields into a serialization structure.

Parameters

fields	a table-like structure used for serialization.
saveDefaultValues	indicates whether or not to save fields which are set to their default value.

Reimplemented from SPICECircuit.

17.103.1.3 Build()

```
void Capacitor::Build ( )  [override], [virtual]
```

Reimplemented from SPICECircuit.

  virtual public methods

Public Member Functions inherited from ModelComponent

- ModelComponent (Model *model, std::string componentTypename, std::string name="")

  constructors
- virtual ~**ModelComponent** ()

  Releases component-owned resources and unregisters it from the model.
- ConnectionManager * getConnectionManager () const

  new public user methods for this component
- void connectTo (ModelComponent *component, unsigned int inputPortNumber=0)

  Connects this component to another component.
- bool hasBreakpointAt ()

  Indicates whether a simulation breakpoint is set on this component.
- void setDescription (std::string _description)

  Updates the free-form description shown by the GUI.
- std::string getDescription () const

  Returns the free-form description associated with this component.
- void remove (ModelComponent *comp)

  Removes a connected component from this component.

Public Member Functions inherited from ModelDataDefinition

- ModelDataDefinition (Model *model, std::string datadefinitionTypename, std::string name="", bool insert↩ IntoModel=true)

  Creates a model data definition and optionally inserts it into the model.
- virtual ~**ModelDataDefinition** ()

  Releases resources owned by this data definition.
- Util::identification getId () const

  Returns the unique identifier of this instance.
- void setName (const std::string &name)

  Updates the logical name of this instance.
- const std::string & getName () const

  Returns the logical name of this instance.
- void setLabel (const std::string &label)

  Updates the user-visible label of this instance.
- const std::string & getLabel () const

  Returns the user-visible label of this instance.
- const std::string & getClassname () const

  Returns the runtime class name used by the plugin system.
- Model * getParentModel () const

  Returns the parent model that owns this definition.
- bool isReportStatistics () const

  Indicates whether this data definition contributes report statistics.
- void setReportStatistics (bool reportStatistics)

  Enables or disables report-statistics generation for this definition.
- ModelDataDefinition * getInternalData (const std::string &name) const

  Looks up a named internal child data definition.
- std::map< std::string, ModelDataDefinition * > * getInternalData () const

  Returns the full map of internal child data definitions.
- std::map< std::string, ModelDataDefinition * > * getAttachedData () const

  Returns the full map of attached data definitions.
- bool hasChanged () const

  Indicates whether this instance has been modified since the last reset.

- void setHasChanged (bool hasChanged)

  Updates the changed flag for this data definition.
- unsigned int getLevel () const

  Returns the hierarchical editing context containing this element.
- void setModelLevel (unsigned int _modelLevel)

  Sets this element's hierarchical editing context.
- List< SimulationControl * > * getSimulationControls () const

  Returns the simulation controls owned by this data definition.
- TraceManager::Level getTraceLevelSpecific () const

  Returns the trace level that applies specifically to this definition.
- void setTraceLevelSpecific (TraceManager::Level level)

  Updates the trace level used by this definition.
- void defineTraceLevelSpecific (TraceManager::Level traceLevelspecific, bool traceLevelSpecific↩ Enabled=true)

  Defines the specific trace level and optionally enables it immediately.
- bool isTraceLevelSpecificEnabled () const

  Indicates whether the specific trace level is enabled.
- void setTraceLevelSpecificEnabled (bool traceLevelSpecificEnabled)

  Enables or disables the specific trace level.

Static Public Member Functions

- static PluginInformation * **GetPluginInformation** ()
- static ModelComponent * **LoadInstance** (Model *model, PersistenceRecord *fields)
- static ModelDataDefinition * **NewInstance** (Model *model, std::string name="")

Static Public Member Functions inherited from ModelComponent

- static ModelComponent * LoadInstance (Model *model, PersistenceRecord *fields)

  static public methods that must have implementations (Load and New just the same. GetInformation must provide specific infos for the new component
- static bool Check (ModelComponent *component)

  Validates a component instance.
- static void CreateInternalData (ModelComponent *component)

  Creates internal data required by a component instance.
- static void SaveInstance (PersistenceRecord *fields, ModelComponent *component)

  Serializes a component instance into a persistence record.
- static void DispatchEvent (Event *event)

  Dispatches a simulation event to the target component.

Static Public Member Functions inherited from ModelDataDefinition

- static ModelDataDefinition * LoadInstance (Model *model, PersistenceRecord *fields, bool insertIntoModel)

  Loads a model data definition instance from serialized fields.
- static ModelDataDefinition * NewInstance (Model *model, std::string name="")

  Creates a new instance of a data definition using the plugin registry.
- static void SaveInstance (PersistenceRecord *fields, ModelDataDefinition *modeldatum)

  Serializes a data definition instance into a persistence record.
- static bool Check (ModelDataDefinition *modeldatum, std::string &errorMessage)

  Validates a data definition instance.
- static void InitBetweenReplications (ModelDataDefinition *modeldatum)

  Resets simulation-time state between replications.
- static void CreateInternalData (ModelDataDefinition *modeldatum)

Creates internal and attached data required by this instance.

- static bool CreateRelatedDataElements (ModelDataDefinition *modeldatum, std::string &errorMessage)

  Creates related data and validates the instance in a single call.

Protected Member Functions

- virtual bool _loadInstance (PersistenceRecord *fields) override

  virtual protected method that must be overriden
- virtual void _saveInstance (PersistenceRecord *fields, bool saveDefaultValues) override

  Saves object fields into a serialization structure.

17.107.1 Detailed Description

Evaluates lifecycle checkpoints and advances whole-cell step time.
CellCycleCheckpointComponent centralizes two concerns that otherwise become scattered across individual submodels:

- explicit advancement of WholeCellState current time and step count; and
- annotation of a coarse lifecycle phase based on energy availability, division readiness, and viability.

The component does not execute metabolism or division itself. It only reads WholeCellState and writes back lifecycle metadata such as:

- `LifecyclePhase` = `newborn`, `growth`, `division_ready`, `starved`, `dead`
- `Viable`

This keeps WholeCellState as a passive data container and concentrates the event-boundary checkpoint logic in a dedicated ModelComponent.

17.107.2 Member Function Documentation

17.107.2.1 _check()

```
bool CellCycleCheckpointComponent::_check (
            std::string & errorMessage )  [override], [protected], [virtual]
```

could be overriden by derived classes
Reimplemented from ModelDataDefinition.

17.107.2.2 _createEditableDataDefinitions()

```
void CellCycleCheckpointComponent::_createEditableDataDefinitions ( )  [override], [protected],
[virtual]
```

Reimplemented from ModelDataDefinition.

17.107.2.3 _initBetweenReplications()

```
void CellCycleCheckpointComponent::_initBetweenReplications ( )  [override], [protected],
[virtual]
```

Reimplemented from ModelDataDefinition.

17.107.2.4 _loadInstance()

```
bool CellCycleCheckpointComponent::_loadInstance (
            PersistenceRecord * fields )  [override], [protected], [virtual]
```

virtual protected method that must be overriden
Reimplemented from ModelComponent.

17.107.2.5 _onDispatchEvent()

```
void CellCycleCheckpointComponent::_onDispatchEvent (
            Entity * entity,
            unsigned int inputPortNumber )  [override], [protected], [virtual]
```

Handles a dispatched event for this component type.
This method is only for ModelComponents, not for ModelDataElements.

Parameters

entity	Entity being processed.
inputPortNumber	Input port where the entity arrived.

Implements ModelComponent.

17.107.2.6 _saveInstance()

```
void CellCycleCheckpointComponent::_saveInstance (
            PersistenceRecord * fields,
            bool saveDefaultValues )  [override], [protected], [virtual]
```

Saves object fields into a serialization structure.

Parameters

fields	a table-like structure used for serialization.
saveDefaultValues	indicates whether or not to save fields which are set to their default value.

Reimplemented from ModelComponent.

17.107.2.7 show()

`std::string CellCycleCheckpointComponent::show ( ) [override], [virtual]`
virtual public methods
Returns a textual representation of this component.

Returns

Human-readable description used for tracing and debugging.

Reimplemented from ModelComponent.
The documentation for this class was generated from the following files:

- plugins/components/WholeCellModeling/CellCycleCheckpointComponent.h
- plugins/components/WholeCellModeling/CellCycleCheckpointComponent.cpp

- Util::identification getId () const

  Returns the unique identifier of this instance.
- void setName (const std::string &name)

  Updates the logical name of this instance.
- const std::string & getName () const

  Returns the logical name of this instance.
- void setLabel (const std::string &label)

  Updates the user-visible label of this instance.
- const std::string & getLabel () const

  Returns the user-visible label of this instance.
- const std::string & getClassname () const

  Returns the runtime class name used by the plugin system.
- Model * getParentModel () const

  Returns the parent model that owns this definition.
- bool isReportStatistics () const

  Indicates whether this data definition contributes report statistics.
- void setReportStatistics (bool reportStatistics)

  Enables or disables report-statistics generation for this definition.
- ModelDataDefinition * getInternalData (const std::string &name) const

  Looks up a named internal child data definition.
- std::map< std::string, ModelDataDefinition * > * getInternalData () const

  Returns the full map of internal child data definitions.
- std::map< std::string, ModelDataDefinition * > * getAttachedData () const

  Returns the full map of attached data definitions.
- bool hasChanged () const

  Indicates whether this instance has been modified since the last reset.
- void setHasChanged (bool hasChanged)

  Updates the changed flag for this data definition.
- unsigned int getLevel () const

  Returns the hierarchical editing context containing this element.
- void setModelLevel (unsigned int _modelLevel)

  Sets this element's hierarchical editing context.
- List< SimulationControl * > * getSimulationControls () const

  Returns the simulation controls owned by this data definition.
- TraceManager::Level getTraceLevelSpecific () const

  Returns the trace level that applies specifically to this definition.
- void setTraceLevelSpecific (TraceManager::Level level)

  Updates the trace level used by this definition.

- void defineTraceLevelSpecific (TraceManager::Level traceLevelspecific, bool traceLevelSpecific↩ Enabled=true)

  Defines the specific trace level and optionally enables it immediately.
- bool isTraceLevelSpecificEnabled () const

  Indicates whether the specific trace level is enabled.
- void setTraceLevelSpecificEnabled (bool traceLevelSpecificEnabled)

  Enables or disables the specific trace level.

Static Public Member Functions

- static PluginInformation * **GetPluginInformation** ()
- static ModelComponent * **LoadInstance** (Model *model, PersistenceRecord *fields)
- static ModelDataDefinition * **NewInstance** (Model *model, std::string name="")

Static Public Member Functions inherited from ModelComponent

- static ModelComponent * LoadInstance (Model *model, PersistenceRecord *fields)

  static public methods that must have implementations (Load and New just the same. GetInformation must provide specific infos for the new component
- static bool Check (ModelComponent *component)

  Validates a component instance.
- static void CreateInternalData (ModelComponent *component)

  Creates internal data required by a component instance.
- static void SaveInstance (PersistenceRecord *fields, ModelComponent *component)

  Serializes a component instance into a persistence record.
- static void DispatchEvent (Event *event)

  Dispatches a simulation event to the target component.

Static Public Member Functions inherited from ModelDataDefinition

- static ModelDataDefinition * LoadInstance (Model *model, PersistenceRecord *fields, bool insertIntoModel)

  Loads a model data definition instance from serialized fields.
- static ModelDataDefinition * NewInstance (Model *model, std::string name="")

  Creates a new instance of a data definition using the plugin registry.
- static void SaveInstance (PersistenceRecord *fields, ModelDataDefinition *modeldatum)

  Serializes a data definition instance into a persistence record.
- static bool Check (ModelDataDefinition *modeldatum, std::string &errorMessage)

  Validates a data definition instance.
- static void InitBetweenReplications (ModelDataDefinition *modeldatum)

  Resets simulation-time state between replications.
- static void CreateInternalData (ModelDataDefinition *modeldatum)

  Creates internal and attached data required by this instance.
- static bool CreateRelatedDataElements (ModelDataDefinition *modeldatum, std::string &errorMessage)

  Creates related data and validates the instance in a single call.

Protected Member Functions

- virtual bool _loadInstance (PersistenceRecord *fields) override

  virtual protected method that must be overriden

17.108.1 Detailed Description

Discrete cell division event for whole-cell model simulations.
Implements the M. genitalium CellDivision process (Karr et al. 2012): Trigger: cell mass >= divisionMass↩ Threshold (default 2 × cellInitialDryWeight) AND (ftsZRingCompletion key in WholeCellState >= ftsZThreshold OR ftsZThreshold == 0, i.e., mass-only trigger)
On division:

- Each integer molecule count is binomially partitioned between daughters (each copy independently assigned to daughter 1 with p=0.5)
- This simulated cell becomes daughter 1
- Cell mass and volume are set to half the pre-division values
- Simulation step count is reset to 0 (new generation)
- WholeCellState lifecycle metadata is updated to reflect the new generation

Output ports: Port 0: entity forwarded when no division occurred this step (normal flow) Port 1: entity forwarded immediately after a division event (optional handler)
The division mass threshold is read from WholeCellState metabolite pool entry "param.cellDivisionMassThreshold" when set by loadParameters(). Override with the divisionMassThreshold property for manual configuration.
FtsZ ring completion is read from WholeCellState molecule count key ftsZRingKey (default "FtsZ_ring_completion", expected range 0–1000 as integer per-mille value; divide by 1000 for fraction).

17.108.2 Member Function Documentation

17.108.2.1 _check()

```
bool CellDivisionEvent::_check (
            std::string & errorMessage )  [override], [protected], [virtual]
```

could be overriden by derived classes
Reimplemented from ModelDataDefinition.

17.108.2.2 _createEditableDataDefinitions()

```
void CellDivisionEvent::_createEditableDataDefinitions ( )  [override], [protected], [virtual]
```

Reimplemented from ModelDataDefinition.

17.108.2.3 _initBetweenReplications()

```
void CellDivisionEvent::_initBetweenReplications ( )  [override], [protected], [virtual]
```

Reimplemented from ModelDataDefinition.

17.108.2.4 _loadInstance()

```
bool CellDivisionEvent::_loadInstance (
            PersistenceRecord * fields )  [override], [protected], [virtual]
```

virtual protected method that must be overriden
Reimplemented from ModelComponent.

17.108.2.5 _onDispatchEvent()

```
void CellDivisionEvent::_onDispatchEvent (
            Entity * entity,
            unsigned int inputPortNumber )  [override], [protected], [virtual]
```

Handles a dispatched event for this component type.
This method is only for ModelComponents, not for ModelDataElements.

Parameters

entity	Entity being processed.
inputPortNumber	Input port where the entity arrived.

Implements ModelComponent.

17.108.2.6 _saveInstance()

```
void CellDivisionEvent::_saveInstance (
            PersistenceRecord * fields,
            bool saveDefaultValues )  [override], [protected], [virtual]
```

Saves object fields into a serialization structure.

Parameters

fields	a table-like structure used for serialization.
saveDefaultValues	indicates whether or not to save fields which are set to their default value.

Reimplemented from ModelComponent.

17.108.2.7 show()

```
std::string CellDivisionEvent::show ( )  [override], [virtual]
```

virtual public methods
Returns a textual representation of this component.

Returns

Human-readable description used for tracing and debugging.

Reimplemented from ModelComponent.
The documentation for this class was generated from the following files:

- plugins/components/WholeCellModeling/CellDivisionEvent.h
- plugins/components/WholeCellModeling/CellDivisionEvent.cpp

17.109 CellFateDecisionComponent Class Reference

Routes entities according to the current whole-cell lifecycle state.

`#include <plugins/components/WholeCellModeling/CellFateDecisionComponent.h>`

  constructors
- virtual ~**ModelComponent** ()

  Releases component-owned resources and unregisters it from the model.
- ConnectionManager * getConnectionManager () const

  new public user methods for this component
- void connectTo (ModelComponent *component, unsigned int inputPortNumber=0)

  Connects this component to another component.
- bool hasBreakpointAt ()

  Indicates whether a simulation breakpoint is set on this component.
- void setDescription (std::string _description)

  Updates the free-form description shown by the GUI.
- std::string getDescription () const

  Returns the free-form description associated with this component.
- void remove (ModelComponent *comp)

  Removes a connected component from this component.

Public Member Functions inherited from ModelDataDefinition

- ModelDataDefinition (Model *model, std::string datadefinitionTypename, std::string name="", bool insert↩ IntoModel=true)

  Creates a model data definition and optionally inserts it into the model.
- virtual ~**ModelDataDefinition** ()

  Releases resources owned by this data definition.
- Util::identification getId () const

  Returns the unique identifier of this instance.
- void setName (const std::string &name)

  Updates the logical name of this instance.
- const std::string & getName () const

  Returns the logical name of this instance.
- void setLabel (const std::string &label)

  Updates the user-visible label of this instance.
- const std::string & getLabel () const

  Returns the user-visible label of this instance.
- const std::string & getClassname () const

  Returns the runtime class name used by the plugin system.
- Model * getParentModel () const

  Returns the parent model that owns this definition.

- bool isReportStatistics () const

  Indicates whether this data definition contributes report statistics.
- void setReportStatistics (bool reportStatistics)

  Enables or disables report-statistics generation for this definition.
- ModelDataDefinition * getInternalData (const std::string &name) const

  Looks up a named internal child data definition.
- std::map< std::string, ModelDataDefinition * > * getInternalData () const

  Returns the full map of internal child data definitions.
- std::map< std::string, ModelDataDefinition * > * getAttachedData () const

  Returns the full map of attached data definitions.
- bool hasChanged () const

  Indicates whether this instance has been modified since the last reset.
- void setHasChanged (bool hasChanged)

  Updates the changed flag for this data definition.
- unsigned int getLevel () const

  Returns the hierarchical editing context containing this element.
- void setModelLevel (unsigned int _modelLevel)

  Sets this element's hierarchical editing context.
- List< SimulationControl * > * getSimulationControls () const

  Returns the simulation controls owned by this data definition.
- TraceManager::Level getTraceLevelSpecific () const

  Returns the trace level that applies specifically to this definition.
- void setTraceLevelSpecific (TraceManager::Level level)

  Updates the trace level used by this definition.
- void defineTraceLevelSpecific (TraceManager::Level traceLevelspecific, bool traceLevelSpecific↩ Enabled=true)

  Defines the specific trace level and optionally enables it immediately.
- bool isTraceLevelSpecificEnabled () const

  Indicates whether the specific trace level is enabled.
- void setTraceLevelSpecificEnabled (bool traceLevelSpecificEnabled)

  Enables or disables the specific trace level.

17.109.1 Detailed Description

Routes entities according to the current whole-cell lifecycle state.
CellFateDecisionComponent converts the coarse lifecycle annotation stored in WholeCellState into explicit simulation branching:

- port 0: viable default flow
- port 1: division-ready flow
- port 2: starved-but-still-viable flow
- port 3: dead or non-viable flow

The component does not mutate biological state. It only reads viability and lifecycle phase from WholeCellState and routes the entity to the appropriate downstream component.

17.109.2 Member Function Documentation

17.109.2.1 _check()

```
bool CellFateDecisionComponent::_check (
            std::string & errorMessage )  [override], [protected], [virtual]
```

could be overriden by derived classes
Reimplemented from ModelDataDefinition.

17.109.2.2 _createEditableDataDefinitions()

```
void CellFateDecisionComponent::_createEditableDataDefinitions ( )  [override], [protected],
[virtual]
```

Reimplemented from ModelDataDefinition.

17.109.2.3 _initBetweenReplications()

```
void CellFateDecisionComponent::_initBetweenReplications ( )  [override], [protected], [virtual]
```

Reimplemented from ModelDataDefinition.

17.109.2.4 _loadInstance()

```
bool CellFateDecisionComponent::_loadInstance (
            PersistenceRecord * fields )  [override], [protected], [virtual]
```

virtual protected method that must be overriden
Reimplemented from ModelComponent.

17.109.2.5 _onDispatchEvent()

```
void CellFateDecisionComponent::_onDispatchEvent (
            Entity * entity,
            unsigned int inputPortNumber )  [override], [protected], [virtual]
```

Handles a dispatched event for this component type.
This method is only for ModelComponents, not for ModelDataElements.

Parameters

entity	Entity being processed.
inputPortNumber	Input port where the entity arrived.

Implements ModelComponent.

17.109.2.6 _saveInstance()

```
void CellFateDecisionComponent::_saveInstance (
            PersistenceRecord * fields,
            bool saveDefaultValues )  [override], [protected], [virtual]
```

Saves object fields into a serialization structure.

Parameters

fields	a table-like structure used for serialization.
saveDefaultValues	indicates whether or not to save fields which are set to their default value.

Reimplemented from ModelComponent.

17.109.2.7 show()

```
std::string CellFateDecisionComponent::show ( )  [override], [virtual]
```

virtual public methods
Returns a textual representation of this component.

Returns

Human-readable description used for tracing and debugging.

Reimplemented from ModelComponent.

- static PluginInformation * **GetPluginInformation** ()
- static ModelComponent * **LoadInstance** (Model *model, PersistenceRecord *fields)
- static ModelDataDefinition * **NewInstance** (Model *model, std::string name="")

Static Public Member Functions inherited from ModelComponent

- static ModelComponent * LoadInstance (Model *model, PersistenceRecord *fields)

  static public methods that must have implementations (Load and New just the same. GetInformation must provide specific infos for the new component
- static bool Check (ModelComponent *component)

  Validates a component instance.
- static void CreateInternalData (ModelComponent *component)

  Creates internal data required by a component instance.
- static void SaveInstance (PersistenceRecord *fields, ModelComponent *component)

  Serializes a component instance into a persistence record.
- static void DispatchEvent (Event *event)

  Dispatches a simulation event to the target component.

Static Public Member Functions inherited from ModelDataDefinition

- static ModelDataDefinition * LoadInstance (Model *model, PersistenceRecord *fields, bool insertIntoModel)

  Loads a model data definition instance from serialized fields.
- static ModelDataDefinition * NewInstance (Model *model, std::string name="")

  Creates a new instance of a data definition using the plugin registry.
- static void SaveInstance (PersistenceRecord *fields, ModelDataDefinition *modeldatum)

  Serializes a data definition instance into a persistence record.
- static bool Check (ModelDataDefinition *modeldatum, std::string &errorMessage)

  Validates a data definition instance.
- static void InitBetweenReplications (ModelDataDefinition *modeldatum)

  Resets simulation-time state between replications.
- static void CreateInternalData (ModelDataDefinition *modeldatum)

  Creates internal and attached data required by this instance.
- static bool CreateRelatedDataElements (ModelDataDefinition *modeldatum, std::string &errorMessage)

  Creates related data and validates the instance in a single call.

Protected Member Functions

- virtual bool _loadInstance (PersistenceRecord *fields) override

  virtual protected method that must be overriden
- virtual void _saveInstance (PersistenceRecord *fields, bool saveDefaultValues) override

  Saves object fields into a serialization structure.
- virtual bool _check (std::string &errorMessage) override

  could be overriden by derived classes

- virtual void _initBetweenReplications () override
- virtual void _onDispatchEvent (Entity *entity, unsigned int inputPortNumber) override

  Handles a dispatched event for this component type.
- virtual void _createEditableDataDefinitions () override

Protected Member Functions inherited from ModelDataDefinition

17.110.1 Detailed Description

Continuous cell growth applied at each simulation step.
Implements exponential mass growth: mass(t+Δt) = mass(t) $\times$ (1 + growthRate $\times$ Δt) volume(fL) = (mass_g $\times$ 1e-3 / density_kg_m3) $\times$ 1e15
Parameter defaults from CovertLab/WholeCell parameters.json (MIT): growthRate = 2.1393e-05 /s (states.↩ MetabolicReaction.meanInitialGrowthRate) density = 1100.0 kg/m^3 (states.Geometry.density) deltaT = 60.0 s (must match simulation clock step)

17.110.2 Member Function Documentation

17.110.2.1 _check()

```
bool CellGrowthComponent::_check (
            std::string & errorMessage )  [override], [protected], [virtual]
```

could be overriden by derived classes
Reimplemented from ModelDataDefinition.

17.110.2.2 _createEditableDataDefinitions()

```
void CellGrowthComponent::_createEditableDataDefinitions ( )  [override], [protected], [virtual]
```

Reimplemented from ModelDataDefinition.

17.110.2.3 _initBetweenReplications()

```
void CellGrowthComponent::_initBetweenReplications ( )  [override], [protected], [virtual]
```

Reimplemented from ModelDataDefinition.

17.110.2.4 _loadInstance()

```
bool CellGrowthComponent::_loadInstance (
            PersistenceRecord * fields )  [override], [protected], [virtual]
```

virtual protected method that must be overriden
Reimplemented from ModelComponent.

17.110.2.5 _onDispatchEvent()

```
void CellGrowthComponent::_onDispatchEvent (
            Entity * entity,
            unsigned int inputPortNumber )  [override], [protected], [virtual]
```

Handles a dispatched event for this component type.
This method is only for ModelComponents, not for ModelDataElements.

Parameters

entity	Entity being processed.
inputPortNumber	Input port where the entity arrived.

Implements ModelComponent.

17.110.2.6 _saveInstance()

```
void CellGrowthComponent::_saveInstance (
            PersistenceRecord * fields,
            bool saveDefaultValues )  [override], [protected], [virtual]
```

Saves object fields into a serialization structure.

Parameters

fields	a table-like structure used for serialization.
saveDefaultValues	indicates whether or not to save fields which are set to their default value.

Reimplemented from ModelComponent.

17.110.2.7 show()

```
std::string CellGrowthComponent::show ( )  [override], [virtual]
```

virtual public methods
Returns a textual representation of this component.

Returns

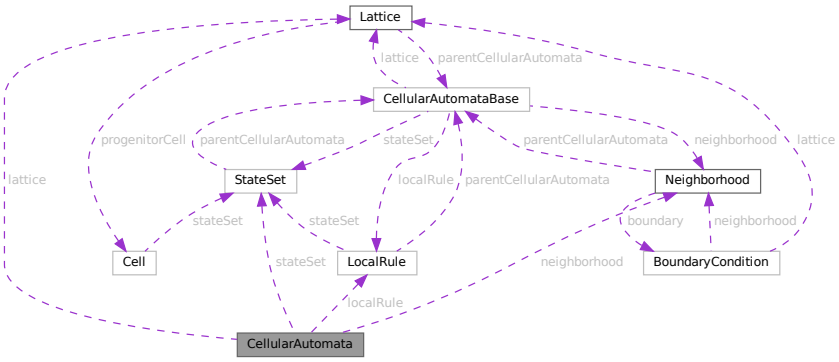
Human-readable description used for tracing and debugging.

Reimplemented from ModelComponent.
The documentation for this class was generated from the following files:

- plugins/components/WholeCellModeling/CellGrowthComponent.h
- plugins/components/WholeCellModeling/CellGrowthComponent.cpp

17.111 CellularAutomata Class Reference

Collaboration diagram for CellularAutomata:



Public Member Functions

- **CellularAutomata** (std::string name="", Lattice ∗lattice=nullptr, StateSet ∗stateSet=nullptr, Neighborhood ∗neighborhood=nullptr, LocalRule ∗localRule=nullptr)
- **CellularAutomata** (const CellularAutomata &orig)
- virtual bool **init** ()

  Init lattice and cells.
- virtual void **step** ()

  Create next configuration c(t+1) = G(c(t))
- virtual void **start** ()

  Run (step) until end of simulation.
- virtual void **pause** ()

  Pase the "run".
- template<typename Class >
  void **addObserver** (Class ∗object, void(Class::∗function)(CellularAutomataEvent))
- std::string **getName** () const

- LocalRule * **getlocalRule** () const

Public Member Functions inherited from ModelComponent

- ModelComponent (Model *model, std::string componentTypename, std::string name="")

  constructors
- virtual ~**ModelComponent** ()

  Releases component-owned resources and unregisters it from the model.
- ConnectionManager * getConnectionManager () const

  new public user methods for this component
- void connectTo (ModelComponent *component, unsigned int inputPortNumber=0)

  Connects this component to another component.
- bool hasBreakpointAt ()

  Indicates whether a simulation breakpoint is set on this component.
- void setDescription (std::string _description)

Updates the free-form description shown by the GUI.

- std::string getDescription () const

  Returns the free-form description associated with this component.

- void remove (ModelComponent *comp)

  Removes a connected component from this component.

Public Member Functions inherited from ModelDataDefinition

- ModelDataDefinition (Model *model, std::string datadefinitionTypename, std::string name="", bool insert↩ IntoModel=true)

  Creates a model data definition and optionally inserts it into the model.

- virtual ~**ModelDataDefinition** ()

  Releases resources owned by this data definition.

- Util::identification getId () const

  Returns the unique identifier of this instance.

- void setName (const std::string &name)

  Updates the logical name of this instance.

- const std::string & getName () const

  Returns the logical name of this instance.

- void setLabel (const std::string &label)

  Updates the user-visible label of this instance.

- const std::string & getLabel () const

  Returns the user-visible label of this instance.

- const std::string & getClassname () const

  Returns the runtime class name used by the plugin system.

- Model * getParentModel () const

  Returns the parent model that owns this definition.

- bool isReportStatistics () const

  Indicates whether this data definition contributes report statistics.

- void setReportStatistics (bool reportStatistics)

  Enables or disables report-statistics generation for this definition.

- ModelDataDefinition * getInternalData (const std::string &name) const

  Looks up a named internal child data definition.

- std::map< std::string, ModelDataDefinition * > * getInternalData () const

  Returns the full map of internal child data definitions.

- std::map< std::string, ModelDataDefinition * > * getAttachedData () const

  Returns the full map of attached data definitions.

- bool hasChanged () const

  Indicates whether this instance has been modified since the last reset.

- void setHasChanged (bool hasChanged)

  Updates the changed flag for this data definition.

- unsigned int getLevel () const

  Returns the hierarchical editing context containing this element.

- void setModelLevel (unsigned int _modelLevel)

  Sets this element's hierarchical editing context.

- List< SimulationControl * > * getSimulationControls () const

  Returns the simulation controls owned by this data definition.

- TraceManager::Level getTraceLevelSpecific () const

  Returns the trace level that applies specifically to this definition.

- void setTraceLevelSpecific (TraceManager::Level level)

  Updates the trace level used by this definition.

- void defineTraceLevelSpecific (TraceManager::Level traceLevelspecific, bool traceLevelSpecific↩ Enabled=true)

  Defines the specific trace level and optionally enables it immediately.
- bool isTraceLevelSpecificEnabled () const

  Indicates whether the specific trace level is enabled.
- void setTraceLevelSpecificEnabled (bool traceLevelSpecificEnabled)

  Enables or disables the specific trace level.

Static Public Member Functions

- static PluginInformation * **GetPluginInformation** ()

  static public methods that must have implementations (Load and New just the same. GetInformation must provide specific infos for the new component
- static ModelComponent * **LoadInstance** (Model *model, PersistenceRecord *fields)
- static ModelDataDefinition * **NewInstance** (Model *model, std::string name="")

Static Public Member Functions inherited from ModelComponent

- static ModelComponent * LoadInstance (Model *model, PersistenceRecord *fields)

  static public methods that must have implementations (Load and New just the same. GetInformation must provide specific infos for the new component
- static bool Check (ModelComponent *component)

  Validates a component instance.
- static void CreateInternalData (ModelComponent *component)

  Creates internal data required by a component instance.
- static void SaveInstance (PersistenceRecord *fields, ModelComponent *component)

  Serializes a component instance into a persistence record.
- static void DispatchEvent (Event *event)

  Dispatches a simulation event to the target component.

Static Public Member Functions inherited from ModelDataDefinition

- static ModelDataDefinition * LoadInstance (Model *model, PersistenceRecord *fields, bool insertIntoModel)

  Loads a model data definition instance from serialized fields.
- static ModelDataDefinition * NewInstance (Model *model, std::string name="")

  Creates a new instance of a data definition using the plugin registry.
- static void SaveInstance (PersistenceRecord *fields, ModelDataDefinition *modeldatum)

  Serializes a data definition instance into a persistence record.
- static bool Check (ModelDataDefinition *modeldatum, std::string &errorMessage)

  Validates a data definition instance.
- static void InitBetweenReplications (ModelDataDefinition *modeldatum)

  Resets simulation-time state between replications.
- static void CreateInternalData (ModelDataDefinition *modeldatum)

  Creates internal and attached data required by this instance.
- static bool CreateRelatedDataElements (ModelDataDefinition *modeldatum, std::string &errorMessage)

  Creates related data and validates the instance in a single call.

Protected Member Functions

- virtual bool _loadInstance (PersistenceRecord *fields) override

  virtual protected method that must be overriden
- virtual void _saveInstance (PersistenceRecord *fields, bool saveDefaultValues) override

  Saves object fields into a serialization structure.
- virtual void _onDispatchEvent (Entity *entity, unsigned int inputPortNumber) override

  This method is only for ModelComponents, not ModelDataElements.
- virtual bool _check (std::string *errorMessage)

  virtual protected methods that could be overriden by derived classes, if needed
- virtual void _initBetweenReplications () override

Protected Member Functions inherited from ModelDataDefinition

17.115.1 Detailed Description

This component ...

17.115.2 Member Function Documentation

17.115.2.1 _check()

```
bool CellularAutomataComp::_check (
            std::string * errorMessage )  [protected], [virtual]
```

virtual protected methods that could be overriden by derived classes, if needed
This method is called by ModelChecker during model check. The component should check itself to verify if user parameters are ok (ex: correct syntax for the parser) and everithing in its parameters allow the model too run without errors in this component

17.115.2.2 _initBetweenReplications()

```
void CellularAutomataComp::_initBetweenReplications ( )  [override], [protected], [virtual]
```

This method returns all changes in the parser that are needed by plugins of this ModelDatas. When connecting a new plugin, ParserChangesInformation are used to change parser source code, whch is after compiled and dinamically linked to to simulator kernel to reflect the changes
This method is called by ModelSimulation when initianting the replication. The model should set all value for a new replication (Ex: setting back to 0 any internal counter, clearing lists, etc.
Reimplemented from ModelDataDefinition.

17.115.2.3 _loadInstance()

```
bool CellularAutomataComp::_loadInstance (
            PersistenceRecord * fields )  [override], [protected], [virtual]
```

virtual protected method that must be overriden
Reimplemented from ModelComponent.

17.115.2.4 _onDispatchEvent()

```
void CellularAutomataComp::_onDispatchEvent (
            Entity * entity,
            unsigned int inputPortNumber )  [override], [protected], [virtual]
```

This method is only for ModelComponents, not ModelDataElements.
Implements ModelComponent.

17.115.2.5 _saveInstance()

```
void CellularAutomataComp::_saveInstance (
            PersistenceRecord * fields,
            bool saveDefaultValues )  [override], [protected], [virtual]
```

Saves object fields into a serialization structure.

Parameters

fields	a table-like structure used for serialization.
saveDefaultValues	indicates whether or not to save fields which are set to their default value.

Reimplemented from ModelComponent.

17.115.2.6 show()

```
std::string CellularAutomataComp::show ( )  [override], [virtual]
```

virtual public methods
Reimplemented from ModelComponent.
The documentation for this class was generated from the following files:

- plugins/components/ModalModel/CellularAutomataComp.h
- plugins/components/ModalModel/CellularAutomataComp.cpp

- applications/gui/genesys/cellular_automata/CellularAutomataViewerWindow.cpp

17.125 ChatMessage Struct Reference

One message in a multi-turn conversation with an LLM.
`#include <tools/AIAssistant/AIProviderClient_if.h>`

Public Attributes

- std::string **role**

  "system", "user", or "assistant".
- std::string **content**

  Text content of the message.

17.125.1 Detailed Description

One message in a multi-turn conversation with an LLM.
Role conventions follow the OpenAI and Anthropic chat-completion APIs:

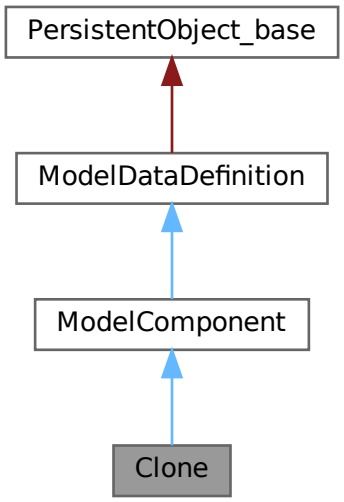
- "system" — instructions/persona injected before the conversation.
- "user" — message from the human turn.
- "assistant" — previous model replies (for multi-turn context).

The documentation for this struct was generated from the following file:

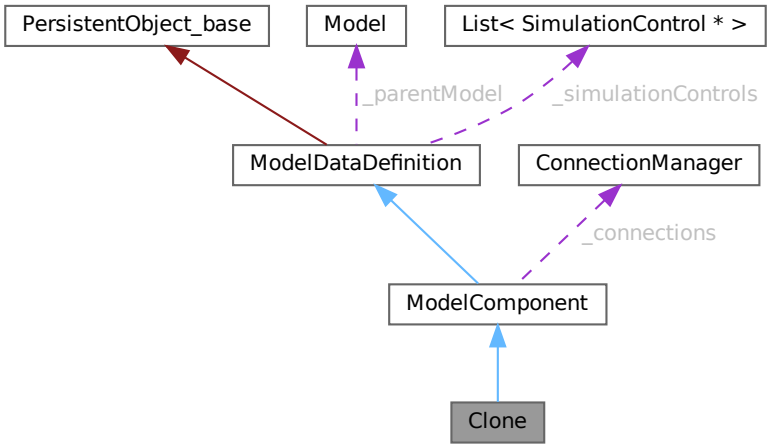
- tools/AIAssistant/AIProviderClient_if.h

17.126 Clone Class Reference

Creates `_numClonesExpression` copies of the incoming entity (same EntityType and Attribute values), sending clones out port 1 and the original out port 0.
`#include <plugins/components/DiscreteProcessing/Clone.h>`
Inheritance diagram for Clone:



Collaboration diagram for Clone:



Public Member Functions

- **Clone** (Model *model, std::string name="")
- virtual std::string show () override

  virtual public methods
- void **setNumClonesExpression** (std::string numClones)
- std::string **getNumClonesExpression** () const

Public Member Functions inherited from ModelComponent

- ModelComponent (Model *model, std::string componentTypename, std::string name="")

  constructors
- virtual ~**ModelComponent** ()

  Releases component-owned resources and unregisters it from the model.
- ConnectionManager * getConnectionManager () const

  new public user methods for this component
- void connectTo (ModelComponent *component, unsigned int inputPortNumber=0)

  Connects this component to another component.
- bool hasBreakpointAt ()

  Indicates whether a simulation breakpoint is set on this component.
- void setDescription (std::string _description)

  Updates the free-form description shown by the GUI.
- std::string getDescription () const

  Returns the free-form description associated with this component.
- void remove (ModelComponent *comp)

  Removes a connected component from this component.

Public Member Functions inherited from ModelDataDefinition

- ModelDataDefinition (Model *model, std::string datadefinitionTypename, std::string name="", bool insert↩ IntoModel=true)

  Creates a model data definition and optionally inserts it into the model.

- virtual ~**ModelDataDefinition** ()

  Releases resources owned by this data definition.
- Util::identification getId () const

  Returns the unique identifier of this instance.
- void setName (const std::string &name)

  Updates the logical name of this instance.
- const std::string & getName () const

  Returns the logical name of this instance.
- void setLabel (const std::string &label)

  Updates the user-visible label of this instance.
- const std::string & getLabel () const

  Returns the user-visible label of this instance.
- const std::string & getClassname () const

  Returns the runtime class name used by the plugin system.
- Model * getParentModel () const

  Returns the parent model that owns this definition.
- bool isReportStatistics () const

  Indicates whether this data definition contributes report statistics.
- void setReportStatistics (bool reportStatistics)

  Enables or disables report-statistics generation for this definition.
- ModelDataDefinition * getInternalData (const std::string &name) const

  Looks up a named internal child data definition.
- std::map< std::string, ModelDataDefinition * > * getInternalData () const

  Returns the full map of internal child data definitions.
- std::map< std::string, ModelDataDefinition * > * getAttachedData () const

  Returns the full map of attached data definitions.
- bool hasChanged () const

  Indicates whether this instance has been modified since the last reset.
- void setHasChanged (bool hasChanged)

  Updates the changed flag for this data definition.
- unsigned int getLevel () const

  Returns the hierarchical editing context containing this element.
- void setModelLevel (unsigned int _modelLevel)

  Sets this element's hierarchical editing context.
- List< SimulationControl * > * getSimulationControls () const

  Returns the simulation controls owned by this data definition.
- TraceManager::Level getTraceLevelSpecific () const

  Returns the trace level that applies specifically to this definition.
- void setTraceLevelSpecific (TraceManager::Level level)

  Updates the trace level used by this definition.
- void defineTraceLevelSpecific (TraceManager::Level traceLevelspecific, bool traceLevelSpecific↩ Enabled=true)

  Defines the specific trace level and optionally enables it immediately.
- bool isTraceLevelSpecificEnabled () const

  Indicates whether the specific trace level is enabled.
- void setTraceLevelSpecificEnabled (bool traceLevelSpecificEnabled)

  Enables or disables the specific trace level.

Static Public Member Functions

- static PluginInformation * **GetPluginInformation** ()
- static ModelComponent * **LoadInstance** (Model *model, PersistenceRecord *fields)
- static ModelDataDefinition * **NewInstance** (Model *model, std::string name="")

Static Public Member Functions inherited from ModelComponent

- static ModelComponent * LoadInstance (Model *model, PersistenceRecord *fields)

  static public methods that must have implementations (Load and New just the same. GetInformation must provide specific infos for the new component
- static bool Check (ModelComponent *component)

  Validates a component instance.
- static void CreateInternalData (ModelComponent *component)

  Creates internal data required by a component instance.
- static void SaveInstance (PersistenceRecord *fields, ModelComponent *component)

  Serializes a component instance into a persistence record.
- static void DispatchEvent (Event *event)

  Dispatches a simulation event to the target component.

Static Public Member Functions inherited from ModelDataDefinition

- static ModelDataDefinition * LoadInstance (Model *model, PersistenceRecord *fields, bool insertIntoModel)

  Loads a model data definition instance from serialized fields.
- static ModelDataDefinition * NewInstance (Model *model, std::string name="")

  Creates a new instance of a data definition using the plugin registry.
- static void SaveInstance (PersistenceRecord *fields, ModelDataDefinition *modeldatum)

  Serializes a data definition instance into a persistence record.
- static bool Check (ModelDataDefinition *modeldatum, std::string &errorMessage)

  Validates a data definition instance.
- static void InitBetweenReplications (ModelDataDefinition *modeldatum)

  Resets simulation-time state between replications.
- static void CreateInternalData (ModelDataDefinition *modeldatum)

  Creates internal and attached data required by this instance.
- static bool CreateRelatedDataElements (ModelDataDefinition *modeldatum, std::string &errorMessage)

  Creates related data and validates the instance in a single call.

Protected Member Functions

- virtual bool _loadInstance (PersistenceRecord *fields) override

  virtual protected method that must be overriden
- virtual void _saveInstance (PersistenceRecord *fields, bool saveDefaultValues) override

  Saves object fields into a serialization structure.
- virtual void _onDispatchEvent (Entity *entity, unsigned int inputPortNumber) override

  Handles a dispatched event for this component type.
- virtual bool _check (std::string &errorMessage) override

  could be overriden by derived classes
- virtual void _initBetweenReplications () override
- virtual void _createInternalStatisticReporters () override

Protected Member Functions inherited from ModelDataDefinition

- bool _getSaveDefaultsOption ()

- bool **_traceLevelSpecificEnabled** = false

17.126.1 Detailed Description

Creates `_numClonesExpression` copies of the incoming entity (same EntityType and Attribute values), sending clones out port 1 and the original out port 0.
Arena correspondence: confirmed by the maintainer (2026-08-30) as the intended GenESyS counterpart to the "Duplicate Original" Type of Arena's "Separate module" (Rockwell Automation, *Getting Started with Arena*, "The Basic Process Panel", p. 39) — see Separate, whose own `_onDispatchEvent()` only implements Arena's other Type ("Split Existing Batch"). `_numClonesExpression` matches Arena's "# of Duplicates".
Known difference from Arena: no "Percent Cost to Duplicates" — splitting accumulated category cost/time between the original and its clones is not implemented (see `docs/ai_assistants/reference/ARENA_GENESYS_COMPATIBILITY.md` §6.3 and §6.19).

17.126.2 Member Function Documentation

17.126.2.1 _check()

```
bool Clone::_check (
            std::string & errorMessage )  [override], [protected], [virtual]
```

could be overriden by derived classes
Reimplemented from ModelDataDefinition.

17.126.2.2 _createInternalStatisticReporters()

```
void Clone::_createInternalStatisticReporters ( )  [override], [protected], [virtual]
```

Reimplemented from ModelDataDefinition.

17.126.2.3 _initBetweenReplications()

```
void Clone::_initBetweenReplications ( )  [override], [protected], [virtual]
```

Reimplemented from ModelDataDefinition.

17.126.2.4 _loadInstance()

```
bool Clone::_loadInstance (
            PersistenceRecord * fields )  [override], [protected], [virtual]
```

virtual protected method that must be overriden
Reimplemented from ModelComponent.

17.126.2.5 _onDispatchEvent()

```
void Clone::_onDispatchEvent (
            Entity * entity,
            unsigned int inputPortNumber )  [override], [protected], [virtual]
```

Handles a dispatched event for this component type.
This method is only for ModelComponents, not for ModelDataElements.

Parameters

entity	Entity being processed.
inputPortNumber	Input port where the entity arrived.

Implements ModelComponent.

17.126.2.6 _saveInstance()

```
void Clone::_saveInstance (
            PersistenceRecord * fields,
            bool saveDefaultValues )  [override], [protected], [virtual]
```

Saves object fields into a serialization structure.

Parameters

fields	a table-like structure used for serialization.
saveDefaultValues	indicates whether or not to save fields which are set to their default value.

Reimplemented from ModelComponent.

17.126.2.7 show()

```
std::string Clone::show ( )  [override], [virtual]
```

virtual public methods
Returns a textual representation of this component.

Returns

Human-readable description used for tracing and debugging.

Reimplemented from ModelComponent.
The documentation for this class was generated from the following files:

- plugins/components/DiscreteProcessing/Clone.h
- plugins/components/DiscreteProcessing/Clone.cpp

- virtual unsigned long numElements ()=0

  numElements
- virtual void setAddValueHandler (CollectorAddValueHandler addValueHandler)=0

  setAddValueHandler
- virtual void setClearHandler (CollectorClearHandler clearHandler)=0

  setClearHandler

17.129.1 Detailed Description

Interface responsible for collecting observations of a stochastic variable.
A collector stores values generated during simulation and optionally supports callbacks for integration with online statistics, tracing or UI updates.

17.129.2 Member Function Documentation

17.129.2.1 addValue()

```
virtual void Collector_if::addValue (
            double value,
            double weight = 1 )  [pure virtual]
```

addValue

Parameters

value	
weight	

Adds a new observed value (with optional weight).
Implemented in CollectorDatafileDefaultImpl1, and CollectorDefaultImpl1.

17.129.2.2 clear()

```
virtual void Collector_if::clear ( )  [pure virtual]
```

clear
Clears all collected values and resets internal state.
Implemented in CollectorDatafileDefaultImpl1, and CollectorDefaultImpl1.

17.129.2.3 getLastValue()

```
virtual double Collector_if::getLastValue ( )  [pure virtual]
```

getLastValue

Returns

Returns the last collected value.
Implemented in CollectorDatafileDefaultImpl1, and CollectorDefaultImpl1.

17.129.2.4 numElements()

```
virtual unsigned long Collector_if::numElements ( )  [pure virtual]
```

numElements

Returns

Returns the number of stored observations.
Implemented in CollectorDatafileDefaultImpl1, and CollectorDefaultImpl1.

17.129.2.5 setAddValueHandler()

```
virtual void Collector_if::setAddValueHandler (
            CollectorAddValueHandler addValueHandler )  [pure virtual]
```

setAddValueHandler

Parameters

addValueHandler	

Registers a callback triggered after each added value.
Implemented in CollectorDatafileDefaultImpl1, and CollectorDefaultImpl1.

17.129.2.6 setClearHandler()

```
virtual void Collector_if::setClearHandler (
            CollectorClearHandler clearHandler )  [pure virtual]
```

setClearHandler

Parameters

clearHandler	

Registers a callback triggered when the collector is cleared.
Implemented in CollectorDatafileDefaultImpl1, and CollectorDefaultImpl1.
The documentation for this class was generated from the following file:

- kernel/statistics/Collector_if.h

17.130 CollectorDatafile_if Class Reference

Collector interface specialized in file-backed value storage.

17.130.1 Detailed Description

Collector interface specialized in file-backed value storage.
Besides standard collection operations, implementations provide sequential/random access to persisted samples and filename management for the underlying dataset.

17.130.2 Member Function Documentation

17.130.2.1 getDataFilename()

```
virtual std::string CollectorDatafile_if::getDataFilename ( )  [pure virtual]
```

getDataFilename

Returns

Returns the filename used to persist collected values.
Implemented in CollectorDatafileDefaultImpl1.

17.130.2.2 getNextValue()

```
virtual double CollectorDatafile_if::getNextValue ( )  [pure virtual]
```

getNextValue

Returns

Get the next value in the file and advances the pointer

Implemented in CollectorDatafileDefaultImpl1.

17.130.2.3 getValue()

```
virtual double CollectorDatafile_if::getValue (
            unsigned int rank )  [pure virtual]
```

getValue

Parameters

rank	

Returns

Get a value from a specific position

Implemented in CollectorDatafileDefaultImpl1.

17.130.2.4 seekFirstValue()

```
virtual void CollectorDatafile_if::seekFirstValue ( )  [pure virtual]
```

seekFirstValue
Set the pointer to the first value in the file
Implemented in CollectorDatafileDefaultImpl1.

17.130.2.5 setDataFilename()

```
virtual void CollectorDatafile_if::setDataFilename (
            std::string filename )  [pure virtual]
```

setDataFilename

Parameters

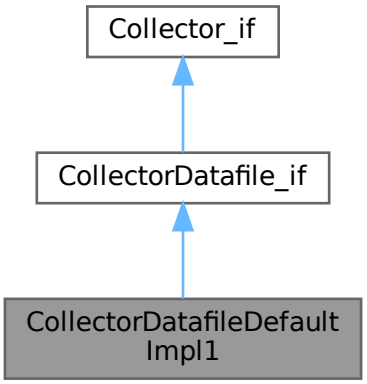
filename	

Sets/updates the filename used to store collected data.
Implemented in CollectorDatafileDefaultImpl1.
The documentation for this class was generated from the following file:

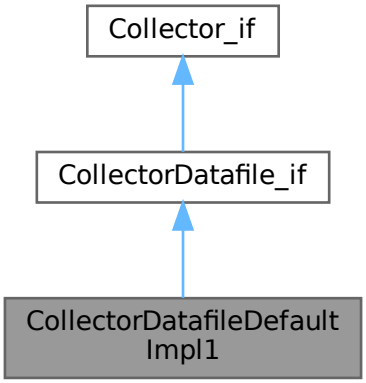
- kernel/statistics/CollectorDatafile_if.h

17.131 CollectorDatafileDefaultImpl1 Class Reference

Default file-backed implementation of `CollectorDatafile_if`.
`#include <kernel/statistics/CollectorDatafileDefaultImpl1.h>`
Inheritance diagram for CollectorDatafileDefaultImpl1:



Collaboration diagram for CollectorDatafileDefaultImpl1:



Public Member Functions

- **CollectorDatafileDefaultImpl1** ()

  Creates an empty file-backed collector instance.
- virtual void clear () override

  Clears collector state and resets file cursor/content as implemented.
- virtual void addValue (double value, double weight=1) override

  Appends a value (and optional weight) to the underlying storage.
- virtual double getLastValue () override

  Returns the most recently collected value.
- virtual unsigned long numElements () override

  Returns the number of collected elements.
- virtual double getValue (unsigned int num) override

  Returns the value stored at ordinal position `num`.
- virtual double getNextValue () override

  Returns the next value from current file cursor and advances cursor.
- virtual void seekFirstValue () override

  Repositions internal cursor to the first stored value.
- virtual std::string getDataFilename () override

  Returns the filename currently used as data backing store.
- virtual void setDataFilename (std::string filename) override

  Sets the filename used as data backing store.
- virtual void setAddValueHandler (CollectorAddValueHandler addValueHandler) override

  Registers callback invoked whenever a value is added.
- virtual void setClearHandler (CollectorClearHandler clearHandler) override

  Registers callback invoked whenever the collector is cleared.

17.131.1 Detailed Description

Default file-backed implementation of `CollectorDatafile_if`.
Stores collected values in an associated data file and keeps lightweight counters/cache for last value and number of elements.

17.131.2 Member Function Documentation

17.131.2.1 addValue()

```
void CollectorDatafileDefaultImpl1::addValue (
            double value,
            double weight = 1 )  [override], [virtual]
```

Appends a value (and optional weight) to the underlying storage.
Implements Collector_if.

17.131.2.2 clear()

```
void CollectorDatafileDefaultImpl1::clear ( )  [override], [virtual]
```

Clears collector state and resets file cursor/content as implemented.
Implements Collector_if.

17.131.2.3 getDataFilename()

```
std::string CollectorDatafileDefaultImpl1::getDataFilename ( )  [override], [virtual]
```

Returns the filename currently used as data backing store.
Implements CollectorDatafile_if.

17.131.2.4 getLastValue()

```
double CollectorDatafileDefaultImpl1::getLastValue ( )  [override], [virtual]
```

Returns the most recently collected value.
Implements Collector_if.

17.131.2.5 getNextValue()

```
double CollectorDatafileDefaultImpl1::getNextValue ( )  [override], [virtual]
```

Returns the next value from current file cursor and advances cursor.
Implements CollectorDatafile_if.

17.131.2.6 getValue()

```
double CollectorDatafileDefaultImpl1::getValue (
            unsigned int num )  [override], [virtual]
```

Returns the value stored at ordinal position `num`.
Implements CollectorDatafile_if.

17.131.2.7 numElements()

```
unsigned long CollectorDatafileDefaultImpl1::numElements ( )  [override], [virtual]
```

Returns the number of collected elements.
Implements Collector_if.

17.131.2.8 seekFirstValue()

```
void CollectorDatafileDefaultImpl1::seekFirstValue ( )  [override], [virtual]
```

Repositions internal cursor to the first stored value.
Implements CollectorDatafile_if.

17.131.2.9 setAddValueHandler()

```
void CollectorDatafileDefaultImpl1::setAddValueHandler (
            CollectorAddValueHandler addValueHandler )  [override], [virtual]
```

Registers callback invoked whenever a value is added.
Implements Collector_if.

17.131.2.10 setClearHandler()

```
void CollectorDatafileDefaultImpl1::setClearHandler (
            CollectorClearHandler clearHandler )  [override], [virtual]
```

Registers callback invoked whenever the collector is cleared.
Implements Collector_if.

17.131.2.11 setDataFilename()

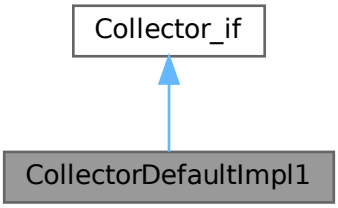
```
void CollectorDatafileDefaultImpl1::setDataFilename (
            std::string filename )  [override], [virtual]
```

Sets the filename used as data backing store.
Implements CollectorDatafile_if.
The documentation for this class was generated from the following files:

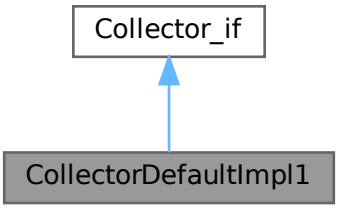
- kernel/statistics/CollectorDatafileDefaultImpl1.h
- kernel/statistics/CollectorDatafileDefaultImpl1.cpp

17.132 CollectorDefaultImpl1 Class Reference

Default in-memory implementation of `Collector_if`.
`#include <kernel/statistics/CollectorDefaultImpl1.h>`
Inheritance diagram for CollectorDefaultImpl1:



Collaboration diagram for CollectorDefaultImpl1:



Public Member Functions

- **CollectorDefaultImpl1** ()

Creates an empty collector.

- virtual void clear () override

  Clears all collected data and resets counters.

- virtual void addValue (double value, double weight=1) override

  Adds a new observation to the collector.

- virtual double getLastValue () override

  Returns the latest observed value.

- virtual unsigned long numElements () override

  Returns total number of observed values.

- virtual void setAddValueHandler (CollectorAddValueHandler addValueHandler) override

  Registers callback notified after each `addValue` call.

- virtual void setClearHandler (CollectorClearHandler clearHandler) override

  Registers callback notified when `clear` is invoked.

17.132.1 Detailed Description

Default in-memory implementation of `Collector_if`.
Maintains minimal aggregate state (last value and count) and supports optional callbacks for add/clear events.

17.132.2 Member Function Documentation

17.132.2.1 addValue()

```
void CollectorDefaultImpl1::addValue (
            double value,
            double weight = 1 )  [override], [virtual]
```

Adds a new observation to the collector.
Implements Collector_if.

17.132.2.2 clear()

```
void CollectorDefaultImpl1::clear ( )  [override], [virtual]
```

Clears all collected data and resets counters.
Implements Collector_if.

17.132.2.3 getLastValue()

```
double CollectorDefaultImpl1::getLastValue ( )  [override], [virtual]
```

Returns the latest observed value.
Implements Collector_if.

17.132.2.4 numElements()

```
unsigned long CollectorDefaultImpl1::numElements ( )  [override], [virtual]
```

Returns total number of observed values.
Implements Collector_if.

17.132.2.5 setAddValueHandler()

```
void CollectorDefaultImpl1::setAddValueHandler (
            CollectorAddValueHandler addValueHandler )  [override], [virtual]
```

Registers callback notified after each `addValue` call.
Implements Collector_if.

17.132.2.6 setClearHandler()

```
void CollectorDefaultImpl1::setClearHandler (
            CollectorClearHandler clearHandler )  [override], [virtual]
```

Registers callback notified when `clear` is invoked.
Implements Collector_if.

- void **captureCurrentMarkingAsInitial** ()
- void **restoreInitialMarking** ()
- FiringMode **getFiringMode** () const
- void **setFiringMode** (FiringMode firingMode)
- virtual std::string show () override

  Returns a textual representation of this data definition.

Public Member Functions inherited from DefaultNetwork

- **DefaultNetwork** (Model *model, std::string name="", std::string dataDefinitionTypename=Util::TypeOf< DefaultNetwork >())
- unsigned int **addInputPort** (const std::string &portName)

  Declares a new input port; returns its 0-based index. Rejects a duplicate name (returns the existing index instead of creating a duplicate).
- unsigned int **addOutputPort** (const std::string &portName)

  Declares a new output port; returns its 0-based index. Rejects a duplicate name (returns the existing index instead of creating a duplicate).
- unsigned int **getNumInputPorts** () const
- unsigned int **getNumOutputPorts** () const
- std::string **getInputPortName** (unsigned int index) const
- std::string **getOutputPortName** (unsigned int index) const
- int **getInputPortIndex** (const std::string &portName) const

  Returns the input port index for `portName`, or -1 when not declared.
- int **getOutputPortIndex** (const std::string &portName) const

  Returns the output port index for `portName`, or -1 when not declared.
- double **getActivationCount** () const

  Number of times activate() has been called since the last replication reset.
- NetworkActivationResult activate (const NetworkActivationFrame &frame)

  Runs exactly one network activation for `frame`.

Public Member Functions inherited from ModelDataDefinition

- ModelDataDefinition (Model *model, std::string datadefinitionTypename, std::string name="", bool insert↩ IntoModel=true)

  Creates a model data definition and optionally inserts it into the model.
- virtual ~**ModelDataDefinition** ()

  Releases resources owned by this data definition.
- Util::identification getId () const

  Returns the unique identifier of this instance.
- void setName (const std::string &name)

  Updates the logical name of this instance.

- const std::string & getName () const

  Returns the logical name of this instance.
- void setLabel (const std::string &label)

  Updates the user-visible label of this instance.
- const std::string & getLabel () const

  Returns the user-visible label of this instance.
- const std::string & getClassname () const

  Returns the runtime class name used by the plugin system.
- Model * getParentModel () const

  Returns the parent model that owns this definition.
- bool isReportStatistics () const

  Indicates whether this data definition contributes report statistics.
- void setReportStatistics (bool reportStatistics)

  Enables or disables report-statistics generation for this definition.
- ModelDataDefinition * getInternalData (const std::string &name) const

  Looks up a named internal child data definition.
- std::map< std::string, ModelDataDefinition * > * getInternalData () const

  Returns the full map of internal child data definitions.
- std::map< std::string, ModelDataDefinition * > * getAttachedData () const

  Returns the full map of attached data definitions.
- bool hasChanged () const

  Indicates whether this instance has been modified since the last reset.
- void setHasChanged (bool hasChanged)

  Updates the changed flag for this data definition.
- unsigned int getLevel () const

  Returns the hierarchical editing context containing this element.
- void setModelLevel (unsigned int _modelLevel)

  Sets this element's hierarchical editing context.
- List< SimulationControl * > * getSimulationControls () const

  Returns the simulation controls owned by this data definition.
- TraceManager::Level getTraceLevelSpecific () const

  Returns the trace level that applies specifically to this definition.
- void setTraceLevelSpecific (TraceManager::Level level)

  Updates the trace level used by this definition.
- void defineTraceLevelSpecific (TraceManager::Level traceLevelspecific, bool traceLevelSpecific↩ Enabled=true)

  Defines the specific trace level and optionally enables it immediately.
- bool isTraceLevelSpecificEnabled () const

  Indicates whether the specific trace level is enabled.
- void setTraceLevelSpecificEnabled (bool traceLevelSpecificEnabled)

  Enables or disables the specific trace level.

Static Public Member Functions

- static ModelDataDefinition * **LoadInstance** (Model *model, PersistenceRecord *fields)

- static ModelDataDefinition * **NewInstance** (Model *model, std::string name="")

Static Public Member Functions inherited from ModelDataDefinition

- static ModelDataDefinition * LoadInstance (Model *model, PersistenceRecord *fields, bool insertIntoModel)

  Loads a model data definition instance from serialized fields.
- static ModelDataDefinition * NewInstance (Model *model, std::string name="")

  Creates a new instance of a data definition using the plugin registry.
- static void SaveInstance (PersistenceRecord *fields, ModelDataDefinition *modeldatum)

  Serializes a data definition instance into a persistence record.
- static bool Check (ModelDataDefinition *modeldatum, std::string &errorMessage)

  Validates a data definition instance.
- static void InitBetweenReplications (ModelDataDefinition *modeldatum)

  Resets simulation-time state between replications.
- static void CreateInternalData (ModelDataDefinition *modeldatum)

  Creates internal and attached data required by this instance.
- static bool CreateRelatedDataElements (ModelDataDefinition *modeldatum, std::string &errorMessage)

  Creates related data and validates the instance in a single call.

Protected Member Functions

- virtual bool _loadInstance (PersistenceRecord *fields) override

  must be overriden by derived classes
- virtual void _saveInstance (PersistenceRecord *fields, bool saveDefaultValues) override

  Saves object fields into a serialization structure.
- virtual bool _check (std::string &errorMessage) override

  could be overriden by derived classes
- virtual void _initBetweenReplications () override
- virtual NetworkActivationResult _activate (const NetworkActivationFrame &frame) override

  Formalism-specific activation behavior.

17.134.1 Detailed Description

Pragmatic fixed-inscription Colored Petri Net subset.
The topology is formally bipartite: places and transitions are nodes, and CPNArc objects connect exactly one place with one transition. The initial subset supports symbolic colors with unsigned multiplicities, fixed arc inscriptions, optional transition guards through the GenESyS parser, and a deterministic single firing per activation.

17.134.2 Member Function Documentation

17.134.2.1 _activate()

```
NetworkActivationResult ColoredPetriNetNetwork::_activate (
            const NetworkActivationFrame & frame )  [override], [protected], [virtual]
```

Formalism-specific activation behavior.
The base implementation performs no state change and returns a result sized to `getNumOutputPorts()` with every output absent. Specializations override this to implement EFSM transition firing, one DTMC step, one CPN firing step, etc. Must not receive or depend on `Entity*` (architecture reference §8.4, §19).
Reimplemented from DefaultNetwork.

17.134.2.2 _check()

```
bool ColoredPetriNetNetwork::_check (
            std::string & errorMessage )  [override], [protected], [virtual]
```

could be overriden by derived classes
Reimplemented from DefaultNetwork.

17.134.2.3 _initBetweenReplications()

```
void ColoredPetriNetNetwork::_initBetweenReplications ( )  [override], [protected], [virtual]
```

Reimplemented from DefaultNetwork.

17.134.2.4 _loadInstance()

```
bool ColoredPetriNetNetwork::_loadInstance (
            PersistenceRecord * fields )  [override], [protected], [virtual]
```

must be overriden by derived classes
Reimplemented from DefaultNetwork.

17.134.2.5 _saveInstance()

```
void ColoredPetriNetNetwork::_saveInstance (
            PersistenceRecord * fields,
            bool saveDefaultValues )  [override], [protected], [virtual]
```

Saves object fields into a serialization structure.

Parameters

fields	a table-like structure used for serialization.
saveDefaultValues	indicates whether or not to save fields which are set to their default value.

Reimplemented from DefaultNetwork.

17.134.2.6 show()

```
std::string ColoredPetriNetNetwork::show ( )  [override], [virtual]
```

Returns a textual representation of this data definition.
Returns the keys of internal ModelDataDefinitions such as counters, statistics collectors and other children needed before model checking.

Returns

Human-readable summary used by traces and debug output.

Reimplemented from DefaultNetwork.

  virtual public methods

Public Member Functions inherited from ModelComponent

- ModelComponent (Model *model, std::string componentTypename, std::string name="")

  constructors
- virtual ~**ModelComponent** ()

  Releases component-owned resources and unregisters it from the model.
- ConnectionManager * getConnectionManager () const

  new public user methods for this component
- void connectTo (ModelComponent *component, unsigned int inputPortNumber=0)

  Connects this component to another component.
- bool hasBreakpointAt ()

  Indicates whether a simulation breakpoint is set on this component.
- void setDescription (std::string _description)

  Updates the free-form description shown by the GUI.
- std::string getDescription () const

  Returns the free-form description associated with this component.
- void remove (ModelComponent *comp)

  Removes a connected component from this component.

Public Member Functions inherited from ModelDataDefinition

- ModelDataDefinition (Model *model, std::string datadefinitionTypename, std::string name="", bool insertIntoModel=true)

  Creates a model data definition and optionally inserts it into the model.
- virtual ~**ModelDataDefinition** ()

  Releases resources owned by this data definition.
- Util::identification getId () const

  Returns the unique identifier of this instance.
- void setName (const std::string &name)

  Updates the logical name of this instance.
- const std::string & getName () const

  Returns the logical name of this instance.
- void setLabel (const std::string &label)

  Updates the user-visible label of this instance.
- const std::string & getLabel () const

  Returns the user-visible label of this instance.
- const std::string & getClassname () const

  Returns the runtime class name used by the plugin system.
- Model * getParentModel () const

  Returns the parent model that owns this definition.
- bool isReportStatistics () const

  Indicates whether this data definition contributes report statistics.
- void setReportStatistics (bool reportStatistics)

  Enables or disables report-statistics generation for this definition.
- ModelDataDefinition * getInternalData (const std::string &name) const

  Looks up a named internal child data definition.
- std::map< std::string, ModelDataDefinition * > * getInternalData () const

  Returns the full map of internal child data definitions.
- std::map< std::string, ModelDataDefinition * > * getAttachedData () const

  Returns the full map of attached data definitions.
- bool hasChanged () const

  Indicates whether this instance has been modified since the last reset.
- void setHasChanged (bool hasChanged)

  Updates the changed flag for this data definition.
- unsigned int getLevel () const

  Returns the hierarchical editing context containing this element.
- void setModelLevel (unsigned int _modelLevel)

  Sets this element's hierarchical editing context.
- List< SimulationControl * > * getSimulationControls () const

  Returns the simulation controls owned by this data definition.
- TraceManager::Level getTraceLevelSpecific () const

  Returns the trace level that applies specifically to this definition.
- void setTraceLevelSpecific (TraceManager::Level level)

  Updates the trace level used by this definition.
- void defineTraceLevelSpecific (TraceManager::Level traceLevelspecific, bool traceLevelSpecificEnabled=true)

  Defines the specific trace level and optionally enables it immediately.
- bool isTraceLevelSpecificEnabled () const

  Indicates whether the specific trace level is enabled.
- void setTraceLevelSpecificEnabled (bool traceLevelSpecificEnabled)

  Enables or disables the specific trace level.

Static Public Member Functions

- static PluginInformation * **GetPluginInformation** ()
- static ModelComponent * **LoadInstance** (Model *model, PersistenceRecord *fields)
- static ModelDataDefinition * **NewInstance** (Model *model, std::string name="")

Static Public Member Functions inherited from ModelComponent

- static ModelComponent * LoadInstance (Model *model, PersistenceRecord *fields)

  static public methods that must have implementations (Load and New just the same. GetInformation must provide specific infos for the new component
- static bool Check (ModelComponent *component)

  Validates a component instance.
- static void CreateInternalData (ModelComponent *component)

  Creates internal data required by a component instance.
- static void SaveInstance (PersistenceRecord *fields, ModelComponent *component)

  Serializes a component instance into a persistence record.
- static void DispatchEvent (Event *event)

  Dispatches a simulation event to the target component.

Static Public Member Functions inherited from ModelDataDefinition

- static ModelDataDefinition * LoadInstance (Model *model, PersistenceRecord *fields, bool insertIntoModel)

  Loads a model data definition instance from serialized fields.
- static ModelDataDefinition * NewInstance (Model *model, std::string name="")

  Creates a new instance of a data definition using the plugin registry.
- static void SaveInstance (PersistenceRecord *fields, ModelDataDefinition *modeldatum)

  Serializes a data definition instance into a persistence record.
- static bool Check (ModelDataDefinition *modeldatum, std::string &errorMessage)

  Validates a data definition instance.
- static void InitBetweenReplications (ModelDataDefinition *modeldatum)

  Resets simulation-time state between replications.
- static void CreateInternalData (ModelDataDefinition *modeldatum)

  Creates internal and attached data required by this instance.
- static bool CreateRelatedDataElements (ModelDataDefinition *modeldatum, std::string &errorMessage)

  Creates related data and validates the instance in a single call.

Protected Member Functions

- virtual bool _loadInstance (PersistenceRecord *fields) override

  virtual protected method that must be overriden
- virtual void _saveInstance (PersistenceRecord *fields, bool saveDefaultValues) override

  Saves object fields into a serialization structure.
- virtual bool _check (std::string &errorMessage) override

  could be overriden by derived classes
- virtual void _initBetweenReplications () override
- virtual void _onDispatchEvent (Entity *entity, unsigned int inputPortNumber) override

  Handles a dispatched event for this component type.
- virtual void _createEditableDataDefinitions () override

Protected Member Functions inherited from ModelDataDefinition

- bool _getSaveDefaultsOption ()

17.138.1 Detailed Description

Moves metabolite proxies between whole-cell regions.
CompartmentExchangeComponent transfers a fraction of a source metabolite pool in WholeCellState into a target pool on each dispatched event. The component can represent didactic transport, exchange, or redistribution policies between global and compartment-scoped pools without embedding that logic directly into examples.
Source and target regions follow this convention:

- empty region name: global WholeCellState metabolite pool;
- non-empty region name: compartment-scoped pool.

17.138.2 Member Function Documentation

17.138.2.1 _check()

```
bool CompartmentExchangeComponent::_check (
            std::string & errorMessage ) [override], [protected], [virtual]
```

could be overriden by derived classes
Reimplemented from ModelDataDefinition.

17.138.2.2 _createEditableDataDefinitions()

```
void CompartmentExchangeComponent::_createEditableDataDefinitions ( ) [override], [protected],
[virtual]
```

Reimplemented from ModelDataDefinition.

17.138.2.3 _initBetweenReplications()

```
void CompartmentExchangeComponent::_initBetweenReplications ( ) [override], [protected],
[virtual]
```

Reimplemented from ModelDataDefinition.

17.138.2.4 _loadInstance()

```
bool CompartmentExchangeComponent::_loadInstance (
            PersistenceRecord * fields ) [override], [protected], [virtual]
```

virtual protected method that must be overriden
Reimplemented from ModelComponent.

17.138.2.5 _onDispatchEvent()

```
void CompartmentExchangeComponent::_onDispatchEvent (
            Entity * entity,
            unsigned int inputPortNumber )  [override], [protected], [virtual]
```

Handles a dispatched event for this component type.
This method is only for ModelComponents, not for ModelDataElements.

Parameters

entity	Entity being processed.
inputPortNumber	Input port where the entity arrived.

Implements ModelComponent.

17.138.2.6 _saveInstance()

```
void CompartmentExchangeComponent::_saveInstance (
            PersistenceRecord * fields,
            bool saveDefaultValues )  [override], [protected], [virtual]
```

Saves object fields into a serialization structure.

Parameters

fields	a table-like structure used for serialization.
saveDefaultValues	indicates whether or not to save fields which are set to their default value.

Reimplemented from ModelComponent.

17.138.2.7 show()

```
std::string CompartmentExchangeComponent::show ( )  [override], [virtual]
```

virtual public methods
Returns a textual representation of this component.

Returns

Human-readable description used for tracing and debugging.

Reimplemented from ModelComponent.

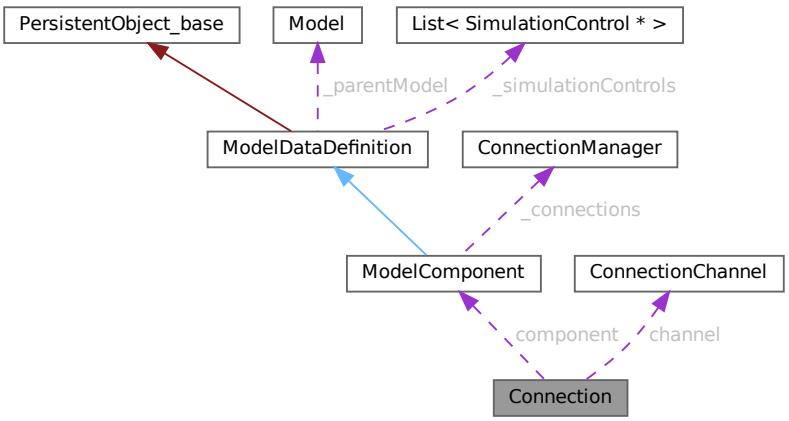
17.145 Connection Struct Reference

```
#include <kernel/simulator/ConnectionManager.h>
```

Collaboration diagram for Connection:



Public Attributes

- ModelComponent * **component**
- ConnectionChannel **channel**

17.145.1 Detailed Description

Defines a connection between two or more ModelComponents. A (receiver) component's inputPort may receive connection from one or more (sender) components' outputPorts. A (sender) component's outputPort is connected to one and only one (receiver) component's inputPort.
The documentation for this struct was generated from the following file:

- kernel/simulator/ConnectionManager.h

17.146 ConnectionChannel Struct Reference

The ConnectionChannel class defines an input or output port that connects a ModelComponent to another.
`#include <kernel/simulator/ConnectionManager.h>`

Public Attributes

- unsigned int **portNumber** = 0
- std::string **portDescription** = ""

17.146.1 Detailed Description

The ConnectionChannel class defines an input or output port that connects a ModelComponent to another.
The documentation for this struct was generated from the following file:

- kernel/simulator/ConnectionManager.h

17.147 ConnectionManager Class Reference

Maintains outgoing connections from a component to downstream components.
`#include <kernel/simulator/ConnectionManager.h>`

Public Member Functions

- **ConnectionManager** ()

  Creates an empty connection manager with zero constraints.
- unsigned int size ()

  size
- Connection * getFrontConnection ()

  getFrontConnection
- Connection * getConnectionAtPort (unsigned int rank)

  getConnectionAtPort
- void insert (ModelComponent *component, unsigned int inputPortNumber=0)

  Inserts a new connection to a target component.
- void insert (Connection *connection)

  insert
- void insertAtPort (unsigned int port, Connection *connection)

  insertAtPort
- void remove (Connection *connection)

  remove
- void removeAtPort (unsigned int port)

  removeAtPort
- std::map< unsigned int, Connection * > * connections () const

  Returns the internal output-port to connection map.
- unsigned int getCurrentOutputConnectionsSize () const

  Returns the number of currently configured outgoing connections.

- void setMaxOutputConnections (unsigned int _maxOutputConnections)

  Sets the maximum number of outgoing connections allowed.
- unsigned int getMaxOutputConnections () const

  Returns the maximum number of outgoing connections allowed.
- void setMinOutputConnections (unsigned int _minOutputConnections)

  Sets the minimum number of outgoing connections allowed.
- unsigned int getMinOutputConnections () const

  Returns the minimum number of outgoing connections allowed.
- unsigned int getCurrentInputConnectionsSize () const

  Returns the number of currently configured incoming connections.
- void setMaxInputConnections (unsigned int _maxInputConnections)

  Sets the maximum number of incoming connections allowed.
- unsigned int getMaxInputConnections () const

  Returns the maximum number of incoming connections allowed.
- void setMinInputConnections (unsigned int _minInputConnections)

  Sets the minimum number of incoming connections allowed.
- unsigned int getMinInputConnections () const

  Returns the minimum number of incoming connections allowed.

17.147.1 Detailed Description

Maintains outgoing connections from a component to downstream components.
A connection maps an output rank (port) to a destination component/input port. The manager also stores min/max input/output constraints used during validation.

17.147.2 Member Function Documentation

17.147.2.1 connections()

```
std::map< unsigned int, Connection * > * ConnectionManager::connections ( ) const
```

Returns the internal output-port to connection map.

Returns

Map of output ports to outgoing connections.

17.147.2.2 getConnectionAtPort()

```
Connection * ConnectionManager::getConnectionAtPort (
            unsigned int rank )
```

getConnectionAtPort

Parameters

rank	

Returns

Connection bound to output rank `rank`.

17.147.2.3 getCurrentInputConnectionsSize()

```
unsigned int ConnectionManager::getCurrentInputConnectionsSize ( ) const
```

Returns the number of currently configured incoming connections.

Returns

Current input connection count.

17.147.2.4 getCurrentOutputConnectionsSize()

```
unsigned int ConnectionManager::getCurrentOutputConnectionsSize ( ) const
```

Returns the number of currently configured outgoing connections.

Returns

Current output connection count.

17.147.2.5 getFrontConnection()

```
Connection * ConnectionManager::getFrontConnection ( )
```

getFrontConnection

Returns

Connection at the first available output rank.

17.147.2.6 getMaxInputConnections()

```
unsigned int ConnectionManager::getMaxInputConnections ( ) const
```

Returns the maximum number of incoming connections allowed.

Returns

Maximum incoming connection count.

17.147.2.7 getMaxOutputConnections()

```
unsigned int ConnectionManager::getMaxOutputConnections ( ) const
```

Returns the maximum number of outgoing connections allowed.

Returns

Maximum outgoing connection count.

17.147.2.8 getMinInputConnections()

```
unsigned int ConnectionManager::getMinInputConnections ( ) const
```

Returns the minimum number of incoming connections allowed.

Returns

Minimum incoming connection count.

17.147.2.9 getMinOutputConnections()

```
unsigned int ConnectionManager::getMinOutputConnections ( ) const
```

Returns the minimum number of outgoing connections allowed.

Returns

Minimum outgoing connection count.

17.147.2.10 insert() [1/2]

```
void ConnectionManager::insert (
            Connection * connection )
```

insert

Parameters

connection	

Inserts a prebuilt connection object.

17.147.2.11 insert() [2/2]

```
void ConnectionManager::insert (
            ModelComponent * component,
            unsigned int inputPortNumber = 0 )
```

Inserts a new connection to a target component.
Creates and inserts a connection to `component` at input port `inputPortNumber`. When the port is not specified, the connection uses the default input port 0.

Parameters

component	Target component.
inputPortNumber	Target input port number.

17.147.2.12 insertAtPort()

```
void ConnectionManager::insertAtPort (
            unsigned int port,
            Connection * connection )
```

insertAtPort

Parameters

port	
connection	

Forces insertion/replacement at a specific output port.

17.147.2.13 remove()

```
void ConnectionManager::remove (
            Connection * connection )
```

remove

Parameters

connection	

Removes a connection by pointer match.

17.147.2.14 removeAtPort()

```
void ConnectionManager::removeAtPort (
            unsigned int port )
```

removeAtPort

Parameters

port	

Removes the connection associated with output port `port`.

17.147.2.15 setMaxInputConnections()

```
void ConnectionManager::setMaxInputConnections (
            unsigned int _maxInputConnections )
```

Sets the maximum number of incoming connections allowed.

Parameters

_maxInputConnections	Maximum incoming connection count.

17.147.2.16 setMaxOutputConnections()

```
void ConnectionManager::setMaxOutputConnections (
            unsigned int _maxOutputConnections )
```

Sets the maximum number of outgoing connections allowed.

Parameters

_maxOutputConnections	Maximum outgoing connection count.

17.147.2.17 setMinInputConnections()

```
void ConnectionManager::setMinInputConnections (
            unsigned int _minInputConnections )
```

Sets the minimum number of incoming connections allowed.

Parameters

_minInputConnections	Minimum incoming connection count.

17.147.2.18 setMinOutputConnections()

```
void ConnectionManager::setMinOutputConnections (
            unsigned int _minOutputConnections )
```

Sets the minimum number of outgoing connections allowed.

Parameters

_minOutputConnections	Minimum outgoing connection count.

17.147.2.19 size()

```
unsigned int ConnectionManager::size ( )
```

size

Returns

Number of configured output connections.

17.155.1 Member Function Documentation

17.155.1.1 Simulate()

```
void ContinuousModel::Simulate (
            Simulator * genesys,
            Model * model,
            PluginManager * plugins )  [override], [virtual]
```

Reimplemented from BaseGenesysTerminalApplication.

The documentation for this class was generated from the following files:

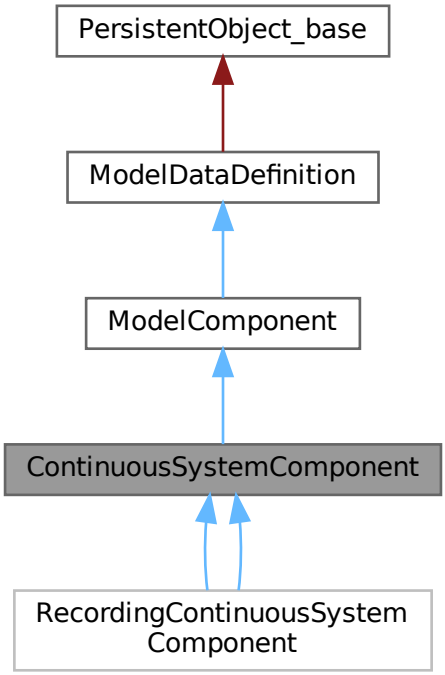
- applications/modelSpecific/teaching/ContinuousModel.h
- applications/modelSpecific/teaching/ContinuousModel.cpp

17.156 ContinuousSystemComponent Class Reference

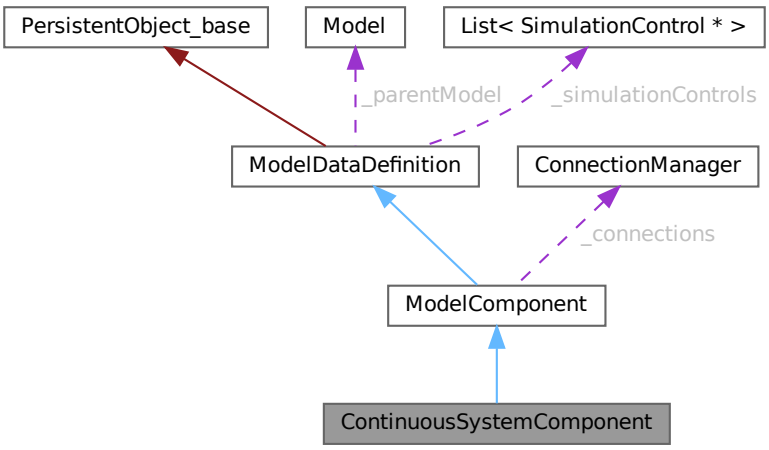
Component that advances a continuous ODE system when entities arrive.

```
#include <plugins/components/Continuous/ContinuousSystemComponent.h>
```

Inheritance diagram for ContinuousSystemComponent:



Collaboration diagram for ContinuousSystemComponent:



Public Member Functions

- **ContinuousSystemComponent** (Model *model, std::string name="")
- virtual std::string show () override

virtual public methods

- void **setOdeSolver** (ODESolver *solver)
- ODESolver * **getOdeSolver** () const
- void **setOdeSolverName** (std::string name)
- std::string **getOdeSolverName** () const

Public Member Functions inherited from ModelComponent

- ModelComponent (Model *model, std::string componentTypename, std::string name="")

  constructors
- virtual ~**ModelComponent** ()

  Releases component-owned resources and unregisters it from the model.
- ConnectionManager * getConnectionManager () const

  new public user methods for this component
- void connectTo (ModelComponent *component, unsigned int inputPortNumber=0)

  Connects this component to another component.
- bool hasBreakpointAt ()

  Indicates whether a simulation breakpoint is set on this component.
- void setDescription (std::string _description)

  Updates the free-form description shown by the GUI.
- std::string getDescription () const

  Returns the free-form description associated with this component.
- void remove (ModelComponent *comp)

  Removes a connected component from this component.

Public Member Functions inherited from ModelDataDefinition

- ModelDataDefinition (Model *model, std::string datadefinitionTypename, std::string name="", bool insert↩ IntoModel=true)

  Creates a model data definition and optionally inserts it into the model.
- virtual ~**ModelDataDefinition** ()

  Releases resources owned by this data definition.
- Util::identification getId () const

  Returns the unique identifier of this instance.
- void setName (const std::string &name)

  Updates the logical name of this instance.
- const std::string & getName () const

  Returns the logical name of this instance.
- void setLabel (const std::string &label)

  Updates the user-visible label of this instance.
- const std::string & getLabel () const

  Returns the user-visible label of this instance.
- const std::string & getClassname () const

  Returns the runtime class name used by the plugin system.
- Model * getParentModel () const

  Returns the parent model that owns this definition.
- bool isReportStatistics () const

  Indicates whether this data definition contributes report statistics.
- void setReportStatistics (bool reportStatistics)

  Enables or disables report-statistics generation for this definition.
- ModelDataDefinition * getInternalData (const std::string &name) const

  Looks up a named internal child data definition.

- std::map< std::string, ModelDataDefinition * > * getInternalData () const

  Returns the full map of internal child data definitions.
- std::map< std::string, ModelDataDefinition * > * getAttachedData () const

  Returns the full map of attached data definitions.
- bool hasChanged () const

  Indicates whether this instance has been modified since the last reset.
- void setHasChanged (bool hasChanged)

  Updates the changed flag for this data definition.
- unsigned int getLevel () const

  Returns the hierarchical editing context containing this element.
- void setModelLevel (unsigned int _modelLevel)

  Sets this element's hierarchical editing context.
- List< SimulationControl * > * getSimulationControls () const

  Returns the simulation controls owned by this data definition.
- TraceManager::Level getTraceLevelSpecific () const

  Returns the trace level that applies specifically to this definition.
- void setTraceLevelSpecific (TraceManager::Level level)

  Updates the trace level used by this definition.
- void defineTraceLevelSpecific (TraceManager::Level traceLevelspecific, bool traceLevelSpecific↩ Enabled=true)

  Defines the specific trace level and optionally enables it immediately.
- bool isTraceLevelSpecificEnabled () const

  Indicates whether the specific trace level is enabled.
- void setTraceLevelSpecificEnabled (bool traceLevelSpecificEnabled)

  Enables or disables the specific trace level.

Static Public Member Functions

- static PluginInformation * **GetPluginInformation** ()
- static ModelComponent * **LoadInstance** (Model *model, PersistenceRecord *fields)
- static ModelDataDefinition * **NewInstance** (Model *model, std::string name="")
- static void **SaveInstance** (PersistenceRecord *fields, ModelComponent *component)
- static bool **Check** (ModelComponent *component)
- static void **CreateInternalData** (ModelComponent *component)
- static void **DispatchEvent** (Event *event)

Static Public Member Functions inherited from ModelComponent

- static ModelComponent * LoadInstance (Model *model, PersistenceRecord *fields)

  static public methods that must have implementations (Load and New just the same. GetInformation must provide specific infos for the new component
- static bool Check (ModelComponent *component)

  Validates a component instance.
- static void CreateInternalData (ModelComponent *component)

  Creates internal data required by a component instance.
- static void SaveInstance (PersistenceRecord *fields, ModelComponent *component)

  Serializes a component instance into a persistence record.
- static void DispatchEvent (Event *event)

  Dispatches a simulation event to the target component.

Static Public Member Functions inherited from ModelDataDefinition

- static ModelDataDefinition * LoadInstance (Model *model, PersistenceRecord *fields, bool insertIntoModel)

  Loads a model data definition instance from serialized fields.
- static ModelDataDefinition * NewInstance (Model *model, std::string name="")

  Creates a new instance of a data definition using the plugin registry.
- static void SaveInstance (PersistenceRecord *fields, ModelDataDefinition *modeldatum)

  Serializes a data definition instance into a persistence record.
- static bool Check (ModelDataDefinition *modeldatum, std::string &errorMessage)

  Validates a data definition instance.
- static void InitBetweenReplications (ModelDataDefinition *modeldatum)

  Resets simulation-time state between replications.
- static void CreateInternalData (ModelDataDefinition *modeldatum)

  Creates internal and attached data required by this instance.
- static bool CreateRelatedDataElements (ModelDataDefinition *modeldatum, std::string &errorMessage)

  Creates related data and validates the instance in a single call.

Protected Member Functions

- virtual void _onDispatchEvent (Entity *entity, unsigned int inputPortNumber) override

  Handles a dispatched event for this component type.
- virtual bool _loadInstance (PersistenceRecord *fields) override

  virtual protected method that must be overriden
- virtual void _saveInstance (PersistenceRecord *fields, bool saveDefaultValues) override

  Saves object fields into a serialization structure.
- virtual bool _check (std::string &errorMessage) override

  could be overriden by derived classes
- virtual void _createEditableDataDefinitions () override

Protected Member Functions inherited from ModelDataDefinition

- bool _getSaveDefaultsOption ()
- virtual ParserChangesInformation * _getParserChangesInformation ()
- virtual void _initBetweenReplications ()
- virtual void _addSimulationControl (SimulationControl *control)
- virtual void _createInternalAndAttachedData ()
- virtual void **_createInternalStatisticReporters** ()
- virtual void _createAttachedAttributes ()

- void **_mandatoryAttachedAttributesClear** ()
- void **_mandatoryEditableDataDefinitionInsert** (const std::string &key, ModelDataDefinition *data)
- void **_mandatoryEditableDataDefinitionRemove** (const std::string &key)
- void **_mandatoryEditableDataDefinitionsClear** ()
- void **_optionalEditableDataDefinitionInsert** (const std::string &key, ModelDataDefinition *data)
- void **_optionalEditableDataDefinitionRemove** (const std::string &key)
- void **_optionalEditableDataDefinitionsClear** ()
- void **_mandatoryNonEditableDataDefinitionInsert** (const std::string &key, ModelDataDefinition *data)
- void **_mandatoryNonEditableDataDefinitionRemove** (const std::string &key)
- void **_mandatoryNonEditableDataDefinitionsClear** ()
- void **_optionalNonEditableDataDefinitionInsert** (const std::string &key, ModelDataDefinition *data)
- void **_optionalNonEditableDataDefinitionRemove** (const std::string &key)
- void **_optionalNonEditableDataDefinitionsClear** ()
- void **_checkCreateAttachedReferencedDataDefinition** (const std::string &expression)

  method to be called to insert attached dataelements that are referenced by string expressions (detected by the parser), to avoid orphaned data definitions
- void **trace** (const std::string &text, TraceManager::Level level=TraceManager::Level::L8_detailed)

  not just an easy access to trace manager, but wrappers to check if specific trace level applies
- void **traceError** (const std::string &text, const std::exception &e)
- void **traceError** (const std::string &text, TraceManager::Level level=TraceManager::Level::L1_errorFatal)
- void **traceReport** (const std::string &text, TraceManager::Level level=TraceManager::Level::L2_results)
- void **traceSimulation** (void *thisobject, double time, Entity *entity, ModelComponent *component, const std::string &text, TraceManager::Level level=TraceManager::Level::L8_detailed)
- void traceSimulation (void *thisobject, const std::string &text, TraceManager::Level level=TraceManager::↩ Level::L8_detailed)

  Traces text to the simulation output.
- void **traceSimulation** (void *thisobject, TraceManager::Level level, const std::string &text)

Additional Inherited Members

Protected Attributes inherited from ModelComponent

- ConnectionManager * _connections = new ConnectionManager()

  virtual protected methods that could be overriden by derived classes, if needed

Protected Attributes inherited from ModelDataDefinition

- std::string **_typename**
- bool **_reportStatistics**
- bool **_hasChanged**
- unsigned int **_modelLevel** = 0
- Model * **_parentModel**
- List< SimulationControl * > * **_simulationControls** = new List<SimulationControl*>()
- TraceManager::Level **_traceLevelSpecific**
- bool **_traceLevelSpecificEnabled** = false

17.156.1 Detailed Description

Component that advances a continuous ODE system when entities arrive.
ContinuousSystemComponent holds a reference to an ODESolver data definition and triggers integration each time an entity enters through port 0. The solved state is written back to the ODESolver so downstream components can read the updated values. The entity is forwarded through output port 0 after integration completes.

17.156.2 Member Function Documentation

17.156.2.1 _check()

```
bool ContinuousSystemComponent::_check (
            std::string & errorMessage )  [override], [protected], [virtual]
```

could be overriden by derived classes
Reimplemented from ModelDataDefinition.

17.156.2.2 _createEditableDataDefinitions()

```
void ContinuousSystemComponent::_createEditableDataDefinitions ( )  [override], [protected],
[virtual]
```

Reimplemented from ModelDataDefinition.

17.156.2.3 _loadInstance()

```
bool ContinuousSystemComponent::_loadInstance (
            PersistenceRecord * fields )  [override], [protected], [virtual]
```

virtual protected method that must be overriden
Reimplemented from ModelComponent.

17.156.2.4 _onDispatchEvent()

```
void ContinuousSystemComponent::_onDispatchEvent (
            Entity * entity,
            unsigned int inputPortNumber )  [override], [protected], [virtual]
```

Handles a dispatched event for this component type.
This method is only for ModelComponents, not for ModelDataElements.

Parameters

entity	Entity being processed.
inputPortNumber	Input port where the entity arrived.

Implements ModelComponent.
Reimplemented in RecordingContinuousSystemComponent, and RecordingContinuousSystemComponent.

17.156.2.5 _saveInstance()

```
void ContinuousSystemComponent::_saveInstance (
            PersistenceRecord * fields,
            bool saveDefaultValues )  [override], [protected], [virtual]
```

Saves object fields into a serialization structure.

Parameters

fields	a table-like structure used for serialization.
saveDefaultValues	indicates whether or not to save fields which are set to their default value.

Reimplemented from ModelComponent.

17.156.2.6 show()

```
std::string ContinuousSystemComponent::show ( )  [override], [virtual]
```

virtual public methods
Returns a textual representation of this component.

Returns

Human-readable description used for tracing and debugging.

Reimplemented from ModelComponent.
The documentation for this class was generated from the following files:

- plugins/components/Continuous/ContinuousSystemComponent.h
- plugins/components/Continuous/ContinuousSystemComponent.cpp

17.157 testing::internal::ConvertibleToIntegerPrinter Struct Reference

Static Public Member Functions

- static void **PrintValue** (internal::BiggestInt value, ::std::ostream *os)

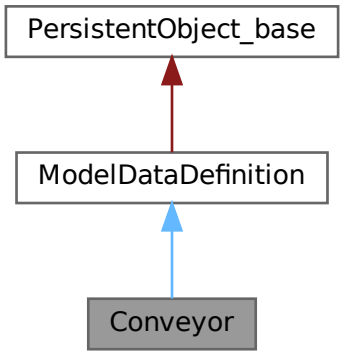
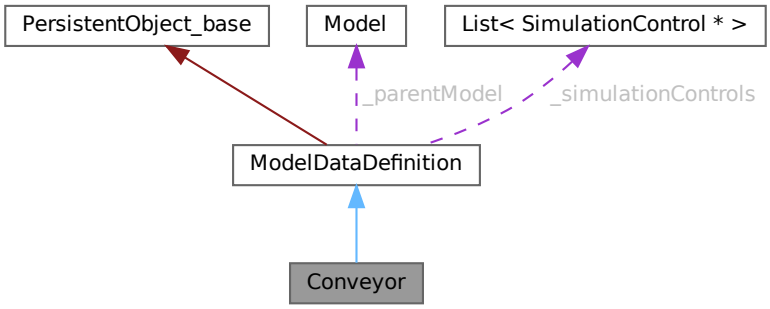
17.159 Conveyor Class Reference

Minimal conveyor data definition built on top of one Segment path.
`#include <plugins/data/MaterialHandling/Conveyor.h>`
Inheritance diagram for Conveyor:



Collaboration diagram for Conveyor:



Public Member Functions

- **Conveyor** (Model *model, std::string name="")
- virtual std::string show () override

  Returns a textual representation of this data definition.
- void **setSegment** (Segment *segment)
- Segment * **getSegment** () const
- void **setVelocity** (double velocity)
- double **getVelocity** () const
- void **setCapacity** (unsigned int capacity)
- unsigned int **getCapacity** () const
- void **setInitiallyActive** (bool initiallyActive)
- bool **isInitiallyActive** () const
- void **setActive** (bool active)
- bool **isActive** () const
- unsigned int **getCurrentAllocation** () const
- bool **access** (unsigned int quantity=1)
- bool **exit** (unsigned int quantity=1)
- double **getDistanceBetween** (const std::string &fromStationName, const std::string &toStationName) const

Public Member Functions inherited from ModelDataDefinition

- ModelDataDefinition (Model *model, std::string datadefinitionTypename, std::string name="", bool insert↩ IntoModel=true)

  Creates a model data definition and optionally inserts it into the model.
- virtual ~**ModelDataDefinition** ()

  Releases resources owned by this data definition.
- Util::identification getId () const

  Returns the unique identifier of this instance.
- void setName (const std::string &name)

  Updates the logical name of this instance.
- const std::string & getName () const

  Returns the logical name of this instance.
- void setLabel (const std::string &label)

  Updates the user-visible label of this instance.
- const std::string & getLabel () const

Returns the user-visible label of this instance.

- const std::string & getClassname () const

  Returns the runtime class name used by the plugin system.
- Model * getParentModel () const

  Returns the parent model that owns this definition.
- bool isReportStatistics () const

  Indicates whether this data definition contributes report statistics.
- void setReportStatistics (bool reportStatistics)

  Enables or disables report-statistics generation for this definition.
- ModelDataDefinition * getInternalData (const std::string &name) const

  Looks up a named internal child data definition.
- std::map< std::string, ModelDataDefinition * > * getInternalData () const

  Returns the full map of internal child data definitions.
- std::map< std::string, ModelDataDefinition * > * getAttachedData () const

  Returns the full map of attached data definitions.
- bool hasChanged () const

  Indicates whether this instance has been modified since the last reset.
- void setHasChanged (bool hasChanged)

  Updates the changed flag for this data definition.
- unsigned int getLevel () const

  Returns the hierarchical editing context containing this element.
- void setModelLevel (unsigned int _modelLevel)

  Sets this element's hierarchical editing context.
- List< SimulationControl * > * getSimulationControls () const

  Returns the simulation controls owned by this data definition.
- TraceManager::Level getTraceLevelSpecific () const

  Returns the trace level that applies specifically to this definition.
- void setTraceLevelSpecific (TraceManager::Level level)

  Updates the trace level used by this definition.
- void defineTraceLevelSpecific (TraceManager::Level traceLevelspecific, bool traceLevelSpecific↩ Enabled=true)

  Defines the specific trace level and optionally enables it immediately.
- bool isTraceLevelSpecificEnabled () const

  Indicates whether the specific trace level is enabled.
- void setTraceLevelSpecificEnabled (bool traceLevelSpecificEnabled)

  Enables or disables the specific trace level.

Static Public Member Functions

- static ModelDataDefinition * **LoadInstance** (Model *model, PersistenceRecord *fields)

17.159.1 Detailed Description

Minimal conveyor data definition built on top of one Segment path.
This implementation intentionally keeps only the semantics required by the current Advanced Transfer closeout: active/inactive state, a single ordered path (Segment), velocity and a simplified concurrent-allocation capacity. It does not model Arena's cell-by-cell occupancy contract.

17.159.2 Member Function Documentation

17.159.2.1 _check()

```
bool Conveyor::_check (
            std::string & errorMessage )  [override], [protected], [virtual]
```

could be overriden by derived classes
Reimplemented from ModelDataDefinition.

17.159.2.2 _createEditableDataDefinitions()

```
void Conveyor::_createEditableDataDefinitions ( )  [override], [protected], [virtual]
```

Reimplemented from ModelDataDefinition.

17.159.2.3 _initBetweenReplications()

```
void Conveyor::_initBetweenReplications ( )  [override], [protected], [virtual]
```

Reimplemented from ModelDataDefinition.

17.159.2.4 _loadInstance()

```
bool Conveyor::_loadInstance (
            PersistenceRecord * fields )  [override], [protected], [virtual]
```

must be overriden by derived classes
Reimplemented from ModelDataDefinition.

17.159.2.5 _saveInstance()

```
void Conveyor::_saveInstance (
            PersistenceRecord * fields,
            bool saveDefaultValues )  [override], [protected], [virtual]
```

Saves object fields into a serialization structure.

Parameters

fields	a table-like structure used for serialization.
saveDefaultValues	indicates whether or not to save fields which are set to their default value.

Reimplemented from ModelDataDefinition.

17.159.2.6 show()

```
std::string Conveyor::show ( )  [override], [virtual]
```

Returns a textual representation of this data definition.
Returns the keys of internal ModelDataDefinitions such as counters, statistics collectors and other children needed before model checking.

Returns

Human-readable summary used by traces and debug output.

Reimplemented from ModelDataDefinition.
The documentation for this class was generated from the following files:

- plugins/data/MaterialHandling/Conveyor.h
- plugins/data/MaterialHandling/Conveyor.cpp

  Updates the user-visible label of this instance.
- const std::string & getLabel () const

  Returns the user-visible label of this instance.
- const std::string & getClassname () const

  Returns the runtime class name used by the plugin system.
- Model * getParentModel () const

  Returns the parent model that owns this definition.
- bool isReportStatistics () const

  Indicates whether this data definition contributes report statistics.
- void setReportStatistics (bool reportStatistics)

  Enables or disables report-statistics generation for this definition.
- ModelDataDefinition * getInternalData (const std::string &name) const

  Looks up a named internal child data definition.
- std::map< std::string, ModelDataDefinition * > * getInternalData () const

  Returns the full map of internal child data definitions.
- std::map< std::string, ModelDataDefinition * > * getAttachedData () const

  Returns the full map of attached data definitions.
- bool hasChanged () const

  Indicates whether this instance has been modified since the last reset.
- void setHasChanged (bool hasChanged)

  Updates the changed flag for this data definition.
- unsigned int getLevel () const

  Returns the hierarchical editing context containing this element.
- void setModelLevel (unsigned int _modelLevel)

  Sets this element's hierarchical editing context.
- List< SimulationControl * > * getSimulationControls () const

  Returns the simulation controls owned by this data definition.
- TraceManager::Level getTraceLevelSpecific () const

  Returns the trace level that applies specifically to this definition.
- void setTraceLevelSpecific (TraceManager::Level level)

  Updates the trace level used by this definition.
- void defineTraceLevelSpecific (TraceManager::Level traceLevelspecific, bool traceLevelSpecificEnabled=true)

  Defines the specific trace level and optionally enables it immediately.
- bool isTraceLevelSpecificEnabled () const

  Indicates whether the specific trace level is enabled.
- void setTraceLevelSpecificEnabled (bool traceLevelSpecificEnabled)

  Enables or disables the specific trace level.

Static Public Member Functions

- static PluginInformation * **GetPluginInformation** ()
- static ModelDataDefinition * **LoadInstance** (Model *model, PersistenceRecord *fields)
- static ModelDataDefinition * **NewInstance** (Model *model, std::string name="")

Static Public Member Functions inherited from ModelDataDefinition

- static ModelDataDefinition * LoadInstance (Model *model, PersistenceRecord *fields, bool insertIntoModel)

  Loads a model data definition instance from serialized fields.
- static ModelDataDefinition * NewInstance (Model *model, std::string name="")

  Creates a new instance of a data definition using the plugin registry.
- static void SaveInstance (PersistenceRecord *fields, ModelDataDefinition *modeldatum)

  Serializes a data definition instance into a persistence record.
- static bool Check (ModelDataDefinition *modeldatum, std::string &errorMessage)

  Validates a data definition instance.
- static void InitBetweenReplications (ModelDataDefinition *modeldatum)

  Resets simulation-time state between replications.
- static void CreateInternalData (ModelDataDefinition *modeldatum)

  Creates internal and attached data required by this instance.
- static bool CreateRelatedDataElements (ModelDataDefinition *modeldatum, std::string &errorMessage)

  Creates related data and validates the instance in a single call.

Protected Member Functions

- virtual bool _loadInstance (PersistenceRecord *fields) override

  must be overriden by derived classes

17.161.1 Detailed Description

Model datum used to accumulate event counts (or weighted counts).
The counter value starts cleared for each replication (depending on model lifecycle hooks) and can be incremented by arbitrary amounts.

17.161.2 Member Function Documentation

17.161.2.1 _check()

```
bool Counter::_check (
            std::string & errorMessage )  [override], [protected], [virtual]
```

could be overriden by derived classes
Reimplemented from ModelDataDefinition.

17.161.2.2 _initBetweenReplications()

```
void Counter::_initBetweenReplications ( )  [override], [protected], [virtual]
```

Reimplemented from ModelDataDefinition.

17.161.2.3 _loadInstance()

```
bool Counter::_loadInstance (
            PersistenceRecord * fields )  [override], [protected], [virtual]
```

must be overriden by derived classes
Reimplemented from ModelDataDefinition.

17.161.2.4 _saveInstance()

```
void Counter::_saveInstance (
            PersistenceRecord * fields,
            bool saveDefaultValues )  [override], [protected], [virtual]
```

Saves object fields into a serialization structure.

Parameters

fields	a table-like structure used for serialization.
saveDefaultValues	indicates whether or not to save fields which are set to their default value.

Reimplemented from ModelDataDefinition.

17.161.2.5 clear()

```
void Counter::clear ( )
```

clear
Resets the internal count value to zero.

17.161.2.6 getCountValue()

```
double Counter::getCountValue ( ) const
```

getCountValue

Returns

Current accumulated count value.

17.161.2.7 getParent()

```
ModelDataDefinition * Counter::getParent ( ) const
```

getParent

Returns

Parent model datum associated with this counter (if any).

17.161.2.8 incCountValue()

```
void Counter::incCountValue (
            double value = 1.0 )
```

incCountValue

Parameters

value	

Adds `value` to the internal count (default increment is 1).

17.161.2.9 show()

```
std::string Counter::show ( )  [override], [virtual]
```

Returns a textual representation of this data definition.
Returns the keys of internal ModelDataDefinitions such as counters, statistics collectors and other children needed before model checking.

Returns

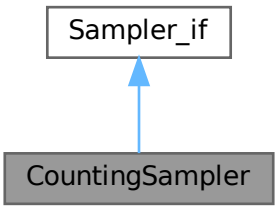
Human-readable summary used by traces and debug output.

Reimplemented from ModelDataDefinition.
The documentation for this class was generated from the following files:

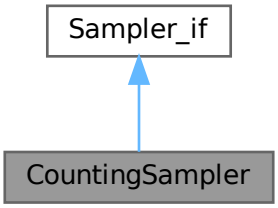
- kernel/simulator/essentialPlugins/Counter.h
- kernel/simulator/essentialPlugins/Counter.cpp

17.162 CountingSampler Class Reference

Inheritance diagram for CountingSampler:



Collaboration diagram for CountingSampler:



Public Member Functions

- **CountingSampler** (int *destroyedCounter, bool *destroyedFlag=nullptr)
- double random () override

  Generates a pseudo-random value uniformly distributed in the range [0,1).
- double sampleBeta (double, double, double infLimit, double) override

  Samples a Beta-distributed value scaled to an arbitrary output interval.
- double sampleBeta (double, double) override

  Samples a standard Beta-distributed value in [0,1].
- double sampleErlang (double, int, double offset=0.0) override

  Samples from an Erlang distribution using the provided mean and number of phases.
- double sampleExponential (double, double offset=0.0) override

  Samples from an Exponential distribution with the provided mean.
- double sampleGamma (double, double, double offset=0.0) override

  Samples from a Gamma distribution using the provided shape/scale parameters.
- double sampleGumbell (double mode, double) override

  Samples from a Gumbel distribution using mode and scale.
- double sampleLogNormal (double, double, double offset=0.0) override

  Samples from a Lognormal distribution parameterized by mean and standard deviation.
- double sampleNormal (double mean, double) override

  Samples from a Normal distribution.
- double sampleTriangular (double min, double, double) override

  Samples from a Triangular distribution.
- double sampleUniform (double min, double) override

  Samples from a continuous Uniform distribution in [min, max].
- double sampleWeibull (double, double) override

  Samples from a Weibull distribution.
- double sampleBinomial (int, double) override

  Samples from a Binomial distribution with `trials` and success probability `p`.
- double sampleBernoulli (double) override

  Samples from a Bernoulli distribution (0/1).
- double sampleDiscrete (double, double,...) override

  Samples from a discrete distribution using a variadic list of probability/value pairs.
- double sampleDiscrete (double *, double *, int) override

  Samples from a discrete distribution using probability/value arrays.
- double sampleGeometric (double) override

Samples from a Geometric distribution with success probability p.

- void setRNGparameters (RNG_Parameters *) override

  Updates the pseudo-random generator internal parameters.

- RNG_Parameters * getRNGparameters () const override

  Returns the current pseudo-random generator parameters.

17.162.1 Member Function Documentation

17.162.1.1 getRNGparameters()

```
RNG_Parameters * CountingSampler::getRNGparameters ( ) const  [inline], [override], [virtual]
```

Returns the current pseudo-random generator parameters.
Implements Sampler_if.

17.162.1.2 random()

```
double CountingSampler::random ( )  [inline], [override], [virtual]
```

Generates a pseudo-random value uniformly distributed in the range [0,1).

Returns

Base pseudo-random value used by the other distribution samplers.

Implements Sampler_if.

17.162.1.3 sampleBernoulli()

```
double CountingSampler::sampleBernoulli (
            double p )  [inline], [override], [virtual]
```

Samples from a Bernoulli distribution (0/1).
Implements Sampler_if.

17.162.1.4 sampleBeta() [1/2]

```
double CountingSampler::sampleBeta (
            double alpha,
            double beta )  [inline], [override], [virtual]
```

Samples a standard Beta-distributed value in [0,1].
Implements Sampler_if.

17.162.1.5 sampleBeta() [2/2]

```
double CountingSampler::sampleBeta (
            double alpha,
            double beta,
            double infLimit,
            double supLimit )  [inline], [override], [virtual]
```

Samples a Beta-distributed value scaled to an arbitrary output interval.

Parameters

alpha	Alpha shape parameter (>0).
beta	Beta shape parameter (>0).
infLimit	Lower bound of the output interval.
supLimit	Upper bound of the output interval.

Returns

Sampled value within [infLimit, supLimit].

Implements Sampler_if.

17.162.1.6 sampleBinomial()

```
double CountingSampler::sampleBinomial (
            int trials,
            double p )  [inline], [override], [virtual]
```

Samples from a Binomial distribution with `trials` and success probability `p`.
Implements Sampler_if.

17.162.1.7 sampleDiscrete() [1/2]

```
double CountingSampler::sampleDiscrete (
            double * prob,
            double * value,
            int size )  [inline], [override], [virtual]
```

Samples from a discrete distribution using probability/value arrays.
Implements Sampler_if.

17.162.1.8 sampleDiscrete() [2/2]

```
double CountingSampler::sampleDiscrete (
            double prob,
            double value,
             ...  )  [inline], [override], [virtual]
```

Samples from a discrete distribution using a variadic list of probability/value pairs.
Implements Sampler_if.

17.162.1.9 sampleErlang()

```
double CountingSampler::sampleErlang (
            double mean,
            int M,
            double offset = 0.0 )  [inline], [override], [virtual]
```

Samples from an Erlang distribution using the provided mean and number of phases.
Implements Sampler_if.

17.162.1.10 sampleExponential()

```
double CountingSampler::sampleExponential (
            double mean,
            double offset = 0.0 )  [inline], [override], [virtual]
```

Samples from an Exponential distribution with the provided mean.
Implements Sampler_if.

17.162.1.11 sampleGamma()

```
double CountingSampler::sampleGamma (
            double alpha,
            double beta,
            double offset = 0.0 )  [inline], [override], [virtual]
```

Samples from a Gamma distribution using the provided shape/scale parameters.
Implements Sampler_if.

17.162.1.12 sampleGeometric()

```
double CountingSampler::sampleGeometric (
            double p )  [inline], [override], [virtual]
```

Samples from a Geometric distribution with success probability p.
Implements Sampler_if.

17.162.1.13 sampleGumbell()

```
double CountingSampler::sampleGumbell (
            double mode,
            double scale )  [inline], [override], [virtual]
```

Samples from a Gumbel distribution using mode and scale.
Implements Sampler_if.

17.162.1.14 sampleLogNormal()

```
double CountingSampler::sampleLogNormal (
            double mean,
            double stddev,
            double offset = 0.0 )  [inline], [override], [virtual]
```

Samples from a Lognormal distribution parameterized by mean and standard deviation.
Implements Sampler_if.

17.162.1.15 sampleNormal()

```
double CountingSampler::sampleNormal (
            double mean,
            double stddev )  [inline], [override], [virtual]
```

Samples from a Normal distribution.
Implements Sampler_if.

17.162.1.16 sampleTriangular()

```
double CountingSampler::sampleTriangular (
            double min,
            double mode,
            double max )  [inline], [override], [virtual]
```

Samples from a Triangular distribution.
Implements Sampler_if.

17.162.1.17 sampleUniform()

```
double CountingSampler::sampleUniform (
            double min,
            double max )  [inline], [override], [virtual]
```

Samples from a continuous Uniform distribution in [min, max].
Implements Sampler_if.

17.162.1.18 sampleWeibull()

```
double CountingSampler::sampleWeibull (
            double alpha,
            double scale )  [inline], [override], [virtual]
```

Samples from a Weibull distribution.
Implements Sampler_if.

17.162.1.19 setRNGparameters()

```
void CountingSampler::setRNGparameters (
            RNG_Parameters * param )  [inline], [override], [virtual]
```

Updates the pseudo-random generator internal parameters.
Implements Sampler_if.

17.163.1 Detailed Description

Directed bipartite arc used by ColoredPetriNetNetwork.
The initial CPN subset uses fixed inscriptions represented as a multiset from symbolic color name to quantity. Variable bindings and typed token values are deliberately deferred.

17.163.2 Member Function Documentation

17.163.2.1 _check()

```
bool CPNArc::_check (
            std::string & errorMessage )  [override], [protected], [virtual]
```

could be overriden by derived classes
Reimplemented from ModelDataDefinition.

17.163.2.2 _loadInstance()

```
bool CPNArc::_loadInstance (
            PersistenceRecord * fields )  [override], [protected], [virtual]
```

must be overriden by derived classes
Reimplemented from ModelDataDefinition.

17.163.2.3 _saveInstance()

```
void CPNArc::_saveInstance (
            PersistenceRecord * fields,
            bool saveDefaultValues )  [override], [protected], [virtual]
```

Saves object fields into a serialization structure.

Parameters

fields	a table-like structure used for serialization.
saveDefaultValues	indicates whether or not to save fields which are set to their default value.

Reimplemented from ModelDataDefinition.

17.163.2.4 show()

```
std::string CPNArc::show ( )  [override], [virtual]
```

Returns a textual representation of this data definition.
Returns the keys of internal ModelDataDefinitions such as counters, statistics collectors and other children needed before model checking.

Returns

Human-readable summary used by traces and debug output.

Reimplemented from ModelDataDefinition.
The documentation for this class was generated from the following files:

- plugins/data/ModalModel/CPNArc.h

- unsigned int **getPriority** () const
- virtual std::string show () override

  virtual public methods

Public Member Functions inherited from DefaultNode

- DefaultNode (Model ∗model, std::string componentTypename, std::string name)

  constructors
- **DefaultNode** (Model ∗model, std::string name="")
- void **addTransition** (DefaultNodeTransition ∗transition)

  new public user methods for this component
- void **removeTransition** (DefaultNodeTransition ∗transition)
- List< DefaultNodeTransition ∗ > ∗ **getTransitions** () const
- void **setInitialNode** (bool initialNode)
- bool **isInitialNode** () const
- void **setFinalNode** (bool finalNode)
- bool **isFinalNode** () const

Public Member Functions inherited from ModelDataDefinition

- ModelDataDefinition (Model ∗model, std::string datadefinitionTypename, std::string name="", bool insert↩ IntoModel=true)

  Creates a model data definition and optionally inserts it into the model.
- virtual ∼**ModelDataDefinition** ()

  Releases resources owned by this data definition.
- Util::identification getId () const

  Returns the unique identifier of this instance.

- void setName (const std::string &name)

  Updates the logical name of this instance.
- const std::string & getName () const

  Returns the logical name of this instance.
- void setLabel (const std::string &label)

  Updates the user-visible label of this instance.
- const std::string & getLabel () const

  Returns the user-visible label of this instance.
- const std::string & getClassname () const

  Returns the runtime class name used by the plugin system.
- Model * getParentModel () const

  Returns the parent model that owns this definition.
- bool isReportStatistics () const

  Indicates whether this data definition contributes report statistics.
- void setReportStatistics (bool reportStatistics)

  Enables or disables report-statistics generation for this definition.
- ModelDataDefinition * getInternalData (const std::string &name) const

  Looks up a named internal child data definition.
- std::map< std::string, ModelDataDefinition * > * getInternalData () const

  Returns the full map of internal child data definitions.
- std::map< std::string, ModelDataDefinition * > * getAttachedData () const

  Returns the full map of attached data definitions.
- bool hasChanged () const

  Indicates whether this instance has been modified since the last reset.
- void setHasChanged (bool hasChanged)

  Updates the changed flag for this data definition.
- unsigned int getLevel () const

  Returns the hierarchical editing context containing this element.
- void setModelLevel (unsigned int _modelLevel)

  Sets this element's hierarchical editing context.
- List< SimulationControl * > * getSimulationControls () const

  Returns the simulation controls owned by this data definition.
- TraceManager::Level getTraceLevelSpecific () const

  Returns the trace level that applies specifically to this definition.
- void setTraceLevelSpecific (TraceManager::Level level)

  Updates the trace level used by this definition.
- void defineTraceLevelSpecific (TraceManager::Level traceLevelspecific, bool traceLevelSpecific↩ Enabled=true)

  Defines the specific trace level and optionally enables it immediately.
- bool isTraceLevelSpecificEnabled () const

  Indicates whether the specific trace level is enabled.
- void setTraceLevelSpecificEnabled (bool traceLevelSpecificEnabled)

  Enables or disables the specific trace level.

Static Public Member Functions

17.164.1 Detailed Description

Transition node used by ColoredPetriNetNetwork.
This is a Petri-net transition node, not a source-to-destination edge. Incidence is represented by explicit CPNArc objects in the owning network.

17.164.2 Member Function Documentation

17.164.2.1 _check()

```
bool CPNTransition::_check (
            std::string & errorMessage )  [override], [protected], [virtual]
```

could be overriden by derived classes
Reimplemented from ModelDataDefinition.

17.164.2.2 _loadInstance()

```
bool CPNTransition::_loadInstance (
            PersistenceRecord * fields )  [override], [protected], [virtual]
```

virtual protected method that must be overriden
Reimplemented from DefaultNode.

17.164.2.3 _saveInstance()

```
void CPNTransition::_saveInstance (
            PersistenceRecord * fields,
            bool saveDefaultValues )  [override], [protected], [virtual]
```

Saves object fields into a serialization structure.

Parameters

fields	a table-like structure used for serialization.
saveDefaultValues	indicates whether or not to save fields which are set to their default value.

Reimplemented from DefaultNode.

17.164.2.4 show()

```
std::string CPNTransition::show ( )  [override], [virtual]
```

virtual public methods
Reimplemented from DefaultNode.
The documentation for this class was generated from the following files:

- plugins/data/ModalModel/CPNTransition.h
- plugins/components/ModalModel/CPNTransition.cpp

Public Member Functions inherited from ModelDataDefinition

- ModelDataDefinition (Model *model, std::string datadefinitionTypename, std::string name="", bool insert↩ IntoModel=true)

  Creates a model data definition and optionally inserts it into the model.
- virtual ~**ModelDataDefinition** ()

  Releases resources owned by this data definition.
- Util::identification getId () const

  Returns the unique identifier of this instance.
- void setName (const std::string &name)

  Updates the logical name of this instance.
- const std::string & getName () const

  Returns the logical name of this instance.
- void setLabel (const std::string &label)

  Updates the user-visible label of this instance.
- const std::string & getLabel () const

  Returns the user-visible label of this instance.
- const std::string & getClassname () const

  Returns the runtime class name used by the plugin system.
- Model * getParentModel () const

  Returns the parent model that owns this definition.
- bool isReportStatistics () const

  Indicates whether this data definition contributes report statistics.
- void setReportStatistics (bool reportStatistics)

  Enables or disables report-statistics generation for this definition.
- ModelDataDefinition * getInternalData (const std::string &name) const

  Looks up a named internal child data definition.
- std::map< std::string, ModelDataDefinition * > * getInternalData () const

  Returns the full map of internal child data definitions.
- std::map< std::string, ModelDataDefinition * > * getAttachedData () const

  Returns the full map of attached data definitions.

- bool hasChanged () const

  Indicates whether this instance has been modified since the last reset.
- void setHasChanged (bool hasChanged)

  Updates the changed flag for this data definition.
- unsigned int getLevel () const

  Returns the hierarchical editing context containing this element.
- void setModelLevel (unsigned int _modelLevel)

  Sets this element's hierarchical editing context.
- List< SimulationControl * > * getSimulationControls () const

  Returns the simulation controls owned by this data definition.
- TraceManager::Level getTraceLevelSpecific () const

  Returns the trace level that applies specifically to this definition.
- void setTraceLevelSpecific (TraceManager::Level level)

  Updates the trace level used by this definition.
- void defineTraceLevelSpecific (TraceManager::Level traceLevelspecific, bool traceLevelSpecific↩ Enabled=true)

  Defines the specific trace level and optionally enables it immediately.
- bool isTraceLevelSpecificEnabled () const

  Indicates whether the specific trace level is enabled.
- void setTraceLevelSpecificEnabled (bool traceLevelSpecificEnabled)

  Enables or disables the specific trace level.

17.165.1 Member Function Documentation

17.165.1.1 _check()

```
bool CppCompiler::_check (
            std::string & errorMessage )  [override], [protected], [virtual]
```

could be overriden by derived classes
Validate minimal compiler configuration before use.
Reimplemented from ModelDataDefinition.

17.165.1.2 _initBetweenReplications()

```
void CppCompiler::_initBetweenReplications ( )  [override], [protected], [virtual]
```

Reimplemented from ModelDataDefinition.

17.165.1.3 _loadInstance()

```
bool CppCompiler::_loadInstance (
            PersistenceRecord * fields )  [override], [protected], [virtual]
```

must be overriden by derived classes
Load persisted compiler configuration.
The structure intentionally follows the same pattern used by other ModelDataDefinition implementations to simplify future maintenance.
Reimplemented from ModelDataDefinition.

17.165.1.4 _saveInstance()

```
void CppCompiler::_saveInstance (
            PersistenceRecord * fields,
            bool saveDefaultValues )  [override], [protected], [virtual]
```

Saves object fields into a serialization structure.

Parameters

fields	a table-like structure used for serialization.
saveDefaultValues	indicates whether or not to save fields which are set to their default value.

Persist compiler configuration.
Keep field names symmetric to _loadInstance for predictable serialization behavior and easier backward-compatible migrations.
Reimplemented from ModelDataDefinition.

17.165.1.5 show()

```
std::string CppCompiler::show ( )  [override], [virtual]
```

Returns a textual representation of this data definition.
Returns the keys of internal ModelDataDefinitions such as counters, statistics collectors and other children needed before model checking.

Returns

Human-readable summary used by traces and debug output.

Reimplemented from ModelDataDefinition.
The documentation for this class was generated from the following files:

- plugins/data/ExternalIntegration/CppCompiler.h
- plugins/data/ExternalIntegration/CppCompiler.cpp

17.166 CppForG Class Reference

```
#include <plugins/components/ExternalIntegration/CppForG.h>
```

Inheritance diagram for CppForG:

- std::string **getIncludesCode** () const

Public Member Functions inherited from ModelComponent

- ModelComponent (Model *model, std::string componentTypename, std::string name="")

  constructors
- virtual ~**ModelComponent** ()

  Releases component-owned resources and unregisters it from the model.
- ConnectionManager * getConnectionManager () const

  new public user methods for this component
- void connectTo (ModelComponent *component, unsigned int inputPortNumber=0)

  Connects this component to another component.
- bool hasBreakpointAt ()

  Indicates whether a simulation breakpoint is set on this component.
- void setDescription (std::string _description)

  Updates the free-form description shown by the GUI.
- std::string getDescription () const

  Returns the free-form description associated with this component.
- void remove (ModelComponent *comp)

  Removes a connected component from this component.

Public Member Functions inherited from ModelDataDefinition

- ModelDataDefinition (Model *model, std::string datadefinitionTypename, std::string name="", bool insertIntoModel=true)

  Creates a model data definition and optionally inserts it into the model.
- virtual ~**ModelDataDefinition** ()

  Releases resources owned by this data definition.
- Util::identification getId () const

  Returns the unique identifier of this instance.
- void setName (const std::string &name)

  Updates the logical name of this instance.
- const std::string & getName () const

  Returns the logical name of this instance.
- void setLabel (const std::string &label)

  Updates the user-visible label of this instance.
- const std::string & getLabel () const

  Returns the user-visible label of this instance.
- const std::string & getClassname () const

  Returns the runtime class name used by the plugin system.
- Model * getParentModel () const

  Returns the parent model that owns this definition.
- bool isReportStatistics () const

  Indicates whether this data definition contributes report statistics.
- void setReportStatistics (bool reportStatistics)

  Enables or disables report-statistics generation for this definition.
- ModelDataDefinition * getInternalData (const std::string &name) const

  Looks up a named internal child data definition.
- std::map< std::string, ModelDataDefinition * > * getInternalData () const

  Returns the full map of internal child data definitions.
- std::map< std::string, ModelDataDefinition * > * getAttachedData () const

  Returns the full map of attached data definitions.
- bool hasChanged () const

  Indicates whether this instance has been modified since the last reset.
- void setHasChanged (bool hasChanged)

  Updates the changed flag for this data definition.
- unsigned int getLevel () const

  Returns the hierarchical editing context containing this element.
- void setModelLevel (unsigned int _modelLevel)

  Sets this element's hierarchical editing context.
- List< SimulationControl * > * getSimulationControls () const

  Returns the simulation controls owned by this data definition.
- TraceManager::Level getTraceLevelSpecific () const

  Returns the trace level that applies specifically to this definition.
- void setTraceLevelSpecific (TraceManager::Level level)

  Updates the trace level used by this definition.
- void defineTraceLevelSpecific (TraceManager::Level traceLevelspecific, bool traceLevelSpecificEnabled=true)

  Defines the specific trace level and optionally enables it immediately.
- bool isTraceLevelSpecificEnabled () const

  Indicates whether the specific trace level is enabled.
- void setTraceLevelSpecificEnabled (bool traceLevelSpecificEnabled)

  Enables or disables the specific trace level.

Static Public Member Functions

17.166.1 Detailed Description

This component ...

17.166.2 Member Function Documentation

17.166.2.1 _check()

```
bool CppForG::_check (
            std::string & errorMessage )  [override], [protected], [virtual]
```

could be overriden by derived classes
Reimplemented from ModelDataDefinition.

17.166.2.2 _createNonEditableDataDefinitions()

```
void CppForG::_createNonEditableDataDefinitions ( )  [override], [protected], [virtual]
```

This method is necessary only for those components that instantiate internal elements that must exist before simulation starts and even before model checking. That's the case of components that have internal StatisticsCollectors, since others components may refer to them as expressions (as in "TVAG(ThisCSTAT)") and therefore the modeldatum must exist before checking such expression
Reimplemented from ModelDataDefinition.

17.166.2.3 _initBetweenReplications()

```
void CppForG::_initBetweenReplications ( )  [override], [protected], [virtual]
```

This method returns all changes in the parser that are needed by plugins of this ModelDatas. When connecting a new plugin, ParserChangesInformation are used to change parser source code, whch is after compiled and dinamically linked to to simulator kernel to reflect the changes
Reimplemented from ModelDataDefinition.

17.166.2.4 _loadInstance()

```
bool CppForG::_loadInstance (
            PersistenceRecord * fields )  [override], [protected], [virtual]
```

virtual protected method that must be overriden
Reimplemented from ModelComponent.

17.166.2.5 _onDispatchEvent()

```
void CppForG::_onDispatchEvent (
            Entity * entity,
            unsigned int inputPortNumber )  [override], [protected], [virtual]
```

Handles a dispatched event for this component type.
This method is only for ModelComponents, not for ModelDataElements.

Parameters

entity	Entity being processed.
inputPortNumber	Input port where the entity arrived.

Implements ModelComponent.

17.166.2.6 _saveInstance()

```
void CppForG::_saveInstance (
            PersistenceRecord * fields,
            bool saveDefaultValues )  [override], [protected], [virtual]
```

Saves object fields into a serialization structure.

Parameters

fields	a table-like structure used for serialization.
saveDefaultValues	indicates whether or not to save fields which are set to their default value.

Reimplemented from ModelComponent.

17.166.2.7 show()

```
std::string CppForG::show ( )  [override], [virtual]
```

virtual public methods
Returns a textual representation of this component.

Returns

Human-readable description used for tracing and debugging.

Reimplemented from ModelComponent.
The documentation for this class was generated from the following files:

- plugins/components/ExternalIntegration/CppForG.h
- plugins/components/ExternalIntegration/CppForG.cpp

17.167 CppModelExporter Class Reference

Service responsible for C++ code representation of the current simulation model.
`#include <applications/gui/genesys/services/CppModelExporter.h>`

Public Member Functions

- **CppModelExporter** (Simulator *simulator, QPlainTextEdit *cppCodeEditor)

  Creates the exporter service for the C++ model-representation pane.
- std::string addCppCodeLine (const std::string &line, unsigned int indent=0) const

  Formats one C++ output line with the requested indentation level.
- void **actualizeModelCppCode** () const

  Rebuilds the full C++ model representation shown in the GUI editor pane.

17.167.1 Detailed Description

Service responsible for C++ code representation of the current simulation model.
The refactoring keeps C++ representation generation outside MainWindow by delegating this concern to a dedicated service. MainWindow wrappers call into this class when model or UI state changes require regeneration.
Responsibilities:

- format indented C++ output lines used by exporter routines;
- rebuild the full C++ representation shown in the GUI code pane.

Boundaries:

- it does not compile or execute generated code;
- it does not persist files directly;
- it does not manage lifecycle/simulation/scene controller flows.

17.167.2 Member Function Documentation

17.167.2.1 addCppCodeLine()

```
std::string CppModelExporter::addCppCodeLine (
            const std::string & line,
            unsigned int indent = 0 ) const
```

Formats one C++ output line with the requested indentation level.

Returns

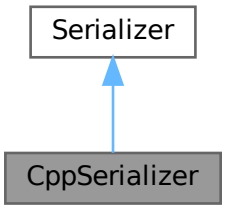
Formatted line that can be appended to the representation buffer.

The documentation for this class was generated from the following files:

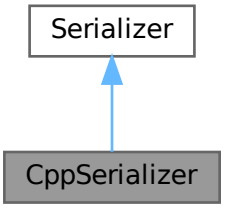
- applications/gui/genesys/services/CppModelExporter.h
- applications/gui/genesys/services/CppModelExporter.cpp

17.168 CppSerializer Class Reference

Inheritance diagram for CppSerializer:



Collaboration diagram for CppSerializer:



Public Member Functions

- **CppSerializer** (Model *model)
- PersistenceRecord * newPersistenceRecord () override

  Creates an empty persistence record.
- bool dump (std::ostream &output) override

  Writes formatted contents to a given output stream.
- bool load (std::istream &input) override

  Attempts to load contents from a given input stream.
- bool get (const std::string &name, PersistenceRecord *entry) override

  Tries to fetch an entry with the given label as a key.
- bool put (const std::string name, const std::string type, const Util::identification id, PersistenceRecord *fields) override

  Upserts an entry into this structure.
- int for_each (std::function< int(const std::string &) > delegate) override

  Iterates over this structure's entries, ordered by ID.

17.168.1 Member Function Documentation

17.168.1.1 dump()

```
bool CppSerializer::dump (
            std::ostream & output )  [override], [virtual]
```

Writes formatted contents to a given output stream.

Parameters

output	output stream to write to.

Returns

whether the current state of this structure's contents was deemed valid for serialization.

Implements Serializer.

17.168.1.2 for_each()

```
int CppSerializer::for_each (
            std::function< int(const std::string &) > delegate )  [override], [virtual]
```

Iterates over this structure's entries, ordered by ID.

Parameters

delegate	delegate which is applied to every entry-identifying key, until it returns a non-zero value.

Returns

either zero, or the first non-zero value returned by the delegate.

Implements Serializer.

17.168.1.3 get()

```
bool CppSerializer::get (
            const std::string & name,
            PersistenceRecord * entry )  [override], [virtual]
```

Tries to fetch an entry with the given label as a key.

Parameters

name	a label which uniquely identifies an entry.
entry	(out-param) a pointer to a caller-owned entry, which is filled on success.

Returns

whether the entry was found and the out-param was actually written to.

Implements Serializer.

17.168.1.4 load()

```
bool CppSerializer::load (
            std::istream & input )  [override], [virtual]
```

Attempts to load contents from a given input stream.

Returns

whether the input was well-formatted and loading was successful.

Implements Serializer.

17.168.1.5 newPersistenceRecord()

```
PersistenceRecord * CppSerializer::newPersistenceRecord ( )  [override], [virtual]
```

Creates an empty persistence record.
Although the returned record can be freed normally with `delete`, care must be taken to only use records which come from a implementation, when configuring that implementation's contents.
Implements Serializer.

17.168.1.6 put()

```
bool CppSerializer::put (
            const std::string name,
            const std::string type,
            const Util::identification id,
            PersistenceRecord * fields )  [override], [virtual]
```

Upserts an entry into this structure.

Parameters

name	a label which uniquely identifies the entry.

Parameters

type	a type name.
id	a component/datadef ID number.
fields	a persistence record for the entry, whose contents will be copied if valid.

Returns

whether the entry was valid and was actually copied into this structure.

Implements Serializer.
The documentation for this class was generated from the following files:

- kernel/simulator/persistence/CppSerializer.h
- kernel/simulator/persistence/CppSerializer.cpp

17.169 Create Class Reference

Source component that generates entities and starts them into the model, driven by a parsed inter-arrival expression, a Schedule, or a Formula.
`#include <plugins/components/Logic/Create.h>`

Public Member Functions inherited from ModelComponent

- ModelComponent (Model *model, std::string componentTypename, std::string name="")

  constructors
- virtual ~**ModelComponent** ()

  Releases component-owned resources and unregisters it from the model.
- ConnectionManager * getConnectionManager () const

  new public user methods for this component
- void connectTo (ModelComponent *component, unsigned int inputPortNumber=0)

  Connects this component to another component.
- bool hasBreakpointAt ()

  Indicates whether a simulation breakpoint is set on this component.
- void setDescription (std::string _description)

  Updates the free-form description shown by the GUI.
- std::string getDescription () const

  Returns the free-form description associated with this component.
- void remove (ModelComponent *comp)

  Removes a connected component from this component.

Public Member Functions inherited from ModelDataDefinition

- ModelDataDefinition (Model *model, std::string datadefinitionTypename, std::string name="", bool insert↩ IntoModel=true)

  Creates a model data definition and optionally inserts it into the model.
- virtual ~**ModelDataDefinition** ()

  Releases resources owned by this data definition.
- Util::identification getId () const

  Returns the unique identifier of this instance.
- void setName (const std::string &name)

  Updates the logical name of this instance.
- const std::string & getName () const

  Returns the logical name of this instance.
- void setLabel (const std::string &label)

  Updates the user-visible label of this instance.
- const std::string & getLabel () const

Returns the user-visible label of this instance.

- const std::string & getClassname () const

  Returns the runtime class name used by the plugin system.

- Model * getParentModel () const

  Returns the parent model that owns this definition.

- bool isReportStatistics () const

  Indicates whether this data definition contributes report statistics.

- void setReportStatistics (bool reportStatistics)

  Enables or disables report-statistics generation for this definition.

- ModelDataDefinition * getInternalData (const std::string &name) const

  Looks up a named internal child data definition.

- std::map< std::string, ModelDataDefinition * > * getInternalData () const

  Returns the full map of internal child data definitions.

- std::map< std::string, ModelDataDefinition * > * getAttachedData () const

  Returns the full map of attached data definitions.

- bool hasChanged () const

  Indicates whether this instance has been modified since the last reset.

- void setHasChanged (bool hasChanged)

  Updates the changed flag for this data definition.

- unsigned int getLevel () const

  Returns the hierarchical editing context containing this element.

- void setModelLevel (unsigned int _modelLevel)

  Sets this element's hierarchical editing context.

- List< SimulationControl * > * getSimulationControls () const

  Returns the simulation controls owned by this data definition.

- TraceManager::Level getTraceLevelSpecific () const

  Returns the trace level that applies specifically to this definition.

- void setTraceLevelSpecific (TraceManager::Level level)

  Updates the trace level used by this definition.

- void defineTraceLevelSpecific (TraceManager::Level traceLevelspecific, bool traceLevelSpecific↩ Enabled=true)

  Defines the specific trace level and optionally enables it immediately.

- bool isTraceLevelSpecificEnabled () const

  Indicates whether the specific trace level is enabled.

- void setTraceLevelSpecificEnabled (bool traceLevelSpecificEnabled)

  Enables or disables the specific trace level.

Static Public Member Functions

- static PluginInformation * **GetPluginInformation** ()
- static ModelComponent * **LoadInstance** (Model *model, PersistenceRecord *fields)
- static ModelDataDefinition * **NewInstance** (Model *model, std::string name="")

Static Public Member Functions inherited from ModelComponent

- static ModelComponent * LoadInstance (Model *model, PersistenceRecord *fields)

  static public methods that must have implementations (Load and New just the same. GetInformation must provide specific infos for the new component

- static bool Check (ModelComponent *component)

  Validates a component instance.

- static void CreateInternalData (ModelComponent *component)

  Creates internal data required by a component instance.

- static void SaveInstance (PersistenceRecord *fields, ModelComponent *component)

  Serializes a component instance into a persistence record.
- static void DispatchEvent (Event *event)

  Dispatches a simulation event to the target component.

Static Public Member Functions inherited from ModelDataDefinition

- static ModelDataDefinition * LoadInstance (Model *model, PersistenceRecord *fields, bool insertIntoModel)

  Loads a model data definition instance from serialized fields.
- static ModelDataDefinition * NewInstance (Model *model, std::string name="")

  Creates a new instance of a data definition using the plugin registry.
- static void SaveInstance (PersistenceRecord *fields, ModelDataDefinition *modeldatum)

  Serializes a data definition instance into a persistence record.
- static bool Check (ModelDataDefinition *modeldatum, std::string &errorMessage)

  Validates a data definition instance.
- static void InitBetweenReplications (ModelDataDefinition *modeldatum)

  Resets simulation-time state between replications.
- static void CreateInternalData (ModelDataDefinition *modeldatum)

  Creates internal and attached data required by this instance.
- static bool CreateRelatedDataElements (ModelDataDefinition *modeldatum, std::string &errorMessage)

  Creates related data and validates the instance in a single call.

Protected Member Functions

- virtual void _onDispatchEvent (Entity *entity, unsigned int inputPortNumber) override

  Handles a dispatched event for this component type.
- virtual bool _loadInstance (PersistenceRecord *fields) override

  virtual protected method that must be overriden
- virtual void _initBetweenReplications () override
- virtual void _saveInstance (PersistenceRecord *fields, bool saveDefaultValues) override

  Saves object fields into a serialization structure.

17.169.1 Detailed Description

Source component that generates entities and starts them into the model, driven by a parsed inter-arrival expression, a Schedule, or a Formula.
Arena correspondence: the "Create module" (Rockwell Automation, *Getting Started with Arena*, "The Basic Process Panel", pp. 31-32). Entity Type, First Creation, Entities per Arrival and Max Arrivals are generalized on the base class SourceModelComponent; see that header for their accessors. Arena's Type field (Random/Schedule/↩ Constant/Expression) is not a stored enum here — Random/Constant/Expression collapse into one parsed time-between-creations expression (SourceModelComponent's default "`EXPO(1.0)`" already matches Arena's default Random behavior), while `_timeBetweenCreationsSchedule` keeps Schedule as a separate, mutually exclusive alternative (`_check()` enforces exactly one active source). `_timeBetweenCreationsFormula` adds a Formula-backed alternative beyond what Arena exposes.
See `docs/ai_assistants/reference/ARENA_GENESYS_COMPATIBILITY.md` §6.1 for the full audited comparison, including an open question about whether Arena's VA/NVA/Wait/Transfer/Other per-entity cost/time accounting has any GenESyS runtime equivalent.

17.169.2 Member Function Documentation

17.169.2.1 _check()

```
bool Create::_check (
            std::string & errorMessage )  [override], [protected], [virtual]
```

could be overriden by derived classes
Reimplemented from SourceModelComponent.

17.169.2.2 _createEditableDataDefinitions()

```
void Create::_createEditableDataDefinitions ( )  [override], [protected], [virtual]
```

Reimplemented from SourceModelComponent.

17.169.2.3 _createInternalStatisticReporters()

```
void Create::_createInternalStatisticReporters ( )  [override], [protected], [virtual]
```

Reimplemented from ModelDataDefinition.

17.169.2.4 _initBetweenReplications()

```
void Create::_initBetweenReplications ( )  [override], [protected], [virtual]
```

Reimplemented from SourceModelComponent.

17.169.2.5 _loadInstance()

```
bool Create::_loadInstance (
            PersistenceRecord * fields )  [override], [protected], [virtual]
```

virtual protected method that must be overriden
Reimplemented from SourceModelComponent.

17.169.2.6 _onDispatchEvent()

```
void Create::_onDispatchEvent (
            Entity * entity,
            unsigned int inputPortNumber )  [override], [protected], [virtual]
```

Handles a dispatched event for this component type.
This method is only for ModelComponents, not for ModelDataElements.

Parameters

entity	Entity being processed.
inputPortNumber	Input port where the entity arrived.

Implements ModelComponent.

17.169.2.7 _saveInstance()

```
void Create::_saveInstance (
            PersistenceRecord * fields,
            bool saveDefaultValues )  [override], [protected], [virtual]
```

Saves object fields into a serialization structure.

Parameters

fields	a table-like structure used for serialization.
saveDefaultValues	indicates whether or not to save fields which are set to their default value.

Reimplemented from SourceModelComponent.

17.169.2.8 show()

```
std::string Create::show ( )  [override], [virtual]
```

virtual public methods
Returns a textual representation of this component.

Returns

Human-readable description used for tracing and debugging.

Reimplemented from SourceModelComponent.

17.182 QtSizePropertyManagerPrivate::Data Struct Reference

Public Member Functions

- QSize **minimumValue** () const
- QSize **maximumValue** () const
- void **setMinimumValue** (const QSize &newMinVal)
- void **setMaximumValue** (const QSize &newMaxVal)

Public Attributes

- QSize **val** { 0, 0 }
- QSize **minVal** { 0, 0 }
- QSize **maxVal** { INT_MAX, INT_MAX }

The documentation for this struct was generated from the following file:

- applications/gui/genesys/propertyeditor/qtpropertybrowser/qtpropertymanager.cpp

17.183 QtStringPropertyManagerPrivate::Data Struct Reference

Public Attributes

- QString **val**
- QString **initVal**
- bool **isInitialed**
- QRegularExpression **regExp**

The documentation for this struct was generated from the following file:

- applications/gui/genesys/propertyeditor/qtpropertybrowser/qtpropertymanager.cpp

17.184 QtTimePropertyManagerPrivate::Data Struct Reference

Public Attributes

- QTime **val** { QTime() }
- QTime **initVal** { QTime() }
- bool **isInitialed** { false }

The documentation for this struct was generated from the following file:

- applications/gui/genesys/propertyeditor/qtpropertybrowser/qtpropertymanager.cpp

17.185 DataAnalyser_if Class Reference

High-level façade for applied statistical analysis over datasets.
`#include <tools/Statistics/DataAnalyser_if.h>`

Public Member Functions

- virtual bool **loadDataSet** (std::string datafilename)=0
- virtual bool **saveDataSet** (std::string datasetname)=0
- virtual void **newDataSet** (std::string datasetname, std::string datafilename)=0
- virtual Fitter_if * **fitter** ()=0
- virtual Sampler_if * **sampler** ()=0
- virtual ExperimentManager_if * **experimenter** ()=0
- virtual HypothesisTester_if * **tester** ()=0

17.185.1 Detailed Description

High-level façade for applied statistical analysis over datasets.
Purpose:

- Coordinate dataset lifecycle and analysis services in a single entry point.

Architectural role:

- Facade that orchestrates fitting, sampling, experiment execution and hypothesis testing.

Ownership/lifetime:

- The returned pointers from fitter(), sampler(), experimenter() and tester() are non-owning views. Concrete implementations must document whether those services are internally owned singletons, members, or externally injected objects.

Implementation status:

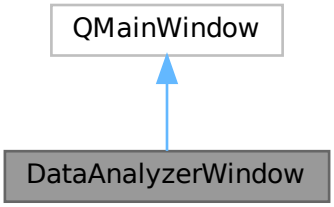
- Interface contract is stable and legacy-compatible.
- A consolidated default concrete implementation is still pending.

The documentation for this class was generated from the following file:

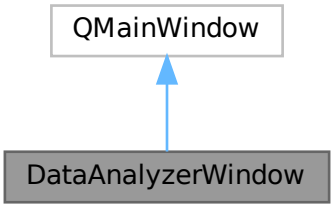
- tools/Statistics/DataAnalyser_if.h

17.186 DataAnalyzerWindow Class Reference

Inheritance diagram for DataAnalyzerWindow:



Collaboration diagram for DataAnalyzerWindow:



Classes

- class DoePreviewPlot
- class HistogramPreview

Public Member Functions

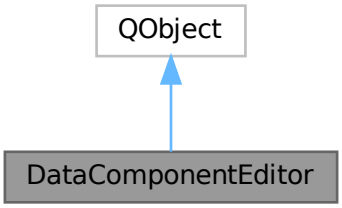
- **DataAnalyzerWindow** (Simulator *simulator, QString &lastDataAnalyzerPath, QWidget *parent=nullptr)

The documentation for this class was generated from the following files:

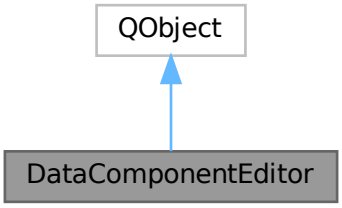
- applications/gui/genesys/tools/dataanalyzer/DataAnalyzerWindow.h
- applications/gui/genesys/tools/dataanalyzer/DataAnalyzerWindow.cpp

17.187 DataComponentEditor Class Reference

Inheritance diagram for DataComponentEditor:



Collaboration diagram for DataComponentEditor:



Public Types

- using **AfterChange** = std::function< void()>

Public Member Functions

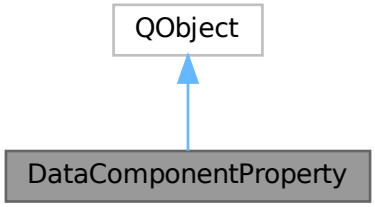
- **DataComponentEditor** (PropertyEditorGenesys *editor, SimulationControl *property, AfterChange after↩ Change={})
- **DataComponentEditor** (PropertyEditorGenesys *editor, List< SimulationControl * > *properties, After↩ Change afterChange={})
- void **open_window** (SimulationControl *property)
- void **open_window** (List< SimulationControl * > *properties)
- void **configure_properties** (SimulationControl *property)
- void **configure_properties** (List< SimulationControl * > *properties)

The documentation for this class was generated from the following files:

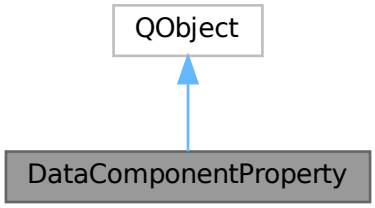
- applications/gui/genesys/propertyeditor/DataComponentEditor.h
- applications/gui/genesys/propertyeditor/DataComponentEditor.cpp

17.188 DataComponentProperty Class Reference

Inheritance diagram for DataComponentProperty:



Collaboration diagram for DataComponentProperty:



Public Types

- using **AfterChange** = std::function< void()>

Public Member Functions

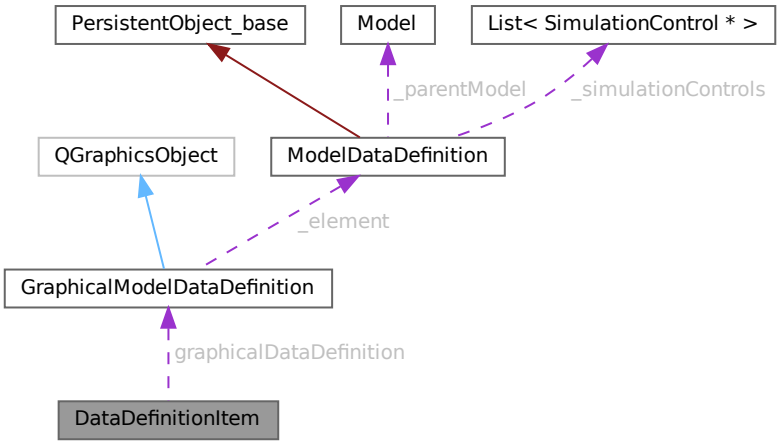
- **DataComponentProperty** (PropertyEditorGenesys *editor, SimulationControl *property, bool necessary↩ Config, AfterChange afterChange={})
- void **open_window** ()
- void **config_values** ()
- bool **isInList** (const std::string &value) const

The documentation for this class was generated from the following files:

- applications/gui/genesys/propertyeditor/DataComponentProperty.h
- applications/gui/genesys/propertyeditor/DataComponentProperty.cpp

17.189 DataDefinitionItem Struct Reference

Collaboration diagram for DataDefinitionItem:



Public Attributes

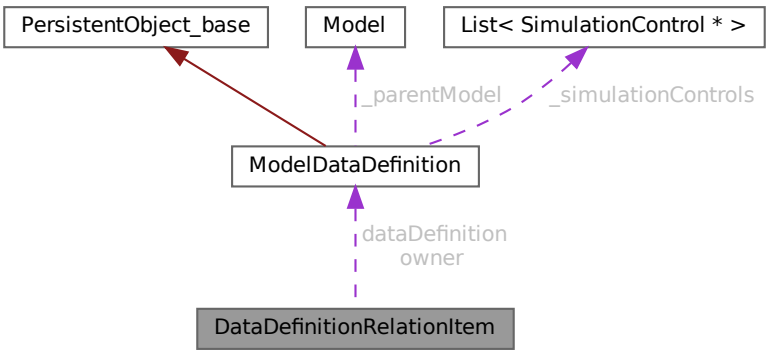
- GraphicalModelDataDefinition * **graphicalDataDefinition**
- QPointF **initialPosition**
- bool **initiallySelected**

The documentation for this struct was generated from the following file:

- applications/gui/genesys/actions/DeleteUndoCommand.h

17.190 DataDefinitionRelationItem Struct Reference

Collaboration diagram for DataDefinitionRelationItem:



Public Attributes

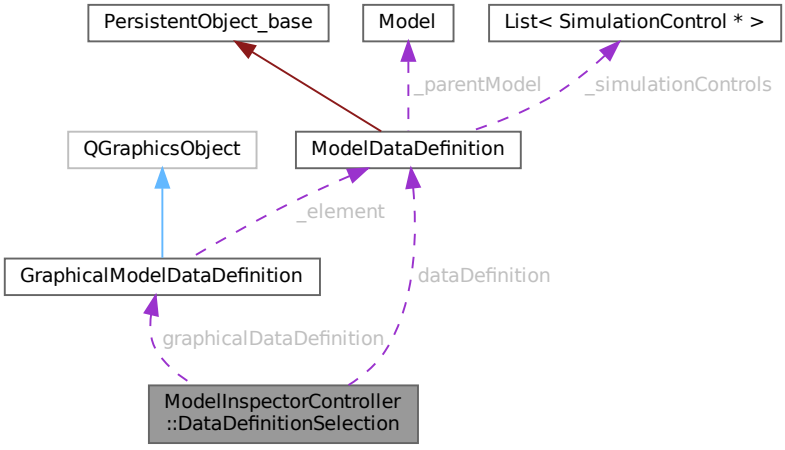
- ModelDataDefinition * **owner**
- ModelDataDefinition * **dataDefinition**
- std::string **key**
- bool **internal**

The documentation for this struct was generated from the following file:

- applications/gui/genesys/actions/DeleteUndoCommand.h

17.191 ModelInspectorController::DataDefinitionSelection Struct Reference

Collaboration diagram for ModelInspectorController::DataDefinitionSelection:



Public Attributes

- bool **handled** = false
- ModelDataDefinition * **dataDefinition** = nullptr
- GraphicalModelDataDefinition * **graphicalDataDefinition** = nullptr

The documentation for this struct was generated from the following file:

- applications/gui/genesys/controllers/ModelInspectorController.h

17.192 AnimationPlot::DataSeries Struct Reference

Public Attributes

- QString **label**
- QString **expression**
- QColor **color** = QColor(31, 119, 180)
- qreal **lineWidth** = 2.0
- QVector< double > **values**

The documentation for this struct was generated from the following file:

- applications/gui/genesys/animations/AnimationPlaceholder.h

17.193 DataSet_if Class Reference

Abstract view of a numeric dataset.
`#include <tools/Statistics/DataSet_if.h>`

Public Member Functions

- virtual unsigned int **size** () const =0
- virtual double **value** (unsigned int index) const =0
- virtual bool **isLoaded** () const =0
- virtual std::string **sourceDescription** () const =0

17.193.1 Detailed Description

Abstract view of a numeric dataset.
Purpose:

- Represent sample data loaded in memory or abstracted from persistent source.

Ownership/lifetime:

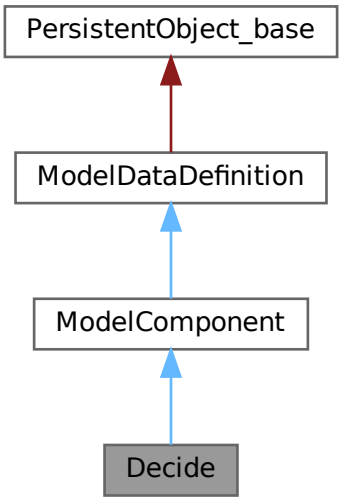
- Implementations own storage/source handles; clients use this interface as a non-owning access contract.

The documentation for this class was generated from the following file:

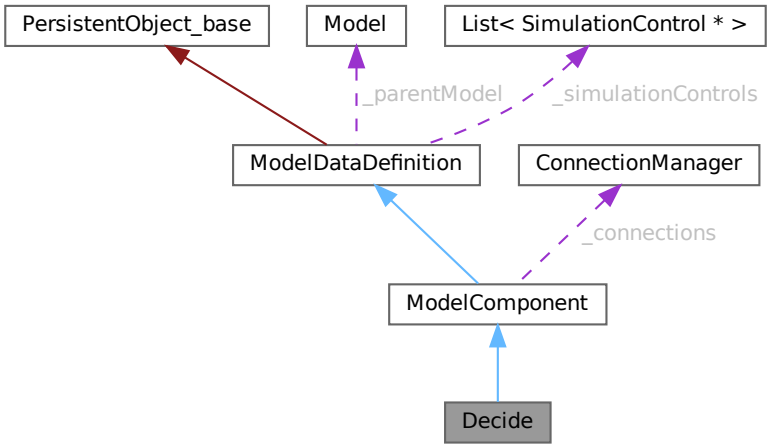
- tools/Statistics/DataSet_if.h

17.194 Decide Class Reference

Routes an entity to the first output port whose parser expression evaluates truthy, or to a trailing "else" port when none do.
`#include <plugins/components/Decisions/Decide.h>`
Inheritance diagram for Decide:



Collaboration diagram for Decide:



Public Member Functions

- **Decide** (Model *model, std::string name="")
- List< std::string > * **getConditions** () const
- void **addConditions** (std::string newCondition)
- void **removeConditions** (std::string condition)
- virtual std::string show () override

  virtual public methods

Public Member Functions inherited from ModelComponent

- ModelComponent (Model *model, std::string componentTypename, std::string name="")

  constructors
- virtual ~**ModelComponent** ()

  Releases component-owned resources and unregisters it from the model.
- ConnectionManager * getConnectionManager () const

  new public user methods for this component
- void connectTo (ModelComponent *component, unsigned int inputPortNumber=0)

  Connects this component to another component.
- bool hasBreakpointAt ()

  Indicates whether a simulation breakpoint is set on this component.
- void setDescription (std::string _description)

  Updates the free-form description shown by the GUI.
- std::string getDescription () const

  Returns the free-form description associated with this component.
- void remove (ModelComponent *comp)

  Removes a connected component from this component.

Public Member Functions inherited from ModelDataDefinition

- ModelDataDefinition (Model *model, std::string datadefinitionTypename, std::string name="", bool insertIntoModel=true)

  Creates a model data definition and optionally inserts it into the model.
- virtual ~**ModelDataDefinition** ()

  Releases resources owned by this data definition.
- Util::identification getId () const

  Returns the unique identifier of this instance.
- void setName (const std::string &name)

  Updates the logical name of this instance.
- const std::string & getName () const

  Returns the logical name of this instance.
- void setLabel (const std::string &label)

  Updates the user-visible label of this instance.
- const std::string & getLabel () const

  Returns the user-visible label of this instance.
- const std::string & getClassname () const

  Returns the runtime class name used by the plugin system.
- Model * getParentModel () const

  Returns the parent model that owns this definition.
- bool isReportStatistics () const

  Indicates whether this data definition contributes report statistics.
- void setReportStatistics (bool reportStatistics)

  Enables or disables report-statistics generation for this definition.
- ModelDataDefinition * getInternalData (const std::string &name) const

  Looks up a named internal child data definition.
- std::map< std::string, ModelDataDefinition * > * getInternalData () const

  Returns the full map of internal child data definitions.
- std::map< std::string, ModelDataDefinition * > * getAttachedData () const

  Returns the full map of attached data definitions.
- bool hasChanged () const

  Indicates whether this instance has been modified since the last reset.
- void setHasChanged (bool hasChanged)

  Updates the changed flag for this data definition.
- unsigned int getLevel () const

  Returns the hierarchical editing context containing this element.
- void setModelLevel (unsigned int _modelLevel)

  Sets this element's hierarchical editing context.
- List< SimulationControl * > * getSimulationControls () const

  Returns the simulation controls owned by this data definition.
- TraceManager::Level getTraceLevelSpecific () const

  Returns the trace level that applies specifically to this definition.
- void setTraceLevelSpecific (TraceManager::Level level)

  Updates the trace level used by this definition.
- void defineTraceLevelSpecific (TraceManager::Level traceLevelspecific, bool traceLevelSpecificEnabled=true)

  Defines the specific trace level and optionally enables it immediately.
- bool isTraceLevelSpecificEnabled () const

  Indicates whether the specific trace level is enabled.
- void setTraceLevelSpecificEnabled (bool traceLevelSpecificEnabled)

  Enables or disables the specific trace level.

Static Public Member Functions

- static PluginInformation * **GetPluginInformation** ()
- static ModelComponent * **LoadInstance** (Model *model, PersistenceRecord *fields)
- static ModelDataDefinition * **NewInstance** (Model *model, std::string name="")

Static Public Member Functions inherited from ModelComponent

- static ModelComponent * LoadInstance (Model *model, PersistenceRecord *fields)

  static public methods that must have implementations (Load and New just the same. GetInformation must provide specific infos for the new component
- static bool Check (ModelComponent *component)

  Validates a component instance.
- static void CreateInternalData (ModelComponent *component)

  Creates internal data required by a component instance.
- static void SaveInstance (PersistenceRecord *fields, ModelComponent *component)

  Serializes a component instance into a persistence record.
- static void DispatchEvent (Event *event)

  Dispatches a simulation event to the target component.

Static Public Member Functions inherited from ModelDataDefinition

- static ModelDataDefinition * LoadInstance (Model *model, PersistenceRecord *fields, bool insertIntoModel)

  Loads a model data definition instance from serialized fields.
- static ModelDataDefinition * NewInstance (Model *model, std::string name="")

  Creates a new instance of a data definition using the plugin registry.
- static void SaveInstance (PersistenceRecord *fields, ModelDataDefinition *modeldatum)

  Serializes a data definition instance into a persistence record.
- static bool Check (ModelDataDefinition *modeldatum, std::string &errorMessage)

  Validates a data definition instance.
- static void InitBetweenReplications (ModelDataDefinition *modeldatum)

  Resets simulation-time state between replications.
- static void CreateInternalData (ModelDataDefinition *modeldatum)

  Creates internal and attached data required by this instance.
- static bool CreateRelatedDataElements (ModelDataDefinition *modeldatum, std::string &errorMessage)

  Creates related data and validates the instance in a single call.

Protected Member Functions

- virtual void _onDispatchEvent (Entity *entity, unsigned int inputPortNumber) override

  Handles a dispatched event for this component type.
- virtual bool _loadInstance (PersistenceRecord *fields) override

  virtual protected method that must be overriden
- virtual void _saveInstance (PersistenceRecord *fields, bool saveDefaultValues) override

  Saves object fields into a serialization structure.
- virtual bool _check (std::string &errorMessage) override

  could be overriden by derived classes
- virtual void _createInternalStatisticReporters () override

Protected Member Functions inherited from ModelDataDefinition

- bool _getSaveDefaultsOption ()
- virtual ParserChangesInformation * _getParserChangesInformation ()
- virtual void _initBetweenReplications ()
- virtual void _addSimulationControl (SimulationControl *control)
- virtual void _createInternalAndAttachedData ()
- virtual void _createAttachedAttributes ()
- virtual void _createNonEditableDataDefinitions ()
- virtual void _createEditableDataDefinitions ()
- void **_templateCreateInternalStatisticReporters** ()
- void **_templateCreateAttachedAttributes** ()
- void **_templateCreateNonEditableDataDefinitions** ()
- void **_templateCreateEditableDataDefinitions** ()
- void **_internaStatisticReportersClear** ()

  legacy helper methods used by the granular create hooks*
- void **_internalDataClear** ()
- void **_internalDataInsert** (const std::string &key, ModelDataDefinition *child)
- void **_internalDataRemove** (const std::string &key)
- void **_attachedDataClear** ()
- void **_attachedDataInsert** (const std::string &key, ModelDataDefinition *data)
- void **_attachedDataRemove** (const std::string &key)
- void **_attachedAttributesInsert** (const std::vector< std::string > &neededNames)
- void **_statisticReporterInsert** (const std::string &key, ModelDataDefinition *data)
- void **_statisticReporterRemove** (const std::string &key)
- void **_statisticReportersClear** ()
- void **_mandatoryAttachedAttributeInsert** (const std::string &key, ModelDataDefinition *data)
- void **_mandatoryAttachedAttributeRemove** (const std::string &key)
- void **_mandatoryAttachedAttributesClear** ()
- void **_mandatoryEditableDataDefinitionInsert** (const std::string &key, ModelDataDefinition *data)
- void **_mandatoryEditableDataDefinitionRemove** (const std::string &key)
- void **_mandatoryEditableDataDefinitionsClear** ()
- void **_optionalEditableDataDefinitionInsert** (const std::string &key, ModelDataDefinition *data)
- void **_optionalEditableDataDefinitionRemove** (const std::string &key)
- void **_optionalEditableDataDefinitionsClear** ()
- void **_mandatoryNonEditableDataDefinitionInsert** (const std::string &key, ModelDataDefinition *data)
- void **_mandatoryNonEditableDataDefinitionRemove** (const std::string &key)
- void **_mandatoryNonEditableDataDefinitionsClear** ()
- void **_optionalNonEditableDataDefinitionInsert** (const std::string &key, ModelDataDefinition *data)
- void **_optionalNonEditableDataDefinitionRemove** (const std::string &key)
- void **_optionalNonEditableDataDefinitionsClear** ()
- void **_checkCreateAttachedReferencedDataDefinition** (const std::string &expression)

  method to be called to insert attached dataelements that are referenced by string expressions (detected by the parser), to avoid orphaned data definitions
- void **trace** (const std::string &text, TraceManager::Level level=TraceManager::Level::L8_detailed)

  not just an easy access to trace manager, but wrappers to check if specific trace level applies
- void **traceError** (const std::string &text, const std::exception &e)
- void **traceError** (const std::string &text, TraceManager::Level level=TraceManager::Level::L1_errorFatal)
- void **traceReport** (const std::string &text, TraceManager::Level level=TraceManager::Level::L2_results)
- void **traceSimulation** (void *thisobject, double time, Entity *entity, ModelComponent *component, const std::string &text, TraceManager::Level level=TraceManager::Level::L8_detailed)
- void traceSimulation (void *thisobject, const std::string &text, TraceManager::Level level=TraceManager::↩ Level::L8_detailed)

  Traces text to the simulation output.
- void **traceSimulation** (void *thisobject, TraceManager::Level level, const std::string &text)

Additional Inherited Members

Protected Attributes inherited from ModelComponent

- ConnectionManager * _connections = new ConnectionManager()

  virtual protected methods that could be overriden by derived classes, if needed

Protected Attributes inherited from ModelDataDefinition

- std::string **_typename**
- bool **_reportStatistics**
- bool **_hasChanged**
- unsigned int **_modelLevel** = 0
- Model * **_parentModel**
- List< SimulationControl * > * **_simulationControls** = new List<SimulationControl*>()
- TraceManager::Level **_traceLevelSpecific**
- bool **_traceLevelSpecificEnabled** = false

17.194.1 Detailed Description

Routes an entity to the first output port whose parser expression evaluates truthy, or to a trailing "else" port when none do.
Arena correspondence: the "Decide module" (Rockwell Automation, *Getting Started with Arena*, "The Basic Process Panel", pp. 36-37), which offers a structured 2-way/N-way, by-Condition/by-Chance dialog (Named/Is/Value with Row/Column for array conditions, or a Percentages field for Chance branching).
GenESyS collapses all of that into one ordered list of boolean parser expressions (`_conditions`), one per output port — a deliberate generalization, not a missing capability. There is no dedicated percentage-based Chance input; expressing chance-based branching (e.g. "60% true") is left to the modeler as a boolean expression over a random draw. Each port has its own entity-count Counter when reporting is enabled.

17.194.2 Member Function Documentation

17.194.2.1 _check()

```
bool Decide::_check (
            std::string & errorMessage )  [override], [protected], [virtual]
```

could be overriden by derived classes
Reimplemented from ModelDataDefinition.

17.194.2.2 _createInternalStatisticReporters()

```
void Decide::_createInternalStatisticReporters ( )  [override], [protected], [virtual]
```

Reimplemented from ModelDataDefinition.

17.194.2.3 _loadInstance()

```
bool Decide::_loadInstance (
            PersistenceRecord * fields )  [override], [protected], [virtual]
```

virtual protected method that must be overriden
Reimplemented from ModelComponent.

17.194.2.4 _onDispatchEvent()

```
void Decide::_onDispatchEvent (
            Entity * entity,
            unsigned int inputPortNumber )  [override], [protected], [virtual]
```

Handles a dispatched event for this component type.
This method is only for ModelComponents, not for ModelDataElements.

Parameters

entity	Entity being processed.
inputPortNumber	Input port where the entity arrived.

Implements ModelComponent.

17.194.2.5 _saveInstance()

```
void Decide::_saveInstance (
            PersistenceRecord * fields,
            bool saveDefaultValues )  [override], [protected], [virtual]
```

Saves object fields into a serialization structure.

Parameters

fields	a table-like structure used for serialization.
saveDefaultValues	indicates whether or not to save fields which are set to their default value.

Reimplemented from ModelComponent.

17.194.2.6 show()

```
std::string Decide::show ( )  [override], [virtual]
```

virtual public methods
Returns a textual representation of this component.

Returns

Human-readable description used for tracing and debugging.

Reimplemented from ModelComponent.

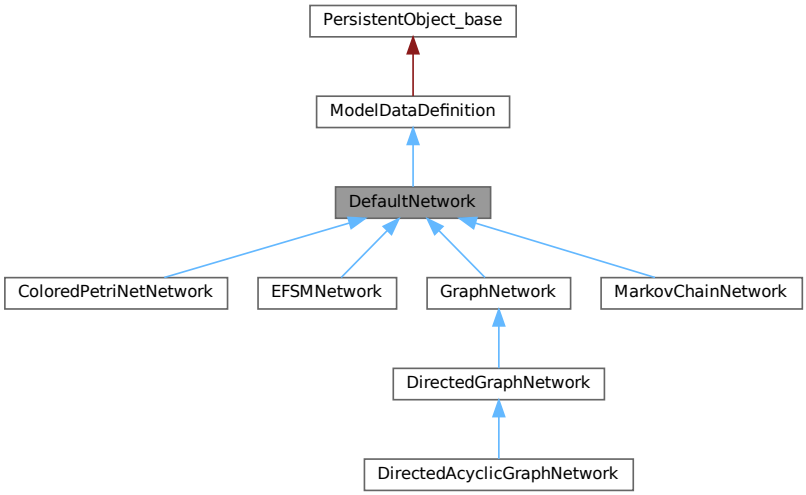
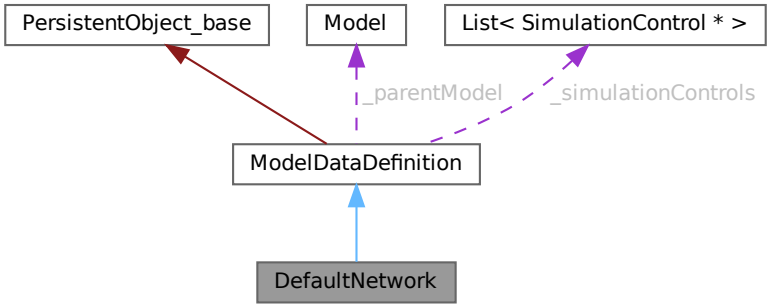
17.202 DefaultNetwork Class Reference

Base class for a formalism-agnostic network model of computation (EFSM, DTMC, Coloured Petri Net, ...) that may be shared by several `ModalModel` process adapters.
`#include <plugins/data/ModalModel/DefaultNetwork.h>`

Inheritance diagram for DefaultNetwork:



Collaboration diagram for DefaultNetwork:



Public Member Functions

- **DefaultNetwork** (Model *model, std::string name="", std::string dataDefinitionTypename=Util::TypeOf< DefaultNetwork >())
- virtual std::string show () override

  Returns a textual representation of this data definition.
- unsigned int **addInputPort** (const std::string &portName)

  Declares a new input port; returns its 0-based index. Rejects a duplicate name (returns the existing index instead of creating a duplicate).
- unsigned int **addOutputPort** (const std::string &portName)

  Declares a new output port; returns its 0-based index. Rejects a duplicate name (returns the existing index instead of creating a duplicate).
- unsigned int **getNumInputPorts** () const
- unsigned int **getNumOutputPorts** () const
- std::string **getInputPortName** (unsigned int index) const

- std::string **getOutputPortName** (unsigned int index) const
- int **getInputPortIndex** (const std::string &portName) const

  Returns the input port index for `portName`, or -1 when not declared.
- int **getOutputPortIndex** (const std::string &portName) const

  Returns the output port index for `portName`, or -1 when not declared.
- double **getActivationCount** () const

  Number of times activate() has been called since the last replication reset.
- NetworkActivationResult activate (const NetworkActivationFrame &frame)

  Runs exactly one network activation for `frame`.

Public Member Functions inherited from ModelDataDefinition

- ModelDataDefinition (Model *model, std::string datadefinitionTypename, std::string name="", bool insertIntoModel=true)

  Creates a model data definition and optionally inserts it into the model.
- virtual ~**ModelDataDefinition** ()

  Releases resources owned by this data definition.
- Util::identification getId () const

  Returns the unique identifier of this instance.
- void setName (const std::string &name)

  Updates the logical name of this instance.
- const std::string & getName () const

  Returns the logical name of this instance.
- void setLabel (const std::string &label)

  Updates the user-visible label of this instance.
- const std::string & getLabel () const

  Returns the user-visible label of this instance.
- const std::string & getClassname () const

  Returns the runtime class name used by the plugin system.
- Model * getParentModel () const

  Returns the parent model that owns this definition.
- bool isReportStatistics () const

  Indicates whether this data definition contributes report statistics.
- void setReportStatistics (bool reportStatistics)

  Enables or disables report-statistics generation for this definition.
- ModelDataDefinition * getInternalData (const std::string &name) const

  Looks up a named internal child data definition.
- std::map< std::string, ModelDataDefinition * > * getInternalData () const

  Returns the full map of internal child data definitions.
- std::map< std::string, ModelDataDefinition * > * getAttachedData () const

  Returns the full map of attached data definitions.
- bool hasChanged () const

  Indicates whether this instance has been modified since the last reset.
- void setHasChanged (bool hasChanged)

  Updates the changed flag for this data definition.
- unsigned int getLevel () const

  Returns the hierarchical editing context containing this element.
- void setModelLevel (unsigned int _modelLevel)

  Sets this element's hierarchical editing context.
- List< SimulationControl * > * getSimulationControls () const

  Returns the simulation controls owned by this data definition.

- TraceManager::Level getTraceLevelSpecific () const

  Returns the trace level that applies specifically to this definition.
- void setTraceLevelSpecific (TraceManager::Level level)

  Updates the trace level used by this definition.
- void defineTraceLevelSpecific (TraceManager::Level traceLevelspecific, bool traceLevelSpecific↩ Enabled=true)

  Defines the specific trace level and optionally enables it immediately.
- bool isTraceLevelSpecificEnabled () const

  Indicates whether the specific trace level is enabled.
- void setTraceLevelSpecificEnabled (bool traceLevelSpecificEnabled)

  Enables or disables the specific trace level.

Static Public Member Functions

- static ModelDataDefinition * **LoadInstance** (Model *model, PersistenceRecord *fields)
- static PluginInformation * **GetPluginInformation** ()
- static ModelDataDefinition * **NewInstance** (Model *model, std::string name="")

Static Public Member Functions inherited from ModelDataDefinition

- static ModelDataDefinition * LoadInstance (Model *model, PersistenceRecord *fields, bool insertIntoModel)

  Loads a model data definition instance from serialized fields.
- static ModelDataDefinition * NewInstance (Model *model, std::string name="")

  Creates a new instance of a data definition using the plugin registry.
- static void SaveInstance (PersistenceRecord *fields, ModelDataDefinition *modeldatum)

  Serializes a data definition instance into a persistence record.
- static bool Check (ModelDataDefinition *modeldatum, std::string &errorMessage)

  Validates a data definition instance.
- static void InitBetweenReplications (ModelDataDefinition *modeldatum)

  Resets simulation-time state between replications.
- static void CreateInternalData (ModelDataDefinition *modeldatum)

  Creates internal and attached data required by this instance.
- static bool CreateRelatedDataElements (ModelDataDefinition *modeldatum, std::string &errorMessage)

  Creates related data and validates the instance in a single call.

Protected Member Functions

- virtual bool _loadInstance (PersistenceRecord *fields) override

  must be overriden by derived classes
- virtual void _saveInstance (PersistenceRecord *fields, bool saveDefaultValues) override

  Saves object fields into a serialization structure.
- virtual bool _check (std::string &errorMessage) override

  could be overriden by derived classes
- virtual void _initBetweenReplications () override
- virtual void _createInternalStatisticReporters () override
- virtual NetworkActivationResult _activate (const NetworkActivationFrame &frame)

  Formalism-specific activation behavior.

Protected Member Functions inherited from ModelDataDefinition

17.202.1 Detailed Description

Base class for a formalism-agnostic network model of computation (EFSM, DTMC, Coloured Petri Net, ...) that may be shared by several `ModalModel` process adapters.
This is the `DefaultNetwork` described in `docs/ai_assistants/reference/GENESYS_MODAL_MODEL_NETWORK_ARCHITECTURE.md` §4.2, §6-§9: a `ModelDataDefinition` (not a `ModelComponent`) that owns its declared input/output port schema, its own persistent runtime state, and an activation counter, and that never receives a GenESyS `Entity*`. Several attached `ModalModel` components may reference and activate the same `DefaultNetwork` instance; the network is the sole source of truth for its state (architecture reference §5, §17-§18).
This base class only implements the infrastructure genuinely common to every formalism: port schema declaration/lookup, the activation counter, and the activation entry point. It intentionally has no notion of nodes, transitions, markings or probabilities — those belong to a specialization (`EFSMNetwork`, `MarkovChainNetwork`, `ColoredPetriNetNetwork`, ...) that overrides `_activate()`.
`activate()` always increments the activation counter, even when the specialization's `_activate()` produces no state change and no present outputs (architecture reference §21) — the counter counts activations, not transitions/firings.

17.202.2 Member Function Documentation

17.202.2.1 _activate()

```
NetworkActivationResult DefaultNetwork::_activate (
            const NetworkActivationFrame & frame )  [protected], [virtual]
```

Formalism-specific activation behavior.
The base implementation performs no state change and returns a result sized to `getNumOutputPorts()` with every output absent. Specializations override this to implement EFSM transition firing, one DTMC step, one CPN firing step, etc. Must not receive or depend on `Entity*` (architecture reference §8.4, §19).
Reimplemented in ColoredPetriNetNetwork, EFSMNetwork, and MarkovChainNetwork.

17.202.2.2 _check()

```
bool DefaultNetwork::_check (
            std::string & errorMessage )  [override], [protected], [virtual]
```

could be overriden by derived classes
Reimplemented from ModelDataDefinition.
Reimplemented in ColoredPetriNetNetwork, DirectedAcyclicGraphNetwork, EFSMNetwork, GraphNetwork, and MarkovChainNetwork.

17.202.2.3 _createInternalStatisticReporters()

```
void DefaultNetwork::_createInternalStatisticReporters ( )  [override], [protected], [virtual]
```

Reimplemented from ModelDataDefinition.

17.202.2.4 _initBetweenReplications()

```
void DefaultNetwork::_initBetweenReplications ( )  [override], [protected], [virtual]
```

Reimplemented from ModelDataDefinition.

17.202.2.5 _loadInstance()

```
bool DefaultNetwork::_loadInstance (
            PersistenceRecord * fields )  [override], [protected], [virtual]
```

must be overriden by derived classes
Reimplemented from ModelDataDefinition.
Reimplemented in ColoredPetriNetNetwork, EFSMNetwork, GraphNetwork, and MarkovChainNetwork.

17.202.2.6 _saveInstance()

```
void DefaultNetwork::_saveInstance (
            PersistenceRecord * fields,
            bool saveDefaultValues )  [override], [protected], [virtual]
```

Saves object fields into a serialization structure.

Parameters

fields	a table-like structure used for serialization.
saveDefaultValues	indicates whether or not to save fields which are set to their default value.

Reimplemented from ModelDataDefinition.
Reimplemented in ColoredPetriNetNetwork, EFSMNetwork, GraphNetwork, and MarkovChainNetwork.

17.202.2.7 activate()

```
NetworkActivationResult DefaultNetwork::activate (
            const NetworkActivationFrame & frame )
```

Runs exactly one network activation for `frame`.
Increments the activation counter unconditionally, then delegates formalism-specific behavior to the protected virtual `_activate()`. The base implementation of `_activate()` produces an all-absent result, so a `DefaultNetwork` used directly (without a specialization) is a valid, inert network.

17.202.2.8 show()

```
std::string DefaultNetwork::show ( )  [override], [virtual]
```

Returns a textual representation of this data definition.
Returns the keys of internal ModelDataDefinitions such as counters, statistics collectors and other children needed before model checking.

Returns

Human-readable summary used by traces and debug output.

Reimplemented from ModelDataDefinition.
Reimplemented in ColoredPetriNetNetwork, EFSMNetwork, GraphNetwork, and MarkovChainNetwork.
The documentation for this class was generated from the following files:

- plugins/data/ModalModel/DefaultNetwork.h
- plugins/data/ModalModel/DefaultNetwork.cpp

17.203 DefaultNode Class Reference

```
#include <plugins/components/ModalModel/DefaultNode.h>
```

  virtual public methods

Public Member Functions inherited from ModelDataDefinition

- ModelDataDefinition (Model *model, std::string datadefinitionTypename, std::string name="", bool insert↩ IntoModel=true)

Creates a model data definition and optionally inserts it into the model.

- virtual ~**ModelDataDefinition** ()

  Releases resources owned by this data definition.

- Util::identification getId () const

  Returns the unique identifier of this instance.

- void setName (const std::string &name)

  Updates the logical name of this instance.

- const std::string & getName () const

  Returns the logical name of this instance.

- void setLabel (const std::string &label)

  Updates the user-visible label of this instance.

- const std::string & getLabel () const

  Returns the user-visible label of this instance.

- const std::string & getClassname () const

  Returns the runtime class name used by the plugin system.

- Model * getParentModel () const

  Returns the parent model that owns this definition.

- bool isReportStatistics () const

  Indicates whether this data definition contributes report statistics.

- void setReportStatistics (bool reportStatistics)

  Enables or disables report-statistics generation for this definition.

- ModelDataDefinition * getInternalData (const std::string &name) const

  Looks up a named internal child data definition.

- std::map< std::string, ModelDataDefinition * > * getInternalData () const

  Returns the full map of internal child data definitions.

- std::map< std::string, ModelDataDefinition * > * getAttachedData () const

  Returns the full map of attached data definitions.

- bool hasChanged () const

  Indicates whether this instance has been modified since the last reset.

- void setHasChanged (bool hasChanged)

  Updates the changed flag for this data definition.

- unsigned int getLevel () const

  Returns the hierarchical editing context containing this element.

- void setModelLevel (unsigned int _modelLevel)

  Sets this element's hierarchical editing context.

- List< SimulationControl * > * getSimulationControls () const

  Returns the simulation controls owned by this data definition.

- TraceManager::Level getTraceLevelSpecific () const

  Returns the trace level that applies specifically to this definition.

- void setTraceLevelSpecific (TraceManager::Level level)

  Updates the trace level used by this definition.

- void defineTraceLevelSpecific (TraceManager::Level traceLevelspecific, bool traceLevelSpecific↩ Enabled=true)

  Defines the specific trace level and optionally enables it immediately.

- bool isTraceLevelSpecificEnabled () const

  Indicates whether the specific trace level is enabled.

- void setTraceLevelSpecificEnabled (bool traceLevelSpecificEnabled)

  Enables or disables the specific trace level.

17.203.1 Detailed Description

This component ...

17.203.2 Constructor & Destructor Documentation

17.203.2.1 DefaultNode()

```
DefaultNode::DefaultNode (
            Model * model,
            std::string componentTypename,
            std::string name )
```

constructors
Externalize function GetPluginInformation to be accessible throught dynamic linked library.

17.203.3 Member Function Documentation

17.203.3.1 _loadInstance()

```
bool DefaultNode::_loadInstance (
            PersistenceRecord * fields )  [override], [protected], [virtual]
```

virtual protected method that must be overriden
Reimplemented from ModelDataDefinition.
Reimplemented in FSMState, PetriPlace, and CPNTransition.

17.203.3.2 _saveInstance()

```
void DefaultNode::_saveInstance (
            PersistenceRecord * fields,
            bool saveDefaultValues )  [override], [protected], [virtual]
```

Saves object fields into a serialization structure.

Parameters

fields	a table-like structure used for serialization.
saveDefaultValues	indicates whether or not to save fields which are set to their default value.

Reimplemented from ModelDataDefinition.
Reimplemented in FSMState, PetriPlace, and CPNTransition.

17.203.3.3 show()

```
std::string DefaultNode::show ( )  [override], [virtual]
```

virtual public methods
Reimplemented from ModelDataDefinition.
Reimplemented in CPNTransition.
The documentation for this class was generated from the following files:

- plugins/components/ModalModel/DefaultNode.h
- plugins/components/ModalModel/DefaultNode.cpp

  virtual public methods

Public Member Functions inherited from ModelComponent

- ModelComponent (Model *model, std::string componentTypename, std::string name="")

  constructors
- virtual ~**ModelComponent** ()

  Releases component-owned resources and unregisters it from the model.
- ConnectionManager * getConnectionManager () const

  new public user methods for this component
- void connectTo (ModelComponent *component, unsigned int inputPortNumber=0)

  Connects this component to another component.
- bool hasBreakpointAt ()

  Indicates whether a simulation breakpoint is set on this component.
- void setDescription (std::string _description)

  Updates the free-form description shown by the GUI.
- std::string getDescription () const

  Returns the free-form description associated with this component.
- void remove (ModelComponent *comp)

  Removes a connected component from this component.

Public Member Functions inherited from ModelDataDefinition

- ModelDataDefinition (Model *model, std::string datadefinitionTypename, std::string name="", bool insert↩ IntoModel=true)

  Creates a model data definition and optionally inserts it into the model.
- virtual ~**ModelDataDefinition** ()

  Releases resources owned by this data definition.
- Util::identification getId () const

  Returns the unique identifier of this instance.
- void setName (const std::string &name)

  Updates the logical name of this instance.
- const std::string & getName () const

  Returns the logical name of this instance.
- void setLabel (const std::string &label)

  Updates the user-visible label of this instance.
- const std::string & getLabel () const

  Returns the user-visible label of this instance.
- const std::string & getClassname () const

  Returns the runtime class name used by the plugin system.
- Model * getParentModel () const

  Returns the parent model that owns this definition.

- bool isReportStatistics () const

  Indicates whether this data definition contributes report statistics.
- void setReportStatistics (bool reportStatistics)

  Enables or disables report-statistics generation for this definition.
- ModelDataDefinition * getInternalData (const std::string &name) const

  Looks up a named internal child data definition.
- std::map< std::string, ModelDataDefinition * > * getInternalData () const

  Returns the full map of internal child data definitions.
- std::map< std::string, ModelDataDefinition * > * getAttachedData () const

  Returns the full map of attached data definitions.
- bool hasChanged () const

  Indicates whether this instance has been modified since the last reset.
- void setHasChanged (bool hasChanged)

  Updates the changed flag for this data definition.
- unsigned int getLevel () const

  Returns the hierarchical editing context containing this element.
- void setModelLevel (unsigned int _modelLevel)

  Sets this element's hierarchical editing context.
- List< SimulationControl * > * getSimulationControls () const

  Returns the simulation controls owned by this data definition.
- TraceManager::Level getTraceLevelSpecific () const

  Returns the trace level that applies specifically to this definition.
- void setTraceLevelSpecific (TraceManager::Level level)

  Updates the trace level used by this definition.
- void defineTraceLevelSpecific (TraceManager::Level traceLevelspecific, bool traceLevelSpecific↩ Enabled=true)

  Defines the specific trace level and optionally enables it immediately.
- bool isTraceLevelSpecificEnabled () const

  Indicates whether the specific trace level is enabled.
- void setTraceLevelSpecificEnabled (bool traceLevelSpecificEnabled)

  Enables or disables the specific trace level.

Static Public Member Functions

- static PluginInformation * **GetPluginInformation** ()
- static ModelComponent * **LoadInstance** (Model *model, PersistenceRecord *fields)
- static ModelDataDefinition * **NewInstance** (Model *model, std::string name="")

Static Public Member Functions inherited from ModelComponent

- static ModelComponent * LoadInstance (Model *model, PersistenceRecord *fields)

  static public methods that must have implementations (Load and New just the same. GetInformation must provide specific infos for the new component
- static bool Check (ModelComponent *component)

  Validates a component instance.
- static void CreateInternalData (ModelComponent *component)

  Creates internal data required by a component instance.
- static void SaveInstance (PersistenceRecord *fields, ModelComponent *component)

  Serializes a component instance into a persistence record.
- static void DispatchEvent (Event *event)

  Dispatches a simulation event to the target component.

Static Public Member Functions inherited from ModelDataDefinition

- static ModelDataDefinition * LoadInstance (Model *model, PersistenceRecord *fields, bool insertIntoModel)

  Loads a model data definition instance from serialized fields.
- static ModelDataDefinition * NewInstance (Model *model, std::string name="")

  Creates a new instance of a data definition using the plugin registry.
- static void SaveInstance (PersistenceRecord *fields, ModelDataDefinition *modeldatum)

  Serializes a data definition instance into a persistence record.
- static bool Check (ModelDataDefinition *modeldatum, std::string &errorMessage)

  Validates a data definition instance.
- static void InitBetweenReplications (ModelDataDefinition *modeldatum)

  Resets simulation-time state between replications.
- static void CreateInternalData (ModelDataDefinition *modeldatum)

  Creates internal and attached data required by this instance.
- static bool CreateRelatedDataElements (ModelDataDefinition *modeldatum, std::string &errorMessage)

  Creates related data and validates the instance in a single call.

Public Attributes

- const struct Delay::DEFAULT_VALUES **DEFAULT**

Protected Member Functions

- virtual void _onDispatchEvent (Entity *entity, unsigned int inputPortNumber) override

  Handles a dispatched event for this component type.
- virtual bool _loadInstance (PersistenceRecord *fields) override

  virtual protected method that must be overriden
- virtual void _saveInstance (PersistenceRecord *fields, bool saveDefaultValues) override

  Saves object fields into a serialization structure.
- virtual bool _check (std::string &errorMessage) override

  could be overriden by derived classes
- virtual void _createInternalStatisticReporters () override
- virtual void _createAttachedAttributes () override

Protected Member Functions inherited from ModelDataDefinition

- bool _getSaveDefaultsOption ()

17.206.1 Detailed Description

Holds an entity in place for an evaluated expression's worth of time, crediting that time to one of five allocation categories.
Arena correspondence: the "Delay module" (Rockwell Automation, *Getting Started with Arena*, "The Advanced Process Panel", pp. 53-54). `_allocation` (a `Util::AllocationType` — ValueAdded/NonValueAdded/Transfer/Wait/Others, matching Arena's five categories exactly) is the closest correspondence to Arena's "Allocation" field.
Confirmed behavior: `_onDispatchEvent()` credits the evaluated delay **time** to the configured category twice — into a `<EntityType>.<Category>Time` StatisticsCollector (when the EntityType reports statistics) and into a running `Entity.Total<Category>Time` attribute on the entity itself. This is the mechanism referenced by `docs/ai_assistants/reference/ARENA_GENESYS_COMPATIBILITY.md` §6.3.
Known difference from Arena: only **time** is allocated; no code path converts accumulated category time into category **cost** (Arena's "costs are calculated and allocated as well").

17.206.2 Member Function Documentation

17.206.2.1 _check()

```
bool Delay::_check (
            std::string & errorMessage )  [override], [protected], [virtual]
```

could be overriden by derived classes
Reimplemented from ModelDataDefinition.

17.206.2.2 _createAttachedAttributes()

```
void Delay::_createAttachedAttributes ( )  [override], [protected], [virtual]
```

Reimplemented from ModelDataDefinition.

17.206.2.3 _createInternalStatisticReporters()

```
void Delay::_createInternalStatisticReporters ( )  [override], [protected], [virtual]
```

Reimplemented from ModelDataDefinition.

17.206.2.4 _loadInstance()

```
bool Delay::_loadInstance (
            PersistenceRecord * fields )  [override], [protected], [virtual]
```

virtual protected method that must be overriden
Reimplemented from ModelComponent.

17.206.2.5 _onDispatchEvent()

```
void Delay::_onDispatchEvent (
            Entity * entity,
            unsigned int inputPortNumber )  [override], [protected], [virtual]
```

Handles a dispatched event for this component type.
This method is only for ModelComponents, not for ModelDataElements.

Parameters

entity	Entity being processed.
inputPortNumber	Input port where the entity arrived.

Implements ModelComponent.

17.206.2.6 _saveInstance()

```
void Delay::_saveInstance (
```

```
PersistenceRecord * fields,
bool saveDefaultValues )  [override], [protected], [virtual]
```

Saves object fields into a serialization structure.

Parameters

fields	a table-like structure used for serialization.
saveDefaultValues	indicates whether or not to save fields which are set to their default value.

Reimplemented from ModelComponent.

17.206.2.7 show()

```
std::string Delay::show ( )  [override], [virtual]
```

virtual public methods
Returns a textual representation of this component.

Returns

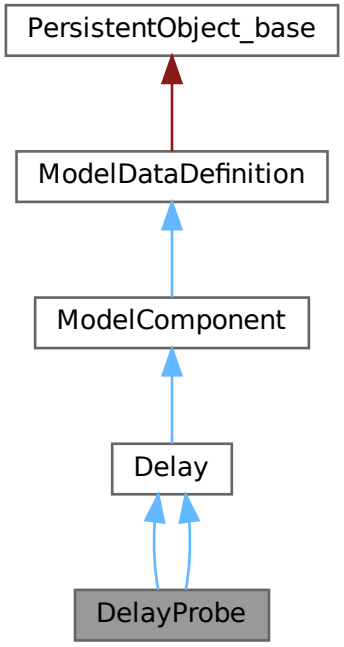
Human-readable description used for tracing and debugging.

Reimplemented from ModelComponent.
The documentation for this class was generated from the following files:

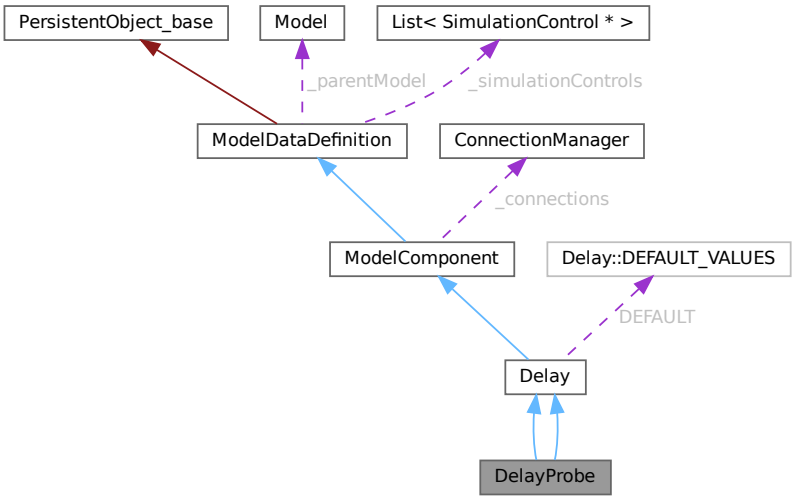
- plugins/components/DiscreteProcessing/Delay.h
- plugins/components/DiscreteProcessing/Delay.cpp

17.207 DelayProbe Class Reference

Inheritance diagram for DelayProbe:



Collaboration diagram for DelayProbe:



Public Member Functions

- **DelayProbe** (Model *model, const std::string &name="")
- void **CreateInternalAndAttachedDataProbe** ()
- StatisticsCollector * **WaitTimeStatisticsCollectorProbe** () const
- void **AddWaitTimeValueProbe** (double waitTime)
- bool **HasAttachedDataProbe** (const std::string &key) const

Public Member Functions inherited from Delay

- **Delay** (Model *model, std::string name="")
- void **setDelayExpression** (std::string _delayExpression, Util::TimeUnit _delayTimeUnit=Util::TimeUnit↩ ::unknown)
- std::string **delayExpression** () const
- void **setDelay** (double delay)
- double **delay** () const
- void **setDelayTimeUnit** (Util::TimeUnit _delayTimeUnit)
- Util::TimeUnit **delayTimeUnit** () const
- void **setAllocation** (Util::AllocationType allocation)
- Util::AllocationType **getAllocation** () const
- virtual std::string show () override

  virtual public methods

Public Member Functions inherited from ModelComponent

- ModelComponent (Model *model, std::string componentTypename, std::string name="")

  constructors
- virtual ~**ModelComponent** ()

  Releases component-owned resources and unregisters it from the model.
- ConnectionManager * getConnectionManager () const

  new public user methods for this component
- void connectTo (ModelComponent *component, unsigned int inputPortNumber=0)

Connects this component to another component.

- bool hasBreakpointAt ()

  Indicates whether a simulation breakpoint is set on this component.

- void setDescription (std::string _description)

  Updates the free-form description shown by the GUI.

- std::string getDescription () const

  Returns the free-form description associated with this component.

- void remove (ModelComponent *comp)

  Removes a connected component from this component.

Public Member Functions inherited from ModelDataDefinition

- ModelDataDefinition (Model *model, std::string datadefinitionTypename, std::string name="", bool insert↩ IntoModel=true)

  Creates a model data definition and optionally inserts it into the model.

- virtual ~**ModelDataDefinition** ()

  Releases resources owned by this data definition.

- Util::identification getId () const

  Returns the unique identifier of this instance.

- void setName (const std::string &name)

  Updates the logical name of this instance.

- const std::string & getName () const

  Returns the logical name of this instance.

- void setLabel (const std::string &label)

  Updates the user-visible label of this instance.

- const std::string & getLabel () const

  Returns the user-visible label of this instance.

- const std::string & getClassname () const

  Returns the runtime class name used by the plugin system.

- Model * getParentModel () const

  Returns the parent model that owns this definition.

- bool isReportStatistics () const

  Indicates whether this data definition contributes report statistics.

- void setReportStatistics (bool reportStatistics)

  Enables or disables report-statistics generation for this definition.

- ModelDataDefinition * getInternalData (const std::string &name) const

  Looks up a named internal child data definition.

- std::map< std::string, ModelDataDefinition * > * getInternalData () const

  Returns the full map of internal child data definitions.

- std::map< std::string, ModelDataDefinition * > * getAttachedData () const

  Returns the full map of attached data definitions.

- bool hasChanged () const

  Indicates whether this instance has been modified since the last reset.

- void setHasChanged (bool hasChanged)

  Updates the changed flag for this data definition.

- unsigned int getLevel () const

  Returns the hierarchical editing context containing this element.

- void setModelLevel (unsigned int _modelLevel)

  Sets this element's hierarchical editing context.

- List< SimulationControl * > * getSimulationControls () const

  Returns the simulation controls owned by this data definition.

- TraceManager::Level getTraceLevelSpecific () const

  Returns the trace level that applies specifically to this definition.
- void setTraceLevelSpecific (TraceManager::Level level)

  Updates the trace level used by this definition.
- void defineTraceLevelSpecific (TraceManager::Level traceLevelspecific, bool traceLevelSpecific↩ Enabled=true)

  Defines the specific trace level and optionally enables it immediately.
- bool isTraceLevelSpecificEnabled () const

  Indicates whether the specific trace level is enabled.
- void setTraceLevelSpecificEnabled (bool traceLevelSpecificEnabled)

  Enables or disables the specific trace level.

Additional Inherited Members

Static Public Member Functions inherited from Delay

- static PluginInformation * **GetPluginInformation** ()
- static ModelComponent * **LoadInstance** (Model *model, PersistenceRecord *fields)
- static ModelDataDefinition * **NewInstance** (Model *model, std::string name="")

Static Public Member Functions inherited from ModelComponent

- static ModelComponent * LoadInstance (Model *model, PersistenceRecord *fields)

  static public methods that must have implementations (Load and New just the same. GetInformation must provide specific infos for the new component
- static bool Check (ModelComponent *component)

  Validates a component instance.
- static void CreateInternalData (ModelComponent *component)

  Creates internal data required by a component instance.
- static void SaveInstance (PersistenceRecord *fields, ModelComponent *component)

  Serializes a component instance into a persistence record.
- static void DispatchEvent (Event *event)

  Dispatches a simulation event to the target component.

Static Public Member Functions inherited from ModelDataDefinition

- static ModelDataDefinition * LoadInstance (Model *model, PersistenceRecord *fields, bool insertIntoModel)

  Loads a model data definition instance from serialized fields.
- static ModelDataDefinition * NewInstance (Model *model, std::string name="")

  Creates a new instance of a data definition using the plugin registry.
- static void SaveInstance (PersistenceRecord *fields, ModelDataDefinition *modeldatum)

  Serializes a data definition instance into a persistence record.
- static bool Check (ModelDataDefinition *modeldatum, std::string &errorMessage)

  Validates a data definition instance.
- static void InitBetweenReplications (ModelDataDefinition *modeldatum)

  Resets simulation-time state between replications.
- static void CreateInternalData (ModelDataDefinition *modeldatum)

  Creates internal and attached data required by this instance.
- static bool CreateRelatedDataElements (ModelDataDefinition *modeldatum, std::string &errorMessage)

  Creates related data and validates the instance in a single call.

Public Attributes inherited from Delay

- const struct Delay::DEFAULT_VALUES **DEFAULT**

Protected Member Functions inherited from Delay

- virtual void _onDispatchEvent (Entity *entity, unsigned int inputPortNumber) override

  Handles a dispatched event for this component type.
- virtual bool _loadInstance (PersistenceRecord *fields) override

  virtual protected method that must be overriden
- virtual void _saveInstance (PersistenceRecord *fields, bool saveDefaultValues) override

  Saves object fields into a serialization structure.
- virtual bool _check (std::string &errorMessage) override

  could be overriden by derived classes
- virtual void _createInternalStatisticReporters () override
- virtual void _createAttachedAttributes () override

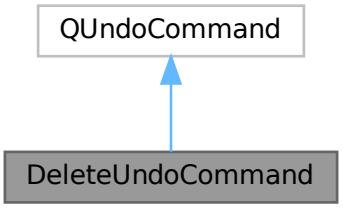
- bool **_traceLevelSpecificEnabled** = false

The documentation for this class was generated from the following file:

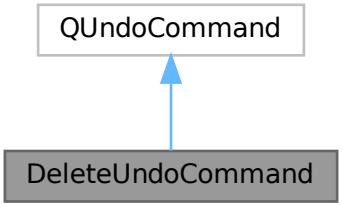
- tests/unit/test_simulator_runtime.cpp

17.208 DeleteUndoCommand Class Reference

Inheritance diagram for DeleteUndoCommand:



Collaboration diagram for DeleteUndoCommand:



Public Member Functions

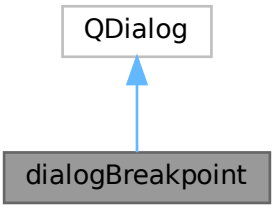
- **DeleteUndoCommand** (QList< QGraphicsItem * > items, ModelGraphicsScene *scene, QUndoCommand *parent=nullptr)
- void **undo** () override
- void **redo** () override

The documentation for this class was generated from the following files:

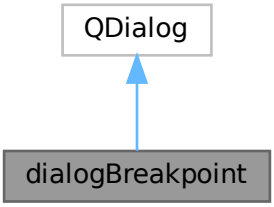
- applications/gui/genesys/actions/DeleteUndoCommand.h
- applications/gui/genesys/actions/DeleteUndoCommand.cpp

17.209 dialogBreakpoint Class Reference

Inheritance diagram for dialogBreakpoint:



Collaboration diagram for dialogBreakpoint:



Classes

- class MVCResult

Public Member Functions

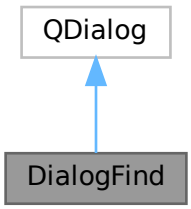
- void **setMVCModel** (Simulator ∗simulator)
- dialogBreakpoint::MVCResult ∗ **getMVCResult** ()

The documentation for this class was generated from the following files:

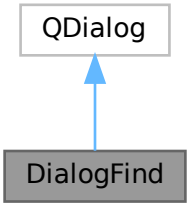
- applications/gui/genesys/dialogs/dialogBreakpoint.h
- applications/gui/genesys/dialogs/dialogBreakpoint.cpp

17.210 DialogFind Class Reference

Inheritance diagram for DialogFind:



Collaboration diagram for DialogFind:



Public Slots

- void **findClicked** ()
- void **nextClicked** ()
- void **previousClicked** ()

Public Member Functions

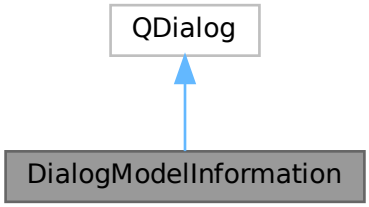
- **DialogFind** (QWidget ∗parent=nullptr, ModelGraphicsScene ∗scene=nullptr)
- QString **getFindText** ()

The documentation for this class was generated from the following files:

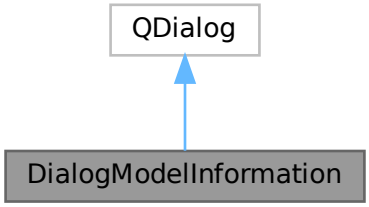
- applications/gui/genesys/dialogs/DialogFind.h
- applications/gui/genesys/dialogs/DialogFind.cpp

17.211 DialogModelInformation Class Reference

Inheritance diagram for DialogModelInformation:



Collaboration diagram for DialogModelInformation:



Public Slots

- void **accept** () override
- void **reject** () override

Public Member Functions

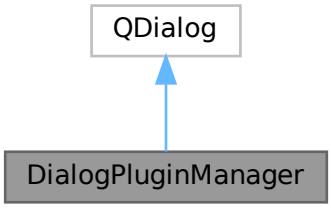
- **DialogModelInformation** (QWidget ∗parent=nullptr)
- void **setModelInfo** (ModelInfo ∗modelInfo)

The documentation for this class was generated from the following files:

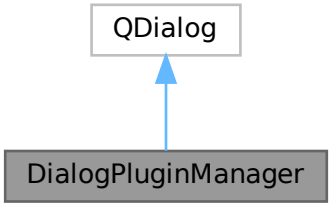
- applications/gui/genesys/dialogs/Dialogmodelinformation.h
- applications/gui/genesys/dialogs/Dialogmodelinformation.cpp

17.212 DialogPluginManager Class Reference

Inheritance diagram for DialogPluginManager:



Collaboration diagram for DialogPluginManager:



Public Member Functions

- DialogPluginManager (QWidget ∗parent=nullptr)

  Builds the plugin manager dialog and prepares the loaded/problem tables.
- void **setSimulator** (Simulator ∗simulator)
- void **setPluginCatalogRefreshCallback** (std::function< void()> refreshCallback)
- void **showProblemPluginsTab** ()

  Selects the problems tab when the dialog is opened for startup diagnostics.

17.212.1 Constructor & Destructor Documentation

17.212.1.1 DialogPluginManager()

```
DialogPluginManager::DialogPluginManager (
            QWidget * parent = nullptr )  [explicit]
```

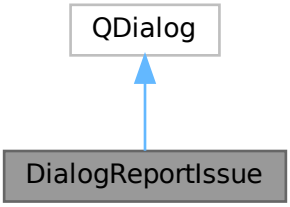
Builds the plugin manager dialog and prepares the loaded/problem tables.
The dialog is responsible for plugin insertion/removal, dependency diagnostics, and recovery of blocked plugins that require system-package installation before they can load.
The documentation for this class was generated from the following files:

- applications/gui/genesys/dialogs/dialogpluginmanager.h
- applications/gui/genesys/dialogs/dialogpluginmanager.cpp

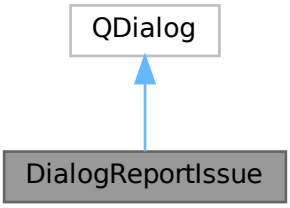
17.213 DialogReportIssue Class Reference

Modal form used to collect a user-facing issue report before relay submission.
`#include <applications/gui/genesys/dialogs/DialogReportIssue.h>`

Inheritance diagram for DialogReportIssue:



Collaboration diagram for DialogReportIssue:



Public Member Functions

- **DialogReportIssue** (QWidget *parent=nullptr)
- IssueReportDraft **draft** () const

  Returns a normalized draft from the current form fields.
- void **setRelayConfigurationStatus** (const QString &endpoint, bool configured, const QString &detail)

  Updates relay availability text and enables/disables the send action accordingly.

17.213.1 Detailed Description

Modal form used to collect a user-facing issue report before relay submission.
Responsibilities:

- collect category, title, description, and optional diagnostic consent flags;
- expose a validated IssueReportDraft for the controller layer;
- reflect whether the report relay is configured and available.

Boundaries:

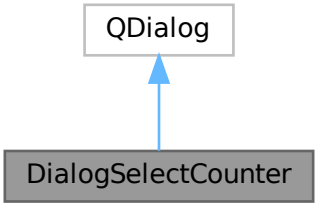
- it does not perform HTTP transport;
- it does not talk to GitHub directly;
- it does not inspect application runtime state on its own.

The documentation for this class was generated from the following files:

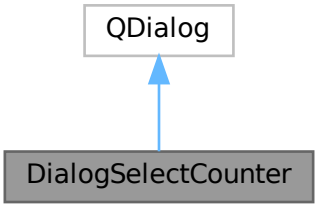
- applications/gui/genesys/dialogs/DialogReportIssue.h
- applications/gui/genesys/dialogs/DialogReportIssue.cpp

17.214 DialogSelectCounter Class Reference

Inheritance diagram for DialogSelectCounter:



Collaboration diagram for DialogSelectCounter:



Public Member Functions

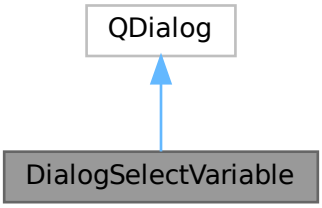
- **DialogSelectCounter** (QWidget *parent=nullptr)
- Counter * **selectedIndex** () const
- void **setCounterItems** (QList< Counter * > *counters, Counter *counter)

The documentation for this class was generated from the following files:

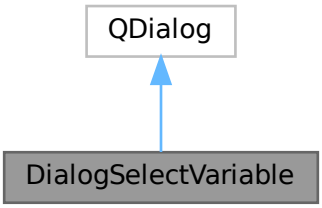
- applications/gui/genesys/dialogs/DialogSelectCounter.h
- applications/gui/genesys/dialogs/DialogSelectCounter.cpp

17.215 DialogSelectVariable Class Reference

Inheritance diagram for DialogSelectVariable:



Collaboration diagram for DialogSelectVariable:



Public Member Functions

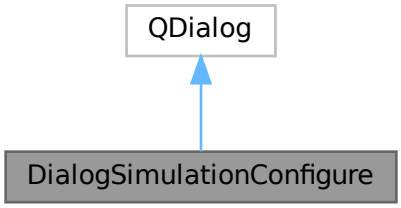
- **DialogSelectVariable** (QWidget *parent=nullptr)
- ModelDataDefinition * **selectedIndex** () const
- void **setVariableItems** (QList< ModelDataDefinition * > *definitions, ModelDataDefinition *definition)

The documentation for this class was generated from the following files:

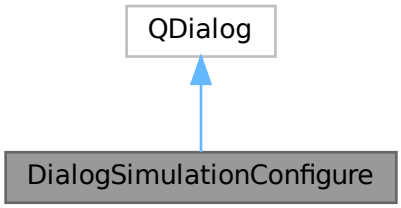
- applications/gui/genesys/dialogs/DialogSelectVariable.h
- applications/gui/genesys/dialogs/DialogSelectVariable.cpp

17.216 DialogSimulationConfigure Class Reference

Inheritance diagram for DialogSimulationConfigure:



Collaboration diagram for DialogSimulationConfigure:



Public Slots

- void accept () override

  Applies the edited configuration back to the model only when the dialog is accepted.
- void reject () override

  Asks for confirmation before discarding unsaved changes.

Public Member Functions

- DialogSimulationConfigure (QWidget ∗parent=nullptr)

  Builds the simulation-configuration dialog and seeds the static combobox content.
- void **setModelSimulation** (ModelSimulation ∗modelSimulation)
- void **setExperimentManager** (ExperimentManager ∗experimentManager)
- void **setParallelizationSettings** (bool ∗enabled, int ∗localThreads, int ∗batchSize)

17.216.1 Constructor & Destructor Documentation

17.216.1.1 DialogSimulationConfigure()

```
DialogSimulationConfigure::DialogSimulationConfigure (
            QWidget * parent = nullptr )  [explicit]
```

Builds the simulation-configuration dialog and seeds the static combobox content.

The dialog currently owns a placeholder entry for distributed parallelization while the local simulation and parallelization settings are still exposed as editable GUI state.

17.216.2 Member Function Documentation

17.216.2.1 accept

`void DialogSimulationConfigure::accept ( ) [override], [slot]`

Applies the edited configuration back to the model only when the dialog is accepted.
This keeps the original values intact until the user confirms the dialog, while still supporting partial ownership of the parallelization fields when no model simulation is currently attached.

17.216.2.2 reject

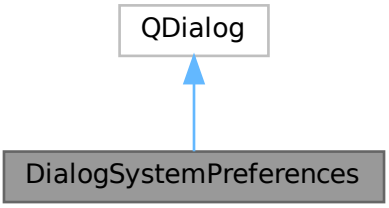
`void DialogSimulationConfigure::reject ( ) [override], [slot]`

Asks for confirmation before discarding unsaved changes.
The dialog checks the current widget state against the snapshot captured at load time so the user does not lose pending configuration edits accidentally.
The documentation for this class was generated from the following files:

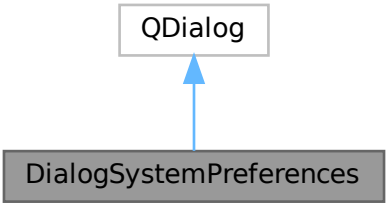
- applications/gui/genesys/dialogs/dialogsimulationconfigure.h
- applications/gui/genesys/dialogs/dialogsimulationconfigure.cpp

17.217 DialogSystemPreferences Class Reference

Inheritance diagram for DialogSystemPreferences:



Collaboration diagram for DialogSystemPreferences:



Public Member Functions

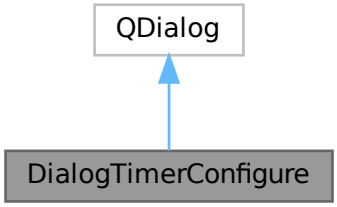
- **DialogSystemPreferences** (Simulator *simulator=nullptr, QWidget *parent=nullptr)

The documentation for this class was generated from the following files:

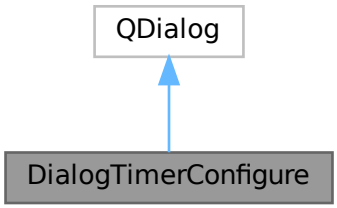
- applications/gui/genesys/dialogs/dialogsystempreferences.h
- applications/gui/genesys/dialogs/dialogsystempreferences.cpp

17.218 DialogTimerConfigure Class Reference

Inheritance diagram for DialogTimerConfigure:



Collaboration diagram for DialogTimerConfigure:



Public Member Functions

- **DialogTimerConfigure** (QWidget *parent=nullptr)
- void **setAnimationTimer** (AnimationTimer *animationTimer)
- void **updateAnimationTimer** ()

The documentation for this class was generated from the following files:

- applications/gui/genesys/dialogs/DialogTimerConfigure.h
- applications/gui/genesys/dialogs/DialogTimerConfigure.cpp

17.219 DialogUtilityController Class Reference

Controller that orchestrates auxiliary dialogs and utility actions.
`#include <applications/gui/genesys/controllers/DialogUtilityController.h>`

Public Member Functions

- **DialogUtilityController** (MainWindow *ownerWidget, Simulator *simulator, Ui::MainWindow *ui, ModelGraphicsView *graphicsView, std::function< void()> showMessageNotImplemented, std::function< void(bool)> actualizeDebugBreakpoints, std::function< bool()> createModelImage, std::function< void()> actualizeActions, std::function< void()> actualizeTabPanes, std::function< void()> reloadPluginCatalog, std::function< ModelGraphicsScene *()> currentScene, double &optimizerPrecision, unsigned int &optimizerMaxSteps, bool &parallelizationEnabled, int &parallelizationThreads, int &parallelizationBatchSize, QString &lastDataAnalyzerPath)

  Builds the utility controller that backs legacy MainWindow dialog wrappers.
- void **onActionAboutAboutTriggered** ()

  Opens the About dialog while preserving legacy action routing.
- void **onActionAboutLicenceTriggered** ()

  Opens the license dialog from the compatibility façade action slot.
- void **onActionAboutGetInvolvedTriggered** ()

  Opens the get-involved/help contribution dialog flow.
- void onActionAboutReportIssueTriggered ()

  Opens the report-issue workflow and submits it through the configured relay.
- void **onActionEditFindTriggered** ()

  Runs find workflow for the currently focused text editor pane.
- void onActionEditReplaceTriggered ()

  Runs replace workflow for the currently focused text editor pane.
- void onActionToolsParserGrammarCheckerTriggered ()

  Opens parser grammar checker utility without altering model state.
- void **onActionToolsOptimizatorTriggered** ()

  Opens optimization settings dialog and stores lightweight preferences.
- void **onActionToolsAIAssistantTriggered** ()

  Opens the AI Assistant panel for LLM-driven simulation model generation.
- void **onActionToolsDataAnalyzerTriggered** ()

  Launches the Data Analyzer workstation using persisted last-path compatibility state.
- void **onActionViewConfigureTriggered** ()

  Opens view configuration dialog and applies delegated scene/UI refreshes.
- void **onActionSimulatorPreferencesTriggered** ()

  Opens simulator preferences utility dialog.
- void **onActionSimulatorsPluginManagerTriggered** (bool showProblemPlugins=false)

  Opens plugin manager dialog from the compatibility action surface.
- void **onPushButtonBreakpointInsertClicked** ()

  Inserts a breakpoint entry based on current scene selection.
- void **onPushButtonBreakpointRemoveClicked** ()

  Removes selected breakpoint entries and refreshes debug breakpoint pane.
- void **onPushButtonExportClicked** ()

  Exports current debug/trace context using legacy push-button route.
- void **onActionParallelizationTriggered** ()

  Opens parallelization configuration and persists run-preference flags.

17.219.1 Detailed Description

Controller that orchestrates auxiliary dialogs and utility actions.
This Phase-11 controller gathers non-core menu/toolbar actions that were still in MainWindow, such as About dialogs, breakpoint utilities, optimization/preferences dialogs, data analyzer launch flow, and parallelization toggles. Responsibilities:

- execute dialog-driven utility actions delegated from MainWindow wrappers;

- access shared UI/simulator state through narrow injected callbacks/references;
- keep compatibility behavior for debug breakpoints and auxiliary tooling actions.

Boundaries:

- it does not own simulator/model lifecycle;
- it does not manage scene command pipeline or property editor internals;
- it acts as a controller-level compatibility wrapper, not as a domain service.

17.219.2 Member Function Documentation

17.219.2.1 onActionAboutReportIssueTriggered()

`void DialogUtilityController::onActionAboutReportIssueTriggered ( )`
Opens the report-issue workflow and submits it through the configured relay.
Opens the GUI issue-report flow, captures runtime context, and submits the payload to the configured relay.
The report draft can include the current model text, console tail, simulation and report logs, the latest process log, and an optional screenshot. The submission result is then surfaced back to the user, including a browser link when the relay returns a created GitHub issue URL.

17.219.2.2 onActionEditReplaceTriggered()

`void DialogUtilityController::onActionEditReplaceTriggered ( )`
Runs replace workflow for the currently focused text editor pane.
Opens the editor replacement dialog and preserves the current find/replace workflow.
The dialog keeps the last search terms, supports case-sensitive matching, wraps the search to the start of the document, and performs single or bulk replacement directly on the code editor without detaching the current selection state.

17.219.2.3 onActionToolsParserGrammarCheckerTriggered()

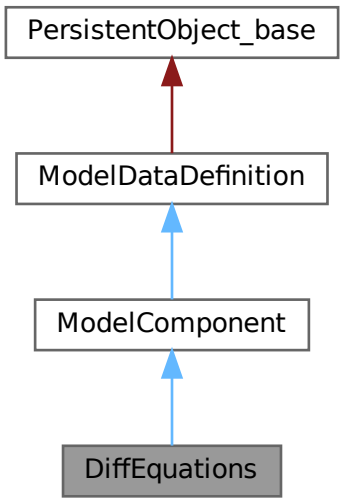
`void DialogUtilityController::onActionToolsParserGrammarCheckerTriggered ( )`
Opens parser grammar checker utility without altering model state.
Builds the parser diagnostics window with grammar overview, DOT export, catalog, and console tabs.
The dialog combines a collapsible grammar map, a DOT text editor, a searchable function catalog, a parser console, and a lightweight model symbol browser so the user can inspect and exercise the expression language from one place.
The documentation for this class was generated from the following files:

- applications/gui/genesys/controllers/DialogUtilityController.h
- applications/gui/genesys/controllers/DialogUtilityController.cpp

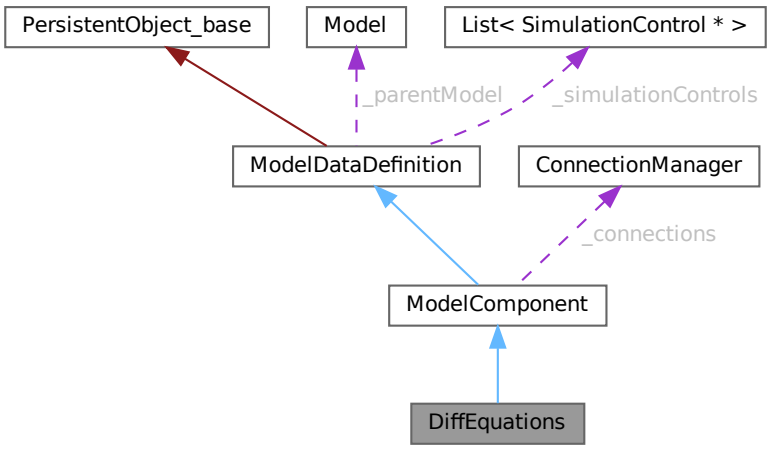
17.220 DiffEquations Class Reference

`#include <plugins/components/Continuous/DiffEquations.h>`

Inheritance diagram for DiffEquations:



Collaboration diagram for DiffEquations:



Public Member Functions

- **DiffEquations** (Model ∗model, std::string name="")
  constructors
- List< std::string > ∗ getEquations () const
  new public user methods for this component
- List< std::string > ∗ **getStateVariableNames** () const
- double **getprecision** () const
- void **setPrecision** (double newPrecision)

- double **getmaxSteps** () const
- void **setMaxSteps** (double newMaxSteps)
- double **getfinalTime** () const
- void **setFinalTime** (double newFinalTime)
- List< double > * **getvaluesOnFinalTime** () const
- virtual std::string show () override

  virtual public methods

Public Member Functions inherited from ModelComponent

- ModelComponent (Model *model, std::string componentTypename, std::string name="")

  constructors
- virtual ~**ModelComponent** ()

  Releases component-owned resources and unregisters it from the model.
- ConnectionManager * getConnectionManager () const

  new public user methods for this component
- void connectTo (ModelComponent *component, unsigned int inputPortNumber=0)

  Connects this component to another component.
- bool hasBreakpointAt ()

  Indicates whether a simulation breakpoint is set on this component.
- void setDescription (std::string _description)

  Updates the free-form description shown by the GUI.
- std::string getDescription () const

  Returns the free-form description associated with this component.
- void remove (ModelComponent *comp)

  Removes a connected component from this component.

Public Member Functions inherited from ModelDataDefinition

- ModelDataDefinition (Model *model, std::string datadefinitionTypename, std::string name="", bool insert↩ IntoModel=true)

  Creates a model data definition and optionally inserts it into the model.
- virtual ~**ModelDataDefinition** ()

  Releases resources owned by this data definition.
- Util::identification getId () const

  Returns the unique identifier of this instance.
- void setName (const std::string &name)

  Updates the logical name of this instance.
- const std::string & getName () const

  Returns the logical name of this instance.
- void setLabel (const std::string &label)

  Updates the user-visible label of this instance.
- const std::string & getLabel () const

  Returns the user-visible label of this instance.
- const std::string & getClassname () const

  Returns the runtime class name used by the plugin system.
- Model * getParentModel () const

  Returns the parent model that owns this definition.
- bool isReportStatistics () const

  Indicates whether this data definition contributes report statistics.
- void setReportStatistics (bool reportStatistics)

  Enables or disables report-statistics generation for this definition.

- ModelDataDefinition * getInternalData (const std::string &name) const

  Looks up a named internal child data definition.
- std::map< std::string, ModelDataDefinition * > * getInternalData () const

  Returns the full map of internal child data definitions.
- std::map< std::string, ModelDataDefinition * > * getAttachedData () const

  Returns the full map of attached data definitions.
- bool hasChanged () const

  Indicates whether this instance has been modified since the last reset.
- void setHasChanged (bool hasChanged)

  Updates the changed flag for this data definition.
- unsigned int getLevel () const

  Returns the hierarchical editing context containing this element.
- void setModelLevel (unsigned int _modelLevel)

  Sets this element's hierarchical editing context.
- List< SimulationControl * > * getSimulationControls () const

  Returns the simulation controls owned by this data definition.
- TraceManager::Level getTraceLevelSpecific () const

  Returns the trace level that applies specifically to this definition.
- void setTraceLevelSpecific (TraceManager::Level level)

  Updates the trace level used by this definition.
- void defineTraceLevelSpecific (TraceManager::Level traceLevelspecific, bool traceLevelSpecific↩ Enabled=true)

  Defines the specific trace level and optionally enables it immediately.
- bool isTraceLevelSpecificEnabled () const

  Indicates whether the specific trace level is enabled.
- void setTraceLevelSpecificEnabled (bool traceLevelSpecificEnabled)

  Enables or disables the specific trace level.

Static Public Member Functions

- static PluginInformation * **GetPluginInformation** ()

  static public methods that must have implementations (Load and New just the same. GetInformation must provide specific infos for the new component
- static ModelComponent * **LoadInstance** (Model *model, PersistenceRecord *fields)
- static ModelDataDefinition * **NewInstance** (Model *model, std::string name="")

Static Public Member Functions inherited from ModelComponent

- static ModelComponent * LoadInstance (Model *model, PersistenceRecord *fields)

  static public methods that must have implementations (Load and New just the same. GetInformation must provide specific infos for the new component
- static bool Check (ModelComponent *component)

  Validates a component instance.
- static void CreateInternalData (ModelComponent *component)

  Creates internal data required by a component instance.
- static void SaveInstance (PersistenceRecord *fields, ModelComponent *component)

  Serializes a component instance into a persistence record.
- static void DispatchEvent (Event *event)

  Dispatches a simulation event to the target component.

Static Public Member Functions inherited from ModelDataDefinition

- static ModelDataDefinition * LoadInstance (Model *model, PersistenceRecord *fields, bool insertIntoModel)

  Loads a model data definition instance from serialized fields.
- static ModelDataDefinition * NewInstance (Model *model, std::string name="")

  Creates a new instance of a data definition using the plugin registry.
- static void SaveInstance (PersistenceRecord *fields, ModelDataDefinition *modeldatum)

  Serializes a data definition instance into a persistence record.
- static bool Check (ModelDataDefinition *modeldatum, std::string &errorMessage)

  Validates a data definition instance.
- static void InitBetweenReplications (ModelDataDefinition *modeldatum)

  Resets simulation-time state between replications.
- static void CreateInternalData (ModelDataDefinition *modeldatum)

  Creates internal and attached data required by this instance.
- static bool CreateRelatedDataElements (ModelDataDefinition *modeldatum, std::string &errorMessage)

  Creates related data and validates the instance in a single call.

Protected Member Functions

- virtual bool _loadInstance (PersistenceRecord *fields) override

  virtual protected method that must be overriden
- virtual void _saveInstance (PersistenceRecord *fields, bool saveDefaultValues) override

  Saves object fields into a serialization structure.
- virtual void _onDispatchEvent (Entity *entity, unsigned int inputPortNumber) override

  This method is only for ModelComponents, not ModelDataElements.
- virtual bool _check (std::string &errorMessage) override

  virtual protected methods that could be overriden by derived classes, if needed
- virtual void _createEditableDataDefinitions () override

Protected Member Functions inherited from ModelDataDefinition

- bool _getSaveDefaultsOption ()

17.220.1 Detailed Description

This component ...

17.220.2 Member Function Documentation

17.220.2.1 _check()

```
bool DiffEquations::_check (
            std::string & errorMessage )  [override], [protected], [virtual]
```

virtual protected methods that could be overriden by derived classes, if needed
This method is called by ModelChecker during model check. The component should check itself to verify if user parameters are ok (ex: correct syntax for the parser) and everithing in its parameters allow the model too run without errors in this component
Reimplemented from ModelDataDefinition.

17.220.2.2 _createEditableDataDefinitions()

```
void DiffEquations::_createEditableDataDefinitions ( )  [override], [protected], [virtual]
```

This method returns all changes in the parser that are needed by plugins of this ModelDatas. When connecting a new plugin, ParserChangesInformation are used to change parser source code, whch is after compiled and dinamically linked to to simulator kernel to reflect the changes
This method is called by ModelSimulation when initianting the replication. The model should set all value for a new replication (Ex: setting back to 0 any internal counter, clearing lists, etc.
This method is not used yet. It should be usefull for new UIs
Reimplemented from ModelDataDefinition.

17.220.2.3 _loadInstance()

```
bool DiffEquations::_loadInstance (
            PersistenceRecord * fields )  [override], [protected], [virtual]
```

virtual protected method that must be overriden
Reimplemented from ModelComponent.

17.220.2.4 _onDispatchEvent()

```
void DiffEquations::_onDispatchEvent (
            Entity * entity,
            unsigned int inputPortNumber )  [override], [protected], [virtual]
```

This method is only for ModelComponents, not ModelDataElements.
Implements ModelComponent.

17.220.2.5 _saveInstance()

```
void DiffEquations::_saveInstance (
            PersistenceRecord * fields,
            bool saveDefaultValues )  [override], [protected], [virtual]
```

Saves object fields into a serialization structure.

Parameters

fields	a table-like structure used for serialization.
saveDefaultValues	indicates whether or not to save fields which are set to their default value.

Reimplemented from ModelComponent.

17.220.2.6 getEquations()

```
List< std::string > * DiffEquations::getEquations ( ) const
```

new public user methods for this component
equations should be in terms of state variable names and t

17.220.2.7 show()

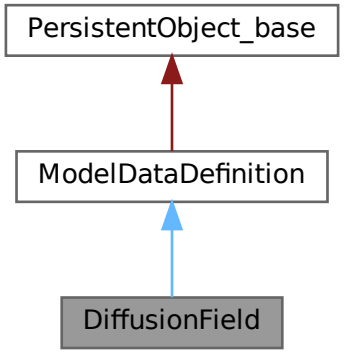
```
std::string DiffEquations::show ( )  [override], [virtual]
```

virtual public methods
Reimplemented from ModelComponent.
The documentation for this class was generated from the following files:

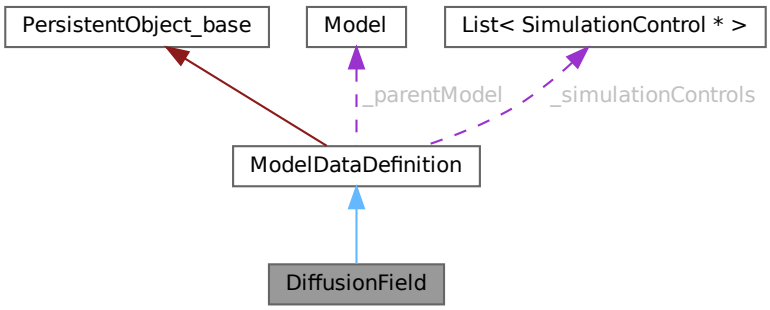
- plugins/components/Continuous/DiffEquations.h
- plugins/components/Continuous/DiffEquations.cpp

17.221 DiffusionField Class Reference

Inheritance diagram for DiffusionField:



Collaboration diagram for DiffusionField:



Public Member Functions

- **DiffusionField** (Model *model, std::string name="")

- double **getMaxValue** () const
- double **getL2Norm** () const
- const std::vector< double > & **getField** () const
- double **getFieldValue** (const std::vector< unsigned int > &multiIndex) const

  Field value at a multi-index (size must equal Dimensions); 0 if invalid.
- bool **simulate** (std::string &errorMessage)
- bool **simulate** (double startTime, double stopTime, double stepSize, std::string &errorMessage)
- bool **advanceOneStep** (std::string &errorMessage)
- std::string **showFieldAsAscii** () const
- virtual std::string show () override

  Returns a textual representation of this data definition.

Public Member Functions inherited from ModelDataDefinition

- ModelDataDefinition (Model *model, std::string datadefinitionTypename, std::string name="", bool insert↩ IntoModel=true)

  Creates a model data definition and optionally inserts it into the model.
- virtual ~**ModelDataDefinition** ()

  Releases resources owned by this data definition.
- Util::identification getId () const

  Returns the unique identifier of this instance.
- void setName (const std::string &name)

  Updates the logical name of this instance.
- const std::string & getName () const

  Returns the logical name of this instance.
- void setLabel (const std::string &label)

Updates the user-visible label of this instance.

- const std::string & getLabel () const

  Returns the user-visible label of this instance.

- const std::string & getClassname () const

  Returns the runtime class name used by the plugin system.

- Model * getParentModel () const

  Returns the parent model that owns this definition.

- bool isReportStatistics () const

  Indicates whether this data definition contributes report statistics.

- void setReportStatistics (bool reportStatistics)

  Enables or disables report-statistics generation for this definition.

- ModelDataDefinition * getInternalData (const std::string &name) const

  Looks up a named internal child data definition.

- std::map< std::string, ModelDataDefinition * > * getInternalData () const

  Returns the full map of internal child data definitions.

- std::map< std::string, ModelDataDefinition * > * getAttachedData () const

  Returns the full map of attached data definitions.

- bool hasChanged () const

  Indicates whether this instance has been modified since the last reset.

- void setHasChanged (bool hasChanged)

  Updates the changed flag for this data definition.

- unsigned int getLevel () const

  Returns the hierarchical editing context containing this element.

- void setModelLevel (unsigned int _modelLevel)

  Sets this element's hierarchical editing context.

- List< SimulationControl * > * getSimulationControls () const

  Returns the simulation controls owned by this data definition.

- TraceManager::Level getTraceLevelSpecific () const

  Returns the trace level that applies specifically to this definition.

- void setTraceLevelSpecific (TraceManager::Level level)

  Updates the trace level used by this definition.

- void defineTraceLevelSpecific (TraceManager::Level traceLevelspecific, bool traceLevelSpecific↩ Enabled=true)

  Defines the specific trace level and optionally enables it immediately.

- bool isTraceLevelSpecificEnabled () const

  Indicates whether the specific trace level is enabled.

- void setTraceLevelSpecificEnabled (bool traceLevelSpecificEnabled)

  Enables or disables the specific trace level.

Static Public Member Functions

- static ModelDataDefinition * **LoadInstance** (Model *model, PersistenceRecord *fields)

17.221.1 Member Function Documentation

17.221.1.1 _check()

```
bool DiffusionField::_check (
            std::string & errorMessage )  [override], [protected], [virtual]
```

could be overriden by derived classes
Reimplemented from ModelDataDefinition.

17.221.1.2 _initBetweenReplications()

```
void DiffusionField::_initBetweenReplications ( )  [override], [protected], [virtual]
```

Reimplemented from ModelDataDefinition.

17.221.1.3 _loadInstance()

```
bool DiffusionField::_loadInstance (
            PersistenceRecord * fields )  [override], [protected], [virtual]
```

must be overriden by derived classes
Reimplemented from ModelDataDefinition.

17.221.1.4 _saveInstance()

```
void DiffusionField::_saveInstance (
            PersistenceRecord * fields,
            bool saveDefaultValues )  [override], [protected], [virtual]
```

Saves object fields into a serialization structure.

Parameters

fields	a table-like structure used for serialization.
saveDefaultValues	indicates whether or not to save fields which are set to their default value.

Reimplemented from ModelDataDefinition.

17.221.1.5 show()

```
std::string DiffusionField::show ( )  [override], [virtual]
```

Returns a textual representation of this data definition.
Returns the keys of internal ModelDataDefinitions such as counters, statistics collectors and other children needed before model checking.

Returns

Human-readable summary used by traces and debug output.

Reimplemented from ModelDataDefinition.
The documentation for this class was generated from the following files:

- plugins/data/Continuous/DiffusionField.h
- plugins/data/Continuous/DiffusionField.cpp

17.222.1 Member Function Documentation

17.222.1.1 dimension()

```
unsigned int DiffusionMethodOfLinesSystem::dimension ( ) const  [inline], [override], [virtual]
```

Implements OdeSystem_if.

17.222.1.2 evaluate()

```
void DiffusionMethodOfLinesSystem::evaluate (
            double ,
            const double * y,
            double * dydt ) const  [inline], [override], [virtual]
```

Implements OdeSystem_if.

The documentation for this class was generated from the following file:

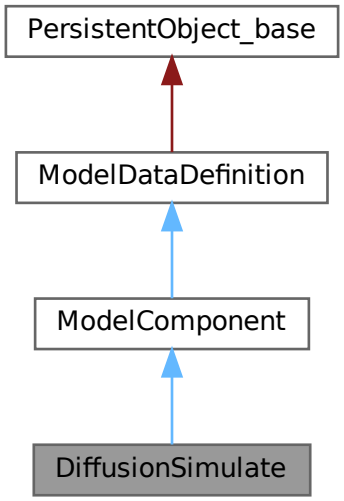
- tools/Continuous/DiffusionMethodOfLinesSystem.h

17.223 DiffusionSimulate Class Reference

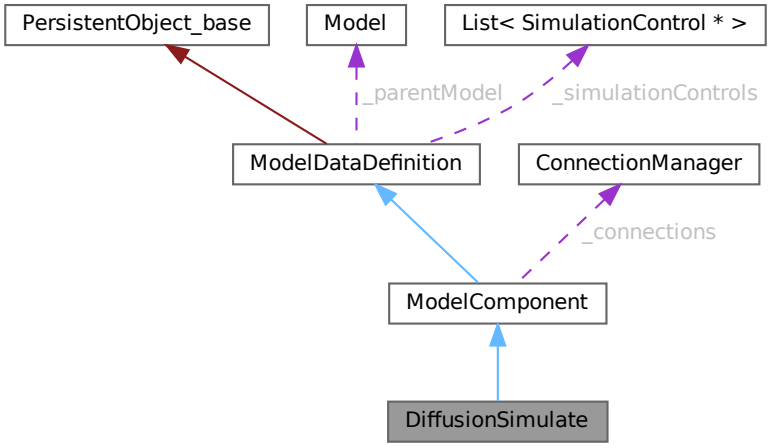
Component that triggers a DiffusionField solve when entities arrive.

`#include <plugins/components/Continuous/DiffusionSimulate.h>`

Inheritance diagram for DiffusionSimulate:



Collaboration diagram for DiffusionSimulate:



Public Member Functions

- **DiffusionSimulate** (Model *model, std::string name="")

- virtual std::string show () override

  virtual public methods

Public Member Functions inherited from ModelComponent

- ModelComponent (Model *model, std::string componentTypename, std::string name="")

  constructors
- virtual ~**ModelComponent** ()

  Releases component-owned resources and unregisters it from the model.
- ConnectionManager * getConnectionManager () const

  new public user methods for this component
- void connectTo (ModelComponent *component, unsigned int inputPortNumber=0)

  Connects this component to another component.
- bool hasBreakpointAt ()

  Indicates whether a simulation breakpoint is set on this component.
- void setDescription (std::string _description)

Updates the free-form description shown by the GUI.

- std::string getDescription () const

  Returns the free-form description associated with this component.

- void remove (ModelComponent *comp)

  Removes a connected component from this component.

Public Member Functions inherited from ModelDataDefinition

- ModelDataDefinition (Model *model, std::string datadefinitionTypename, std::string name="", bool insert↩ IntoModel=true)

  Creates a model data definition and optionally inserts it into the model.

- virtual ~**ModelDataDefinition** ()

  Releases resources owned by this data definition.

- Util::identification getId () const

  Returns the unique identifier of this instance.

- void setName (const std::string &name)

  Updates the logical name of this instance.

- const std::string & getName () const

  Returns the logical name of this instance.

- void setLabel (const std::string &label)

  Updates the user-visible label of this instance.

- const std::string & getLabel () const

  Returns the user-visible label of this instance.

- const std::string & getClassname () const

  Returns the runtime class name used by the plugin system.

- Model * getParentModel () const

  Returns the parent model that owns this definition.

- bool isReportStatistics () const

  Indicates whether this data definition contributes report statistics.

- void setReportStatistics (bool reportStatistics)

  Enables or disables report-statistics generation for this definition.

- ModelDataDefinition * getInternalData (const std::string &name) const

  Looks up a named internal child data definition.

- std::map< std::string, ModelDataDefinition * > * getInternalData () const

  Returns the full map of internal child data definitions.

- std::map< std::string, ModelDataDefinition * > * getAttachedData () const

  Returns the full map of attached data definitions.

- bool hasChanged () const

  Indicates whether this instance has been modified since the last reset.

- void setHasChanged (bool hasChanged)

  Updates the changed flag for this data definition.

- unsigned int getLevel () const

  Returns the hierarchical editing context containing this element.

- void setModelLevel (unsigned int _modelLevel)

  Sets this element's hierarchical editing context.

- List< SimulationControl * > * getSimulationControls () const

  Returns the simulation controls owned by this data definition.

- TraceManager::Level getTraceLevelSpecific () const

  Returns the trace level that applies specifically to this definition.

- void setTraceLevelSpecific (TraceManager::Level level)

  Updates the trace level used by this definition.

- void defineTraceLevelSpecific (TraceManager::Level traceLevelspecific, bool traceLevelSpecific↩ Enabled=true)

  Defines the specific trace level and optionally enables it immediately.
- bool isTraceLevelSpecificEnabled () const

  Indicates whether the specific trace level is enabled.
- void setTraceLevelSpecificEnabled (bool traceLevelSpecificEnabled)

  Enables or disables the specific trace level.

Static Public Member Functions

- static PluginInformation * **GetPluginInformation** ()
- static ModelComponent * **LoadInstance** (Model *model, PersistenceRecord *fields)
- static ModelDataDefinition * **NewInstance** (Model *model, std::string name="")

Static Public Member Functions inherited from ModelComponent

- static ModelComponent * LoadInstance (Model *model, PersistenceRecord *fields)

  static public methods that must have implementations (Load and New just the same. GetInformation must provide specific infos for the new component
- static bool Check (ModelComponent *component)

  Validates a component instance.
- static void CreateInternalData (ModelComponent *component)

  Creates internal data required by a component instance.
- static void SaveInstance (PersistenceRecord *fields, ModelComponent *component)

  Serializes a component instance into a persistence record.
- static void DispatchEvent (Event *event)

  Dispatches a simulation event to the target component.

Static Public Member Functions inherited from ModelDataDefinition

- static ModelDataDefinition * LoadInstance (Model *model, PersistenceRecord *fields, bool insertIntoModel)

  Loads a model data definition instance from serialized fields.
- static ModelDataDefinition * NewInstance (Model *model, std::string name="")

  Creates a new instance of a data definition using the plugin registry.
- static void SaveInstance (PersistenceRecord *fields, ModelDataDefinition *modeldatum)

  Serializes a data definition instance into a persistence record.
- static bool Check (ModelDataDefinition *modeldatum, std::string &errorMessage)

  Validates a data definition instance.
- static void InitBetweenReplications (ModelDataDefinition *modeldatum)

  Resets simulation-time state between replications.
- static void CreateInternalData (ModelDataDefinition *modeldatum)

  Creates internal and attached data required by this instance.
- static bool CreateRelatedDataElements (ModelDataDefinition *modeldatum, std::string &errorMessage)

  Creates related data and validates the instance in a single call.

Protected Member Functions

- virtual bool _loadInstance (PersistenceRecord *fields) override

  virtual protected method that must be overriden
- virtual void _saveInstance (PersistenceRecord *fields, bool saveDefaultValues) override

  Saves object fields into a serialization structure.
- virtual bool _check (std::string &errorMessage) override

  could be overriden by derived classes
- virtual void _onDispatchEvent (Entity *entity, unsigned int inputPortNumber) override

  Handles a dispatched event for this component type.
- virtual void _createEditableDataDefinitions () override

Protected Member Functions inherited from ModelDataDefinition

- bool _getSaveDefaultsOption ()
- virtual ParserChangesInformation * _getParserChangesInformation ()

17.223.1 Detailed Description

Component that triggers a DiffusionField solve when entities arrive.
DiffusionSimulate delegates the continuous diffusion solve to a referenced DiffusionField (a ModelDataDefinition in plugins/data/Continuous). Each arriving entity runs the field either with its own configured time window or with component-provided start/stop/step values, then forwards the entity. This is the discrete->continuous bridge: a discrete-event component drives the continuous PDE subsystem. For event-clock-synchronized advance, enable AutoSchedule on the DiffusionField instead, so it steps once per kernel InternalEvent.

17.223.2 Member Function Documentation

17.223.2.1 _check()

```
bool DiffusionSimulate::_check (
            std::string & errorMessage )  [override], [protected], [virtual]
```

could be overriden by derived classes
Reimplemented from ModelDataDefinition.

17.223.2.2 _createEditableDataDefinitions()

```
void DiffusionSimulate::_createEditableDataDefinitions ( )  [override], [protected], [virtual]
```

Reimplemented from ModelDataDefinition.

17.223.2.3 _loadInstance()

```
bool DiffusionSimulate::_loadInstance (
            PersistenceRecord * fields )  [override], [protected], [virtual]
```

virtual protected method that must be overriden
Reimplemented from ModelComponent.

17.223.2.4 _onDispatchEvent()

```
void DiffusionSimulate::_onDispatchEvent (
            Entity * entity,
            unsigned int inputPortNumber )  [override], [protected], [virtual]
```

Handles a dispatched event for this component type.
This method is only for ModelComponents, not for ModelDataElements.

Parameters

entity	Entity being processed.

Parameters

inputPortNumber	Input port where the entity arrived.

Implements ModelComponent.

17.223.2.5 _saveInstance()

```
void DiffusionSimulate::_saveInstance (
            PersistenceRecord * fields,
            bool saveDefaultValues )  [override], [protected], [virtual]
```

Saves object fields into a serialization structure.

Parameters

fields	a table-like structure used for serialization.
saveDefaultValues	indicates whether or not to save fields which are set to their default value.

Reimplemented from ModelComponent.

17.223.2.6 show()

```
std::string DiffusionSimulate::show ( )  [override], [virtual]
```

virtual public methods
Returns a textual representation of this component.

Returns

Human-readable description used for tracing and debugging.

Reimplemented from ModelComponent.
The documentation for this class was generated from the following files:

- plugins/components/Continuous/DiffusionSimulate.h
- plugins/components/Continuous/DiffusionSimulate.cpp

Public Member Functions

- **Diode** (Model *model, std::string name="")
- void Build () override
- void **setElectricalModel** (std::string electricalModel)

Public Member Functions inherited from SPICECircuit

- **SPICECircuit** (Model *model, std::string name="")

  constructors
- void **setRunner** (SPICERunner *runner)

  new public user methods for this components
- SPICERunner * **getRunner** ()
- virtual std::string show () override

  virtual public methods

Public Member Functions inherited from ModelComponent

- ModelComponent (Model *model, std::string componentTypename, std::string name="")

  constructors
- virtual ~**ModelComponent** ()

  Releases component-owned resources and unregisters it from the model.
- ConnectionManager * getConnectionManager () const

  new public user methods for this component
- void connectTo (ModelComponent *component, unsigned int inputPortNumber=0)

  Connects this component to another component.
- bool hasBreakpointAt ()

  Indicates whether a simulation breakpoint is set on this component.
- void setDescription (std::string _description)

  Updates the free-form description shown by the GUI.
- std::string getDescription () const

  Returns the free-form description associated with this component.
- void remove (ModelComponent *comp)

  Removes a connected component from this component.

Public Member Functions inherited from ModelDataDefinition

- ModelDataDefinition (Model *model, std::string datadefinitionTypename, std::string name="", bool insert↩ IntoModel=true)

  Creates a model data definition and optionally inserts it into the model.
- virtual ~**ModelDataDefinition** ()

  Releases resources owned by this data definition.
- Util::identification getId () const

  Returns the unique identifier of this instance.
- void setName (const std::string &name)

  Updates the logical name of this instance.
- const std::string & getName () const

  Returns the logical name of this instance.
- void setLabel (const std::string &label)

  Updates the user-visible label of this instance.
- const std::string & getLabel () const

  Returns the user-visible label of this instance.
- const std::string & getClassname () const

Returns the runtime class name used by the plugin system.

- Model * getParentModel () const

  Returns the parent model that owns this definition.

- bool isReportStatistics () const

  Indicates whether this data definition contributes report statistics.

- void setReportStatistics (bool reportStatistics)

  Enables or disables report-statistics generation for this definition.

- ModelDataDefinition * getInternalData (const std::string &name) const

  Looks up a named internal child data definition.

- std::map< std::string, ModelDataDefinition * > * getInternalData () const

  Returns the full map of internal child data definitions.

- std::map< std::string, ModelDataDefinition * > * getAttachedData () const

  Returns the full map of attached data definitions.

- bool hasChanged () const

  Indicates whether this instance has been modified since the last reset.

- void setHasChanged (bool hasChanged)

  Updates the changed flag for this data definition.

- unsigned int getLevel () const

  Returns the hierarchical editing context containing this element.

- void setModelLevel (unsigned int _modelLevel)

  Sets this element's hierarchical editing context.

- List< SimulationControl * > * getSimulationControls () const

  Returns the simulation controls owned by this data definition.

- TraceManager::Level getTraceLevelSpecific () const

  Returns the trace level that applies specifically to this definition.

- void setTraceLevelSpecific (TraceManager::Level level)

  Updates the trace level used by this definition.

- void defineTraceLevelSpecific (TraceManager::Level traceLevelspecific, bool traceLevelSpecific↩ Enabled=true)

  Defines the specific trace level and optionally enables it immediately.

- bool isTraceLevelSpecificEnabled () const

  Indicates whether the specific trace level is enabled.

- void setTraceLevelSpecificEnabled (bool traceLevelSpecificEnabled)

  Enables or disables the specific trace level.

Static Public Member Functions

- static PluginInformation * **GetPluginInformation** ()
- static ModelComponent * **LoadInstance** (Model *model, PersistenceRecord *fields)
- static ModelDataDefinition * **NewInstance** (Model *model, std::string name="")

Static Public Member Functions inherited from SPICECircuit

- static PluginInformation * **GetPluginInformation** ()

  static public methods that must have implementations (Load and New just the same. GetInformation must provide specific infos for the new component

- static ModelComponent * **LoadInstance** (Model *model, PersistenceRecord *fields)
- static ModelDataDefinition * **NewInstance** (Model *model, std::string name="")
- static std::vector< std::string > **split** (std::string word, char split_char)

  Externalize function GetPluginInformation to be accessible throught dynamic linked library.

Static Public Member Functions inherited from ModelComponent

- static ModelComponent * LoadInstance (Model *model, PersistenceRecord *fields)

  static public methods that must have implementations (Load and New just the same. GetInformation must provide specific infos for the new component
- static bool Check (ModelComponent *component)

  Validates a component instance.
- static void CreateInternalData (ModelComponent *component)

  Creates internal data required by a component instance.
- static void SaveInstance (PersistenceRecord *fields, ModelComponent *component)

  Serializes a component instance into a persistence record.
- static void DispatchEvent (Event *event)

  Dispatches a simulation event to the target component.

Static Public Member Functions inherited from ModelDataDefinition

- static ModelDataDefinition * LoadInstance (Model *model, PersistenceRecord *fields, bool insertIntoModel)

  Loads a model data definition instance from serialized fields.
- static ModelDataDefinition * NewInstance (Model *model, std::string name="")

  Creates a new instance of a data definition using the plugin registry.
- static void SaveInstance (PersistenceRecord *fields, ModelDataDefinition *modeldatum)

  Serializes a data definition instance into a persistence record.
- static bool Check (ModelDataDefinition *modeldatum, std::string &errorMessage)

  Validates a data definition instance.
- static void InitBetweenReplications (ModelDataDefinition *modeldatum)

  Resets simulation-time state between replications.
- static void CreateInternalData (ModelDataDefinition *modeldatum)

  Creates internal and attached data required by this instance.
- static bool CreateRelatedDataElements (ModelDataDefinition *modeldatum, std::string &errorMessage)

  Creates related data and validates the instance in a single call.

Protected Member Functions

- virtual bool _loadInstance (PersistenceRecord *fields) override

  virtual protected method that must be overriden
- virtual void _saveInstance (PersistenceRecord *fields, bool saveDefaultValues) override

  Saves object fields into a serialization structure.

Protected Member Functions inherited from SPICECircuit

17.224.1 Member Function Documentation

17.224.1.1 _loadInstance()

```
bool Diode::_loadInstance (
            PersistenceRecord * fields )  [override], [protected], [virtual]
```

virtual protected method that must be overriden
Reimplemented from SPICECircuit.

17.224.1.2 _saveInstance()

```
void Diode::_saveInstance (
            PersistenceRecord * fields,
            bool saveDefaultValues )  [override], [protected], [virtual]
```

Saves object fields into a serialization structure.

Parameters

fields	a table-like structure used for serialization.
saveDefaultValues	indicates whether or not to save fields which are set to their default value.

Reimplemented from SPICECircuit.

17.224.1.3 Build()

```
void Diode::Build ( )  [override], [virtual]
```

Reimplemented from SPICECircuit.
The documentation for this class was generated from the following files:

- plugins/components/ElectronicsSimulation/SPICECircuit.h
- plugins/components/ElectronicsSimulation/SPICECircuit.cpp

17.225 DirectedAcyclicGraphNetwork Class Reference

Directed graph specialization that enforces the DAG invariant.

  Declares a new input port; returns its 0-based index. Rejects a duplicate name (returns the existing index instead of creating a duplicate).
- unsigned int **addOutputPort** (const std::string &portName)

  Declares a new output port; returns its 0-based index. Rejects a duplicate name (returns the existing index instead of creating a duplicate).
- unsigned int **getNumInputPorts** () const
- unsigned int **getNumOutputPorts** () const
- std::string **getInputPortName** (unsigned int index) const
- std::string **getOutputPortName** (unsigned int index) const
- int **getInputPortIndex** (const std::string &portName) const

  Returns the input port index for `portName`, or -1 when not declared.
- int **getOutputPortIndex** (const std::string &portName) const

  Returns the output port index for `portName`, or -1 when not declared.
- double **getActivationCount** () const

  Number of times activate() has been called since the last replication reset.
- NetworkActivationResult activate (const NetworkActivationFrame &frame)

  Runs exactly one network activation for `frame`.

Public Member Functions inherited from ModelDataDefinition

- ModelDataDefinition (Model *model, std::string datadefinitionTypename, std::string name="", bool insertIntoModel=true)

  Creates a model data definition and optionally inserts it into the model.
- virtual ~**ModelDataDefinition** ()

  Releases resources owned by this data definition.
- Util::identification getId () const

  Returns the unique identifier of this instance.
- void setName (const std::string &name)

  Updates the logical name of this instance.

- const std::string & getName () const

  Returns the logical name of this instance.
- void setLabel (const std::string &label)

  Updates the user-visible label of this instance.
- const std::string & getLabel () const

  Returns the user-visible label of this instance.
- const std::string & getClassname () const

  Returns the runtime class name used by the plugin system.
- Model * getParentModel () const

  Returns the parent model that owns this definition.
- bool isReportStatistics () const

  Indicates whether this data definition contributes report statistics.
- void setReportStatistics (bool reportStatistics)

  Enables or disables report-statistics generation for this definition.
- ModelDataDefinition * getInternalData (const std::string &name) const

  Looks up a named internal child data definition.
- std::map< std::string, ModelDataDefinition * > * getInternalData () const

  Returns the full map of internal child data definitions.
- std::map< std::string, ModelDataDefinition * > * getAttachedData () const

  Returns the full map of attached data definitions.
- bool hasChanged () const

  Indicates whether this instance has been modified since the last reset.
- void setHasChanged (bool hasChanged)

  Updates the changed flag for this data definition.
- unsigned int getLevel () const

  Returns the hierarchical editing context containing this element.
- void setModelLevel (unsigned int _modelLevel)

  Sets this element's hierarchical editing context.
- List< SimulationControl * > * getSimulationControls () const

  Returns the simulation controls owned by this data definition.
- TraceManager::Level getTraceLevelSpecific () const

  Returns the trace level that applies specifically to this definition.
- void setTraceLevelSpecific (TraceManager::Level level)

  Updates the trace level used by this definition.
- void defineTraceLevelSpecific (TraceManager::Level traceLevelspecific, bool traceLevelSpecific↩ Enabled=true)

  Defines the specific trace level and optionally enables it immediately.
- bool isTraceLevelSpecificEnabled () const

  Indicates whether the specific trace level is enabled.
- void setTraceLevelSpecificEnabled (bool traceLevelSpecificEnabled)

  Enables or disables the specific trace level.

- static ModelDataDefinition * **NewInstance** (Model *model, std::string name="")

Static Public Member Functions inherited from ModelDataDefinition

- static ModelDataDefinition * LoadInstance (Model *model, PersistenceRecord *fields, bool insertIntoModel)

  Loads a model data definition instance from serialized fields.
- static ModelDataDefinition * NewInstance (Model *model, std::string name="")

  Creates a new instance of a data definition using the plugin registry.
- static void SaveInstance (PersistenceRecord *fields, ModelDataDefinition *modeldatum)

  Serializes a data definition instance into a persistence record.
- static bool Check (ModelDataDefinition *modeldatum, std::string &errorMessage)

  Validates a data definition instance.
- static void InitBetweenReplications (ModelDataDefinition *modeldatum)

  Resets simulation-time state between replications.
- static void CreateInternalData (ModelDataDefinition *modeldatum)

  Creates internal and attached data required by this instance.
- static bool CreateRelatedDataElements (ModelDataDefinition *modeldatum, std::string &errorMessage)

  Creates related data and validates the instance in a single call.

Protected Member Functions

- virtual bool _check (std::string &errorMessage) override

  could be overriden by derived classes

17.225.1 Detailed Description

Directed graph specialization that enforces the DAG invariant.
Edges that would create a directed cycle are rejected on insertion, and the model checker validates the invariant again for corrupted persistence.

17.225.2 Member Function Documentation

17.225.2.1 _check()

```
bool DirectedAcyclicGraphNetwork::_check (
            std::string & errorMessage )  [override], [protected], [virtual]
```

could be overriden by derived classes
Reimplemented from GraphNetwork.

17.225.2.2 addEdge()

```
bool DirectedAcyclicGraphNetwork::addEdge (
            GraphEdge * edge )  [override], [virtual]
```

Reimplemented from GraphNetwork.
The documentation for this class was generated from the following files:

- plugins/data/ModalModel/DirectedAcyclicGraphNetwork.h
- plugins/components/ModalModel/DirectedAcyclicGraphNetwork.cpp

17.226 DirectedGraphNetwork Class Reference

Directed mathematical graph specialization.
`#include <plugins/data/ModalModel/DirectedGraphNetwork.h>`

Inheritance diagram for DirectedGraphNetwork:

- GraphPathResult **shortestPathDijkstra** (GraphNode *source, GraphNode *destination) const
- std::vector< std::vector< GraphNode * > > **connectedComponents** () const
- virtual std::string show () override

  Returns a textual representation of this data definition.

Public Member Functions inherited from DefaultNetwork

- **DefaultNetwork** (Model *model, std::string name="", std::string dataDefinitionTypename=Util::TypeOf< DefaultNetwork >())
- unsigned int **addInputPort** (const std::string &portName)

  Declares a new input port; returns its 0-based index. Rejects a duplicate name (returns the existing index instead of creating a duplicate).
- unsigned int **addOutputPort** (const std::string &portName)

  Declares a new output port; returns its 0-based index. Rejects a duplicate name (returns the existing index instead of creating a duplicate).
- unsigned int **getNumInputPorts** () const
- unsigned int **getNumOutputPorts** () const
- std::string **getInputPortName** (unsigned int index) const
- std::string **getOutputPortName** (unsigned int index) const
- int **getInputPortIndex** (const std::string &portName) const

  Returns the input port index for `portName`, or -1 when not declared.
- int **getOutputPortIndex** (const std::string &portName) const

  Returns the output port index for `portName`, or -1 when not declared.
- double **getActivationCount** () const

  Number of times activate() has been called since the last replication reset.
- NetworkActivationResult activate (const NetworkActivationFrame &frame)

  Runs exactly one network activation for `frame`.

Public Member Functions inherited from ModelDataDefinition

- ModelDataDefinition (Model *model, std::string datadefinitionTypename, std::string name="", bool insert↩ IntoModel=true)

  Creates a model data definition and optionally inserts it into the model.
- virtual ~**ModelDataDefinition** ()

  Releases resources owned by this data definition.
- Util::identification getId () const

  Returns the unique identifier of this instance.
- void setName (const std::string &name)

  Updates the logical name of this instance.
- const std::string & getName () const

  Returns the logical name of this instance.
- void setLabel (const std::string &label)

  Updates the user-visible label of this instance.
- const std::string & getLabel () const

  Returns the user-visible label of this instance.

- const std::string & getClassname () const

  Returns the runtime class name used by the plugin system.
- Model * getParentModel () const

  Returns the parent model that owns this definition.
- bool isReportStatistics () const

  Indicates whether this data definition contributes report statistics.
- void setReportStatistics (bool reportStatistics)

  Enables or disables report-statistics generation for this definition.
- ModelDataDefinition * getInternalData (const std::string &name) const

  Looks up a named internal child data definition.
- std::map< std::string, ModelDataDefinition * > * getInternalData () const

  Returns the full map of internal child data definitions.
- std::map< std::string, ModelDataDefinition * > * getAttachedData () const

  Returns the full map of attached data definitions.
- bool hasChanged () const

  Indicates whether this instance has been modified since the last reset.
- void setHasChanged (bool hasChanged)

  Updates the changed flag for this data definition.
- unsigned int getLevel () const

  Returns the hierarchical editing context containing this element.
- void setModelLevel (unsigned int _modelLevel)

  Sets this element's hierarchical editing context.
- List< SimulationControl * > * getSimulationControls () const

  Returns the simulation controls owned by this data definition.
- TraceManager::Level getTraceLevelSpecific () const

  Returns the trace level that applies specifically to this definition.
- void setTraceLevelSpecific (TraceManager::Level level)

  Updates the trace level used by this definition.
- void defineTraceLevelSpecific (TraceManager::Level traceLevelspecific, bool traceLevelSpecific↩ Enabled=true)

  Defines the specific trace level and optionally enables it immediately.
- bool isTraceLevelSpecificEnabled () const

  Indicates whether the specific trace level is enabled.
- void setTraceLevelSpecificEnabled (bool traceLevelSpecificEnabled)

  Enables or disables the specific trace level.

17.226.1 Detailed Description

Directed mathematical graph specialization.
In DirectedGraphNetwork an edge u->v makes v a successor of u and u a predecessor of v. It does not imply the reverse relation. Self-loops and parallel edges are supported.

17.226.2 Member Function Documentation

17.226.2.1 _edgeConnects()

```
bool DirectedGraphNetwork::_edgeConnects (
            GraphEdge * edge,
            GraphNode * source,
            GraphNode * destination ) const  [override], [protected], [virtual]
```

Reimplemented from GraphNetwork.

17.226.2.2 _oppositeNode()

```
GraphNode * DirectedGraphNetwork::_oppositeNode (
            GraphEdge * edge,
            GraphNode * node ) const  [override], [protected], [virtual]
```

Reimplemented from GraphNetwork.

17.226.2.3 getIncomingEdges()

```
std::vector< GraphEdge * > DirectedGraphNetwork::getIncomingEdges (
            GraphNode * node ) const  [override], [virtual]
```

Reimplemented from GraphNetwork.

17.226.2.4 getOutgoingEdges()

```
std::vector< GraphEdge * > DirectedGraphNetwork::getOutgoingEdges (
            GraphNode * node ) const  [override], [virtual]
```

Reimplemented from GraphNetwork.

17.226.2.5 getPredecessors()

```
std::vector< GraphNode * > DirectedGraphNetwork::getPredecessors (
            GraphNode * node ) const  [override], [virtual]
```

Reimplemented from GraphNetwork.

17.226.2.6 getSuccessors()

```
std::vector< GraphNode * > DirectedGraphNetwork::getSuccessors (
            GraphNode * node ) const  [override], [virtual]
```

Reimplemented from GraphNetwork.

17.226.2.7 hasCycle()

```
bool DirectedGraphNetwork::hasCycle ( ) const  [override], [virtual]
```

Reimplemented from GraphNetwork.

17.226.2.8 inDegree()

```
unsigned int DirectedGraphNetwork::inDegree (
            GraphNode * node ) const  [override], [virtual]
```

Reimplemented from GraphNetwork.

17.226.2.9 isDirected()

```
bool DirectedGraphNetwork::isDirected ( ) const  [override], [virtual]
```

Reimplemented from GraphNetwork.

17.226.2.10 outDegree()

```
unsigned int DirectedGraphNetwork::outDegree (
            GraphNode * node ) const  [override], [virtual]
```

Reimplemented from GraphNetwork.

17.226.2.11 topologicalOrder()

```
GraphTopologicalOrderResult DirectedGraphNetwork::topologicalOrder ( ) const  [override],
[virtual]
```

Reimplemented from GraphNetwork.

The documentation for this class was generated from the following files:

- plugins/data/ModalModel/DirectedGraphNetwork.h

  virtual public methods

Public Member Functions inherited from SinkModelComponent

- **SinkModelComponent** (Model *model, std::string componentTypename, std::string name="")

Public Member Functions inherited from ModelComponent

- ModelComponent (Model *model, std::string componentTypename, std::string name="")

  constructors
- virtual ~**ModelComponent** ()

  Releases component-owned resources and unregisters it from the model.
- ConnectionManager * getConnectionManager () const

  new public user methods for this component
- void connectTo (ModelComponent *component, unsigned int inputPortNumber=0)

  Connects this component to another component.
- bool hasBreakpointAt ()

  Indicates whether a simulation breakpoint is set on this component.
- void setDescription (std::string _description)

  Updates the free-form description shown by the GUI.
- std::string getDescription () const

  Returns the free-form description associated with this component.
- void remove (ModelComponent *comp)

  Removes a connected component from this component.

Public Member Functions inherited from ModelDataDefinition

- ModelDataDefinition (Model *model, std::string datadefinitionTypename, std::string name="", bool insert↩ IntoModel=true)

  Creates a model data definition and optionally inserts it into the model.
- virtual ~**ModelDataDefinition** ()

  Releases resources owned by this data definition.
- Util::identification getId () const

  Returns the unique identifier of this instance.
- void setName (const std::string &name)

  Updates the logical name of this instance.
- const std::string & getName () const

  Returns the logical name of this instance.
- void setLabel (const std::string &label)

  Updates the user-visible label of this instance.
- const std::string & getLabel () const

  Returns the user-visible label of this instance.
- const std::string & getClassname () const

  Returns the runtime class name used by the plugin system.
- Model * getParentModel () const

  Returns the parent model that owns this definition.
- bool isReportStatistics () const

  Indicates whether this data definition contributes report statistics.
- void setReportStatistics (bool reportStatistics)

Enables or disables report-statistics generation for this definition.

- ModelDataDefinition * getInternalData (const std::string &name) const

  Looks up a named internal child data definition.
- std::map< std::string, ModelDataDefinition * > * getInternalData () const

  Returns the full map of internal child data definitions.
- std::map< std::string, ModelDataDefinition * > * getAttachedData () const

  Returns the full map of attached data definitions.
- bool hasChanged () const

  Indicates whether this instance has been modified since the last reset.
- void setHasChanged (bool hasChanged)

  Updates the changed flag for this data definition.
- unsigned int getLevel () const

  Returns the hierarchical editing context containing this element.
- void setModelLevel (unsigned int _modelLevel)

  Sets this element's hierarchical editing context.
- List< SimulationControl * > * getSimulationControls () const

  Returns the simulation controls owned by this data definition.
- TraceManager::Level getTraceLevelSpecific () const

  Returns the trace level that applies specifically to this definition.
- void setTraceLevelSpecific (TraceManager::Level level)

  Updates the trace level used by this definition.
- void defineTraceLevelSpecific (TraceManager::Level traceLevelspecific, bool traceLevelSpecific↩ Enabled=true)

  Defines the specific trace level and optionally enables it immediately.
- bool isTraceLevelSpecificEnabled () const

  Indicates whether the specific trace level is enabled.
- void setTraceLevelSpecificEnabled (bool traceLevelSpecificEnabled)

  Enables or disables the specific trace level.

Static Public Member Functions

- static PluginInformation * **GetPluginInformation** ()
- static ModelComponent * **LoadInstance** (Model *model, PersistenceRecord *fields)
- static ModelDataDefinition * **NewInstance** (Model *model, std::string name="")

Static Public Member Functions inherited from ModelComponent

- static ModelComponent * LoadInstance (Model *model, PersistenceRecord *fields)

  static public methods that must have implementations (Load and New just the same. GetInformation must provide specific infos for the new component
- static bool Check (ModelComponent *component)

  Validates a component instance.
- static void CreateInternalData (ModelComponent *component)

  Creates internal data required by a component instance.
- static void SaveInstance (PersistenceRecord *fields, ModelComponent *component)

  Serializes a component instance into a persistence record.
- static void DispatchEvent (Event *event)

  Dispatches a simulation event to the target component.

Static Public Member Functions inherited from ModelDataDefinition

- static ModelDataDefinition * LoadInstance (Model *model, PersistenceRecord *fields, bool insertIntoModel)

  Loads a model data definition instance from serialized fields.
- static ModelDataDefinition * NewInstance (Model *model, std::string name="")

  Creates a new instance of a data definition using the plugin registry.
- static void SaveInstance (PersistenceRecord *fields, ModelDataDefinition *modeldatum)

  Serializes a data definition instance into a persistence record.
- static bool Check (ModelDataDefinition *modeldatum, std::string &errorMessage)

  Validates a data definition instance.
- static void InitBetweenReplications (ModelDataDefinition *modeldatum)

  Resets simulation-time state between replications.
- static void CreateInternalData (ModelDataDefinition *modeldatum)

  Creates internal and attached data required by this instance.
- static bool CreateRelatedDataElements (ModelDataDefinition *modeldatum, std::string &errorMessage)

  Creates related data and validates the instance in a single call.

Protected Member Functions

- virtual void _onDispatchEvent (Entity *entity, unsigned int inputPortNumber) override

  Handles a dispatched event for this component type.
- virtual bool _loadInstance (PersistenceRecord *fields) override

  virtual protected method that must be overriden
- virtual void _saveInstance (PersistenceRecord *fields, bool saveDefaultValues) override

  Saves object fields into a serialization structure.
- virtual void _initBetweenReplications () override
- virtual bool _check (std::string &errorMessage) override

  could be overriden by derived classes
- virtual void _createInternalStatisticReporters () override
- virtual void _createAttachedAttributes () override

Protected Member Functions inherited from ModelDataDefinition

- bool _getSaveDefaultsOption ()
- virtual ParserChangesInformation * _getParserChangesInformation ()

17.229.1 Detailed Description

Sink component that ends an entity's life in the model, optionally recording its total time in system before removing it.
Arena correspondence: the "Dispose module" (Rockwell Automation, *Getting Started with Arena*, "The Basic Process Panel", p. 32). `isReportStatistics()` (inherited) is the closest correspondence to Arena's "Record Entity Statistics" checkbox.
Known difference from Arena: only a single collapsed `TotalTimeInSystem` statistic is produced per EntityType (gated by that EntityType's own `isReportStatistics()`); Arena's separate value-added/non-value-added/wait/transfer/other time-and-cost breakdown has no confirmed GenESyS runtime equivalent — see `docs/ai_assistants/reference/ARENA_GENESYS_COMPATIBILITY.md` §6.2-§6.3.

17.229.2 Member Function Documentation

17.229.2.1 _check()

```
bool Dispose::_check (
            std::string & errorMessage )  [override], [protected], [virtual]
```

could be overriden by derived classes
Reimplemented from SinkModelComponent.

17.229.2.2 _createAttachedAttributes()

```
void Dispose::_createAttachedAttributes ( )  [override], [protected], [virtual]
```

Reimplemented from ModelDataDefinition.

17.229.2.3 _createInternalStatisticReporters()

```
void Dispose::_createInternalStatisticReporters ( )  [override], [protected], [virtual]
```

Reimplemented from ModelDataDefinition.

17.229.2.4 _initBetweenReplications()

```
void Dispose::_initBetweenReplications ( )  [override], [protected], [virtual]
```

Reimplemented from ModelDataDefinition.

17.229.2.5 _loadInstance()

```
bool Dispose::_loadInstance (
            PersistenceRecord * fields )  [override], [protected], [virtual]
```

virtual protected method that must be overriden
Reimplemented from SinkModelComponent.

17.229.2.6 _onDispatchEvent()

```
void Dispose::_onDispatchEvent (
            Entity * entity,
            unsigned int inputPortNumber )  [override], [protected], [virtual]
```

Handles a dispatched event for this component type.
This method is only for ModelComponents, not for ModelDataElements.

Parameters

entity	Entity being processed.
inputPortNumber	Input port where the entity arrived.

Implements ModelComponent.

17.229.2.7 _saveInstance()

```
void Dispose::_saveInstance (
            PersistenceRecord * fields,
            bool saveDefaultValues )  [override], [protected], [virtual]
```

Saves object fields into a serialization structure.

Parameters

fields	a table-like structure used for serialization.
saveDefaultValues	indicates whether or not to save fields which are set to their default value.

Reimplemented from SinkModelComponent.

17.229.2.8 show()

```
std::string Dispose::show ( )  [override], [virtual]
```

virtual public methods
Returns a textual representation of this component.

Returns

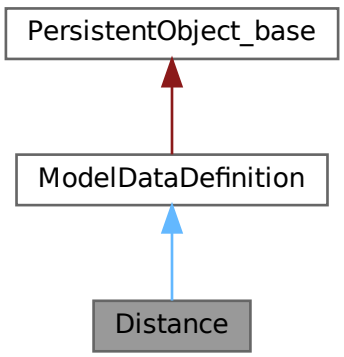
Human-readable description used for tracing and debugging.

Reimplemented from ModelComponent.
The documentation for this class was generated from the following files:

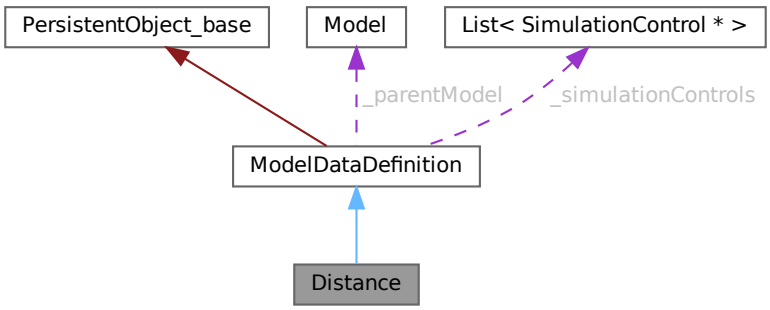
- plugins/components/Logic/Dispose.h
- plugins/components/Logic/Dispose.cpp

17.230 Distance Class Reference

Data definition holding a set of direct station-to-station distances, used by free-path (non-guided) `Transporter` units to compute travel time.
`#include <plugins/data/MaterialHandling/Distance.h>`
Inheritance diagram for Distance:



Collaboration diagram for Distance:



Public Member Functions

- **Distance** (Model ∗model, std::string name="")
- virtual std::string show () override

  Returns a textual representation of this data definition.
- List< DistanceEntry ∗ > ∗ **getEntries** () const
- void **insertEntry** (DistanceEntry ∗entry)
- double **getDistanceBetween** (const std::string &fromStationName, const std::string &toStationName) const

  Returns the direct distance between two stations, or -1 when no matching entry exists.

Public Member Functions inherited from ModelDataDefinition

- ModelDataDefinition (Model ∗model, std::string datadefinitionTypename, std::string name="", bool insert↩ IntoModel=true)

  Creates a model data definition and optionally inserts it into the model.
- virtual ∼**ModelDataDefinition** ()

  Releases resources owned by this data definition.
- Util::identification getId () const

  Returns the unique identifier of this instance.
- void setName (const std::string &name)

  Updates the logical name of this instance.
- const std::string & getName () const

  Returns the logical name of this instance.
- void setLabel (const std::string &label)

  Updates the user-visible label of this instance.
- const std::string & getLabel () const

  Returns the user-visible label of this instance.
- const std::string & getClassname () const

  Returns the runtime class name used by the plugin system.
- Model ∗ getParentModel () const

  Returns the parent model that owns this definition.
- bool isReportStatistics () const

  Indicates whether this data definition contributes report statistics.
- void setReportStatistics (bool reportStatistics)

  Enables or disables report-statistics generation for this definition.
- ModelDataDefinition ∗ getInternalData (const std::string &name) const

Looks up a named internal child data definition.

- std::map< std::string, ModelDataDefinition * > * getInternalData () const

  Returns the full map of internal child data definitions.
- std::map< std::string, ModelDataDefinition * > * getAttachedData () const

  Returns the full map of attached data definitions.
- bool hasChanged () const

  Indicates whether this instance has been modified since the last reset.
- void setHasChanged (bool hasChanged)

  Updates the changed flag for this data definition.
- unsigned int getLevel () const

  Returns the hierarchical editing context containing this element.
- void setModelLevel (unsigned int _modelLevel)

  Sets this element's hierarchical editing context.
- List< SimulationControl * > * getSimulationControls () const

  Returns the simulation controls owned by this data definition.
- TraceManager::Level getTraceLevelSpecific () const

  Returns the trace level that applies specifically to this definition.
- void setTraceLevelSpecific (TraceManager::Level level)

  Updates the trace level used by this definition.
- void defineTraceLevelSpecific (TraceManager::Level traceLevelspecific, bool traceLevelSpecific↩ Enabled=true)

  Defines the specific trace level and optionally enables it immediately.
- bool isTraceLevelSpecificEnabled () const

  Indicates whether the specific trace level is enabled.
- void setTraceLevelSpecificEnabled (bool traceLevelSpecificEnabled)

  Enables or disables the specific trace level.

Static Public Member Functions

- static ModelDataDefinition * **LoadInstance** (Model *model, PersistenceRecord *fields)

17.230.1 Detailed Description

Data definition holding a set of direct station-to-station distances, used by free-path (non-guided) `Transporter` units to compute travel time.
Arena correspondence: the "Distance module" (Rockwell Automation, *Getting Started with Arena*, "The Advanced Transfer Panel", p. 106), which defines a Distance Set of (Beginning Station, Ending Station, Distance) triples for free-path transporters.
Known limitation of this initial implementation: only a direct from/to (or to/from, when `bidirectional`) lookup is supported — there is no multi-hop shortest-path resolution when two stations are not directly listed.

17.230.2 Member Function Documentation

17.230.2.1 _check()

```
bool Distance::_check (
            std::string & errorMessage )  [override], [protected], [virtual]
```

could be overriden by derived classes
Reimplemented from ModelDataDefinition.

17.230.2.2 _loadInstance()

```
bool Distance::_loadInstance (
            PersistenceRecord * fields )  [override], [protected], [virtual]
```

must be overriden by derived classes
Reimplemented from ModelDataDefinition.

17.230.2.3 _saveInstance()

```
void Distance::_saveInstance (
            PersistenceRecord * fields,
            bool saveDefaultValues )  [override], [protected], [virtual]
```

Saves object fields into a serialization structure.

Parameters

fields	a table-like structure used for serialization.
saveDefaultValues	indicates whether or not to save fields which are set to their default value.

Reimplemented from ModelDataDefinition.

17.230.2.4 show()

`std::string Distance::show ( ) [override], [virtual]`
Returns a textual representation of this data definition.
Returns the keys of internal ModelDataDefinitions such as counters, statistics collectors and other children needed before model checking.

Returns

Human-readable summary used by traces and debug output.

Reimplemented from ModelDataDefinition.
The documentation for this class was generated from the following files:

- plugins/data/MaterialHandling/Distance.h
- plugins/data/MaterialHandling/Distance.cpp

17.231 DistanceEntry Class Reference

One directed (from-station, to-station, length) entry of a Distance set, used to look up a free-path Transporter's travel length between two stations.
`#include <plugins/data/MaterialHandling/Distance.h>`

Public Member Functions

- **DistanceEntry** (std::string fromStationName, std::string toStationName, double length, bool bidirectional=true)

Public Attributes

- std::string **fromStationName**
- std::string **toStationName**
- double **length**
- bool **bidirectional**

17.231.1 Detailed Description

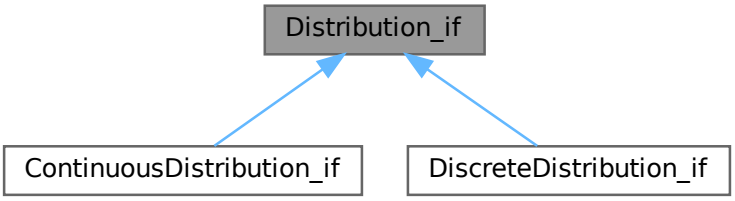
One directed (from-station, to-station, length) entry of a Distance set, used to look up a free-path Transporter's travel length between two stations.
The documentation for this class was generated from the following file:

- plugins/data/MaterialHandling/Distance.h

17.232 Distribution_if Class Reference

Base abstraction for a theoretical probability distribution.
`#include <tools/Statistics/Distribution_if.h>`

Inheritance diagram for Distribution_if:



Public Member Functions

- virtual std::string **name** () const =0

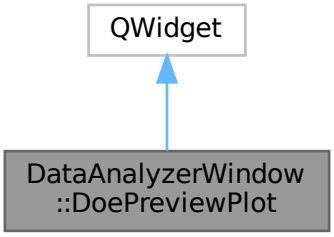
17.232.1 Detailed Description

Base abstraction for a theoretical probability distribution.
The documentation for this class was generated from the following file:

- tools/Statistics/Distribution_if.h

17.233 DataAnalyzerWindow::DoePreviewPlot Class Reference

Inheritance diagram for DataAnalyzerWindow::DoePreviewPlot:



Collaboration diagram for DataAnalyzerWindow::DoePreviewPlot:

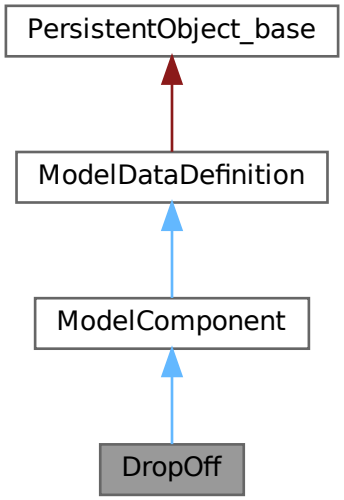
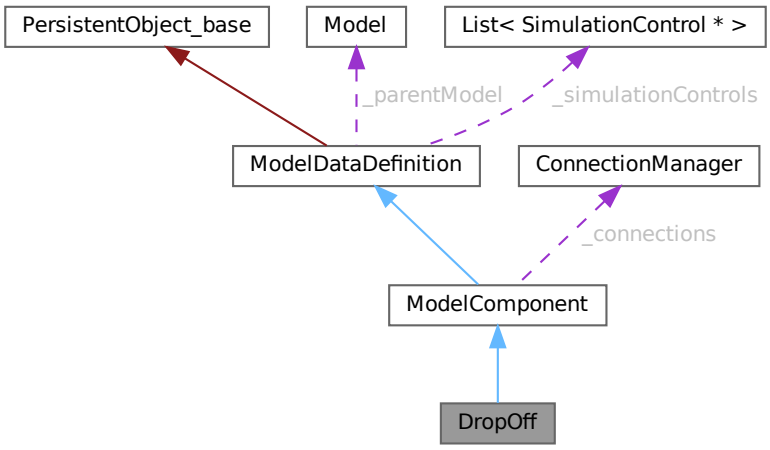
17.240 DropOff Class Reference

Placeholder for releasing a subset of a batched group's members.
`#include <plugins/components/Decisions/DropOff.h>`

Inheritance diagram for DropOff:



Collaboration diagram for DropOff:



Public Member Functions

- **DropOff** (Model ∗model, std::string name="")
- virtual std::string show () override

  virtual public methods
- void **setQuantityExpression** (std::string quantityExpression)
- std::string **getQuantityExpression** () const
- void **setStartingRankExpression** (std::string startingRankExpression)
- std::string **getStartingRankExpression** () const

Public Member Functions inherited from ModelComponent

- ModelComponent (Model *model, std::string componentTypename, std::string name="")

  constructors
- virtual ~**ModelComponent** ()

  Releases component-owned resources and unregisters it from the model.
- ConnectionManager * getConnectionManager () const

  new public user methods for this component
- void connectTo (ModelComponent *component, unsigned int inputPortNumber=0)

  Connects this component to another component.
- bool hasBreakpointAt ()

  Indicates whether a simulation breakpoint is set on this component.
- void setDescription (std::string _description)

  Updates the free-form description shown by the GUI.
- std::string getDescription () const

  Returns the free-form description associated with this component.
- void remove (ModelComponent *comp)

  Removes a connected component from this component.

Public Member Functions inherited from ModelDataDefinition

- ModelDataDefinition (Model *model, std::string datadefinitionTypename, std::string name="", bool insert↩ IntoModel=true)

  Creates a model data definition and optionally inserts it into the model.
- virtual ~**ModelDataDefinition** ()

  Releases resources owned by this data definition.
- Util::identification getId () const

  Returns the unique identifier of this instance.
- void setName (const std::string &name)

  Updates the logical name of this instance.
- const std::string & getName () const

  Returns the logical name of this instance.
- void setLabel (const std::string &label)

  Updates the user-visible label of this instance.
- const std::string & getLabel () const

  Returns the user-visible label of this instance.
- const std::string & getClassname () const

  Returns the runtime class name used by the plugin system.
- Model * getParentModel () const

  Returns the parent model that owns this definition.
- bool isReportStatistics () const

  Indicates whether this data definition contributes report statistics.
- void setReportStatistics (bool reportStatistics)

  Enables or disables report-statistics generation for this definition.
- ModelDataDefinition * getInternalData (const std::string &name) const

  Looks up a named internal child data definition.
- std::map< std::string, ModelDataDefinition * > * getInternalData () const

  Returns the full map of internal child data definitions.
- std::map< std::string, ModelDataDefinition * > * getAttachedData () const

  Returns the full map of attached data definitions.
- bool hasChanged () const

  Indicates whether this instance has been modified since the last reset.

- void setHasChanged (bool hasChanged)

  Updates the changed flag for this data definition.
- unsigned int getLevel () const

  Returns the hierarchical editing context containing this element.
- void setModelLevel (unsigned int _modelLevel)

  Sets this element's hierarchical editing context.
- List< SimulationControl * > * getSimulationControls () const

  Returns the simulation controls owned by this data definition.
- TraceManager::Level getTraceLevelSpecific () const

  Returns the trace level that applies specifically to this definition.
- void setTraceLevelSpecific (TraceManager::Level level)

  Updates the trace level used by this definition.
- void defineTraceLevelSpecific (TraceManager::Level traceLevelspecific, bool traceLevelSpecific↩ Enabled=true)

  Defines the specific trace level and optionally enables it immediately.
- bool isTraceLevelSpecificEnabled () const

  Indicates whether the specific trace level is enabled.
- void setTraceLevelSpecificEnabled (bool traceLevelSpecificEnabled)

  Enables or disables the specific trace level.

Static Public Member Functions

- static PluginInformation * **GetPluginInformation** ()
- static ModelComponent * **LoadInstance** (Model *model, PersistenceRecord *fields)
- static ModelDataDefinition * **NewInstance** (Model *model, std::string name="")

Static Public Member Functions inherited from ModelComponent

- static ModelComponent * LoadInstance (Model *model, PersistenceRecord *fields)

  static public methods that must have implementations (Load and New just the same. GetInformation must provide specific infos for the new component
- static bool Check (ModelComponent *component)

  Validates a component instance.
- static void CreateInternalData (ModelComponent *component)

  Creates internal data required by a component instance.
- static void SaveInstance (PersistenceRecord *fields, ModelComponent *component)

  Serializes a component instance into a persistence record.
- static void DispatchEvent (Event *event)

  Dispatches a simulation event to the target component.

Static Public Member Functions inherited from ModelDataDefinition

- static ModelDataDefinition * LoadInstance (Model *model, PersistenceRecord *fields, bool insertIntoModel)

  Loads a model data definition instance from serialized fields.
- static ModelDataDefinition * NewInstance (Model *model, std::string name="")

  Creates a new instance of a data definition using the plugin registry.
- static void SaveInstance (PersistenceRecord *fields, ModelDataDefinition *modeldatum)

  Serializes a data definition instance into a persistence record.
- static bool Check (ModelDataDefinition *modeldatum, std::string &errorMessage)

  Validates a data definition instance.
- static void InitBetweenReplications (ModelDataDefinition *modeldatum)

  Resets simulation-time state between replications.
- static void CreateInternalData (ModelDataDefinition *modeldatum)

Creates internal and attached data required by this instance.

- static bool CreateRelatedDataElements (ModelDataDefinition *modeldatum, std::string &errorMessage)

  Creates related data and validates the instance in a single call.

Protected Member Functions

- virtual void _onDispatchEvent (Entity *entity, unsigned int inputPortNumber) override

  Handles a dispatched event for this component type.
- virtual bool _loadInstance (PersistenceRecord *fields) override

  virtual protected method that must be overriden
- virtual void _saveInstance (PersistenceRecord *fields, bool saveDefaultValues) override

  Saves object fields into a serialization structure.
- virtual bool _check (std::string &errorMessage) override

  could be overriden by derived classes

Protected Member Functions inherited from ModelDataDefinition

- bool _getSaveDefaultsOption ()
- virtual ParserChangesInformation * _getParserChangesInformation ()
- virtual void _initBetweenReplications ()

17.240.1 Detailed Description

Placeholder for releasing a subset of a batched group's members.
Arena correspondence: the "Dropoff module" (Rockwell Automation, *Getting Started with Arena*, "The Advanced Process Panel", p. 54).

Warning

Incomplete stub template: this class declares no fields at all, and `_onDispatchEvent()` unconditionally forwards the entity without interacting with any EntityGroup. See `docs/ai_↩ assistants/reference/ARENA_GENESYS_COMPATIBILITY.md` §6.17.

17.240.2 Member Function Documentation

17.240.2.1 _check()

```
bool DropOff::_check (
            std::string & errorMessage ) [override], [protected], [virtual]
```

could be overriden by derived classes
Reimplemented from ModelDataDefinition.

17.240.2.2 _loadInstance()

```
bool DropOff::_loadInstance (
            PersistenceRecord * fields )  [override], [protected], [virtual]
```

virtual protected method that must be overriden
Reimplemented from ModelComponent.

17.240.2.3 _onDispatchEvent()

```
void DropOff::_onDispatchEvent (
            Entity * entity,
            unsigned int inputPortNumber )  [override], [protected], [virtual]
```

Handles a dispatched event for this component type.
This method is only for ModelComponents, not for ModelDataElements.

Parameters

entity	Entity being processed.
inputPortNumber	Input port where the entity arrived.

Implements ModelComponent.

17.240.2.4 _saveInstance()

```
void DropOff::_saveInstance (
            PersistenceRecord * fields,
            bool saveDefaultValues )  [override], [protected], [virtual]
```

Saves object fields into a serialization structure.

Parameters

fields	a table-like structure used for serialization.
saveDefaultValues	indicates whether or not to save fields which are set to their default value.

Reimplemented from ModelComponent.

17.240.2.5 show()

```
std::string DropOff::show ( )  [override], [virtual]
```

virtual public methods
Returns a textual representation of this component.

Returns

Human-readable description used for tracing and debugging.

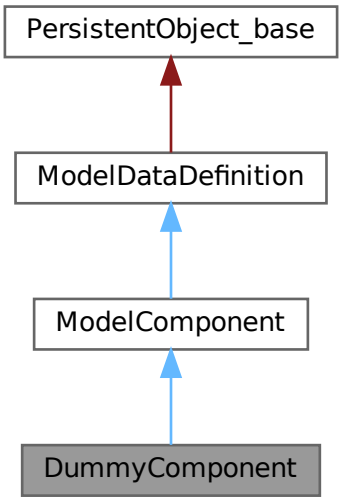
Reimplemented from ModelComponent.
The documentation for this class was generated from the following files:

- plugins/components/Decisions/DropOff.h
- plugins/components/Decisions/DropOff.cpp

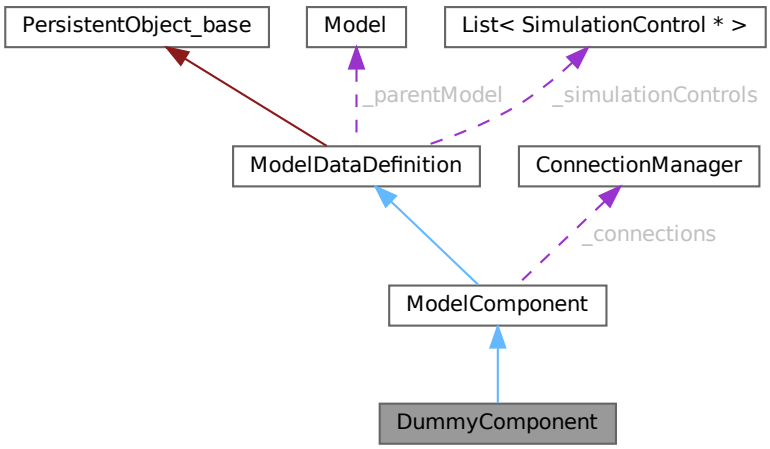
17.241 DummyComponent Class Reference

```
#include <plugins/components/Template/DummyComponent.h>
```

Inheritance diagram for DummyComponent:



Collaboration diagram for DummyComponent:



Public Member Functions

- DummyComponent (Model *model, std::string name="")
  constructors
- virtual std::string show () override
  new public user methods for this component

Public Member Functions inherited from ModelComponent

- ModelComponent (Model *model, std::string componentTypename, std::string name="")

constructors

- virtual ~**ModelComponent** ()

  Releases component-owned resources and unregisters it from the model.
- ConnectionManager * getConnectionManager () const

  new public user methods for this component
- void connectTo (ModelComponent *component, unsigned int inputPortNumber=0)

  Connects this component to another component.
- bool hasBreakpointAt ()

  Indicates whether a simulation breakpoint is set on this component.
- void setDescription (std::string _description)

  Updates the free-form description shown by the GUI.
- std::string getDescription () const

  Returns the free-form description associated with this component.
- void remove (ModelComponent *comp)

  Removes a connected component from this component.

Public Member Functions inherited from ModelDataDefinition

- ModelDataDefinition (Model *model, std::string datadefinitionTypename, std::string name="", bool insert↩ IntoModel=true)

  Creates a model data definition and optionally inserts it into the model.
- virtual ~**ModelDataDefinition** ()

  Releases resources owned by this data definition.
- Util::identification getId () const

  Returns the unique identifier of this instance.
- void setName (const std::string &name)

  Updates the logical name of this instance.
- const std::string & getName () const

  Returns the logical name of this instance.
- void setLabel (const std::string &label)

  Updates the user-visible label of this instance.
- const std::string & getLabel () const

  Returns the user-visible label of this instance.
- const std::string & getClassname () const

  Returns the runtime class name used by the plugin system.
- Model * getParentModel () const

  Returns the parent model that owns this definition.
- bool isReportStatistics () const

  Indicates whether this data definition contributes report statistics.
- void setReportStatistics (bool reportStatistics)

  Enables or disables report-statistics generation for this definition.
- ModelDataDefinition * getInternalData (const std::string &name) const

  Looks up a named internal child data definition.
- std::map< std::string, ModelDataDefinition * > * getInternalData () const

  Returns the full map of internal child data definitions.
- std::map< std::string, ModelDataDefinition * > * getAttachedData () const

  Returns the full map of attached data definitions.
- bool hasChanged () const

  Indicates whether this instance has been modified since the last reset.
- void setHasChanged (bool hasChanged)

  Updates the changed flag for this data definition.

- unsigned int getLevel () const

  Returns the hierarchical editing context containing this element.
- void setModelLevel (unsigned int _modelLevel)

  Sets this element's hierarchical editing context.
- List< SimulationControl * > * getSimulationControls () const

  Returns the simulation controls owned by this data definition.
- TraceManager::Level getTraceLevelSpecific () const

  Returns the trace level that applies specifically to this definition.
- void setTraceLevelSpecific (TraceManager::Level level)

  Updates the trace level used by this definition.
- void defineTraceLevelSpecific (TraceManager::Level traceLevelspecific, bool traceLevelSpecific↩ Enabled=true)

  Defines the specific trace level and optionally enables it immediately.
- bool isTraceLevelSpecificEnabled () const

  Indicates whether the specific trace level is enabled.
- void setTraceLevelSpecificEnabled (bool traceLevelSpecificEnabled)

  Enables or disables the specific trace level.

Static Public Member Functions

- static PluginInformation * **GetPluginInformation** ()

  static public methods that must have implementations (Load and New just the same. GetInformation must provide specific infos for the new component
- static ModelComponent * **LoadInstance** (Model *model, PersistenceRecord *fields)
- static ModelDataDefinition * **NewInstance** (Model *model, std::string name="")

Static Public Member Functions inherited from ModelComponent

- static ModelComponent * LoadInstance (Model *model, PersistenceRecord *fields)

  static public methods that must have implementations (Load and New just the same. GetInformation must provide specific infos for the new component
- static bool Check (ModelComponent *component)

  Validates a component instance.
- static void CreateInternalData (ModelComponent *component)

  Creates internal data required by a component instance.
- static void SaveInstance (PersistenceRecord *fields, ModelComponent *component)

  Serializes a component instance into a persistence record.
- static void DispatchEvent (Event *event)

  Dispatches a simulation event to the target component.

Static Public Member Functions inherited from ModelDataDefinition

- static ModelDataDefinition * LoadInstance (Model *model, PersistenceRecord *fields, bool insertIntoModel)

  Loads a model data definition instance from serialized fields.
- static ModelDataDefinition * NewInstance (Model *model, std::string name="")

  Creates a new instance of a data definition using the plugin registry.
- static void SaveInstance (PersistenceRecord *fields, ModelDataDefinition *modeldatum)

  Serializes a data definition instance into a persistence record.
- static bool Check (ModelDataDefinition *modeldatum, std::string &errorMessage)

  Validates a data definition instance.
- static void InitBetweenReplications (ModelDataDefinition *modeldatum)

  Resets simulation-time state between replications.
- static void CreateInternalData (ModelDataDefinition *modeldatum)

Creates internal and attached data required by this instance.

- static bool CreateRelatedDataElements (ModelDataDefinition *modeldatum, std::string &errorMessage)

  Creates related data and validates the instance in a single call.

Protected Member Functions

- virtual bool _loadInstance (PersistenceRecord *fields) override

  virtual protected method that must be overriden
- virtual void _saveInstance (PersistenceRecord *fields, bool saveDefaultValues) override

  Saves object fields into a serialization structure.
- virtual void _onDispatchEvent (Entity *entity, unsigned int inputPortNumber) override

  This method is only for ModelComponents, not ModelDataElements.

Protected Member Functions inherited from ModelDataDefinition

- bool _getSaveDefaultsOption ()
- virtual bool _check (std::string &errorMessage)

  could be overriden by derived classes
- virtual ParserChangesInformation * _getParserChangesInformation ()

17.241.1 Detailed Description

This component ...

17.241.2 Constructor & Destructor Documentation

17.241.2.1 DummyComponent()

```
DummyComponent::DummyComponent (
            Model * model,
            std::string name = "" )
```

constructors
Externalize function GetPluginInformation to be accessible throught dynamic linked library.

17.241.3 Member Function Documentation

17.241.3.1 _loadInstance()

```
bool DummyComponent::_loadInstance (
            PersistenceRecord * fields )  [override], [protected], [virtual]
```

virtual protected method that must be overriden
Reimplemented from ModelComponent.

17.241.3.2 _onDispatchEvent()

```
void DummyComponent::_onDispatchEvent (
            Entity * entity,
            unsigned int inputPortNumber )  [override], [protected], [virtual]
```

This method is only for ModelComponents, not ModelDataElements.
Implements ModelComponent.

17.241.3.3 _saveInstance()

```
void DummyComponent::_saveInstance (
            PersistenceRecord * fields,
            bool saveDefaultValues )  [override], [protected], [virtual]
```

Saves object fields into a serialization structure.

Parameters

fields	a table-like structure used for serialization.
saveDefaultValues	indicates whether or not to save fields which are set to their default value.

Reimplemented from ModelComponent.

17.241.3.4 show()

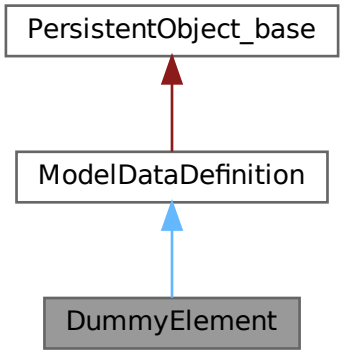
```
std::string DummyComponent::show ( )  [override], [virtual]
```

new public user methods for this component
virtual public methods
Reimplemented from ModelComponent.
The documentation for this class was generated from the following files:

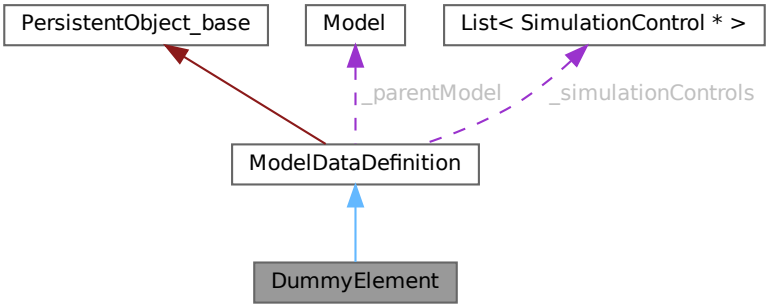
- plugins/components/Template/DummyComponent.h
- plugins/components/Template/DummyComponent.cpp

17.242 DummyElement Class Reference

Inheritance diagram for DummyElement:



Collaboration diagram for DummyElement:



Public Member Functions

- **DummyElement** (Model *model, std::string name="")

  constructors
- void **setSomeString** (const std::string &someString)

  new public user methods for this component
- std::string **getSomeString** () const
- void **setSomeUint** (unsigned int someUint)
- unsigned int **getSomeUint** () const
- virtual std::string show () override

  virtual public methods

Public Member Functions inherited from ModelDataDefinition

- ModelDataDefinition (Model *model, std::string datadefinitionTypename, std::string name="", bool insert↩ IntoModel=true)

  Creates a model data definition and optionally inserts it into the model.
- virtual ~**ModelDataDefinition** ()

  Releases resources owned by this data definition.
- Util::identification getId () const

  Returns the unique identifier of this instance.
- void setName (const std::string &name)

  Updates the logical name of this instance.
- const std::string & getName () const

  Returns the logical name of this instance.
- void setLabel (const std::string &label)

  Updates the user-visible label of this instance.
- const std::string & getLabel () const

  Returns the user-visible label of this instance.
- const std::string & getClassname () const

  Returns the runtime class name used by the plugin system.
- Model * getParentModel () const

  Returns the parent model that owns this definition.
- bool isReportStatistics () const

  Indicates whether this data definition contributes report statistics.
- void setReportStatistics (bool reportStatistics)

Enables or disables report-statistics generation for this definition.

- ModelDataDefinition * getInternalData (const std::string &name) const

  Looks up a named internal child data definition.
- std::map< std::string, ModelDataDefinition * > * getInternalData () const

  Returns the full map of internal child data definitions.
- std::map< std::string, ModelDataDefinition * > * getAttachedData () const

  Returns the full map of attached data definitions.
- bool hasChanged () const

  Indicates whether this instance has been modified since the last reset.
- void setHasChanged (bool hasChanged)

  Updates the changed flag for this data definition.
- unsigned int getLevel () const

  Returns the hierarchical editing context containing this element.
- void setModelLevel (unsigned int _modelLevel)

  Sets this element's hierarchical editing context.
- List< SimulationControl * > * getSimulationControls () const

  Returns the simulation controls owned by this data definition.
- TraceManager::Level getTraceLevelSpecific () const

  Returns the trace level that applies specifically to this definition.
- void setTraceLevelSpecific (TraceManager::Level level)

  Updates the trace level used by this definition.
- void defineTraceLevelSpecific (TraceManager::Level traceLevelspecific, bool traceLevelSpecific↩ Enabled=true)

  Defines the specific trace level and optionally enables it immediately.
- bool isTraceLevelSpecificEnabled () const

  Indicates whether the specific trace level is enabled.
- void setTraceLevelSpecificEnabled (bool traceLevelSpecificEnabled)

  Enables or disables the specific trace level.

17.242.1 Member Function Documentation

17.242.1.1 _check()

```
bool DummyElement::_check (
            std::string & errorMessage )  [override], [protected], [virtual]
```

could be overriden by derived classes
Reimplemented from ModelDataDefinition.

17.242.1.2 _loadInstance()

```
bool DummyElement::_loadInstance (
            PersistenceRecord * fields )  [override], [protected], [virtual]
```

virtual protected method that must be overriden
Reimplemented from ModelDataDefinition.

17.242.1.3 _saveInstance()

```
void DummyElement::_saveInstance (
            PersistenceRecord * fields,
            bool saveDefaultValues )  [override], [protected], [virtual]
```

Saves object fields into a serialization structure.

Parameters

fields	a table-like structure used for serialization.
saveDefaultValues	indicates whether or not to save fields which are set to their default value.

Reimplemented from ModelDataDefinition.

17.242.1.4 show()

```
std::string DummyElement::show ( )  [override], [virtual]
```

virtual public methods
Reimplemented from ModelDataDefinition.
The documentation for this class was generated from the following files:

- plugins/data/Template/DummyElement.h
- plugins/data/Template/DummyElement.cpp

17.243 EditCommandController Class Reference

Controller for edit/clipboard/grouping command orchestration in the scene.
`#include <applications/gui/genesys/controllers/EditCommandController.h>`

Public Member Functions

- **EditCommandController** (Simulator *simulator, ModelGraphicsView *graphicsView, std::function< void()> actualizeActions, bool *cut, QList< GraphicalModelComponent * > **gmcCopies, QList< GraphicalConnection * > **portsCopies, QList< QGraphicsItem * > **drawCopy, QList< QGraphics↩ ItemGroup * > **groupCopy)

  Creates the edit-command controller used by MainWindow compatibility slots.
- void **onActionEditUndoTriggered** () const

  Delegates undo command handling without changing scene undo semantics.
- void **onActionEditRedoTriggered** () const

  Delegates redo command handling without changing scene undo semantics.
- void **onActionEditCutTriggered** () const

  Delegates cut command handling while preserving compatibility copy buffers.
- void **onActionEditCopyTriggered** () const

  Delegates copy command handling while preserving compatibility copy buffers.
- void **onActionEditPasteTriggered** () const

  Delegates paste command handling while preserving compatibility copy buffers.
- void **onActionEditDeleteTriggered** () const

  Delegates delete command handling while preserving undo integration.
- void **onActionEditGroupTriggered** () const

  Delegates group command handling through scene grouping APIs.
- void **onActionEditUngroupTriggered** () const

  Delegates ungroup command handling through scene grouping APIs.
- void **onActionViewGroupTriggered** () const

  Delegates view-group command handling through scene grouping APIs.
- void **onActionViewUngroupTriggered** () const

  Delegates view-ungroup command handling through scene grouping APIs.
- void **saveItemForCopy** (QList< GraphicalModelComponent * > *gmcList, QList< GraphicalConnection * > *connList) const

  Stores eligible selected items in compatibility clipboard structures.
- void **helpCopy** () const

  Performs deep-copy preparation for subsequent paste command execution.

17.243.1 Detailed Description

Controller for edit/clipboard/grouping command orchestration in the scene.
This Phase-9 controller keeps MainWindow slots as compatibility wrappers while centralizing clipboard buffers, grouping operations, and undo-aware edit command dispatch against the current graphical scene.
Responsibilities:

- execute undo/redo/cut/copy/paste/delete/group/ungroup command flows;
- preserve legacy clipboard structures used by graphical components and drawings;

- trigger action refresh callbacks after command execution.

Boundaries:

- it does not own scene lifetime (resolved from injected graphics view);
- it does not persist clipboard state across sessions;
- it does not manage simulation events, model lifecycle, or property-editor synchronization.

The documentation for this class was generated from the following files:

- applications/gui/genesys/controllers/EditCommandController.h
- applications/gui/genesys/controllers/EditCommandController.cpp

17.244 EditorFactoryPrivate< Editor > Class Template Reference

Public Types

- FSMState ∗ **getCurrentState** () const
- void **setCurrentState** (FSMState ∗state)
- void **setConflictPolicy** (ConflictPolicy policy)
- ConflictPolicy **getConflictPolicy** () const
- virtual std::string show () override

  Returns a textual representation of this data definition.

Public Member Functions inherited from DefaultNetwork

- **DefaultNetwork** (Model ∗model, std::string name="", std::string dataDefinitionTypename=Util::TypeOf< DefaultNetwork >())
- unsigned int **addInputPort** (const std::string &portName)

  Declares a new input port; returns its 0-based index. Rejects a duplicate name (returns the existing index instead of creating a duplicate).
- unsigned int **addOutputPort** (const std::string &portName)

  Declares a new output port; returns its 0-based index. Rejects a duplicate name (returns the existing index instead of creating a duplicate).

- unsigned int **getNumInputPorts** () const
- unsigned int **getNumOutputPorts** () const
- std::string **getInputPortName** (unsigned int index) const
- std::string **getOutputPortName** (unsigned int index) const
- int **getInputPortIndex** (const std::string &portName) const

  Returns the input port index for `portName`, or -1 when not declared.
- int **getOutputPortIndex** (const std::string &portName) const

  Returns the output port index for `portName`, or -1 when not declared.
- double **getActivationCount** () const

  Number of times activate() has been called since the last replication reset.
- NetworkActivationResult activate (const NetworkActivationFrame &frame)

  Runs exactly one network activation for `frame`.

Public Member Functions inherited from ModelDataDefinition

- ModelDataDefinition (Model *model, std::string datadefinitionTypename, std::string name="", bool insertIntoModel=true)

  Creates a model data definition and optionally inserts it into the model.
- virtual ~**ModelDataDefinition** ()

  Releases resources owned by this data definition.
- Util::identification getId () const

  Returns the unique identifier of this instance.
- void setName (const std::string &name)

  Updates the logical name of this instance.
- const std::string & getName () const

  Returns the logical name of this instance.
- void setLabel (const std::string &label)

  Updates the user-visible label of this instance.
- const std::string & getLabel () const

  Returns the user-visible label of this instance.
- const std::string & getClassname () const

  Returns the runtime class name used by the plugin system.
- Model * getParentModel () const

  Returns the parent model that owns this definition.
- bool isReportStatistics () const

  Indicates whether this data definition contributes report statistics.
- void setReportStatistics (bool reportStatistics)

  Enables or disables report-statistics generation for this definition.
- ModelDataDefinition * getInternalData (const std::string &name) const

  Looks up a named internal child data definition.
- std::map< std::string, ModelDataDefinition * > * getInternalData () const

  Returns the full map of internal child data definitions.
- std::map< std::string, ModelDataDefinition * > * getAttachedData () const

  Returns the full map of attached data definitions.
- bool hasChanged () const

  Indicates whether this instance has been modified since the last reset.
- void setHasChanged (bool hasChanged)

  Updates the changed flag for this data definition.
- unsigned int getLevel () const

  Returns the hierarchical editing context containing this element.
- void setModelLevel (unsigned int _modelLevel)

Sets this element's hierarchical editing context.

- List< SimulationControl * > * getSimulationControls () const

  Returns the simulation controls owned by this data definition.
- TraceManager::Level getTraceLevelSpecific () const

  Returns the trace level that applies specifically to this definition.
- void setTraceLevelSpecific (TraceManager::Level level)

  Updates the trace level used by this definition.
- void defineTraceLevelSpecific (TraceManager::Level traceLevelspecific, bool traceLevelSpecific↩ Enabled=true)

  Defines the specific trace level and optionally enables it immediately.
- bool isTraceLevelSpecificEnabled () const

  Indicates whether the specific trace level is enabled.
- void setTraceLevelSpecificEnabled (bool traceLevelSpecificEnabled)

  Enables or disables the specific trace level.

Static Public Member Functions

- static ModelDataDefinition * **LoadInstance** (Model *model, PersistenceRecord *fields)
- static PluginInformation * **GetPluginInformation** ()
- static ModelDataDefinition * **NewInstance** (Model *model, std::string name="")
- static std::string **convertConflictPolicyToString** (ConflictPolicy policy)

- static ModelDataDefinition * **NewInstance** (Model *model, std::string name="")

Static Public Member Functions inherited from ModelDataDefinition

- static ModelDataDefinition * LoadInstance (Model *model, PersistenceRecord *fields, bool insertIntoModel)

  Loads a model data definition instance from serialized fields.
- static ModelDataDefinition * NewInstance (Model *model, std::string name="")

  Creates a new instance of a data definition using the plugin registry.
- static void SaveInstance (PersistenceRecord *fields, ModelDataDefinition *modeldatum)

  Serializes a data definition instance into a persistence record.
- static bool Check (ModelDataDefinition *modeldatum, std::string &errorMessage)

  Validates a data definition instance.
- static void InitBetweenReplications (ModelDataDefinition *modeldatum)

  Resets simulation-time state between replications.
- static void CreateInternalData (ModelDataDefinition *modeldatum)

  Creates internal and attached data required by this instance.
- static bool CreateRelatedDataElements (ModelDataDefinition *modeldatum, std::string &errorMessage)

  Creates related data and validates the instance in a single call.

Protected Member Functions

- virtual bool _loadInstance (PersistenceRecord *fields) override

  must be overriden by derived classes
- virtual void _saveInstance (PersistenceRecord *fields, bool saveDefaultValues) override

  Saves object fields into a serialization structure.

17.246.1 Detailed Description

Extended finite-state-machine network specialization.
`EFSMNetwork` owns the modal state machine semantics that used to live in `ModalModelDefault`: the current state, the initial state, state nodes and EFSM transitions. A `ModalModelDefault` only adapts process entities to this network through explicit input/output bindings.
Transition ownership: `addTransition()` and persistence reload take exclusive ownership of heap-allocated `EFSMTransition` objects and delete them from the network destructor / reload path. Callers must not stack-allocate transitions that are registered with the network and must not delete them separately.
This first implementation supports one deterministic activation step: evaluate outgoing transitions of the current state, select the enabled transition with the lowest priority value, update the current state, and expose the transition output expression on output port 0 when present.

17.246.2 Member Function Documentation

17.246.2.1 _activate()

```
NetworkActivationResult EFSMNetwork::_activate (
            const NetworkActivationFrame & frame )  [override], [protected], [virtual]
```

Formalism-specific activation behavior.
The base implementation performs no state change and returns a result sized to `getNumOutputPorts()` with every output absent. Specializations override this to implement EFSM transition firing, one DTMC step, one CPN firing step, etc. Must not receive or depend on `Entity*` (architecture reference §8.4, §19).
Reimplemented from DefaultNetwork.

17.246.2.2 _check()

```
bool EFSMNetwork::_check (
            std::string & errorMessage )  [override], [protected], [virtual]
```

could be overriden by derived classes
Reimplemented from DefaultNetwork.

17.246.2.3 _initBetweenReplications()

```
void EFSMNetwork::_initBetweenReplications ( )  [override], [protected], [virtual]
```

Reimplemented from DefaultNetwork.

17.246.2.4 _loadInstance()

```
bool EFSMNetwork::_loadInstance (
            PersistenceRecord * fields )  [override], [protected], [virtual]
```

must be overriden by derived classes
Reimplemented from DefaultNetwork.

17.246.2.5 _saveInstance()

```
void EFSMNetwork::_saveInstance (
            PersistenceRecord * fields,
            bool saveDefaultValues )  [override], [protected], [virtual]
```

Saves object fields into a serialization structure.

Parameters

fields	a table-like structure used for serialization.
saveDefaultValues	indicates whether or not to save fields which are set to their default value.

Reimplemented from DefaultNetwork.

17.246.2.6 detachTransition()

```
std::unique_ptr< EFSMTransition > EFSMNetwork::detachTransition (
            EFSMTransition * transition,
            unsigned int * ordinal = nullptr )
```

Detaches an owned transition without destroying it. The returned owner can safely retain the transition for an undo command. `ordinal` receives its former persisted sequence position. Returns empty if it is not registered.

17.246.2.7 restoreTransition()

```
bool EFSMNetwork::restoreTransition (
            EFSMTransition * transition,
            unsigned int ordinal )
```

Reattaches a detached transition at its prior sequence position. Ownership transfers to the network only when this returns true.

17.246.2.8 show()

```
std::string EFSMNetwork::show ( )  [override], [virtual]
```

Returns a textual representation of this data definition.
Returns the keys of internal ModelDataDefinitions such as counters, statistics collectors and other children needed before model checking.

Returns

Human-readable summary used by traces and debug output.

Reimplemented from DefaultNetwork.
The documentation for this class was generated from the following files:

- plugins/data/ModalModel/EFSMNetwork.h
- plugins/components/ModalModel/EFSMNetwork.cpp

17.247 EFSMNetworkDiagramLayout Struct Reference

GUI-only presentation layout for one EFSMNetwork diagram.
`#include <applications/gui/genesys/services/EFSMNetworkDiagramLayout.h>`

Classes

- struct StatePosition
- struct TransitionLayout

Public Member Functions

- bool **isEmpty** () const

Public Attributes

- unsigned long **networkId** = 0
- QString **networkName**
- QVector< StatePosition > **states**
- QVector< TransitionLayout > **transitions**

17.247.1 Detailed Description

GUI-only presentation layout for one EFSMNetwork diagram.
This is purely visual/presentation data: node positions and optional transition control/label points. It never carries mathematical state (current/initial state, guards, actions, priorities, probabilities) – that remains the exclusive responsibility of `EFSMNetwork`/`FSMState`/ `EFSMTransition`. A missing or empty layout is valid; the future viewer falls back to deterministic automatic positioning.
`EFSMTransition` has no persistent identity in the kernel (unlike `FSMState`, which is a `ModelDataDefinition`). The graphical entry uses `ordinal` as the zero-based index in the complete `getTransitions()` list. That sequence is written and reconstructed by the EFSM `.gen` persistence contract and distinguishes parallel and unnamed transitions without using display names. Source/destination names remain integrity checks. The identity is stable only while transition order is unchanged.
The documentation for this struct was generated from the following file:

- applications/gui/genesys/services/EFSMNetworkDiagramLayout.h

17.257.1 Member Function Documentation

17.257.1.1 OnEnvironmentsSetUpEnd()

```
void testing::EmptyTestEventListener::OnEnvironmentsSetUpEnd (
            const UnitTest &  )  [inline], [override], [virtual]
```

Implements testing::TestEventListener.

17.257.1.2 OnEnvironmentsSetUpStart()

```
void testing::EmptyTestEventListener::OnEnvironmentsSetUpStart (
            const UnitTest &  )  [inline], [override], [virtual]
```

Implements testing::TestEventListener.

17.257.1.3 OnEnvironmentsTearDownEnd()

```
void testing::EmptyTestEventListener::OnEnvironmentsTearDownEnd (
            const UnitTest &  )  [inline], [override], [virtual]
```

Implements testing::TestEventListener.

17.257.1.4 OnEnvironmentsTearDownStart()

```
void testing::EmptyTestEventListener::OnEnvironmentsTearDownStart (
            const UnitTest &  )  [inline], [override], [virtual]
```

Implements testing::TestEventListener.

17.257.1.5 OnTestCaseEnd()

```
void testing::EmptyTestEventListener::OnTestCaseEnd (
            const TestCase &  )  [inline], [override], [virtual]
```

Reimplemented from testing::TestEventListener.

17.257.1.6 OnTestCaseStart()

```
void testing::EmptyTestEventListener::OnTestCaseStart (
            const TestCase &  )  [inline], [override], [virtual]
```

Reimplemented from testing::TestEventListener.

17.257.1.7 OnTestDisabled()

```
void testing::EmptyTestEventListener::OnTestDisabled (
            const TestInfo &  )  [inline], [override], [virtual]
```

Reimplemented from testing::TestEventListener.

17.257.1.8 OnTestEnd()

```
void testing::EmptyTestEventListener::OnTestEnd (
            const TestInfo &  )  [inline], [override], [virtual]
```

Implements testing::TestEventListener.

17.257.1.9 OnTestIterationEnd()

```
void testing::EmptyTestEventListener::OnTestIterationEnd (
            const UnitTest & ,
            int  )  [inline], [override], [virtual]
```

Implements testing::TestEventListener.

17.257.1.10 OnTestIterationStart()

```
void testing::EmptyTestEventListener::OnTestIterationStart (
            const UnitTest & ,
            int  )  [inline], [override], [virtual]
```

Implements testing::TestEventListener.

17.257.1.11 OnTestPartResult()

```
void testing::EmptyTestEventListener::OnTestPartResult (
            const TestPartResult &  )  [inline], [override], [virtual]
```

Implements testing::TestEventListener.

17.257.1.12 OnTestProgramEnd()

```
void testing::EmptyTestEventListener::OnTestProgramEnd (
            const UnitTest &  )  [inline], [override], [virtual]
```

Implements testing::TestEventListener.

17.257.1.13 OnTestProgramStart()

```
void testing::EmptyTestEventListener::OnTestProgramStart (
            const UnitTest &  )  [inline], [override], [virtual]
```

Implements testing::TestEventListener.

17.257.1.14 OnTestStart()

```
void testing::EmptyTestEventListener::OnTestStart (
            const TestInfo &  )  [inline], [override], [virtual]
```

Implements testing::TestEventListener.

17.257.1.15 OnTestSuiteEnd()

```
void testing::EmptyTestEventListener::OnTestSuiteEnd (
            const TestSuite &  )  [inline], [override], [virtual]
```

Reimplemented from testing::TestEventListener.

17.257.1.16 OnTestSuiteStart()

```
void testing::EmptyTestEventListener::OnTestSuiteStart (
            const TestSuite &  )  [inline], [override], [virtual]
```

Reimplemented from testing::TestEventListener.

Public Member Functions

- **Enter** (Model ∗model, std::string name="")
- virtual std::string show () override

  virtual public methods
- void **setStation** (Station ∗_station)
- void **setStationName** (std::string stationName)
- Station ∗ **getStation** () const

Public Member Functions inherited from ModelComponent

- ModelComponent (Model *model, std::string componentTypename, std::string name="")

  constructors
- virtual ~**ModelComponent** ()

  Releases component-owned resources and unregisters it from the model.
- ConnectionManager * getConnectionManager () const

  new public user methods for this component
- void connectTo (ModelComponent *component, unsigned int inputPortNumber=0)

  Connects this component to another component.
- bool hasBreakpointAt ()

  Indicates whether a simulation breakpoint is set on this component.
- void setDescription (std::string _description)

  Updates the free-form description shown by the GUI.
- std::string getDescription () const

  Returns the free-form description associated with this component.
- void remove (ModelComponent *comp)

  Removes a connected component from this component.

Public Member Functions inherited from ModelDataDefinition

- ModelDataDefinition (Model *model, std::string datadefinitionTypename, std::string name="", bool insert↩ IntoModel=true)

  Creates a model data definition and optionally inserts it into the model.
- virtual ~**ModelDataDefinition** ()

  Releases resources owned by this data definition.
- Util::identification getId () const

  Returns the unique identifier of this instance.
- void setName (const std::string &name)

  Updates the logical name of this instance.
- const std::string & getName () const

  Returns the logical name of this instance.
- void setLabel (const std::string &label)

  Updates the user-visible label of this instance.
- const std::string & getLabel () const

  Returns the user-visible label of this instance.
- const std::string & getClassname () const

  Returns the runtime class name used by the plugin system.
- Model * getParentModel () const

  Returns the parent model that owns this definition.
- bool isReportStatistics () const

  Indicates whether this data definition contributes report statistics.
- void setReportStatistics (bool reportStatistics)

  Enables or disables report-statistics generation for this definition.
- ModelDataDefinition * getInternalData (const std::string &name) const

  Looks up a named internal child data definition.
- std::map< std::string, ModelDataDefinition * > * getInternalData () const

  Returns the full map of internal child data definitions.
- std::map< std::string, ModelDataDefinition * > * getAttachedData () const

  Returns the full map of attached data definitions.
- bool hasChanged () const

  Indicates whether this instance has been modified since the last reset.

- void setHasChanged (bool hasChanged)

  Updates the changed flag for this data definition.
- unsigned int getLevel () const

  Returns the hierarchical editing context containing this element.
- void setModelLevel (unsigned int _modelLevel)

  Sets this element's hierarchical editing context.
- List< SimulationControl * > * getSimulationControls () const

  Returns the simulation controls owned by this data definition.
- TraceManager::Level getTraceLevelSpecific () const

  Returns the trace level that applies specifically to this definition.
- void setTraceLevelSpecific (TraceManager::Level level)

  Updates the trace level used by this definition.
- void defineTraceLevelSpecific (TraceManager::Level traceLevelspecific, bool traceLevelSpecific↩ Enabled=true)

  Defines the specific trace level and optionally enables it immediately.
- bool isTraceLevelSpecificEnabled () const

  Indicates whether the specific trace level is enabled.
- void setTraceLevelSpecificEnabled (bool traceLevelSpecificEnabled)

  Enables or disables the specific trace level.

Static Public Member Functions

- static PluginInformation * **GetPluginInformation** ()
- static ModelComponent * **LoadInstance** (Model *model, PersistenceRecord *fields)
- static ModelDataDefinition * **NewInstance** (Model *model, std::string name="")

Static Public Member Functions inherited from ModelComponent

- static ModelComponent * LoadInstance (Model *model, PersistenceRecord *fields)

  static public methods that must have implementations (Load and New just the same. GetInformation must provide specific infos for the new component
- static bool Check (ModelComponent *component)

  Validates a component instance.
- static void CreateInternalData (ModelComponent *component)

  Creates internal data required by a component instance.
- static void SaveInstance (PersistenceRecord *fields, ModelComponent *component)

  Serializes a component instance into a persistence record.
- static void DispatchEvent (Event *event)

  Dispatches a simulation event to the target component.

Static Public Member Functions inherited from ModelDataDefinition

- static ModelDataDefinition * LoadInstance (Model *model, PersistenceRecord *fields, bool insertIntoModel)

  Loads a model data definition instance from serialized fields.
- static ModelDataDefinition * NewInstance (Model *model, std::string name="")

  Creates a new instance of a data definition using the plugin registry.
- static void SaveInstance (PersistenceRecord *fields, ModelDataDefinition *modeldatum)

  Serializes a data definition instance into a persistence record.
- static bool Check (ModelDataDefinition *modeldatum, std::string &errorMessage)

  Validates a data definition instance.
- static void InitBetweenReplications (ModelDataDefinition *modeldatum)

  Resets simulation-time state between replications.
- static void CreateInternalData (ModelDataDefinition *modeldatum)

Creates internal and attached data required by this instance.

- static bool CreateRelatedDataElements (ModelDataDefinition *modeldatum, std::string &errorMessage)

  Creates related data and validates the instance in a single call.

Protected Member Functions

- virtual void _onDispatchEvent (Entity *entity, unsigned int inputPortNumber) override

  Handles a dispatched event for this component type.
- virtual bool _loadInstance (PersistenceRecord *fields) override

  virtual protected method that must be overriden
- virtual void _saveInstance (PersistenceRecord *fields, bool saveDefaultValues) override

  Saves object fields into a serialization structure.
- virtual bool _check (std::string &errorMessage) override

  could be overriden by derived classes
- virtual void _createInternalStatisticReporters () override
- virtual void _createEditableDataDefinitions () override

Protected Member Functions inherited from ModelDataDefinition

- bool _getSaveDefaultsOption ()
- virtual ParserChangesInformation * _getParserChangesInformation ()

- TraceManager::Level **_traceLevelSpecific**
- bool **_traceLevelSpecificEnabled** = false

17.258.1 Detailed Description

Enter module DESCRIPTION The Enter module defines a station (or a set of stations) corresponding to a physical or logical location where processing occurs. When an entity arrives at an Enter module, an unloading delay may occur and any transfer device used to transfer the entity to the Enter module's station may be released. The station (or each station within the defined set) has a matching Activity Area that is used to report all times and costs accrued by the entities in this station. This Activity Area's name is the same as the station. If a parent Activity Area is defined, then it also accrues any times and costs by the entities in this station. TYPICAL USES The start of a part's production in a series of parallel processes where the part's forklift needs to be released The start of a document's processing after the document has been created where the mail clerk resource needs to be released PROMPTS Prompt Description Name Unique name of the module that will be displayed in the flowchart Station Type Type of station, either a single Station or station Set. Station Name Name of the individual station. A given station can only exist once within a model. Parent Activity Area Name of the Activity Area's parent. Associated Intersection Name of the intersection associated with this station in a guided transporter network. Report Statistics Specifies whether or not statistics will automatically be collected and stored in the report database for this station and its corresponding activity area. Set Name Name of the station set. A given station set can only exist once within a model. Save Attribute Specifies the attribute to be used to store the index into the station set for an entity entering this module. Set Members This repeat group permits you to define the individual stations that are to be members of the specified station set. A station set must have at least one member station. Active when Station

Type is Set. Station Name This field indicates the name of a station that is to be a member of this station set. A given station can only exist within a model once. Therefore, an individual station can only be the member of one station set, and that individual station may not be the name of a station in another module. Parent Activity Area Name of the Activity Area's parent for the station set member. Associated Intersection Name of the intersection associated with this station set in a guided transporter network. Report Statistics Specifies whether or not statistics will automatically be collected and stored in the report database for this station set member and its corresponding activity area. Allocation Type of category to which the entity's incurred delay time and cost will be added. Delay This field defines the delay that will be experienced by entities immediately upon arrival at the station. Units Time units used for the delay time. Transfer In If a resource, transporter, or conveyor was used to transfer the entity to this station, this can be used to release, free, or exit the device. If Release Resource is selected, the specified resource is released. If Free Transporter is selected, the specified transporter is freed. If Exit Conveyor is selected, the specified conveyor is exited. Transporter Name Name of the transporter to be freed upon arrival to the station. Active when Transfer Name is Free Transporter. Unit Number Unit number of the transporter if the transporter is multicapacity. Conveyor Name Name of the conveyor to exit upon arrival to the station. Resource Type Type of allocation, either single Resource or resource Set. Resource Name Name of the resource to release. Active when Transfer Name is Release Resource. Set Name Name of the resource set from which the resource is to be released. Release Rule Determines which member of the set is to be released, either the Last Member Seized, First Member Seized, or Specific Member. Set Index Index into the set that determines which member of the set is to be released. Attribute Name Name of the attribute that determines the instance number of the resource to release. Expression Expression value that determines the instance number of the resource to release.

17.258.2 Member Function Documentation

17.258.2.1 _check()

```
bool Enter::_check (
            std::string & errorMessage )  [override], [protected], [virtual]
```

could be overriden by derived classes
Reimplemented from ModelDataDefinition.

17.258.2.2 _createEditableDataDefinitions()

```
void Enter::_createEditableDataDefinitions ( )  [override], [protected], [virtual]
```

Reimplemented from ModelDataDefinition.

17.258.2.3 _createInternalStatisticReporters()

```
void Enter::_createInternalStatisticReporters ( )  [override], [protected], [virtual]
```

Reimplemented from ModelDataDefinition.

17.258.2.4 _loadInstance()

```
bool Enter::_loadInstance (
            PersistenceRecord * fields )  [override], [protected], [virtual]
```

virtual protected method that must be overriden
Reimplemented from ModelComponent.

17.258.2.5 _onDispatchEvent()

```
void Enter::_onDispatchEvent (
            Entity * entity,
            unsigned int inputPortNumber )  [override], [protected], [virtual]
```

Handles a dispatched event for this component type.
This method is only for ModelComponents, not for ModelDataElements.

Parameters

entity	Entity being processed.
inputPortNumber	Input port where the entity arrived.

Implements ModelComponent.

17.258.2.6 _saveInstance()

```
void Enter::_saveInstance (
            PersistenceRecord * fields,
            bool saveDefaultValues )  [override], [protected], [virtual]
```

Saves object fields into a serialization structure.

Parameters

fields	a table-like structure used for serialization.
saveDefaultValues	indicates whether or not to save fields which are set to their default value.

Reimplemented from ModelComponent.

17.258.2.7 show()

```
std::string Enter::show ( )  [override], [virtual]
```

virtual public methods
Returns a textual representation of this component.

Returns

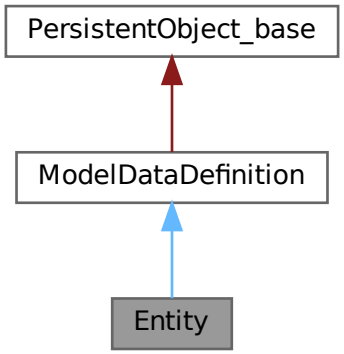
Human-readable description used for tracing and debugging.

Reimplemented from ModelComponent.
The documentation for this class was generated from the following files:

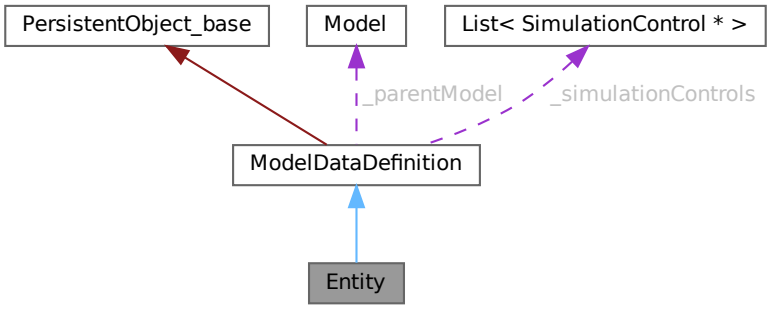
- plugins/components/MaterialHandling/Enter.h
- plugins/components/MaterialHandling/Enter.cpp

17.259 Entity Class Reference

Runtime entity (token) flowing through the model during simulation.
`#include <kernel/simulator/essentialPlugins/Entity.h>`
Inheritance diagram for Entity:



Collaboration diagram for Entity:



Public Member Functions

- virtual std::string show () override

  Returns a textual representation of this data definition.
- void setEntityTypeName (std::string entityTypeName)

  setEntityTypeName
- std::string getEntityTypeName () const

  getEntityTypeName
- void setEntityType (EntityType *entityType)

  setEntityType
- EntityType * getEntityType () const

  getEntityType
- double getAttributeValue (std::string attributeName, std::string index="")

  getAttributeValue
- double getAttributeValue (Util::identification attributeID, std::string index="")

  getAttributeValue
- void setAttributeValue (std::string attributeName, double value, std::string index="", bool createIfNot↩ Found=false)

  setAttributeValue
- void setAttributeValue (Util::identification attributeID, double value, std::string index="")

  setAttributeValue
- void **copyAttributeValues** (std::string destinationAttributeName, std::string sourceAttributeName)

  Copies all sparse values from one attribute to another for this entity.
- Util::identification entityNumber () const

  entityNumber

Public Member Functions inherited from ModelDataDefinition

- ModelDataDefinition (Model *model, std::string datadefinitionTypename, std::string name="", bool insert↩ IntoModel=true)

  Creates a model data definition and optionally inserts it into the model.
- virtual ~**ModelDataDefinition** ()

  Releases resources owned by this data definition.
- Util::identification getId () const

  Returns the unique identifier of this instance.

- void setName (const std::string &name)

  Updates the logical name of this instance.
- const std::string & getName () const

  Returns the logical name of this instance.
- void setLabel (const std::string &label)

  Updates the user-visible label of this instance.
- const std::string & getLabel () const

  Returns the user-visible label of this instance.
- const std::string & getClassname () const

  Returns the runtime class name used by the plugin system.
- Model * getParentModel () const

  Returns the parent model that owns this definition.
- bool isReportStatistics () const

  Indicates whether this data definition contributes report statistics.
- void setReportStatistics (bool reportStatistics)

  Enables or disables report-statistics generation for this definition.
- ModelDataDefinition * getInternalData (const std::string &name) const

  Looks up a named internal child data definition.
- std::map< std::string, ModelDataDefinition * > * getInternalData () const

  Returns the full map of internal child data definitions.
- std::map< std::string, ModelDataDefinition * > * getAttachedData () const

  Returns the full map of attached data definitions.
- bool hasChanged () const

  Indicates whether this instance has been modified since the last reset.
- void setHasChanged (bool hasChanged)

  Updates the changed flag for this data definition.
- unsigned int getLevel () const

  Returns the hierarchical editing context containing this element.
- void setModelLevel (unsigned int _modelLevel)

  Sets this element's hierarchical editing context.
- List< SimulationControl * > * getSimulationControls () const

  Returns the simulation controls owned by this data definition.
- TraceManager::Level getTraceLevelSpecific () const

  Returns the trace level that applies specifically to this definition.
- void setTraceLevelSpecific (TraceManager::Level level)

  Updates the trace level used by this definition.
- void defineTraceLevelSpecific (TraceManager::Level traceLevelspecific, bool traceLevelSpecific↩ Enabled=true)

  Defines the specific trace level and optionally enables it immediately.
- bool isTraceLevelSpecificEnabled () const

  Indicates whether the specific trace level is enabled.
- void setTraceLevelSpecificEnabled (bool traceLevelSpecificEnabled)

  Enables or disables the specific trace level.

Protected Member Functions

- virtual bool _loadInstance (PersistenceRecord *fields) override

  must be overriden by derived classes
- virtual void _saveInstance (PersistenceRecord *fields, bool saveDefaultValues) override

  Saves object fields into a serialization structure.
- virtual bool _check (std::string &errorMessage) override

  could be overriden by derived classes

- void traceSimulation (void *thisobject, const std::string &text, TraceManager::Level level=TraceManager::↩ Level::L8_detailed)

  Traces text to the simulation output.
- void **traceSimulation** (void *thisobject, TraceManager::Level level, const std::string &text)

Friends

- class **Model**

Additional Inherited Members

Static Public Member Functions inherited from ModelDataDefinition

- static ModelDataDefinition * LoadInstance (Model *model, PersistenceRecord *fields, bool insertIntoModel)

  Loads a model data definition instance from serialized fields.
- static ModelDataDefinition * NewInstance (Model *model, std::string name="")

  Creates a new instance of a data definition using the plugin registry.
- static void SaveInstance (PersistenceRecord *fields, ModelDataDefinition *modeldatum)

  Serializes a data definition instance into a persistence record.
- static bool Check (ModelDataDefinition *modeldatum, std::string &errorMessage)

  Validates a data definition instance.
- static void InitBetweenReplications (ModelDataDefinition *modeldatum)

  Resets simulation-time state between replications.
- static void CreateInternalData (ModelDataDefinition *modeldatum)

  Creates internal and attached data required by this instance.
- static bool CreateRelatedDataElements (ModelDataDefinition *modeldatum, std::string &errorMessage)

  Creates related data and validates the instance in a single call.

Protected Attributes inherited from ModelDataDefinition

- bool **_traceLevelSpecificEnabled** = false

17.259.1 Detailed Description

Runtime entity (token) flowing through the model during simulation.
This is the live, per-replication object created and destroyed by `Model` for each simulated item (a "job", "customer", "part", etc.). It owns the sparse per-entity attribute values (see Attribute) and a pointer to its EntityType, but it is not itself the data definition an end user edits before running the model.
Arena correspondence: the configurable "Entity module" (name, initial picture, holding cost/hour and initial VA/↩ NVA/waiting/transfer/other costs; Rockwell Automation, *Getting Started with Arena*, "The Basic Process Panel", pp. 44-45) is a data definition and corresponds to EntityType, not to this class. This class is the closest correspondence to what Arena calls an "entity" at simulation time: an instance created from an entity type, carrying attribute values and a runtime identification number.
Construction/destruction are restricted to `Model` so that entity lifetime always stays under simulator control.

17.259.2 Member Function Documentation

17.259.2.1 _check()

```
bool Entity::_check (
            std::string & errorMessage )  [override], [protected], [virtual]
```

could be overriden by derived classes
Reimplemented from ModelDataDefinition.

17.259.2.2 _loadInstance()

```
bool Entity::_loadInstance (
            PersistenceRecord * fields )  [override], [protected], [virtual]
```

must be overriden by derived classes
Reimplemented from ModelDataDefinition.

17.259.2.3 _saveInstance()

```
void Entity::_saveInstance (
            PersistenceRecord * fields,
            bool saveDefaultValues )  [override], [protected], [virtual]
```

Saves object fields into a serialization structure.

Parameters

fields	a table-like structure used for serialization.
saveDefaultValues	indicates whether or not to save fields which are set to their default value.

Reimplemented from ModelDataDefinition.

17.259.2.4 entityNumber()

```
Util::identification Entity::entityNumber ( ) const
```

entityNumber

Returns

Unique runtime identifier for this entity instance.

17.259.2.5 getAttributeValue() [1/2]

```
double Entity::getAttributeValue (
            std::string attributeName,
            std::string index = "" )
```

getAttributeValue

Parameters

index	
attributeName	

Returns

Current attribute value for the provided name/index.

17.259.2.6 getAttributeValue() [2/2]

```
double Entity::getAttributeValue (
            Util::identification attributeID,
            std::string index = "" )
```

getAttributeValue

Parameters

index	
attributeID	

Returns

Current attribute value for the provided id/index.

17.259.2.7 getEntityType()

```
EntityType * Entity::getEntityType ( ) const
```

getEntityType

Returns

Pointer to the associated entity type.

17.259.2.8 getEntityTypeName()

```
std::string Entity::getEntityTypeName ( ) const
```

getEntityTypeName

Returns

Name of the associated entity type.

17.259.2.9 setAttributeValue() [1/2]

```
void Entity::setAttributeValue (
            std::string attributeName,
            double value,
            std::string index = "",
            bool createIfNotFound = false )
```

setAttributeValue

Parameters

index	
attributeName	
value	
createIfNotFound	

Assigns an attribute value by name and optionally creates missing attributes.

17.259.2.10 setAttributeValue() [2/2]

```
void Entity::setAttributeValue (
            Util::identification attributeID,
            double value,
            std::string index = "" )
```

setAttributeValue

Parameters

index	
attributeID	
value	

Assigns an attribute value by attribute identifier.

17.259.2.11 setEntityType()

```
void Entity::setEntityType (
```

```
            EntityType * entityType )
```
setEntityType

Parameters

entityType	

Directly assigns the entity type pointer.

17.259.2.12 setEntityTypeName()

```
void Entity::setEntityTypeName (
            std::string entityTypeName )
```
setEntityTypeName

Parameters

entityTypeName	

Sets entity type by name (indirect lookup through model data manager).

17.259.2.13 show()

```
std::string Entity::show ( )  [override], [virtual]
```
Returns a textual representation of this data definition.
Returns the keys of internal ModelDataDefinitions such as counters, statistics collectors and other children needed before model checking.

Returns

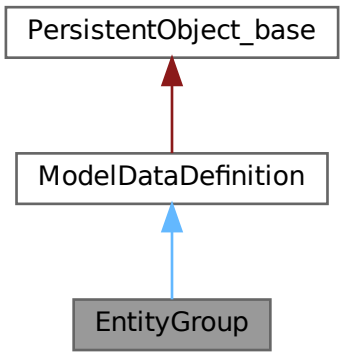
Human-readable summary used by traces and debug output.

Reimplemented from ModelDataDefinition.
The documentation for this class was generated from the following files:

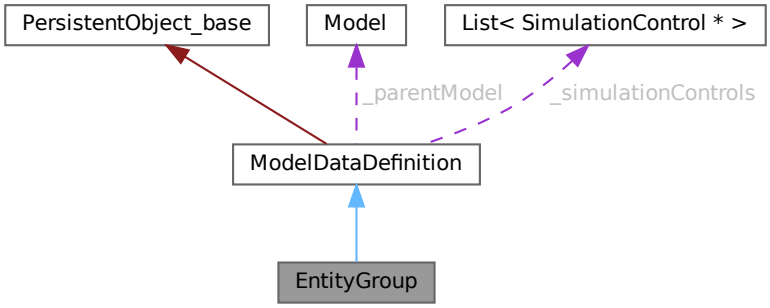
- kernel/simulator/essentialPlugins/Entity.h
- kernel/simulator/essentialPlugins/Entity.cpp

17.260 EntityGroup Class Reference

Inheritance diagram for EntityGroup:



Collaboration diagram for EntityGroup:



Public Member Functions

- **EntityGroup** (Model *model, std::string name="")
- virtual std::string show () override

  Returns a textual representation of this data definition.
- void **insertElement** (unsigned int idKey, Entity *modeldatum)
- void **removeElement** (unsigned int idKey, Entity *modeldatum)
- List< Entity * > * **getGroup** (unsigned int idKey)

Public Member Functions inherited from ModelDataDefinition

- ModelDataDefinition (Model *model, std::string datadefinitionTypename, std::string name="", bool insert↩ IntoModel=true)

  Creates a model data definition and optionally inserts it into the model.
- virtual ~**ModelDataDefinition** ()

  Releases resources owned by this data definition.
- Util::identification getId () const

  Returns the unique identifier of this instance.
- void setName (const std::string &name)

  Updates the logical name of this instance.
- const std::string & getName () const

  Returns the logical name of this instance.
- void setLabel (const std::string &label)

  Updates the user-visible label of this instance.
- const std::string & getLabel () const

  Returns the user-visible label of this instance.
- const std::string & getClassname () const

  Returns the runtime class name used by the plugin system.
- Model * getParentModel () const

  Returns the parent model that owns this definition.
- bool isReportStatistics () const

  Indicates whether this data definition contributes report statistics.
- void setReportStatistics (bool reportStatistics)

  Enables or disables report-statistics generation for this definition.
- ModelDataDefinition * getInternalData (const std::string &name) const

  Looks up a named internal child data definition.

- std::map< std::string, ModelDataDefinition * > * getInternalData () const

  Returns the full map of internal child data definitions.
- std::map< std::string, ModelDataDefinition * > * getAttachedData () const

  Returns the full map of attached data definitions.
- bool hasChanged () const

  Indicates whether this instance has been modified since the last reset.
- void setHasChanged (bool hasChanged)

  Updates the changed flag for this data definition.
- unsigned int getLevel () const

  Returns the hierarchical editing context containing this element.
- void setModelLevel (unsigned int _modelLevel)

  Sets this element's hierarchical editing context.
- List< SimulationControl * > * getSimulationControls () const

  Returns the simulation controls owned by this data definition.
- TraceManager::Level getTraceLevelSpecific () const

  Returns the trace level that applies specifically to this definition.
- void setTraceLevelSpecific (TraceManager::Level level)

  Updates the trace level used by this definition.
- void defineTraceLevelSpecific (TraceManager::Level traceLevelspecific, bool traceLevelSpecific↩ Enabled=true)

  Defines the specific trace level and optionally enables it immediately.
- bool isTraceLevelSpecificEnabled () const

  Indicates whether the specific trace level is enabled.
- void setTraceLevelSpecificEnabled (bool traceLevelSpecificEnabled)

  Enables or disables the specific trace level.

17.261.1 Detailed Description

Data definition describing one class of entity that Create-family components may instantiate at simulation time.
Arena correspondence: the "Entity module" (Rockwell Automation, *Getting Started with Arena*, "The Basic Process Panel", pp. 44-45), which defines an entity type's initial picture, holding cost/hour and initial value-added/non-value-added/waiting/transfer/other cost attributes.
Confirmed in this class: initial picture (`initialPicture`) and initial value-added, non-value-added, waiting and other costs. `setInitialWaitingCost()/initialWaitingCost()` and the sibling VA/NVA/Other accessors are the closest correspondence to Arena's four cost categories.
Known differences from Arena: there is no explicit "Holding Cost/Hour" field, and Arena's fifth cost category ("↩ Initial Transfer Cost") has no dedicated accessor here; a maintainer should decide whether to add them or keep the current four-category cost model. Runtime entities created from an EntityType are instances of Entity, not of this class.

17.261.2 Member Function Documentation

17.261.2.1 _createInternalStatisticReporters()

```
void EntityType::_createInternalStatisticReporters ( )  [override], [protected], [virtual]
```

Reimplemented from ModelDataDefinition.

17.261.2.2 _initBetweenReplications()

```
void EntityType::_initBetweenReplications ( )  [override], [protected], [virtual]
```

Reimplemented from ModelDataDefinition.

17.261.2.3 _loadInstance()

```
bool EntityType::_loadInstance (
            PersistenceRecord * fields )  [override], [protected], [virtual]
```

must be overriden by derived classes
Reimplemented from ModelDataDefinition.

17.261.2.4 _saveInstance()

```
void EntityType::_saveInstance (
            PersistenceRecord * fields,
            bool saveDefaultValues )  [override], [protected], [virtual]
```

Saves object fields into a serialization structure.

Parameters

fields	a table-like structure used for serialization.
saveDefaultValues	indicates whether or not to save fields which are set to their default value.

Reimplemented from ModelDataDefinition.

17.261.2.5 addGetStatisticsCollector()

```
StatisticsCollector * EntityType::addGetStatisticsCollector (
            std::string name )
```

addGetStatisticsCollector

Parameters

name	

Returns

17.261.2.6 show()

```
std::string EntityType::show ( )  [override], [virtual]
```

Returns a textual representation of this data definition.
Returns the keys of internal ModelDataDefinitions such as counters, statistics collectors and other children needed before model checking.

Returns

Human-readable summary used by traces and debug output.

Reimplemented from ModelDataDefinition.

  virtual public methods

Public Member Functions inherited from ModelComponent

- ModelComponent (Model *model, std::string componentTypename, std::string name="")

  constructors
- virtual ~**ModelComponent** ()

  Releases component-owned resources and unregisters it from the model.
- ConnectionManager * getConnectionManager () const

  new public user methods for this component
- void connectTo (ModelComponent *component, unsigned int inputPortNumber=0)

  Connects this component to another component.
- bool hasBreakpointAt ()

  Indicates whether a simulation breakpoint is set on this component.
- void setDescription (std::string _description)

  Updates the free-form description shown by the GUI.
- std::string getDescription () const

  Returns the free-form description associated with this component.
- void remove (ModelComponent *comp)

  Removes a connected component from this component.

Public Member Functions inherited from ModelDataDefinition

- ModelDataDefinition (Model *model, std::string datadefinitionTypename, std::string name="", bool insertIntoModel=true)

  Creates a model data definition and optionally inserts it into the model.
- virtual ~**ModelDataDefinition** ()

  Releases resources owned by this data definition.
- Util::identification getId () const

  Returns the unique identifier of this instance.
- void setName (const std::string &name)

  Updates the logical name of this instance.
- const std::string & getName () const

  Returns the logical name of this instance.
- void setLabel (const std::string &label)

  Updates the user-visible label of this instance.
- const std::string & getLabel () const

  Returns the user-visible label of this instance.
- const std::string & getClassname () const

  Returns the runtime class name used by the plugin system.
- Model * getParentModel () const

  Returns the parent model that owns this definition.
- bool isReportStatistics () const

  Indicates whether this data definition contributes report statistics.
- void setReportStatistics (bool reportStatistics)

  Enables or disables report-statistics generation for this definition.
- ModelDataDefinition * getInternalData (const std::string &name) const

  Looks up a named internal child data definition.
- std::map< std::string, ModelDataDefinition * > * getInternalData () const

  Returns the full map of internal child data definitions.
- std::map< std::string, ModelDataDefinition * > * getAttachedData () const

  Returns the full map of attached data definitions.
- bool hasChanged () const

  Indicates whether this instance has been modified since the last reset.
- void setHasChanged (bool hasChanged)

  Updates the changed flag for this data definition.
- unsigned int getLevel () const

  Returns the hierarchical editing context containing this element.
- void setModelLevel (unsigned int _modelLevel)

  Sets this element's hierarchical editing context.
- List< SimulationControl * > * getSimulationControls () const

  Returns the simulation controls owned by this data definition.
- TraceManager::Level getTraceLevelSpecific () const

  Returns the trace level that applies specifically to this definition.
- void setTraceLevelSpecific (TraceManager::Level level)

  Updates the trace level used by this definition.
- void defineTraceLevelSpecific (TraceManager::Level traceLevelspecific, bool traceLevelSpecificEnabled=true)

  Defines the specific trace level and optionally enables it immediately.
- bool isTraceLevelSpecificEnabled () const

  Indicates whether the specific trace level is enabled.
- void setTraceLevelSpecificEnabled (bool traceLevelSpecificEnabled)

  Enables or disables the specific trace level.

Static Public Member Functions

- static PluginInformation * **GetPluginInformation** ()
- static ModelComponent * **LoadInstance** (Model *model, PersistenceRecord *fields)
- static ModelDataDefinition * **NewInstance** (Model *model, std::string name="")

Static Public Member Functions inherited from ModelComponent

- static ModelComponent * LoadInstance (Model *model, PersistenceRecord *fields)

  static public methods that must have implementations (Load and New just the same. GetInformation must provide specific infos for the new component
- static bool Check (ModelComponent *component)

  Validates a component instance.
- static void CreateInternalData (ModelComponent *component)

  Creates internal data required by a component instance.
- static void SaveInstance (PersistenceRecord *fields, ModelComponent *component)

  Serializes a component instance into a persistence record.
- static void DispatchEvent (Event *event)

  Dispatches a simulation event to the target component.

Static Public Member Functions inherited from ModelDataDefinition

- static ModelDataDefinition * LoadInstance (Model *model, PersistenceRecord *fields, bool insertIntoModel)

  Loads a model data definition instance from serialized fields.
- static ModelDataDefinition * NewInstance (Model *model, std::string name="")

  Creates a new instance of a data definition using the plugin registry.
- static void SaveInstance (PersistenceRecord *fields, ModelDataDefinition *modeldatum)

  Serializes a data definition instance into a persistence record.
- static bool Check (ModelDataDefinition *modeldatum, std::string &errorMessage)

  Validates a data definition instance.
- static void InitBetweenReplications (ModelDataDefinition *modeldatum)

  Resets simulation-time state between replications.
- static void CreateInternalData (ModelDataDefinition *modeldatum)

  Creates internal and attached data required by this instance.
- static bool CreateRelatedDataElements (ModelDataDefinition *modeldatum, std::string &errorMessage)

  Creates related data and validates the instance in a single call.

Protected Member Functions

- virtual bool _loadInstance (PersistenceRecord *fields) override

  virtual protected method that must be overriden
- virtual void _saveInstance (PersistenceRecord *fields, bool saveDefaultValues) override

  Saves object fields into a serialization structure.
- virtual bool _check (std::string &errorMessage) override

  could be overriden by derived classes
- virtual void _initBetweenReplications () override
- virtual void _onDispatchEvent (Entity *entity, unsigned int inputPortNumber) override

  Handles a dispatched event for this component type.
- virtual void _createEditableDataDefinitions () override

Protected Member Functions inherited from ModelDataDefinition

- bool _getSaveDefaultsOption ()
- virtual ParserChangesInformation * _getParserChangesInformation ()
- virtual void _addSimulationControl (SimulationControl *control)
- virtual void _createInternalAndAttachedData ()
- virtual void **_createInternalStatisticReporters** ()
- virtual void _createAttachedAttributes ()
- virtual void _createNonEditableDataDefinitions ()
- void **_templateCreateInternalStatisticReporters** ()
- void **_templateCreateAttachedAttributes** ()
- void **_templateCreateNonEditableDataDefinitions** ()
- void **_templateCreateEditableDataDefinitions** ()
- void **_internaStatisticReportersClear** ()

  legacy helper methods used by the granular create hooks*
- void **_internalDataClear** ()
- void **_internalDataInsert** (const std::string &key, ModelDataDefinition *child)
- void **_internalDataRemove** (const std::string &key)
- void **_attachedDataClear** ()
- void **_attachedDataInsert** (const std::string &key, ModelDataDefinition *data)
- void **_attachedDataRemove** (const std::string &key)
- void **_attachedAttributesInsert** (const std::vector< std::string > &neededNames)
- void **_statisticReporterInsert** (const std::string &key, ModelDataDefinition *data)
- void **_statisticReporterRemove** (const std::string &key)
- void **_statisticReportersClear** ()
- void **_mandatoryAttachedAttributeInsert** (const std::string &key, ModelDataDefinition *data)
- void **_mandatoryAttachedAttributeRemove** (const std::string &key)
- void **_mandatoryAttachedAttributesClear** ()
- void **_mandatoryEditableDataDefinitionInsert** (const std::string &key, ModelDataDefinition *data)
- void **_mandatoryEditableDataDefinitionRemove** (const std::string &key)
- void **_mandatoryEditableDataDefinitionsClear** ()
- void **_optionalEditableDataDefinitionInsert** (const std::string &key, ModelDataDefinition *data)
- void **_optionalEditableDataDefinitionRemove** (const std::string &key)
- void **_optionalEditableDataDefinitionsClear** ()
- void **_mandatoryNonEditableDataDefinitionInsert** (const std::string &key, ModelDataDefinition *data)
- void **_mandatoryNonEditableDataDefinitionRemove** (const std::string &key)
- void **_mandatoryNonEditableDataDefinitionsClear** ()
- void **_optionalNonEditableDataDefinitionInsert** (const std::string &key, ModelDataDefinition *data)
- void **_optionalNonEditableDataDefinitionRemove** (const std::string &key)
- void **_optionalNonEditableDataDefinitionsClear** ()
- void **_checkCreateAttachedReferencedDataDefinition** (const std::string &expression)

  method to be called to insert attached dataelements that are referenced by string expressions (detected by the parser), to avoid orphaned data definitions
- void **trace** (const std::string &text, TraceManager::Level level=TraceManager::Level::L8_detailed)

  not just an easy access to trace manager, but wrappers to check if specific trace level applies
- void **traceError** (const std::string &text, const std::exception &e)
- void **traceError** (const std::string &text, TraceManager::Level level=TraceManager::Level::L1_errorFatal)
- void **traceReport** (const std::string &text, TraceManager::Level level=TraceManager::Level::L2_results)
- void **traceSimulation** (void *thisobject, double time, Entity *entity, ModelComponent *component, const std::string &text, TraceManager::Level level=TraceManager::Level::L8_detailed)
- void traceSimulation (void *thisobject, const std::string &text, TraceManager::Level level=TraceManager::↩ Level::L8_detailed)

  Traces text to the simulation output.
- void **traceSimulation** (void *thisobject, TraceManager::Level level, const std::string &text)

Additional Inherited Members

Protected Attributes inherited from ModelComponent

- ConnectionManager * _connections = new ConnectionManager()

  virtual protected methods that could be overriden by derived classes, if needed

Protected Attributes inherited from ModelDataDefinition

- Util::identification **_id**
- std::string **_typename**
- bool **_reportStatistics**
- bool **_hasChanged**
- unsigned int **_modelLevel** = 0
- Model * **_parentModel**
- List< SimulationControl * > * **_simulationControls** = new List<SimulationControl*>()
- TraceManager::Level **_traceLevelSpecific**
- bool **_traceLevelSpecificEnabled** = false

17.264.1 Detailed Description

Coordinates a didactic eukaryotic cell cycle over a shared WholeCellState.
EukaryoticCellCycleComponent provides an explicit, event-driven lifecycle layer for budding-yeast-like whole-cell models. It interprets shared state variables and compartment-specific energy proxies, then annotates WholeCellState with a coarse-grained eukaryotic cycle:

- `newborn`
- `g1_budding`
- `s_phase`
- `g2_phase`
- `m_phase`
- `division_ready`
- `arrested`
- `dead`

The component does not execute metabolism, transport, expression, or division itself. Instead, it consumes their outputs from WholeCellState and advances four progress variables stored as pathway activities:

- bud growth progress
- DNA replication progress
- spindle assembly progress
- mitotic exit progress

This design keeps structural biology in BioCompartment, mutable system state in WholeCellState, and dynamic checkpoint logic in a dedicated ModelComponent.

17.264.2 Member Function Documentation

17.264.2.1 _check()

```
bool EukaryoticCellCycleComponent::_check (
            std::string & errorMessage )  [override], [protected], [virtual]
```

could be overriden by derived classes
Reimplemented from ModelDataDefinition.

17.264.2.2 _createEditableDataDefinitions()

```
void EukaryoticCellCycleComponent::_createEditableDataDefinitions ( )  [override], [protected], [virtual]
```

Reimplemented from ModelDataDefinition.

17.264.2.3 _initBetweenReplications()

```
void EukaryoticCellCycleComponent::_initBetweenReplications ( )  [override], [protected], [virtual]
```

Reimplemented from ModelDataDefinition.

17.264.2.4 _loadInstance()

```
bool EukaryoticCellCycleComponent::_loadInstance (
            PersistenceRecord * fields )  [override], [protected], [virtual]
```

virtual protected method that must be overriden
Reimplemented from ModelComponent.

17.264.2.5 _onDispatchEvent()

```
void EukaryoticCellCycleComponent::_onDispatchEvent (
            Entity * entity,
            unsigned int inputPortNumber )  [override], [protected], [virtual]
```

Handles a dispatched event for this component type.
This method is only for ModelComponents, not for ModelDataElements.

Parameters

entity	Entity being processed.
inputPortNumber	Input port where the entity arrived.

Implements ModelComponent.

17.264.2.6 _saveInstance()

```
void EukaryoticCellCycleComponent::_saveInstance (
            PersistenceRecord * fields,
            bool saveDefaultValues )  [override], [protected], [virtual]
```

Saves object fields into a serialization structure.

Parameters

fields	a table-like structure used for serialization.
saveDefaultValues	indicates whether or not to save fields which are set to their default value.

Reimplemented from ModelComponent.

17.264.2.7 show()

```
std::string EukaryoticCellCycleComponent::show ( )  [override], [virtual]
```

virtual public methods
Returns a textual representation of this component.

Returns

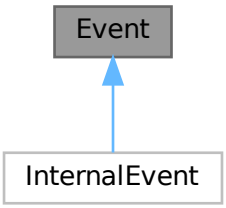
Human-readable description used for tracing and debugging.

Reimplemented from ModelComponent.
The documentation for this class was generated from the following files:

- plugins/components/WholeCellModeling/EukaryoticCellCycleComponent.h
- plugins/components/WholeCellModeling/EukaryoticCellCycleComponent.cpp

17.265 Event Class Reference

`#include <kernel/simulator/Event.h>`
Inheritance diagram for Event:



Public Member Functions

- **Event** (double time, Entity *entity, ModelComponent *component, unsigned int componentinputPort↩ Number=0)
- **Event** (double time, Entity *entity, Connection *connection)
- double getTime () const

  getTime
- ModelComponent * getComponent () const

  getComponent
- Entity * getEntity () const

  getEntity
- unsigned int getComponentinputPortNumber () const

  getComponentinputPortNumber
- void setEntity (Entity *_entity)

  setEntity
- virtual std::string **show** ()

Protected Attributes

- double **_time**

17.265.1 Detailed Description

An an instantaneaous event, triggered at a certain moment by an entity upon reaching a component. The simulated time advances in discrete points in time and that are the instants that an event is triggered.

17.265.2 Member Function Documentation

17.265.2.1 getComponent()

`ModelComponent * Event::getComponent ( ) const`
getComponent

Returns

17.265.2.2 getComponentinputPortNumber()

```
unsigned int Event::getComponentinputPortNumber ( ) const
```

getComponentinputPortNumber

Returns

17.265.2.3 getEntity()

```
Entity * Event::getEntity ( ) const
```

getEntity

Returns

17.265.2.4 getTime()

```
double Event::getTime ( ) const
```

getTime

Returns

17.265.2.5 setEntity()

```
void Event::setEntity (
            Entity * _entity )
```

setEntity

Parameters

_entity	

The documentation for this class was generated from the following files:

- kernel/simulator/Event.h
- kernel/simulator/Event.cpp

  Returns the user-visible label of this instance.
- const std::string & getClassname () const

  Returns the runtime class name used by the plugin system.
- Model * getParentModel () const

  Returns the parent model that owns this definition.
- bool isReportStatistics () const

  Indicates whether this data definition contributes report statistics.
- void setReportStatistics (bool reportStatistics)

  Enables or disables report-statistics generation for this definition.
- ModelDataDefinition * getInternalData (const std::string &name) const

  Looks up a named internal child data definition.
- std::map< std::string, ModelDataDefinition * > * getInternalData () const

  Returns the full map of internal child data definitions.
- std::map< std::string, ModelDataDefinition * > * getAttachedData () const

  Returns the full map of attached data definitions.
- bool hasChanged () const

  Indicates whether this instance has been modified since the last reset.
- void setHasChanged (bool hasChanged)

  Updates the changed flag for this data definition.
- unsigned int getLevel () const

  Returns the hierarchical editing context containing this element.
- void setModelLevel (unsigned int _modelLevel)

  Sets this element's hierarchical editing context.
- List< SimulationControl * > * getSimulationControls () const

  Returns the simulation controls owned by this data definition.
- TraceManager::Level getTraceLevelSpecific () const

  Returns the trace level that applies specifically to this definition.
- void setTraceLevelSpecific (TraceManager::Level level)

  Updates the trace level used by this definition.
- void defineTraceLevelSpecific (TraceManager::Level traceLevelspecific, bool traceLevelSpecificEnabled=true)

  Defines the specific trace level and optionally enables it immediately.
- bool isTraceLevelSpecificEnabled () const

  Indicates whether the specific trace level is enabled.
- void setTraceLevelSpecificEnabled (bool traceLevelSpecificEnabled)

  Enables or disables the specific trace level.

Static Public Member Functions

- static PluginInformation * **GetPluginInformation** ()
- static ModelComponent * **LoadInstance** (Model *model, PersistenceRecord *fields)
- static ModelDataDefinition * **NewInstance** (Model *model, std::string name="")

Static Public Member Functions inherited from ModelComponent

- static ModelComponent * LoadInstance (Model *model, PersistenceRecord *fields)

  static public methods that must have implementations (Load and New just the same. GetInformation must provide specific infos for the new component
- static bool Check (ModelComponent *component)

  Validates a component instance.
- static void CreateInternalData (ModelComponent *component)

  Creates internal data required by a component instance.
- static void SaveInstance (PersistenceRecord *fields, ModelComponent *component)

  Serializes a component instance into a persistence record.
- static void DispatchEvent (Event *event)

  Dispatches a simulation event to the target component.

Static Public Member Functions inherited from ModelDataDefinition

- static ModelDataDefinition * LoadInstance (Model *model, PersistenceRecord *fields, bool insertIntoModel)

  Loads a model data definition instance from serialized fields.
- static ModelDataDefinition * NewInstance (Model *model, std::string name="")

  Creates a new instance of a data definition using the plugin registry.
- static void SaveInstance (PersistenceRecord *fields, ModelDataDefinition *modeldatum)

  Serializes a data definition instance into a persistence record.
- static bool Check (ModelDataDefinition *modeldatum, std::string &errorMessage)

  Validates a data definition instance.
- static void InitBetweenReplications (ModelDataDefinition *modeldatum)

  Resets simulation-time state between replications.
- static void CreateInternalData (ModelDataDefinition *modeldatum)

  Creates internal and attached data required by this instance.
- static bool CreateRelatedDataElements (ModelDataDefinition *modeldatum, std::string &errorMessage)

  Creates related data and validates the instance in a single call.

Protected Member Functions

- virtual void _onDispatchEvent (Entity *entity, unsigned int inputPortNumber) override

  Handles a dispatched event for this component type.
- virtual bool _loadInstance (PersistenceRecord *fields) override

  virtual protected method that must be overriden
- virtual void _saveInstance (PersistenceRecord *fields, bool saveDefaultValues) override

  Saves object fields into a serialization structure.
- virtual bool _check (std::string &errorMessage) override

  could be overriden by derived classes

17.272.1 Detailed Description

Exit module DESCRIPTION The Exit module releases the entity's cells on the specified conveyor. If another entity is waiting in queue for the conveyor at the same station when the cells are released, it will then access the conveyor. TYPICAL USES Cases exit a conveyor for packing Bad parts are removed from the conveyor and disposed Passengers remove luggage from the baggage claim conveyor PROMPTS Prompt Description Name Unique name of the module that will be displayed in the flowchart. Conveyor Name Name of the conveyor on which the entity will exit. If left blank, the previously accessed conveyor is assumed.

17.272.2 of Cells Number of contiguous conveyor cells the entity will relinquish.

17.272.3 Member Function Documentation

17.272.3.1 _check()

```
bool Exit::_check (
            std::string & errorMessage )  [override], [protected], [virtual]
```

could be overriden by derived classes
Reimplemented from ModelDataDefinition.

17.272.3.2 _loadInstance()

```
bool Exit::_loadInstance (
            PersistenceRecord * fields )  [override], [protected], [virtual]
```

virtual protected method that must be overriden
Reimplemented from ModelComponent.

17.272.3.3 _onDispatchEvent()

```
void Exit::_onDispatchEvent (
            Entity * entity,
            unsigned int inputPortNumber )  [override], [protected], [virtual]
```

Handles a dispatched event for this component type.
This method is only for ModelComponents, not for ModelDataElements.

Parameters

entity	Entity being processed.
inputPortNumber	Input port where the entity arrived.

Implements ModelComponent.

17.272.3.4 _saveInstance()

```
void Exit::_saveInstance (
            PersistenceRecord * fields,
            bool saveDefaultValues )  [override], [protected], [virtual]
```

Saves object fields into a serialization structure.

Parameters

fields	a table-like structure used for serialization.
saveDefaultValues	indicates whether or not to save fields which are set to their default value.

Reimplemented from ModelComponent.

17.272.3.5 show()

```
std::string Exit::show ( )  [override], [virtual]
```

virtual public methods
Returns a textual representation of this component.

Returns

Human-readable description used for tracing and debugging.

Reimplemented from ModelComponent.
The documentation for this class was generated from the following files:

- plugins/components/MaterialHandling/Exit.h
- plugins/components/MaterialHandling/Exit.cpp

17.273 ExperimentManager Class Reference

Manages higher-level simulation experiments.
`#include <kernel/simulator/ExperimentManager.h>`

Public Member Functions

- **ExperimentManager** (Simulator *simulator)
- SimulationExperiment * **newSimulationExperiment** ()
- void **insert** (SimulationExperiment *experiment)
- void **remove** (SimulationExperiment *experiment)
- void **setCurrent** (SimulationExperiment *experiment)
- bool **saveSimulationExperiment** (std::string filename)
- bool **loadSimulationExperiment** (std::string filename)
- unsigned int **size** ()
- SimulationExperiment * **front** ()
- SimulationExperiment * **current** ()
- SimulationExperiment * **next** ()
- List< SimulationExperiment * > * **getExperiments** () const

17.273.1 Detailed Description

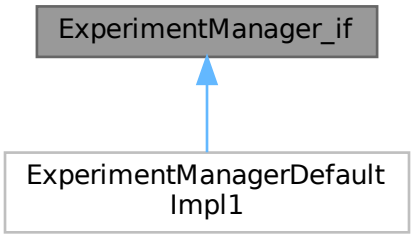
Manages higher-level simulation experiments.
Historically, GenESyS initially supported only the basic experiment controls available through ModelSimulation, especially the number of replications and the replication length.
This class represents a later attempt to move more advanced experiment design concerns into the simulation kernel, including higher-level experiment sets, scenario management and future Process Analyzer-like workflows.

This layer is still under development and should be treated as an incomplete experimental abstraction on top of the already functional ModelSimulation mechanism.
The documentation for this class was generated from the following files:

- kernel/simulator/ExperimentManager.h
- kernel/simulator/ExperimentManager.cpp

17.274 ExperimentManager_if Class Reference

Interface that coordinates execution of scenario-based simulation experiments.
`#include <kernel/simulator/ExperimetManager_if.h>`
Inheritance diagram for ExperimentManager_if:



Public Member Functions

- virtual List< SimulationScenario * > * getScenarios () const =0

  Returns the list of scenarios that compose the experiment.
- virtual void startSimulationOfScenario (SimulationScenario *scenario)=0

  Starts simulation for a specific scenario.
- virtual void startExperiment ()=0

  Starts full experiment execution (all enabled scenarios).
- virtual void stopExperiment ()=0

  Requests interruption of the currently running experiment.
- virtual void addTraceSimulationHandler (traceSimulationProcessListener traceSimulationProcessListener)=0

  Registers a callback to receive simulation progress traces for the experiment.

17.274.1 Detailed Description

Interface that coordinates execution of scenario-based simulation experiments.
An experiment manager owns a set of scenarios, starts/stops scenario runs and exposes progress tracing hooks so higher-level tools can monitor experiment status.

17.274.2 Member Function Documentation

17.274.2.1 addTraceSimulationHandler()

```
virtual void ExperimentManager_if::addTraceSimulationHandler (
            traceSimulationProcessListener traceSimulationProcessListener )  [pure virtual]
```

Registers a callback to receive simulation progress traces for the experiment.
Implemented in ExperimentManagerDefaultImpl1.

17.274.2.2 getScenarios()

```
virtual List< SimulationScenario * > * ExperimentManager_if::getScenarios ( ) const  [pure
virtual]
```

Returns the list of scenarios that compose the experiment.
Implemented in ExperimentManagerDefaultImpl1.

17.274.2.3 startExperiment()

```
virtual void ExperimentManager_if::startExperiment ( )  [pure virtual]
```

Starts full experiment execution (all enabled scenarios).
Implemented in ExperimentManagerDefaultImpl1.

17.274.2.4 startSimulationOfScenario()

```
virtual void ExperimentManager_if::startSimulationOfScenario (
            SimulationScenario * scenario )  [pure virtual]
```

Starts simulation for a specific scenario.
Implemented in ExperimentManagerDefaultImpl1.

17.274.2.5 stopExperiment()

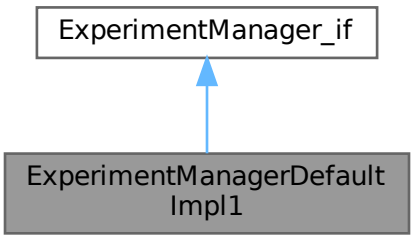
```
virtual void ExperimentManager_if::stopExperiment ( )  [pure virtual]
```

Requests interruption of the currently running experiment.
Implemented in ExperimentManagerDefaultImpl1.
The documentation for this class was generated from the following file:

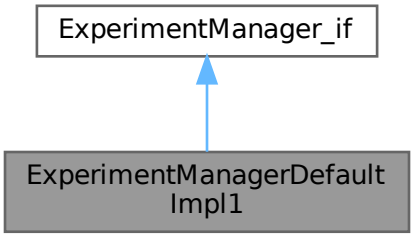
- kernel/simulator/ExperimetManager_if.h

17.275 ExperimentManagerDefaultImpl1 Class Reference

Inheritance diagram for ExperimentManagerDefaultImpl1:



Collaboration diagram for ExperimentManagerDefaultImpl1:



Public Member Functions

- virtual List< SimulationScenario * > * getScenarios () const override

  Returns the list of scenarios that compose the experiment.
- virtual void startSimulationOfScenario (SimulationScenario *scenario) override

  Starts simulation for a specific scenario.
- virtual void startExperiment () override

  Starts full experiment execution (all enabled scenarios).
- virtual void stopExperiment () override

  Requests interruption of the currently running experiment.
- virtual void addTraceSimulationHandler (traceSimulationProcessListener traceSimulationProcessListener) override

  Registers a callback to receive simulation progress traces for the experiment.

17.275.1 Member Function Documentation

17.275.1.1 addTraceSimulationHandler()

```
void ExperimentManagerDefaultImpl1::addTraceSimulationHandler (
            traceSimulationProcessListener traceSimulationProcessListener ) [override], [virtual]
```

Registers a callback to receive simulation progress traces for the experiment.
Implements ExperimentManager_if.

17.275.1.2 getScenarios()

```
List< SimulationScenario * > * ExperimentManagerDefaultImpl1::getScenarios ( ) const [override],
[virtual]
```

Returns the list of scenarios that compose the experiment.
Implements ExperimentManager_if.

17.275.1.3 startExperiment()

```
void ExperimentManagerDefaultImpl1::startExperiment ( ) [override], [virtual]
```

Starts full experiment execution (all enabled scenarios).
Implements ExperimentManager_if.

17.275.1.4 startSimulationOfScenario()

```
void ExperimentManagerDefaultImpl1::startSimulationOfScenario (
            SimulationScenario * scenario )  [override], [virtual]
```

Starts simulation for a specific scenario.
Implements ExperimentManager_if.

17.275.1.5 stopExperiment()

```
void ExperimentManagerDefaultImpl1::stopExperiment ( )  [override], [virtual]
```

Requests interruption of the currently running experiment.
Implements ExperimentManager_if.
The documentation for this class was generated from the following files:

- kernel/simulator/ExperimentManagerDefaultImpl1.h
- kernel/simulator/ExperimentManagerDefaultImpl1.cpp

Public Attributes

- int **k**
- int **p**
- int **r**
- int **NUM_FACTORS**
- int **NUM_ROWS**
- std::vector< std::vector< int > > **resultsMatrix**

17.281.1 Member Function Documentation

17.281.1.1 calculateResultsMean()

```
void FactorialDesign::calculateResultsMean ( )
```

Calculates the mean of results for each set of experiments from all replications.
This method computes the mean of results for each set of experiments from all replications, which are stored in the 'resultsMatrix'.
The resulting mean values are stored in the 'resultsMean' member variable.

17.281.1.2 calculateStatistics()

```
void FactorialDesign::calculateStatistics ( )
```

Calculates statistical measures.

This method computes various statistical measures, including effect sums, effect averages, square sums, square sum of errors, square sum total, factor variations, and error variation. These measures are essential for assessing the significance of experimental factors and understanding the variability in the experimental results. The calculated statistics are stored in corresponding member variables for further analysis.

17.281.1.3 checkFeasibility()

```
bool FactorialDesign::checkFeasibility ( )
```

Checks the feasibility of the factorial design.

This method evaluates the feasibility of a factorial design based on the number of interactions.

Returns

true if the factorial design is feasible, false otherwise.

17.281.1.4 createColumnLabels()

```
void FactorialDesign::createColumnLabels ( )
```

Adds column labels for the sign table.

This method creates labels for experimental factors (F1, F2, ..., FN), interaction terms, and results (R1, R2, ..., Rr, R∼) based on the combinations of factor levels generated earlier. Additionally, it adds aliases for confounded factors and ensures appropriate labeling for each column in the table.

The resulting column labels are stored in the 'columnLabels' member variable.

17.281.1.5 createSignTable()

```
void FactorialDesign::createSignTable ( )
```

Creates the sign table for a Factorial Design of Experiments.

This method creates a sign table containing inputs and results of all experiments. It calculates the input for each interaction as the product of the inputs of its factors.

The resulting signTable is a vector of tuples, each representing a row in the sign table. Each tuple contains information about an experiment, facilitating further analysis and interpretation of the experimental results.

17.281.1.6 generateIndexCombinations()

```
void FactorialDesign::generateIndexCombinations ( )
```

Generates combinations of indexes for the Factorial Design of Experiments.

This method generates combinations of indexes with lengths ranging from 1 to NUM_FACTORS. The generated combinations are precomputed and utilized to access various data structures. These structures are essential for constructing the sign table and performing statistical calculations.

17.281.1.7 generateInputs()

```
void FactorialDesign::generateInputs ( )
```

Generates input vectors of experiments to populate the sign table.

This method creates input vectors representing the experimental conditions in a Factorial Design. Each input vector is a combination of factor levels, where the presence of a factor at a high level is represented by '1', whereas a low level is represented by '-1'. The generated input vectors cover all possible combinations of factor levels based on a binary counting pattern.

The resulting input vectors are stored in the 'inputs' member variable.

17.281.1.8 linearRegression()

```
double FactorialDesign::linearRegression (
            const std::vector< int > & xs )
```

Performs linear regression based on a set of input factors.

This method calculates the predicted result (y) using a linear regression model. The model is constructed using the effect averages for each factor in the Factorial Design, and the input factors provided in the 'xs' vector. The predicted result is the sum of the intercept (effect average for the first factor) and the product of each input factor with its corresponding effect average.

Parameters

xs	A vector representing the levels of input factors for which the result is predicted.

Returns

The predicted result (y) based on the linear regression model.

17.281.1.9 showImpacts()

```
void FactorialDesign::showImpacts ( )
```

Displays the impacts of factors, interaction of factors and experimental error.
This method prints the impacts of individual factors, interaction of factors and experimental error as calculated from the statistical measures. The impacts are represented as percentages of total variability, and provide insights into the significance of each factor and the contribution of experimental error to the overall variability.

17.281.1.10 showLinearRegressionModel()

```
void FactorialDesign::showLinearRegressionModel ( )
```

Displays the linear regression model.
This method prints the linear regression model for predicting the result variable based on the inputs of factors and interactions. The model is presented in the form of a mathematical expression, where coefficients are the intercept and the averages of effects for each factor, including interactions.

17.281.1.11 showResiduals()

```
void FactorialDesign::showResiduals ( )
```

Displays the residuals for the experimental results.
This method calculates and prints the residuals, which represent the differences between the observed experimental results and the values predicted by the linear regression model.

17.281.1.12 showSignTable()

```
void FactorialDesign::showSignTable ( )
```

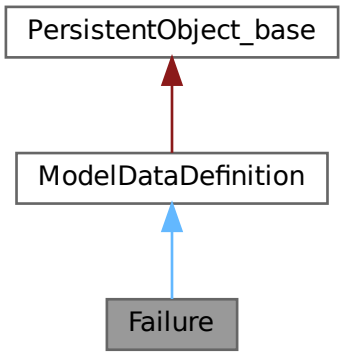
Displays the sign table.
This method prints the sign table, organized in a tabular format, to the console. The table includes column labels, experiment numbers, input combinations and results. The output is formatted to align columns, providing a clear and readable representation of the experimental conditions and their corresponding information.
The documentation for this class was generated from the following files:

- tools/FactorialDesign/FactorialDesign.h
- tools/FactorialDesign/FactorialDesign.cpp

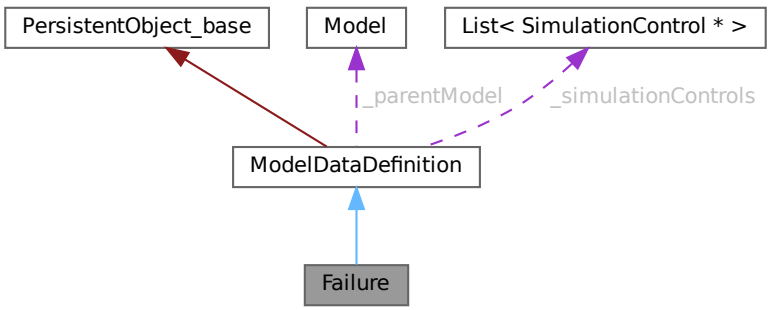
17.282 Failure Class Reference

Data definition describing a resource breakdown pattern (whole resource failure regardless of capacity) attached to one or more Resource instances.
`#include <plugins/data/DiscreteProcessing/Failure.h>`

Inheritance diagram for Failure:



Collaboration diagram for Failure:



Public Types

- enum class **FailureType** : int { **COUNT** = 0 , **TIME** = 1 , **num_elements** = 2 }

Public Member Functions inherited from ModelDataDefinition

- ModelDataDefinition (Model *model, std::string datadefinitionTypename, std::string name="", bool insert↩ IntoModel=true)

  Creates a model data definition and optionally inserts it into the model.
- virtual ~**ModelDataDefinition** ()

  Releases resources owned by this data definition.
- Util::identification getId () const

  Returns the unique identifier of this instance.
- void setName (const std::string &name)

  Updates the logical name of this instance.
- const std::string & getName () const

  Returns the logical name of this instance.
- void setLabel (const std::string &label)

  Updates the user-visible label of this instance.
- const std::string & getLabel () const

  Returns the user-visible label of this instance.
- const std::string & getClassname () const

  Returns the runtime class name used by the plugin system.
- Model * getParentModel () const

  Returns the parent model that owns this definition.
- bool isReportStatistics () const

  Indicates whether this data definition contributes report statistics.
- void setReportStatistics (bool reportStatistics)

  Enables or disables report-statistics generation for this definition.
- ModelDataDefinition * getInternalData (const std::string &name) const

  Looks up a named internal child data definition.
- std::map< std::string, ModelDataDefinition * > * getInternalData () const

  Returns the full map of internal child data definitions.
- std::map< std::string, ModelDataDefinition * > * getAttachedData () const

  Returns the full map of attached data definitions.
- bool hasChanged () const

  Indicates whether this instance has been modified since the last reset.
- void setHasChanged (bool hasChanged)

  Updates the changed flag for this data definition.
- unsigned int getLevel () const

  Returns the hierarchical editing context containing this element.
- void setModelLevel (unsigned int _modelLevel)

  Sets this element's hierarchical editing context.
- List< SimulationControl * > * getSimulationControls () const

  Returns the simulation controls owned by this data definition.

- TraceManager::Level getTraceLevelSpecific () const

  Returns the trace level that applies specifically to this definition.
- void setTraceLevelSpecific (TraceManager::Level level)

  Updates the trace level used by this definition.
- void defineTraceLevelSpecific (TraceManager::Level traceLevelspecific, bool traceLevelSpecific↩ Enabled=true)

  Defines the specific trace level and optionally enables it immediately.
- bool isTraceLevelSpecificEnabled () const

  Indicates whether the specific trace level is enabled.
- void setTraceLevelSpecificEnabled (bool traceLevelSpecificEnabled)

  Enables or disables the specific trace level.

Static Public Member Functions inherited from ModelDataDefinition

- static ModelDataDefinition * LoadInstance (Model *model, PersistenceRecord *fields, bool insertIntoModel)

  Loads a model data definition instance from serialized fields.
- static ModelDataDefinition * NewInstance (Model *model, std::string name="")

  Creates a new instance of a data definition using the plugin registry.
- static void SaveInstance (PersistenceRecord *fields, ModelDataDefinition *modeldatum)

  Serializes a data definition instance into a persistence record.
- static bool Check (ModelDataDefinition *modeldatum, std::string &errorMessage)

  Validates a data definition instance.
- static void InitBetweenReplications (ModelDataDefinition *modeldatum)

  Resets simulation-time state between replications.
- static void CreateInternalData (ModelDataDefinition *modeldatum)

  Creates internal and attached data required by this instance.
- static bool CreateRelatedDataElements (ModelDataDefinition *modeldatum, std::string &errorMessage)

  Creates related data and validates the instance in a single call.

Protected Member Functions

- virtual bool _loadInstance (PersistenceRecord *fields) override

  must be overriden by derived classes
- virtual void _saveInstance (PersistenceRecord *fields, bool saveDefaultValues) override

  Saves object fields into a serialization structure.
- virtual bool _check (std::string &errorMessage) override

  could be overriden by derived classes
- virtual void _initBetweenReplications () override

17.282.1 Detailed Description

Data definition describing a resource breakdown pattern (whole resource failure regardless of capacity) attached to one or more Resource instances.
Arena correspondence: the "Failure module" (Rockwell Automation, *Getting Started with Arena*, "The Advanced Process Panel", pp. 71-72). `FailureType` (COUNT/TIME) mirrors Arena's count-based/time-based failure types; `_countExpression`, `_upTimeExpression/_upTimeTimeUnit` and `_downTimeExpression/_downTimeTimeUnit` are the closest correspondence to Arena's Count, Up Time and Down Time fields (generalized to parsed expressions rather than static numbers). `FailureRule` (IGNORE/PREEMPT/WAIT) mirrors Arena's Failure Rule as configured per resource/failure pair.
Known difference from Arena: there is no "Uptime in this State only" field, so a time-based failure's up-time clock cannot be scoped to a single resource state (e.g. only while Busy); it always runs against total simulated time.

17.282.2 Member Function Documentation

17.282.2.1 _check()

```
bool Failure::_check (
            std::string & errorMessage )  [override], [protected], [virtual]
```

could be overriden by derived classes
Validate failure expressions according to selected failure mode.
Reimplemented from ModelDataDefinition.

17.282.2.2 _initBetweenReplications()

```
void Failure::_initBetweenReplications ( )  [override], [protected], [virtual]
```

Reimplemented from ModelDataDefinition.

17.282.2.3 _loadInstance()

```
bool Failure::_loadInstance (
            PersistenceRecord * fields )  [override], [protected], [virtual]
```

must be overriden by derived classes
Load Failure persistence fields.
This method mirrors _saveInstance field names to preserve a deterministic serialization contract.
Reimplemented from ModelDataDefinition.

17.282.2.4 _saveInstance()

```
void Failure::_saveInstance (
            PersistenceRecord * fields,
            bool saveDefaultValues )  [override], [protected], [virtual]
```

Saves object fields into a serialization structure.

Parameters

fields	a table-like structure used for serialization.
saveDefaultValues	indicates whether or not to save fields which are set to their default value.

Persist Failure configuration fields.
Reimplemented from ModelDataDefinition.

17.282.2.5 show()

```
std::string Failure::show ( )  [override], [virtual]
```

Returns a textual representation of this data definition.
Returns the keys of internal ModelDataDefinitions such as counters, statistics collectors and other children needed before model checking.

Returns

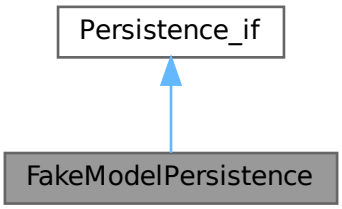
Human-readable summary used by traces and debug output.

Reimplemented from ModelDataDefinition.
The documentation for this class was generated from the following files:

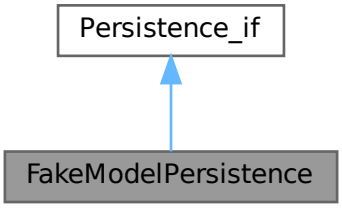
- plugins/data/DiscreteProcessing/Failure.h
- plugins/data/DiscreteProcessing/Failure.cpp

17.283 FakeModelPersistence Class Reference

Inheritance diagram for FakeModelPersistence:



Collaboration diagram for FakeModelPersistence:



Public Member Functions

- bool save (std::string) override

  Serializes and saves the model to the provided filename.
- bool load (std::string) override

  Loads and deserializes a model from file.
- bool hasChanged () override

  Indicates whether persistent state changed since the last save/load.
- void setHasChanged (bool) override

  Updates the persistent-state changed flag.
- bool getOption (Persistence_if::Options) override

  Returns whether a persistence option is currently enabled.
- void setOption (Persistence_if::Options, bool) override

  Enables or disables a persistence option.
- std::string getFormatedField (PersistenceRecord ∗) override

  Formats a set of fields as text according to the persistence format.

Additional Inherited Members

Public Types inherited from Persistence_if

- enum class **Options** : int {
  SAVEDEFAULTS = 1 , **HIDEIDKEY** = 2 , **HIDETYPEKEY** = 4 , **HIDENAMEKEY** = 8 ,
  SORTALPHLY = 16 }

17.283.1 Member Function Documentation

17.283.1.1 getFormatedField()

```
std::string FakeModelPersistence::getFormatedField (
            PersistenceRecord * fields ) [inline], [override], [virtual]
```

Formats a set of fields as text according to the persistence format.
Implements Persistence_if.

17.283.1.2 getOption()

```
bool FakeModelPersistence::getOption (
            Persistence_if::Options option ) [inline], [override], [virtual]
```

Returns whether a persistence option is currently enabled.
Implements Persistence_if.

17.283.1.3 hasChanged()

```
bool FakeModelPersistence::hasChanged ( ) [inline], [override], [virtual]
```

Indicates whether persistent state changed since the last save/load.
Implements Persistence_if.

17.283.1.4 load()

```
bool FakeModelPersistence::load (
            std::string filename ) [inline], [override], [virtual]
```

Loads and deserializes a model from file.
Implements Persistence_if.

17.283.1.5 save()

```
bool FakeModelPersistence::save (
            std::string filename )  [inline], [override], [virtual]
```

Serializes and saves the model to the provided filename.
Implements Persistence_if.

17.283.1.6 setHasChanged()

```
void FakeModelPersistence::setHasChanged (
            bool hasChanged )  [inline], [override], [virtual]
```

Updates the persistent-state changed flag.
Implements Persistence_if.

17.283.1.7 setOption()

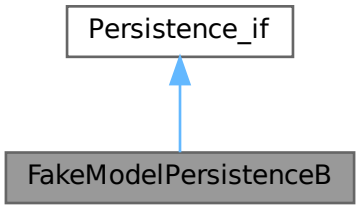
```
void FakeModelPersistence::setOption (
            Persistence_if::Options option,
            bool value )  [inline], [override], [virtual]
```

Enables or disables a persistence option.
Implements Persistence_if.
The documentation for this class was generated from the following file:

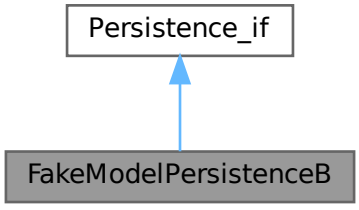
- tests/unit/test_simulator_support.cpp

17.284 FakeModelPersistenceB Class Reference

Inheritance diagram for FakeModelPersistenceB:



Collaboration diagram for FakeModelPersistenceB:



Public Member Functions

- bool save (std::string) override

  Serializes and saves the model to the provided filename.
- bool load (std::string) override

  Loads and deserializes a model from file.
- bool hasChanged () override

  Indicates whether persistent state changed since the last save/load.
- void setHasChanged (bool) override

  Updates the persistent-state changed flag.
- bool getOption (Persistence_if::Options) override

  Returns whether a persistence option is currently enabled.
- void setOption (Persistence_if::Options, bool) override

  Enables or disables a persistence option.
- std::string getFormatedField (PersistenceRecord ∗) override

  Formats a set of fields as text according to the persistence format.

Additional Inherited Members

Public Types inherited from Persistence_if

- enum class **Options** : int {
  SAVEDEFAULTS = 1 , **HIDEIDKEY** = 2 , **HIDETYPEKEY** = 4 , **HIDENAMEKEY** = 8 ,
  SORTALPHLY = 16 }

17.284.1 Member Function Documentation

17.284.1.1 getFormatedField()

```
std::string FakeModelPersistenceB::getFormatedField (
            PersistenceRecord * fields ) [inline], [override], [virtual]
```

Formats a set of fields as text according to the persistence format.
Implements Persistence_if.

17.284.1.2 getOption()

```
bool FakeModelPersistenceB::getOption (
            Persistence_if::Options option ) [inline], [override], [virtual]
```

Returns whether a persistence option is currently enabled.
Implements Persistence_if.

17.284.1.3 hasChanged()

```
bool FakeModelPersistenceB::hasChanged ( ) [inline], [override], [virtual]
```

Indicates whether persistent state changed since the last save/load.
Implements Persistence_if.

17.284.1.4 load()

```
bool FakeModelPersistenceB::load (
            std::string filename ) [inline], [override], [virtual]
```

Loads and deserializes a model from file.
Implements Persistence_if.

17.284.1.5 save()

```
bool FakeModelPersistenceB::save (
            std::string filename )  [inline], [override], [virtual]
```

Serializes and saves the model to the provided filename.
Implements Persistence_if.

17.284.1.6 setHasChanged()

```
void FakeModelPersistenceB::setHasChanged (
            bool hasChanged )  [inline], [override], [virtual]
```

Updates the persistent-state changed flag.
Implements Persistence_if.

17.284.1.7 setOption()

```
void FakeModelPersistenceB::setOption (
            Persistence_if::Options option,
            bool value )  [inline], [override], [virtual]
```

Enables or disables a persistence option.
Implements Persistence_if.

  static void **PrintValue** (const T &, ::std::ostream *os)

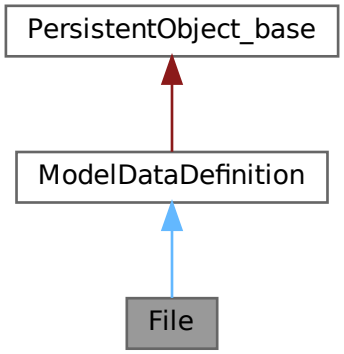
The documentation for this struct was generated from the following file:

- gtest/gtest/gtest-printers.h

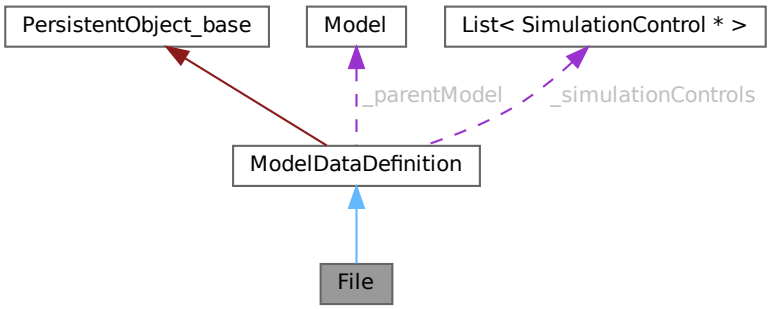
17.287 File Class Reference

Data definition identifying an external file and its access mode (read/write/append/read-write), used by file-driven components and data definitions.
`#include <plugins/data/InputOutput/File.h>`

Inheritance diagram for File:



Collaboration diagram for File:



Public Types

- enum class **AccessMode** : unsigned int { **Read** = 0 , **Write** = 1 , **Append** = 2 , **ReadWrite** = 3 }

Public Member Functions

- **File** (Model ∗model, std::string name="")
- void **setSystemFilename** (std::string systemFilename)
- std::string **getSystemFilename** () const
- std::string **getFilenameOnly** () const
- std::string **getPathOnly** () const
- void **setAccessMode** (AccessMode accessMode)
- AccessMode **getAccessMode** () const
- void **setAccessModeAsString** (std::string accessMode)
- std::string **getAccessModeAsString** () const
- virtual std::string show () override

  Returns a textual representation of this data definition.

Public Member Functions inherited from ModelDataDefinition

- ModelDataDefinition (Model *model, std::string datadefinitionTypename, std::string name="", bool insertIntoModel=true)

  Creates a model data definition and optionally inserts it into the model.
- virtual ~**ModelDataDefinition** ()

  Releases resources owned by this data definition.
- Util::identification getId () const

  Returns the unique identifier of this instance.
- void setName (const std::string &name)

  Updates the logical name of this instance.
- const std::string & getName () const

  Returns the logical name of this instance.
- void setLabel (const std::string &label)

  Updates the user-visible label of this instance.
- const std::string & getLabel () const

  Returns the user-visible label of this instance.
- const std::string & getClassname () const

  Returns the runtime class name used by the plugin system.
- Model * getParentModel () const

  Returns the parent model that owns this definition.
- bool isReportStatistics () const

  Indicates whether this data definition contributes report statistics.
- void setReportStatistics (bool reportStatistics)

  Enables or disables report-statistics generation for this definition.
- ModelDataDefinition * getInternalData (const std::string &name) const

  Looks up a named internal child data definition.
- std::map< std::string, ModelDataDefinition * > * getInternalData () const

  Returns the full map of internal child data definitions.
- std::map< std::string, ModelDataDefinition * > * getAttachedData () const

  Returns the full map of attached data definitions.
- bool hasChanged () const

  Indicates whether this instance has been modified since the last reset.
- void setHasChanged (bool hasChanged)

  Updates the changed flag for this data definition.
- unsigned int getLevel () const

  Returns the hierarchical editing context containing this element.
- void setModelLevel (unsigned int _modelLevel)

  Sets this element's hierarchical editing context.
- List< SimulationControl * > * getSimulationControls () const

  Returns the simulation controls owned by this data definition.
- TraceManager::Level getTraceLevelSpecific () const

  Returns the trace level that applies specifically to this definition.
- void setTraceLevelSpecific (TraceManager::Level level)

  Updates the trace level used by this definition.
- void defineTraceLevelSpecific (TraceManager::Level traceLevelspecific, bool traceLevelSpecificEnabled=true)

  Defines the specific trace level and optionally enables it immediately.
- bool isTraceLevelSpecificEnabled () const

  Indicates whether the specific trace level is enabled.
- void setTraceLevelSpecificEnabled (bool traceLevelSpecificEnabled)

  Enables or disables the specific trace level.

Static Public Member Functions

- static ModelDataDefinition ∗ **LoadInstance** (Model ∗model, PersistenceRecord ∗fields)

17.287.1 Detailed Description

Data definition identifying an external file and its access mode (read/write/append/read-write), used by file-driven components and data definitions.
Arena correspondence: the "File module" (Rockwell Automation, *Getting Started with Arena*, "The Advanced Process Panel", pp. 72-73), which backs the ReadWrite, Variable and Expression modules with a much richer set of structured data sources (typed file access, ADO connection strings, fixed/free/Fortran record structure, recordsets, SQL command text, named Excel ranges, Access table names, etc.).
Known difference from Arena: this class only models a plain operating-system file name and an `AccessMode` (Read/Write/Append/ ReadWrite); none of Arena's structured recordset/ADO/spreadsheet/database concepts have a GenESyS equivalent, so this correspondence is partial and covers only unformatted file access.

17.287.2 Member Function Documentation

17.287.2.1 _check()

```
bool File::_check (
            std::string & errorMessage )  [override], [protected], [virtual]
```

could be overriden by derived classes
Reimplemented from ModelDataDefinition.

17.287.2.2 _getParserChangesInformation()

```
ParserChangesInformation * File::_getParserChangesInformation ( )  [override], [protected],
[virtual]
```

This method returns all changes in the parser that are needed by plugins of this ModelDatas. When connecting a new plugin, ParserChangesInformation are used to change parser source code, whch is after compiled and dinamically linked to to simulator kernel to reflect the changes Return parser deltas required by File.
File currently does not require parser extensions.
Reimplemented from ModelDataDefinition.

17.287.2.3 _loadInstance()

```
bool File::_loadInstance (
            PersistenceRecord * fields )  [override], [protected], [virtual]
```

must be overriden by derived classes
Reimplemented from ModelDataDefinition.

17.287.2.4 _saveInstance()

```
void File::_saveInstance (
            PersistenceRecord * fields,
            bool saveDefaultValues )  [override], [protected], [virtual]
```

Saves object fields into a serialization structure.

Parameters

fields	a table-like structure used for serialization.
saveDefaultValues	indicates whether or not to save fields which are set to their default value.

Reimplemented from ModelDataDefinition.

17.287.2.5 show()

```
std::string File::show ( )  [override], [virtual]
```

Returns a textual representation of this data definition.
Returns the keys of internal ModelDataDefinitions such as counters, statistics collectors and other children needed before model checking.

Returns

Human-readable summary used by traces and debug output.

Reimplemented from ModelDataDefinition.
The documentation for this class was generated from the following files:

- virtual std::string getDataFilename ()=0

  Retrieves the currently configured dataset source filename.

17.291.1 Detailed Description

Interface for fitting theoretical distributions to real datasets.
Purpose:

- Infer parameters of candidate probability distributions from sample data.

Architectural role:

- Core fitting abstraction consumed by analysis workflows.

Mathematical meaning:

- Each fit∗ method estimates family parameters and writes an adherence/error measure in `sqrerror` (typically squared-error-like criterion).
- fitAll() selects the best candidate according to implementation-defined criterion.
- isNormalDistributed() should be interpreted as a normality adherence check under the given confidence level.

Preconditions:

- Output pointers must be valid non-null addresses.
- Data source must be configured through setDataFilename() before fitting.

Postconditions:

- Output pointers are filled with estimated values when operation succeeds.

Failure modes:

- Concrete implementations may return conservative defaults and/or report failure when insufficient data or unsupported models are provided.

Legacy compatibility:

- The pointer-based output API is intentionally preserved as a legacy public contract; it is not necessarily the final long-term shape.

17.291.2 Member Function Documentation

17.291.2.1 getDataFilename()

```
virtual std::string Fitter_if::getDataFilename ( )  [pure virtual]
```

Retrieves the currently configured dataset source filename.
Implemented in FitterDummyImpl, and FitterDefaultImpl.

17.291.2.2 setDataFilename()

```
virtual void Fitter_if::setDataFilename (
            std::string dataFilename )  [pure virtual]
```

Defines the dataset source filename used by fitting operations.
Implemented in FitterDummyImpl, and FitterDefaultImpl.
The documentation for this class was generated from the following file:

- tools/Statistics/Fitter_if.h

17.292 FitterDefaultImpl Class Reference

Functional implementation of Fitter_if consolidated through FITTER-2.
`#include <tools/Statistics/FitterDefaultImpl.h>`

- virtual void fitAll (double *sqrerror, std::string *name) override
- virtual void setDataFilename (std::string dataFilename) override

  Defines the dataset source filename used by fitting operations.
- virtual std::string getDataFilename () override

  Retrieves the currently configured dataset source filename.

17.292.1 Detailed Description

Functional implementation of Fitter_if consolidated through FITTER-2.
Current scope:

- Supports real dataset loading from binary file with raw sequential doubles (compatible with CollectorDatafileDefaultImpl1 persistence format).
- Implements fitting for Uniform, Triangular, Normal, Exponential, Erlang, Beta (scaled) and Weibull.

Error metric:

- Uses SSE between empirical CDF points p_i = (i+0.5)/n and fitted model CDF.
- The same criterion is used consistently by fit∗ methods and fitAll().

Failure convention:

- sqrerror = +infinity.
- returned parameters = quiet_NaN().
- fitAll name = "no-valid-fit" or "invalid-dataset".
- isNormalDistributed() = false on invalid/insufficient data.

17.292.2 Member Function Documentation

17.292.2.1 fitAll()

```
virtual void FitterDefaultImpl::fitAll (
            double * sqrerror,
            std::string * name )  [inline], [override], [virtual]
```

Implements Fitter_if.

17.292.2.2 fitBeta()

```
virtual void FitterDefaultImpl::fitBeta (
            double * sqrerror,
            double * alpha,
            double * beta,
            double * infLimit,
            double * supLimit )  [inline], [override], [virtual]
```

Implements Fitter_if.

17.292.2.3 fitErlang()

```
virtual void FitterDefaultImpl::fitErlang (
            double * sqrerror,
            double * avg,
            double * m )  [inline], [override], [virtual]
```

Implements Fitter_if.

17.292.2.4 fitExpo()

```
virtual void FitterDefaultImpl::fitExpo (
            double * sqrerror,
            double * avg1 )  [inline], [override], [virtual]
```

Implements Fitter_if.

17.292.2.5 fitNormal()

```
virtual void FitterDefaultImpl::fitNormal (
            double * sqrerror,
            double * avg,
            double * stddev )  [inline], [override], [virtual]
```

Implements Fitter_if.

17.292.2.6 fitTriangular()

```
virtual void FitterDefaultImpl::fitTriangular (
            double * sqrerror,
            double * min,
            double * mo,
            double * max )  [inline], [override], [virtual]
```

Implements Fitter_if.

17.292.2.7 fitUniform()

```
virtual void FitterDefaultImpl::fitUniform (
            double * sqrerror,
            double * min,
            double * max )  [inline], [override], [virtual]
```

Implements Fitter_if.

17.292.2.8 fitWeibull()

```
virtual void FitterDefaultImpl::fitWeibull (
            double * sqrerror,
            double * alpha,
            double * scale )  [inline], [override], [virtual]
```

Implements Fitter_if.

17.292.2.9 getDataFilename()

```
virtual std::string FitterDefaultImpl::getDataFilename ( )  [inline], [override], [virtual]
```

Retrieves the currently configured dataset source filename.
Implements Fitter_if.

17.292.2.10 isNormalDistributed()

```
virtual bool FitterDefaultImpl::isNormalDistributed (
            double confidencelevel )  [inline], [override], [virtual]
```

Implements Fitter_if.

17.292.2.11 setDataFilename()

```
virtual void FitterDefaultImpl::setDataFilename (
            std::string dataFilename )  [inline], [override], [virtual]
```

Defines the dataset source filename used by fitting operations.
Implements Fitter_if.
The documentation for this class was generated from the following file:

- tools/Statistics/FitterDefaultImpl.h

17.293 FitterDummyImpl Class Reference

Placeholder implementation of Fitter_if.

- void fitWeibull (double ∗sqrerror, double ∗alpha, double ∗scale)
- void fitAll (double ∗sqrerror, std::string ∗name)
- void setDataFilename (std::string dataFilename)

  Defines the dataset source filename used by fitting operations.
- std::string getDataFilename ()

  Retrieves the currently configured dataset source filename.

17.293.1 Detailed Description

Placeholder implementation of Fitter_if.
Purpose:

- Keep binary/source compatibility while a functional fitter implementation is not fully available.

Implementation status:

- Dummy/stub component; not a functional fitting engine.

Planned evolution:

- To be replaced as default by FitterDefaultImpl when fitting logic is consolidated.

17.293.2 Member Function Documentation

17.293.2.1 fitAll()

```
void FitterDummyImpl::fitAll (
            double * sqrerror,
            std::string * name )  [virtual]
```

Implements Fitter_if.

17.293.2.2 fitBeta()

```
void FitterDummyImpl::fitBeta (
            double * sqrerror,
            double * alpha,
            double * beta,
            double * infLimit,
            double * supLimit )  [virtual]
```

Implements Fitter_if.

17.293.2.3 fitErlang()

```
void FitterDummyImpl::fitErlang (
            double * sqrerror,
            double * avg,
            double * m )  [virtual]
```

Implements Fitter_if.

17.293.2.4 fitExpo()

```
void FitterDummyImpl::fitExpo (
            double * sqrerror,
            double * avg1 )  [virtual]
```

Implements Fitter_if.

17.293.2.5 fitNormal()

```
void FitterDummyImpl::fitNormal (
            double * sqrerror,
            double * avg,
            double * stddev )  [virtual]
```

Implements Fitter_if.

17.293.2.6 fitTriangular()

```
void FitterDummyImpl::fitTriangular (
            double * sqrerror,
            double * min,
            double * mo,
            double * max )  [virtual]
```

Implements Fitter_if.

17.293.2.7 fitUniform()

```
void FitterDummyImpl::fitUniform (
            double * sqrerror,
            double * min,
            double * max )  [virtual]
```

Implements Fitter_if.

17.293.2.8 fitWeibull()

```
void FitterDummyImpl::fitWeibull (
            double * sqrerror,
            double * alpha,
            double * scale )  [virtual]
```

Implements Fitter_if.

17.293.2.9 getDataFilename()

```
std::string FitterDummyImpl::getDataFilename ( )  [virtual]
```

Retrieves the currently configured dataset source filename.
Implements Fitter_if.

17.293.2.10 isNormalDistributed()

```
bool FitterDummyImpl::isNormalDistributed (
            double confidencelevel )  [virtual]
```

Implements Fitter_if.

17.293.2.11 setDataFilename()

```
void FitterDummyImpl::setDataFilename (
            std::string dataFilename )  [virtual]
```

Defines the dataset source filename used by fitting operations.
Implements Fitter_if.

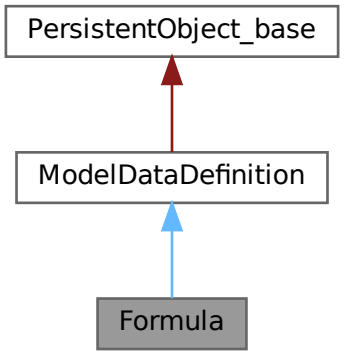
17.303 Formula Class Reference

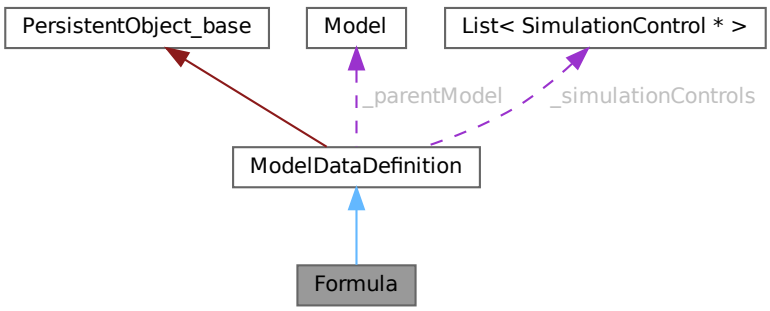
Data definition holding one or more named parser expressions, optionally indexed to represent a 1D/2D array of expressions.

`#include <plugins/data/Logic/Formula.h>`

Inheritance diagram for Formula:



Collaboration diagram for Formula:



Public Member Functions

- Formula (Model *model, std::string name="")

  Creates an empty formula definition.
- virtual ~**Formula** () override

  Releases formula-owned resources.
- virtual std::string show () override

  Returns a textual representation of the formula.
- unsigned int size ()

  Returns the number of indexed expressions stored in this formula.
- void setExpression (std::string formulaExpression, std::string index="")

  Stores or updates the expression associated with an index.

- std::string getExpression (std::string index="")

  Returns the expression associated with an index.
- double getValue (std::string index)

  Evaluates the expression associated with an index.

Public Member Functions inherited from ModelDataDefinition

- ModelDataDefinition (Model *model, std::string datadefinitionTypename, std::string name="", bool insert↩ IntoModel=true)

  Creates a model data definition and optionally inserts it into the model.
- virtual ~**ModelDataDefinition** ()

  Releases resources owned by this data definition.
- Util::identification getId () const

  Returns the unique identifier of this instance.
- void setName (const std::string &name)

  Updates the logical name of this instance.
- const std::string & getName () const

  Returns the logical name of this instance.
- void setLabel (const std::string &label)

  Updates the user-visible label of this instance.
- const std::string & getLabel () const

  Returns the user-visible label of this instance.
- const std::string & getClassname () const

  Returns the runtime class name used by the plugin system.
- Model * getParentModel () const

  Returns the parent model that owns this definition.
- bool isReportStatistics () const

  Indicates whether this data definition contributes report statistics.
- void setReportStatistics (bool reportStatistics)

  Enables or disables report-statistics generation for this definition.
- ModelDataDefinition * getInternalData (const std::string &name) const

  Looks up a named internal child data definition.
- std::map< std::string, ModelDataDefinition * > * getInternalData () const

  Returns the full map of internal child data definitions.
- std::map< std::string, ModelDataDefinition * > * getAttachedData () const

  Returns the full map of attached data definitions.
- bool hasChanged () const

  Indicates whether this instance has been modified since the last reset.
- void setHasChanged (bool hasChanged)

  Updates the changed flag for this data definition.
- unsigned int getLevel () const

  Returns the hierarchical editing context containing this element.
- void setModelLevel (unsigned int _modelLevel)

  Sets this element's hierarchical editing context.
- List< SimulationControl * > * getSimulationControls () const

  Returns the simulation controls owned by this data definition.
- TraceManager::Level getTraceLevelSpecific () const

  Returns the trace level that applies specifically to this definition.
- void setTraceLevelSpecific (TraceManager::Level level)

  Updates the trace level used by this definition.

- void defineTraceLevelSpecific (TraceManager::Level traceLevelspecific, bool traceLevelSpecific↩ Enabled=true)

  Defines the specific trace level and optionally enables it immediately.
- bool isTraceLevelSpecificEnabled () const

  Indicates whether the specific trace level is enabled.
- void setTraceLevelSpecificEnabled (bool traceLevelSpecificEnabled)

  Enables or disables the specific trace level.

Static Public Member Functions

- static PluginInformation * GetPluginInformation ()

  Returns plugin metadata for this formula type.
- static ModelDataDefinition * LoadInstance (Model *model, PersistenceRecord *fields)

  Loads a formula from serialized fields.
- static ModelDataDefinition * NewInstance (Model *model, std::string name="")

  Creates a new empty formula instance.

Static Public Member Functions inherited from ModelDataDefinition

- static ModelDataDefinition * LoadInstance (Model *model, PersistenceRecord *fields, bool insertIntoModel)

  Loads a model data definition instance from serialized fields.
- static ModelDataDefinition * NewInstance (Model *model, std::string name="")

  Creates a new instance of a data definition using the plugin registry.
- static void SaveInstance (PersistenceRecord *fields, ModelDataDefinition *modeldatum)

  Serializes a data definition instance into a persistence record.
- static bool Check (ModelDataDefinition *modeldatum, std::string &errorMessage)

  Validates a data definition instance.
- static void InitBetweenReplications (ModelDataDefinition *modeldatum)

  Resets simulation-time state between replications.
- static void CreateInternalData (ModelDataDefinition *modeldatum)

  Creates internal and attached data required by this instance.
- static bool CreateRelatedDataElements (ModelDataDefinition *modeldatum, std::string &errorMessage)

  Creates related data and validates the instance in a single call.

Protected Member Functions

- virtual bool _loadInstance (PersistenceRecord *fields) override

  must be overriden by derived classes
- virtual void _saveInstance (PersistenceRecord *fields, bool saveDefaultValues) override

  Saves object fields into a serialization structure.
- virtual bool _check (std::string &errorMessage) override

  could be overriden by derived classes
- virtual void _createAttachedAttributes () override

Protected Member Functions inherited from ModelDataDefinition

17.303.1 Detailed Description

Data definition holding one or more named parser expressions, optionally indexed to represent a 1D/2D array of expressions.
Arena correspondence: the "Expression module" (Rockwell Automation, *Getting Started with Arena*, "The Advanced Process Panel", p. 70), which defines named expressions (optionally arrays) that may combine numbers, distributions, operators, attributes and variables, and are referenced by name elsewhere in the model. `setExpression()`/`getExpression()` with a textual index are the closest correspondence to Arena's Rows/Columns indexing; `getValue()` evaluates the stored expression through the parser.
Known differences from Arena: there is no declared Data Type (Real / String / Native) and no external-file linkage (File Name, Recordset) to source expression values from outside the model.

17.303.2 Constructor & Destructor Documentation

17.303.2.1 Formula()

```
Formula::Formula (
            Model * model,
            std::string name = "" )
```

Creates an empty formula definition.

Parameters

model	Parent model.
name	Initial formula name.

17.303.3 Member Function Documentation

17.303.3.1 _check()

```
bool Formula::_check (
            std::string & errorMessage )  [override], [protected], [virtual]
```

could be overriden by derived classes
Reimplemented from ModelDataDefinition.

17.303.3.2 _createAttachedAttributes()

```
void Formula::_createAttachedAttributes ( )  [override], [protected], [virtual]
```

This method returns all changes in the parser that are needed by plugins of this ModelDatas. When connecting a new plugin, ParserChangesInformation are used to change parser source code, whch is after compiled and dinamically linked to to simulator kernel to reflect the changes @ToDo: NOT AN ATTRIBUTE
Reimplemented from ModelDataDefinition.

17.303.3.3 _loadInstance()

```
bool Formula::_loadInstance (
            PersistenceRecord * fields )  [override], [protected], [virtual]
```

must be overriden by derived classes
Load formula expressions map.
Reimplemented from ModelDataDefinition.

17.303.3.4 _saveInstance()

```
void Formula::_saveInstance (
            PersistenceRecord * fields,
            bool saveDefaultValues )  [override], [protected], [virtual]
```

Saves object fields into a serialization structure.

Parameters

fields	a table-like structure used for serialization.
saveDefaultValues	indicates whether or not to save fields which are set to their default value.

Persist formula expressions map.
Reimplemented from ModelDataDefinition.

17.303.3.5 getExpression()

```
std::string Formula::getExpression (
            std::string index = "" )
```

Returns the expression associated with an index.

Parameters

index	Optional index key used for vectorized formulas.

Returns

Stored formula text, or an empty string when absent.

17.303.3.6 GetPluginInformation()

```
PluginInformation * Formula::GetPluginInformation ( )  [static]
```

Returns plugin metadata for this formula type.

Returns

Plugin information block.

17.303.3.7 getValue()

```
double Formula::getValue (
            std::string index )
```

Evaluates the expression associated with an index.

Parameters

index	Optional index key used for vectorized formulas.

Returns

Numeric value of the indexed expression.

17.303.3.8 LoadInstance()

```
ModelDataDefinition * Formula::LoadInstance (
            Model * model,
            PersistenceRecord * fields )  [static]
```

Loads a formula from serialized fields.

Parameters

model	Parent model.
fields	Serialized fields.

Returns

Newly created formula instance.

17.303.3.9 NewInstance()

```
ModelDataDefinition * Formula::NewInstance (
            Model * model,
            std::string name = "" )  [static]
```

Creates a new empty formula instance.

Parameters

model	Parent model.
name	Initial formula name.

Returns

Newly created formula instance.

17.303.3.10 setExpression()

```
void Formula::setExpression (
            std::string formulaExpression,
            std::string index = "" )
```

Stores or updates the expression associated with an index.

Parameters

formulaExpression	Formula text.
index	Optional index key used for vectorized formulas.

17.303.3.11 show()

```
std::string Formula::show ( )  [override], [virtual]
```

Returns a textual representation of the formula.

Returns

Human-readable formula summary.

Reimplemented from ModelDataDefinition.

17.303.3.12 size()

```
unsigned int Formula::size ( )
```

Returns the number of indexed expressions stored in this formula.

Returns

Number of expression slots.

Public Member Functions inherited from ModelDataDefinition

- ModelDataDefinition (Model ∗model, std::string datadefinitionTypename, std::string name="", bool insert↩ IntoModel=true)

  Creates a model data definition and optionally inserts it into the model.
- virtual ∼**ModelDataDefinition** ()

  Releases resources owned by this data definition.
- Util::identification getId () const

  Returns the unique identifier of this instance.

- void setName (const std::string &name)

  Updates the logical name of this instance.
- const std::string & getName () const

  Returns the logical name of this instance.
- void setLabel (const std::string &label)

  Updates the user-visible label of this instance.
- const std::string & getLabel () const

  Returns the user-visible label of this instance.
- const std::string & getClassname () const

  Returns the runtime class name used by the plugin system.
- Model * getParentModel () const

  Returns the parent model that owns this definition.
- bool isReportStatistics () const

  Indicates whether this data definition contributes report statistics.
- void setReportStatistics (bool reportStatistics)

  Enables or disables report-statistics generation for this definition.
- ModelDataDefinition * getInternalData (const std::string &name) const

  Looks up a named internal child data definition.
- std::map< std::string, ModelDataDefinition * > * getInternalData () const

  Returns the full map of internal child data definitions.
- std::map< std::string, ModelDataDefinition * > * getAttachedData () const

  Returns the full map of attached data definitions.
- bool hasChanged () const

  Indicates whether this instance has been modified since the last reset.
- void setHasChanged (bool hasChanged)

  Updates the changed flag for this data definition.
- unsigned int getLevel () const

  Returns the hierarchical editing context containing this element.
- void setModelLevel (unsigned int _modelLevel)

  Sets this element's hierarchical editing context.
- List< SimulationControl * > * getSimulationControls () const

  Returns the simulation controls owned by this data definition.
- TraceManager::Level getTraceLevelSpecific () const

  Returns the trace level that applies specifically to this definition.
- void setTraceLevelSpecific (TraceManager::Level level)

  Updates the trace level used by this definition.
- void defineTraceLevelSpecific (TraceManager::Level traceLevelspecific, bool traceLevelSpecific↩ Enabled=true)

  Defines the specific trace level and optionally enables it immediately.
- bool isTraceLevelSpecificEnabled () const

  Indicates whether the specific trace level is enabled.
- void setTraceLevelSpecificEnabled (bool traceLevelSpecificEnabled)

  Enables or disables the specific trace level.

17.304.1 Member Function Documentation

17.304.1.1 _loadInstance()

```
bool FSMState::_loadInstance (
            PersistenceRecord * fields )  [override], [protected], [virtual]
```

virtual protected method that must be overriden
Reimplemented from DefaultNode.

17.304.1.2 _saveInstance()

```
void FSMState::_saveInstance (
            PersistenceRecord * fields,
            bool saveDefaultValues )  [override], [protected], [virtual]
```

Saves object fields into a serialization structure.

Parameters

fields	a table-like structure used for serialization.
saveDefaultValues	indicates whether or not to save fields which are set to their default value.

Reimplemented from DefaultNode.
The documentation for this class was generated from the following files:

  virtual public methods

Public Member Functions inherited from ModelComponent

- ModelComponent (Model *model, std::string componentTypename, std::string name="")

  constructors
- virtual ~**ModelComponent** ()

  Releases component-owned resources and unregisters it from the model.
- ConnectionManager * getConnectionManager () const

  new public user methods for this component
- void connectTo (ModelComponent *component, unsigned int inputPortNumber=0)

  Connects this component to another component.
- bool hasBreakpointAt ()

  Indicates whether a simulation breakpoint is set on this component.
- void setDescription (std::string _description)

Updates the free-form description shown by the GUI.

- std::string getDescription () const

  Returns the free-form description associated with this component.

- void remove (ModelComponent *comp)

  Removes a connected component from this component.

Public Member Functions inherited from ModelDataDefinition

- ModelDataDefinition (Model *model, std::string datadefinitionTypename, std::string name="", bool insert↩ IntoModel=true)

  Creates a model data definition and optionally inserts it into the model.

- virtual ~**ModelDataDefinition** ()

  Releases resources owned by this data definition.

- Util::identification getId () const

  Returns the unique identifier of this instance.

- void setName (const std::string &name)

  Updates the logical name of this instance.

- const std::string & getName () const

  Returns the logical name of this instance.

- void setLabel (const std::string &label)

  Updates the user-visible label of this instance.

- const std::string & getLabel () const

  Returns the user-visible label of this instance.

- const std::string & getClassname () const

  Returns the runtime class name used by the plugin system.

- Model * getParentModel () const

  Returns the parent model that owns this definition.

- bool isReportStatistics () const

  Indicates whether this data definition contributes report statistics.

- void setReportStatistics (bool reportStatistics)

  Enables or disables report-statistics generation for this definition.

- ModelDataDefinition * getInternalData (const std::string &name) const

  Looks up a named internal child data definition.

- std::map< std::string, ModelDataDefinition * > * getInternalData () const

  Returns the full map of internal child data definitions.

- std::map< std::string, ModelDataDefinition * > * getAttachedData () const

  Returns the full map of attached data definitions.

- bool hasChanged () const

  Indicates whether this instance has been modified since the last reset.

- void setHasChanged (bool hasChanged)

  Updates the changed flag for this data definition.

- unsigned int getLevel () const

  Returns the hierarchical editing context containing this element.

- void setModelLevel (unsigned int _modelLevel)

  Sets this element's hierarchical editing context.

- List< SimulationControl * > * getSimulationControls () const

  Returns the simulation controls owned by this data definition.

- TraceManager::Level getTraceLevelSpecific () const

  Returns the trace level that applies specifically to this definition.

- void setTraceLevelSpecific (TraceManager::Level level)

  Updates the trace level used by this definition.

- void defineTraceLevelSpecific (TraceManager::Level traceLevelspecific, bool traceLevelSpecific↩ Enabled=true)

  Defines the specific trace level and optionally enables it immediately.
- bool isTraceLevelSpecificEnabled () const

  Indicates whether the specific trace level is enabled.
- void setTraceLevelSpecificEnabled (bool traceLevelSpecificEnabled)

  Enables or disables the specific trace level.

17.305.1 Detailed Description

FtsZ ring polymerization dynamics for whole-cell division timing.
Implements a simplified two-state Euler ODE for the FtsZ ring completion fraction f ∈ [0,1], stored as a per-mille integer (0–1000) in WholeCellState under the key ftsZRingKey (default "FtsZ_ring_completion").
Monomer availability is read from WholeCellState under ftsZMonomerKey (default "FtsZ_monomer"). The reference count N_ref is captured on the first _onDispatchEvent call (N_m at t=0) and held constant; the fraction N_m/N_ref scales the polymerization rate (lower monomer count = slower growth).
ODE (per step): f_new = f + (k_poly * phi * (1-f) - k_depoly * f) * deltaT where k_poly = activationFwd * volumeNorm [/s] k_depoly = activationRev * volumeNorm [/s] phi = N_m / N_ref [dimensionless monomer availability]
Default volumeNorm = 3.94e-5 is calibrated so that k_poly ≈ 4.3e-5/s, which gives ∼35% ring completion at t ≈ 12 000 s — consistent with the M. genitalium cell cycle. activationFwd and activationRev are read from WholeCellState "param.ftsZActivationFwd"/"param.ftsZActivationRev" when loadParameters() has been called; otherwise the component uses its own stored defaults.

17.305.2 Member Function Documentation

17.305.2.1 _check()

```
bool FtsZPolymerizationComponent::_check (
            std::string & errorMessage )  [override], [protected], [virtual]
```

could be overriden by derived classes
Reimplemented from ModelDataDefinition.

17.305.2.2 _createEditableDataDefinitions()

```
void FtsZPolymerizationComponent::_createEditableDataDefinitions ( )  [override], [protected],
[virtual]
```

Reimplemented from ModelDataDefinition.

17.305.2.3 _initBetweenReplications()

```
void FtsZPolymerizationComponent::_initBetweenReplications ( )  [override], [protected], [virtual]
```

Reimplemented from ModelDataDefinition.

17.305.2.4 _loadInstance()

```
bool FtsZPolymerizationComponent::_loadInstance (
            PersistenceRecord * fields )  [override], [protected], [virtual]
```

virtual protected method that must be overriden
Reimplemented from ModelComponent.

17.305.2.5 _onDispatchEvent()

```
void FtsZPolymerizationComponent::_onDispatchEvent (
            Entity * entity,
            unsigned int inputPortNumber )  [override], [protected], [virtual]
```

Handles a dispatched event for this component type.
This method is only for ModelComponents, not for ModelDataElements.

Parameters

entity	Entity being processed.
inputPortNumber	Input port where the entity arrived.

Implements ModelComponent.

17.305.2.6 _saveInstance()

```
void FtsZPolymerizationComponent::_saveInstance (
            PersistenceRecord * fields,
            bool saveDefaultValues )  [override], [protected], [virtual]
```

Saves object fields into a serialization structure.

Parameters

fields	a table-like structure used for serialization.
saveDefaultValues	indicates whether or not to save fields which are set to their default value.

Reimplemented from ModelComponent.

17.305.2.7 show()

```
std::string FtsZPolymerizationComponent::show ( )  [override], [virtual]
```

virtual public methods
Returns a textual representation of this component.

Returns

Human-readable description used for tracing and debugging.

Reimplemented from ModelComponent.
The documentation for this class was generated from the following files:

- plugins/components/WholeCellModeling/FtsZPolymerizationComponent.h
- plugins/components/WholeCellModeling/FtsZPolymerizationComponent.cpp

17.311.1 Detailed Description

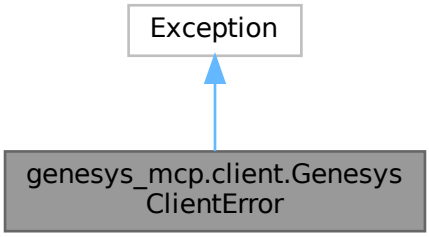
```
Stateful HTTP client for one Genesys worker-app session.
```

The documentation for this class was generated from the following file:

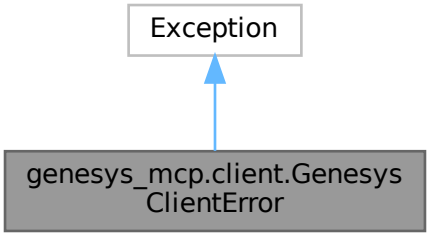
- applications/mcp/genesys_mcp/client.py

17.312 genesys_mcp.client.GenesysClientError Class Reference

Inheritance diagram for genesys_mcp.client.GenesysClientError:



Collaboration diagram for genesys_mcp.client.GenesysClientError:



Public Member Functions

- None **__init__** (self, int status_code, str message)

Public Attributes

- **status_code**

17.312.1 Detailed Description

```
Raised when the Genesys REST API returns an error.
```

The documentation for this class was generated from the following file:

- applications/mcp/genesys_mcp/client.py

17.313 GenesysKnowledgeBaseSummary Struct Reference

Aggregate summary of the current knowledge base state.
`#include <tools/AIAssistant/AIAssistant_if.h>`

Public Attributes

- unsigned int **numberOfPlugins** = 0
- unsigned int **numberOfComponents** = 0
- unsigned int **numberOfDataDefinitions** = 0
- std::string **summaryMarkdown**

  Full knowledge base rendered as a Markdown table.

17.313.1 Detailed Description

Aggregate summary of the current knowledge base state.
The documentation for this struct was generated from the following file:

- tools/AIAssistant/AIAssistant_if.h

17.314 GenesysKnowledgeItem Struct Reference

One entry in the GenESyS knowledge base used to inform the AI assistant.
`#include <tools/AIAssistant/AIAssistant_if.h>`

Public Attributes

- std::string **name**

  Short identifier (e.g. "Queue", "Create", "Entity").
- std::string **category**

  Broad category: "Component", "DataDefinition", "Plugin", etc.
- std::string **typeName**

  Exact C++ typename used by the kernel (e.g. "Queue").
- std::string **description**

  One-paragraph description of purpose and behaviour.
- std::string **usage**

  Typical usage pattern or construction example.
- std::string **constraints**

  Known constraints, limitations, or required connection rules.

17.314.1 Detailed Description

One entry in the GenESyS knowledge base used to inform the AI assistant.
Knowledge items describe available simulation building blocks so that the assistant can map natural-language descriptions to concrete GenESyS types. Items are populated from:

- Static documentation embedded at build time.
- Dynamic introspection of connected plugins via SimulatorFacade (Stage 2, see AIAssistant_if::refreshKnowledgeBaseFromSimu

The documentation for this struct was generated from the following file:

- tools/AIAssistant/AIAssistant_if.h

The documentation for this class was generated from the following files:

- parser/Genesys++-driver.h
- parser/Genesys++-driver.cpp
- parser/Genesys++-scanner.cpp

17.316 yy::genesyspp_parser Class Reference

A Bison parser.

`#include <parser/GenesysParser.h>`

Classes

- struct basic_symbol
- struct by_kind

  Type access provider for token (enum) based symbols.
- class context
- struct symbol_kind

  Symbol kinds.
- struct symbol_type

  "External" symbols: returned by the scanner.
- struct syntax_error

  Syntax errors thrown from user actions.
- struct token

  Token kinds.
- class value_type

Public Types

- typedef value_type **semantic_type**

  Backward compatibility (Bison 3.8).
- typedef location **location_type**

  Symbol locations.
- typedef token::token_kind_type **token_kind_type**

  Token kind, as returned by yylex.
- typedef token_kind_type **token_type**

  Backward compatibility alias (Bison 3.6).
- typedef symbol_kind::symbol_kind_type **symbol_kind_type**

  (Internal) symbol kind.
- typedef by_kind **by_type**

  Backward compatibility for a private implementation detail (Bison 3.6).
- typedef int **debug_level_type**

  Type for debugging levels.

Public Member Functions

- **genesyspp_parser** (genesyspp_driver &driver_yyarg)

  Build a parser object.
- int operator() ()
- virtual int parse ()
- std::ostream & **debug_stream** () const YY_ATTRIBUTE_PURE

  The current debugging stream.
- void **set_debug_stream** (std::ostream &)

  Set the current debugging stream.
- debug_level_type **debug_level** () const YY_ATTRIBUTE_PURE

  The current debugging level.
- void **set_debug_level** (debug_level_type l)

  Set the current debugging level.
- virtual void error (const location_type &loc, const std::string &msg)
- void **error** (const syntax_error &err)

  Report a syntax error.

Static Public Member Functions

- static std::string symbol_name (symbol_kind_type yysymbol)

Static Public Attributes

- static const symbol_kind_type **YYNTOKENS** = symbol_kind::YYNTOKENS

  The number of tokens.

17.316.1 Detailed Description

A Bison parser.

17.316.2 Member Function Documentation

17.316.2.1 error()

```
void yy::genesyspp_parser::error (
            const location_type & loc,
            const std::string & msg )  [virtual]
```

Report a syntax error.

Parameters

loc	where the syntax error is found.
msg	a description of the syntax error.

17.316.2.2 operator()()

```
int yy::genesyspp_parser::operator() ( )
```

Parse. An alias for parse ().

Returns

0 iff parsing succeeded.

17.316.2.3 parse()

```
int yy::genesyspp_parser::parse ( )  [virtual]
```

Parse.

Returns

0 iff parsing succeeded.

Length of the RHS of the rule being reduced.
The lookahead symbol.
The locations where the error started and ended.
The return value of parse ().

17.316.2.4 symbol_name()

```
std::string yy::genesyspp_parser::symbol_name (
            symbol_kind_type yysymbol )  [static]
```

The user-facing name of the symbol whose (internal) number is YYSYMBOL. No bounds checking.
The documentation for this class was generated from the following files:

- parser/GenesysParser.h
- parser/GenesysParser.cpp

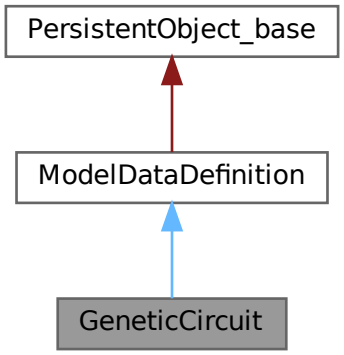
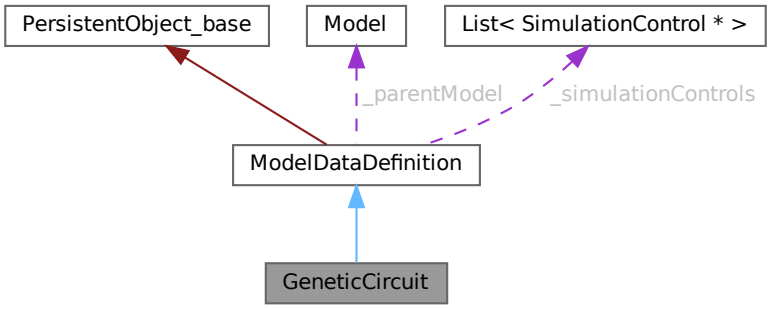
17.321 GeneticCircuit Class Reference

`#include <plugins/data/BiochemicalSimulation/GeneticCircuit.h>`
Inheritance diagram for GeneticCircuit:



Collaboration diagram for GeneticCircuit:



Public Member Functions

- **GeneticCircuit** (Model *model, std::string name="")
- void **addPart** (std::string partName)
- void **addRegulation** (std::string regulationName)
- void **clearParts** ()
- void **clearRegulations** ()
- const std::vector< std::string > & **getPartNames** () const
- const std::vector< std::string > & **getRegulationNames** () const
- void **setHostOrganism** (std::string hostOrganism)
- std::string **getHostOrganism** () const
- void **setCompartment** (std::string compartment)
- std::string **getCompartment** () const
- void **setEnabled** (bool enabled)
- bool **isEnabled** () const
- virtual std::string show () override

  Returns a textual representation of this data definition.

Public Member Functions inherited from ModelDataDefinition

- ModelDataDefinition (Model *model, std::string datadefinitionTypename, std::string name="", bool insert↩ IntoModel=true)

  Creates a model data definition and optionally inserts it into the model.
- virtual ~**ModelDataDefinition** ()

  Releases resources owned by this data definition.
- Util::identification getId () const

  Returns the unique identifier of this instance.
- void setName (const std::string &name)

  Updates the logical name of this instance.
- const std::string & getName () const

  Returns the logical name of this instance.
- void setLabel (const std::string &label)

  Updates the user-visible label of this instance.
- const std::string & getLabel () const

  Returns the user-visible label of this instance.
- const std::string & getClassname () const

Returns the runtime class name used by the plugin system.

- Model * getParentModel () const

  Returns the parent model that owns this definition.
- bool isReportStatistics () const

  Indicates whether this data definition contributes report statistics.
- void setReportStatistics (bool reportStatistics)

  Enables or disables report-statistics generation for this definition.
- ModelDataDefinition * getInternalData (const std::string &name) const

  Looks up a named internal child data definition.
- std::map< std::string, ModelDataDefinition * > * getInternalData () const

  Returns the full map of internal child data definitions.
- std::map< std::string, ModelDataDefinition * > * getAttachedData () const

  Returns the full map of attached data definitions.
- bool hasChanged () const

  Indicates whether this instance has been modified since the last reset.
- void setHasChanged (bool hasChanged)

  Updates the changed flag for this data definition.
- unsigned int getLevel () const

  Returns the hierarchical editing context containing this element.
- void setModelLevel (unsigned int _modelLevel)

  Sets this element's hierarchical editing context.
- List< SimulationControl * > * getSimulationControls () const

  Returns the simulation controls owned by this data definition.
- TraceManager::Level getTraceLevelSpecific () const

  Returns the trace level that applies specifically to this definition.
- void setTraceLevelSpecific (TraceManager::Level level)

  Updates the trace level used by this definition.
- void defineTraceLevelSpecific (TraceManager::Level traceLevelspecific, bool traceLevelSpecific↩ Enabled=true)

  Defines the specific trace level and optionally enables it immediately.
- bool isTraceLevelSpecificEnabled () const

  Indicates whether the specific trace level is enabled.
- void setTraceLevelSpecificEnabled (bool traceLevelSpecificEnabled)

  Enables or disables the specific trace level.

Static Public Member Functions

- static ModelDataDefinition * **LoadInstance** (Model *model, PersistenceRecord *fields)
- static PluginInformation * **GetPluginInformation** ()
- static ModelDataDefinition * **NewInstance** (Model *model, std::string name="")

Static Public Member Functions inherited from ModelDataDefinition

- static ModelDataDefinition * LoadInstance (Model *model, PersistenceRecord *fields, bool insertIntoModel)

  Loads a model data definition instance from serialized fields.
- static ModelDataDefinition * NewInstance (Model *model, std::string name="")

  Creates a new instance of a data definition using the plugin registry.
- static void SaveInstance (PersistenceRecord *fields, ModelDataDefinition *modeldatum)

  Serializes a data definition instance into a persistence record.
- static bool Check (ModelDataDefinition *modeldatum, std::string &errorMessage)

  Validates a data definition instance.
- static void InitBetweenReplications (ModelDataDefinition *modeldatum)

Resets simulation-time state between replications.

- static void CreateInternalData (ModelDataDefinition ∗modeldatum)

  Creates internal and attached data required by this instance.

- static bool CreateRelatedDataElements (ModelDataDefinition ∗modeldatum, std::string &errorMessage)

  Creates related data and validates the instance in a single call.

Protected Member Functions

- virtual bool _loadInstance (PersistenceRecord ∗fields) override

  must be overriden by derived classes

- virtual void _saveInstance (PersistenceRecord ∗fields, bool saveDefaultValues) override

  Saves object fields into a serialization structure.

- virtual bool _check (std::string &errorMessage) override

  could be overriden by derived classes

17.321.1 Detailed Description

Aggregate genetic circuit definition.
A GeneticCircuit stores an ordered sequence of genetic parts and a set of regulatory relationships by name so it can be persisted independently from runtime object pointers.

17.321.2 Member Function Documentation

17.321.2.1 _check()

```
bool GeneticCircuit::_check (
            std::string & errorMessage )  [override], [protected], [virtual]
```

could be overriden by derived classes
Reimplemented from ModelDataDefinition.

17.321.2.2 _loadInstance()

```
bool GeneticCircuit::_loadInstance (
            PersistenceRecord * fields )  [override], [protected], [virtual]
```

must be overriden by derived classes
Reimplemented from ModelDataDefinition.

17.321.2.3 _saveInstance()

```
void GeneticCircuit::_saveInstance (
            PersistenceRecord * fields,
            bool saveDefaultValues )  [override], [protected], [virtual]
```

Saves object fields into a serialization structure.

Parameters

fields	a table-like structure used for serialization.
saveDefaultValues	indicates whether or not to save fields which are set to their default value.

Reimplemented from ModelDataDefinition.

17.321.2.4 show()

```
std::string GeneticCircuit::show ( )  [override], [virtual]
```

Returns a textual representation of this data definition.
Returns the keys of internal ModelDataDefinitions such as counters, statistics collectors and other children needed before model checking.

Returns

Human-readable summary used by traces and debug output.

Reimplemented from ModelDataDefinition.
The documentation for this class was generated from the following files:

- plugins/data/BiochemicalSimulation/GeneticCircuit.h
- plugins/data/BiochemicalSimulation/GeneticCircuit.cpp

- void **setBasalExpressionRate** (double basalExpressionRate)
- double **getBasalExpressionRate** () const
- void **setDegradationRate** (double degradationRate)
- double **getDegradationRate** () const

- void **setEnabled** (bool enabled)
- bool **isEnabled** () const
- virtual std::string show () override

  Returns a textual representation of this data definition.

Public Member Functions inherited from ModelDataDefinition

- ModelDataDefinition (Model *model, std::string datadefinitionTypename, std::string name="", bool insert↩ IntoModel=true)

  Creates a model data definition and optionally inserts it into the model.
- virtual ~**ModelDataDefinition** ()

  Releases resources owned by this data definition.
- Util::identification getId () const

  Returns the unique identifier of this instance.
- void setName (const std::string &name)

  Updates the logical name of this instance.
- const std::string & getName () const

  Returns the logical name of this instance.
- void setLabel (const std::string &label)

  Updates the user-visible label of this instance.
- const std::string & getLabel () const

  Returns the user-visible label of this instance.
- const std::string & getClassname () const

  Returns the runtime class name used by the plugin system.
- Model * getParentModel () const

  Returns the parent model that owns this definition.
- bool isReportStatistics () const

  Indicates whether this data definition contributes report statistics.
- void setReportStatistics (bool reportStatistics)

  Enables or disables report-statistics generation for this definition.
- ModelDataDefinition * getInternalData (const std::string &name) const

  Looks up a named internal child data definition.
- std::map< std::string, ModelDataDefinition * > * getInternalData () const

  Returns the full map of internal child data definitions.
- std::map< std::string, ModelDataDefinition * > * getAttachedData () const

  Returns the full map of attached data definitions.
- bool hasChanged () const

  Indicates whether this instance has been modified since the last reset.
- void setHasChanged (bool hasChanged)

  Updates the changed flag for this data definition.
- unsigned int getLevel () const

  Returns the hierarchical editing context containing this element.
- void setModelLevel (unsigned int _modelLevel)

  Sets this element's hierarchical editing context.
- List< SimulationControl * > * getSimulationControls () const

  Returns the simulation controls owned by this data definition.
- TraceManager::Level getTraceLevelSpecific () const

  Returns the trace level that applies specifically to this definition.
- void setTraceLevelSpecific (TraceManager::Level level)

  Updates the trace level used by this definition.

- void defineTraceLevelSpecific (TraceManager::Level traceLevelspecific, bool traceLevelSpecific↩ Enabled=true)

  Defines the specific trace level and optionally enables it immediately.
- bool isTraceLevelSpecificEnabled () const

  Indicates whether the specific trace level is enabled.
- void setTraceLevelSpecificEnabled (bool traceLevelSpecificEnabled)

  Enables or disables the specific trace level.

17.323.1 Detailed Description

Genetic circuit structural part definition.
This data definition represents a reusable genetic part (promoter, RBS, CDS, terminator, etc.) and optionally links it to the BioSpecies produced by the part expression flow.

17.323.2 Member Function Documentation

17.323.2.1 _check()

```
bool GeneticCircuitPart::_check (
            std::string & errorMessage )  [override], [protected], [virtual]
```

could be overriden by derived classes
Reimplemented from ModelDataDefinition.

17.323.2.2 _loadInstance()

```
bool GeneticCircuitPart::_loadInstance (
            PersistenceRecord * fields )  [override], [protected], [virtual]
```

must be overriden by derived classes
Reimplemented from ModelDataDefinition.

17.323.2.3 _saveInstance()

```
void GeneticCircuitPart::_saveInstance (
            PersistenceRecord * fields,
            bool saveDefaultValues )  [override], [protected], [virtual]
```

Saves object fields into a serialization structure.

Parameters

fields	a table-like structure used for serialization.
saveDefaultValues	indicates whether or not to save fields which are set to their default value.

Reimplemented from ModelDataDefinition.

17.323.2.4 show()

```
std::string GeneticCircuitPart::show ( )  [override], [virtual]
```

Returns a textual representation of this data definition.
Returns the keys of internal ModelDataDefinitions such as counters, statistics collectors and other children needed before model checking.

Returns

Human-readable summary used by traces and debug output.

Reimplemented from ModelDataDefinition.
The documentation for this class was generated from the following files:

- plugins/data/BiochemicalSimulation/GeneticCircuitPart.h
- plugins/data/BiochemicalSimulation/GeneticCircuitPart.cpp

17.324 GeneticCircuitSimulate Class Reference

  virtual public methods

Public Member Functions inherited from ModelComponent

- ModelComponent (Model *model, std::string componentTypename, std::string name="")

  constructors
- virtual ~**ModelComponent** ()

  Releases component-owned resources and unregisters it from the model.
- ConnectionManager * getConnectionManager () const

  new public user methods for this component
- void connectTo (ModelComponent *component, unsigned int inputPortNumber=0)

  Connects this component to another component.
- bool hasBreakpointAt ()

  Indicates whether a simulation breakpoint is set on this component.
- void setDescription (std::string _description)

  Updates the free-form description shown by the GUI.
- std::string getDescription () const

  Returns the free-form description associated with this component.
- void remove (ModelComponent *comp)

  Removes a connected component from this component.

Public Member Functions inherited from ModelDataDefinition

- ModelDataDefinition (Model *model, std::string datadefinitionTypename, std::string name="", bool insert↩ IntoModel=true)

  Creates a model data definition and optionally inserts it into the model.
- virtual ~**ModelDataDefinition** ()

  Releases resources owned by this data definition.
- Util::identification getId () const

  Returns the unique identifier of this instance.
- void setName (const std::string &name)

  Updates the logical name of this instance.
- const std::string & getName () const

  Returns the logical name of this instance.
- void setLabel (const std::string &label)

  Updates the user-visible label of this instance.
- const std::string & getLabel () const

  Returns the user-visible label of this instance.
- const std::string & getClassname () const

Returns the runtime class name used by the plugin system.

- Model * getParentModel () const

  Returns the parent model that owns this definition.
- bool isReportStatistics () const

  Indicates whether this data definition contributes report statistics.
- void setReportStatistics (bool reportStatistics)

  Enables or disables report-statistics generation for this definition.
- ModelDataDefinition * getInternalData (const std::string &name) const

  Looks up a named internal child data definition.
- std::map< std::string, ModelDataDefinition * > * getInternalData () const

  Returns the full map of internal child data definitions.
- std::map< std::string, ModelDataDefinition * > * getAttachedData () const

  Returns the full map of attached data definitions.
- bool hasChanged () const

  Indicates whether this instance has been modified since the last reset.
- void setHasChanged (bool hasChanged)

  Updates the changed flag for this data definition.
- unsigned int getLevel () const

  Returns the hierarchical editing context containing this element.
- void setModelLevel (unsigned int _modelLevel)

  Sets this element's hierarchical editing context.
- List< SimulationControl * > * getSimulationControls () const

  Returns the simulation controls owned by this data definition.
- TraceManager::Level getTraceLevelSpecific () const

  Returns the trace level that applies specifically to this definition.
- void setTraceLevelSpecific (TraceManager::Level level)

  Updates the trace level used by this definition.
- void defineTraceLevelSpecific (TraceManager::Level traceLevelspecific, bool traceLevelSpecific↩ Enabled=true)

  Defines the specific trace level and optionally enables it immediately.
- bool isTraceLevelSpecificEnabled () const

  Indicates whether the specific trace level is enabled.
- void setTraceLevelSpecificEnabled (bool traceLevelSpecificEnabled)

  Enables or disables the specific trace level.

Static Public Member Functions

Static Public Member Functions inherited from ModelComponent

- static ModelComponent * LoadInstance (Model *model, PersistenceRecord *fields)

  static public methods that must have implementations (Load and New just the same. GetInformation must provide specific infos for the new component
- static bool Check (ModelComponent *component)

  Validates a component instance.
- static void CreateInternalData (ModelComponent *component)

  Creates internal data required by a component instance.

- static void SaveInstance (PersistenceRecord *fields, ModelComponent *component)

  Serializes a component instance into a persistence record.
- static void DispatchEvent (Event *event)

  Dispatches a simulation event to the target component.

Static Public Member Functions inherited from ModelDataDefinition

- static ModelDataDefinition * LoadInstance (Model *model, PersistenceRecord *fields, bool insertIntoModel)

  Loads a model data definition instance from serialized fields.
- static ModelDataDefinition * NewInstance (Model *model, std::string name="")

  Creates a new instance of a data definition using the plugin registry.
- static void SaveInstance (PersistenceRecord *fields, ModelDataDefinition *modeldatum)

  Serializes a data definition instance into a persistence record.
- static bool Check (ModelDataDefinition *modeldatum, std::string &errorMessage)

  Validates a data definition instance.
- static void InitBetweenReplications (ModelDataDefinition *modeldatum)

  Resets simulation-time state between replications.
- static void CreateInternalData (ModelDataDefinition *modeldatum)

  Creates internal and attached data required by this instance.
- static bool CreateRelatedDataElements (ModelDataDefinition *modeldatum, std::string &errorMessage)

  Creates related data and validates the instance in a single call.

Protected Member Functions

- virtual bool _loadInstance (PersistenceRecord *fields) override

  virtual protected method that must be overriden
- virtual void _saveInstance (PersistenceRecord *fields, bool saveDefaultValues) override

  Saves object fields into a serialization structure.
- virtual bool _check (std::string &errorMessage) override

  could be overriden by derived classes
- virtual void _onDispatchEvent (Entity *entity, unsigned int inputPortNumber) override

  Handles a dispatched event for this component type.
- virtual void _createEditableDataDefinitions () override

Protected Member Functions inherited from ModelDataDefinition

17.324.1 Detailed Description

Component that simulates a GeneticCircuit over a time window.

17.324.2 Member Function Documentation

17.324.2.1 _check()

```
bool GeneticCircuitSimulate::_check (
            std::string & errorMessage )  [override], [protected], [virtual]
```

could be overriden by derived classes
Reimplemented from ModelDataDefinition.

17.324.2.2 _createEditableDataDefinitions()

```
void GeneticCircuitSimulate::_createEditableDataDefinitions ( )  [override], [protected],
[virtual]
```

Reimplemented from ModelDataDefinition.

17.324.2.3 _loadInstance()

```
bool GeneticCircuitSimulate::_loadInstance (
            PersistenceRecord * fields )  [override], [protected], [virtual]
```

virtual protected method that must be overriden
Reimplemented from ModelComponent.

17.324.2.4 _onDispatchEvent()

```
void GeneticCircuitSimulate::_onDispatchEvent (
            Entity * entity,
            unsigned int inputPortNumber )  [override], [protected], [virtual]
```

Handles a dispatched event for this component type.
This method is only for ModelComponents, not for ModelDataElements.

Parameters

entity	Entity being processed.
inputPortNumber	Input port where the entity arrived.

Implements ModelComponent.

17.324.2.5 _saveInstance()

```
void GeneticCircuitSimulate::_saveInstance (
            PersistenceRecord * fields,
            bool saveDefaultValues )  [override], [protected], [virtual]
```

Saves object fields into a serialization structure.

Parameters

fields	a table-like structure used for serialization.
saveDefaultValues	indicates whether or not to save fields which are set to their default value.

Reimplemented from ModelComponent.

17.324.2.6 show()

```
std::string GeneticCircuitSimulate::show ( )  [override], [virtual]
```

virtual public methods

Returns a textual representation of this component.

Returns

Human-readable description used for tracing and debugging.

Reimplemented from ModelComponent.
The documentation for this class was generated from the following files:

- plugins/components/BiochemicalSimulation/GeneticCircuitSimulate.h
- plugins/components/BiochemicalSimulation/GeneticCircuitSimulate.cpp

17.325 GeneticCircuitSimulationSummary Struct Reference

Public Attributes

- bool **succeeded** = false
- unsigned int **sampleCount** = 0
- double **totalExpression** = 0.0
- std::string **message** = ""

The documentation for this struct was generated from the following file:

- virtual std::string show () override

  virtual public methods

Public Member Functions inherited from ModelComponent

- ModelComponent (Model ∗model, std::string componentTypename, std::string name="")

  constructors
- virtual ∼**ModelComponent** ()

  Releases component-owned resources and unregisters it from the model.
- ConnectionManager ∗ getConnectionManager () const

  new public user methods for this component
- void connectTo (ModelComponent ∗component, unsigned int inputPortNumber=0)

  Connects this component to another component.
- bool hasBreakpointAt ()

  Indicates whether a simulation breakpoint is set on this component.
- void setDescription (std::string _description)

  Updates the free-form description shown by the GUI.

- std::string getDescription () const

  Returns the free-form description associated with this component.
- void remove (ModelComponent *comp)

  Removes a connected component from this component.

Public Member Functions inherited from ModelDataDefinition

- ModelDataDefinition (Model *model, std::string datadefinitionTypename, std::string name="", bool insert↩ IntoModel=true)

  Creates a model data definition and optionally inserts it into the model.
- virtual ~**ModelDataDefinition** ()

  Releases resources owned by this data definition.
- Util::identification getId () const

  Returns the unique identifier of this instance.
- void setName (const std::string &name)

  Updates the logical name of this instance.
- const std::string & getName () const

  Returns the logical name of this instance.
- void setLabel (const std::string &label)

  Updates the user-visible label of this instance.
- const std::string & getLabel () const

  Returns the user-visible label of this instance.
- const std::string & getClassname () const

  Returns the runtime class name used by the plugin system.
- Model * getParentModel () const

  Returns the parent model that owns this definition.
- bool isReportStatistics () const

  Indicates whether this data definition contributes report statistics.
- void setReportStatistics (bool reportStatistics)

  Enables or disables report-statistics generation for this definition.
- ModelDataDefinition * getInternalData (const std::string &name) const

  Looks up a named internal child data definition.
- std::map< std::string, ModelDataDefinition * > * getInternalData () const

  Returns the full map of internal child data definitions.
- std::map< std::string, ModelDataDefinition * > * getAttachedData () const

  Returns the full map of attached data definitions.
- bool hasChanged () const

  Indicates whether this instance has been modified since the last reset.
- void setHasChanged (bool hasChanged)

  Updates the changed flag for this data definition.
- unsigned int getLevel () const

  Returns the hierarchical editing context containing this element.
- void setModelLevel (unsigned int _modelLevel)

  Sets this element's hierarchical editing context.
- List< SimulationControl * > * getSimulationControls () const

  Returns the simulation controls owned by this data definition.
- TraceManager::Level getTraceLevelSpecific () const

  Returns the trace level that applies specifically to this definition.
- void setTraceLevelSpecific (TraceManager::Level level)

  Updates the trace level used by this definition.

- void defineTraceLevelSpecific (TraceManager::Level traceLevelspecific, bool traceLevelSpecific↩ Enabled=true)

  Defines the specific trace level and optionally enables it immediately.
- bool isTraceLevelSpecificEnabled () const

  Indicates whether the specific trace level is enabled.
- void setTraceLevelSpecificEnabled (bool traceLevelSpecificEnabled)

  Enables or disables the specific trace level.

Static Public Member Functions

- static PluginInformation * **GetPluginInformation** ()
- static ModelComponent * **LoadInstance** (Model *model, PersistenceRecord *fields)
- static ModelDataDefinition * **NewInstance** (Model *model, std::string name="")

Static Public Member Functions inherited from ModelComponent

- static ModelComponent * LoadInstance (Model *model, PersistenceRecord *fields)

  static public methods that must have implementations (Load and New just the same. GetInformation must provide specific infos for the new component
- static bool Check (ModelComponent *component)

  Validates a component instance.
- static void CreateInternalData (ModelComponent *component)

  Creates internal data required by a component instance.
- static void SaveInstance (PersistenceRecord *fields, ModelComponent *component)

  Serializes a component instance into a persistence record.
- static void DispatchEvent (Event *event)

  Dispatches a simulation event to the target component.

Static Public Member Functions inherited from ModelDataDefinition

- static ModelDataDefinition * LoadInstance (Model *model, PersistenceRecord *fields, bool insertIntoModel)

  Loads a model data definition instance from serialized fields.
- static ModelDataDefinition * NewInstance (Model *model, std::string name="")

  Creates a new instance of a data definition using the plugin registry.
- static void SaveInstance (PersistenceRecord *fields, ModelDataDefinition *modeldatum)

  Serializes a data definition instance into a persistence record.
- static bool Check (ModelDataDefinition *modeldatum, std::string &errorMessage)

  Validates a data definition instance.
- static void InitBetweenReplications (ModelDataDefinition *modeldatum)

  Resets simulation-time state between replications.
- static void CreateInternalData (ModelDataDefinition *modeldatum)

  Creates internal and attached data required by this instance.
- static bool CreateRelatedDataElements (ModelDataDefinition *modeldatum, std::string &errorMessage)

  Creates related data and validates the instance in a single call.

Protected Member Functions

- virtual bool _loadInstance (PersistenceRecord *fields) override

  virtual protected method that must be overriden
- virtual void _saveInstance (PersistenceRecord *fields, bool saveDefaultValues) override

  Saves object fields into a serialization structure.

17.326.1 Detailed Description

Component that executes one expression update step over a GeneticCircuit.

17.326.2 Member Function Documentation

17.326.2.1 _check()

```
bool GeneticExpressionStep::_check (
            std::string & errorMessage ) [override], [protected], [virtual]
```

could be overriden by derived classes
Reimplemented from ModelDataDefinition.

17.326.2.2 _createEditableDataDefinitions()

```
void GeneticExpressionStep::_createEditableDataDefinitions ( ) [override], [protected], [virtual]
```

Reimplemented from ModelDataDefinition.

17.326.2.3 _loadInstance()

```
bool GeneticExpressionStep::_loadInstance (
            PersistenceRecord * fields ) [override], [protected], [virtual]
```

virtual protected method that must be overriden
Reimplemented from ModelComponent.

17.326.2.4 _onDispatchEvent()

```
void GeneticExpressionStep::_onDispatchEvent (
            Entity * entity,
            unsigned int inputPortNumber ) [override], [protected], [virtual]
```

Handles a dispatched event for this component type.
This method is only for ModelComponents, not for ModelDataElements.

Parameters

entity	Entity being processed.
inputPortNumber	Input port where the entity arrived.

Implements ModelComponent.

17.326.2.5 _saveInstance()

```
void GeneticExpressionStep::_saveInstance (
            PersistenceRecord * fields,
            bool saveDefaultValues )  [override], [protected], [virtual]
```

Saves object fields into a serialization structure.

Parameters

fields	a table-like structure used for serialization.
saveDefaultValues	indicates whether or not to save fields which are set to their default value.

Reimplemented from ModelComponent.

17.326.2.6 show()

```
std::string GeneticExpressionStep::show ( )  [override], [virtual]
```

virtual public methods
Returns a textual representation of this component.

Returns

Human-readable description used for tracing and debugging.

Reimplemented from ModelComponent.
The documentation for this class was generated from the following files:

- plugins/components/BiochemicalSimulation/GeneticExpressionStep.h
- plugins/components/BiochemicalSimulation/GeneticExpressionStep.cpp

17.327 GeneticRegulation Class Reference

- virtual std::string show () override

  Returns a textual representation of this data definition.

Public Member Functions inherited from ModelDataDefinition

- ModelDataDefinition (Model *model, std::string datadefinitionTypename, std::string name="", bool insert↩ IntoModel=true)

  Creates a model data definition and optionally inserts it into the model.
- virtual ~**ModelDataDefinition** ()

  Releases resources owned by this data definition.
- Util::identification getId () const

  Returns the unique identifier of this instance.
- void setName (const std::string &name)

  Updates the logical name of this instance.
- const std::string & getName () const

  Returns the logical name of this instance.
- void setLabel (const std::string &label)

  Updates the user-visible label of this instance.

- const std::string & getLabel () const

  Returns the user-visible label of this instance.
- const std::string & getClassname () const

  Returns the runtime class name used by the plugin system.
- Model * getParentModel () const

  Returns the parent model that owns this definition.
- bool isReportStatistics () const

  Indicates whether this data definition contributes report statistics.
- void setReportStatistics (bool reportStatistics)

  Enables or disables report-statistics generation for this definition.
- ModelDataDefinition * getInternalData (const std::string &name) const

  Looks up a named internal child data definition.
- std::map< std::string, ModelDataDefinition * > * getInternalData () const

  Returns the full map of internal child data definitions.
- std::map< std::string, ModelDataDefinition * > * getAttachedData () const

  Returns the full map of attached data definitions.
- bool hasChanged () const

  Indicates whether this instance has been modified since the last reset.
- void setHasChanged (bool hasChanged)

  Updates the changed flag for this data definition.
- unsigned int getLevel () const

  Returns the hierarchical editing context containing this element.
- void setModelLevel (unsigned int _modelLevel)

  Sets this element's hierarchical editing context.
- List< SimulationControl * > * getSimulationControls () const

  Returns the simulation controls owned by this data definition.
- TraceManager::Level getTraceLevelSpecific () const

  Returns the trace level that applies specifically to this definition.
- void setTraceLevelSpecific (TraceManager::Level level)

  Updates the trace level used by this definition.
- void defineTraceLevelSpecific (TraceManager::Level traceLevelspecific, bool traceLevelSpecific↩ Enabled=true)

  Defines the specific trace level and optionally enables it immediately.
- bool isTraceLevelSpecificEnabled () const

  Indicates whether the specific trace level is enabled.
- void setTraceLevelSpecificEnabled (bool traceLevelSpecificEnabled)

  Enables or disables the specific trace level.

17.327.1 Detailed Description

Transcriptional regulation relationship for genetic circuits.

17.327.2 Member Function Documentation

17.327.2.1 _check()

```
bool GeneticRegulation::_check (
            std::string & errorMessage )  [override], [protected], [virtual]
```

could be overriden by derived classes
Reimplemented from ModelDataDefinition.

17.327.2.2 _loadInstance()

```
bool GeneticRegulation::_loadInstance (
            PersistenceRecord * fields )  [override], [protected], [virtual]
```

must be overriden by derived classes
Reimplemented from ModelDataDefinition.

17.327.2.3 _saveInstance()

```
void GeneticRegulation::_saveInstance (
            PersistenceRecord * fields,
            bool saveDefaultValues )  [override], [protected], [virtual]
```

Saves object fields into a serialization structure.

Parameters

fields	a table-like structure used for serialization.
saveDefaultValues	indicates whether or not to save fields which are set to their default value.

Reimplemented from ModelDataDefinition.

17.327.2.4 show()

```
std::string GeneticRegulation::show ( )  [override], [virtual]
```

Returns a textual representation of this data definition.
Returns the keys of internal ModelDataDefinitions such as counters, statistics collectors and other children needed before model checking.

Returns

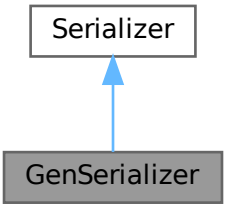
Human-readable summary used by traces and debug output.

Reimplemented from ModelDataDefinition.
The documentation for this class was generated from the following files:

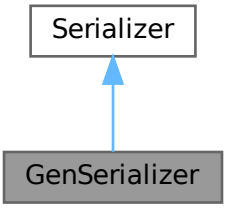
- plugins/data/BiochemicalSimulation/GeneticRegulation.h
- plugins/data/BiochemicalSimulation/GeneticRegulation.cpp

17.328 GenSerializer Class Reference

Inheritance diagram for GenSerializer:



Collaboration diagram for GenSerializer:



Public Member Functions

- **GenSerializer** (Model *model)
- PersistenceRecord * newPersistenceRecord () override

  Creates an empty persistence record.
- bool dump (std::ostream &output) override

  Writes formatted contents to a given output stream.
- bool load (std::istream &input) override

  Attempts to load contents from a given input stream.
- bool get (const std::string &name, PersistenceRecord *entry) override

  Tries to fetch an entry with the given label as a key.
- bool put (const std::string name, const std::string type, const Util::identification id, PersistenceRecord *fields) override

  Upserts an entry into this structure.
- int for_each (std::function< int(const std::string &) > delegate) override

  Iterates over this structure's entries, ordered by ID.

Friends

- class **PersistenceDefaultImpl2**

17.328.1 Member Function Documentation

17.328.1.1 dump()

```
bool GenSerializer::dump (
            std::ostream & output )  [override], [virtual]
```

Writes formatted contents to a given output stream.

Parameters

output	output stream to write to.

Returns

whether the current state of this structure's contents was deemed valid for serialization.

Implements Serializer.

17.328.1.2 for_each()

```
int GenSerializer::for_each (
            std::function< int(const std::string &) > delegate )  [override], [virtual]
```

Iterates over this structure's entries, ordered by ID.

Parameters

delegate	delegate which is applied to every entry-identifying key, until it returns a non-zero value.

Returns

either zero, or the first non-zero value returned by the delegate.

Implements Serializer.

17.328.1.3 get()

```
bool GenSerializer::get (
            const std::string & name,
            PersistenceRecord * entry )  [override], [virtual]
```

Tries to fetch an entry with the given label as a key.

Parameters

name	a label which uniquely identifies an entry.
entry	(out-param) a pointer to a caller-owned entry, which is filled on success.

Returns

whether the entry was found and the out-param was actually written to.

Implements Serializer.

17.328.1.4 load()

```
bool GenSerializer::load (
            std::istream & input )  [override], [virtual]
```

Attempts to load contents from a given input stream.

Returns

whether the input was well-formatted and loading was successful.

Implements Serializer.

17.328.1.5 newPersistenceRecord()

```
PersistenceRecord * GenSerializer::newPersistenceRecord ( )  [override], [virtual]
```

Creates an empty persistence record.
Although the returned record can be freed normally with `delete`, care must be taken to only use records which come from a implementation, when configuring that implementation's contents.
Implements Serializer.

17.328.1.6 put()

```
bool GenSerializer::put (
            const std::string name,
            const std::string type,
            const Util::identification id,
            PersistenceRecord * fields )  [override], [virtual]
```

Upserts an entry into this structure.

Parameters

name	a label which uniquely identifies the entry.
type	a type name.
id	a component/datadef ID number.
fields	a persistence record for the entry, whose contents will be copied if valid.

Returns

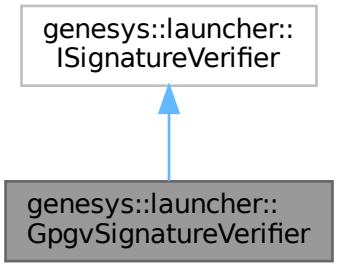
whether the entry was valid and was actually copied into this structure.

Implements Serializer.
The documentation for this class was generated from the following files:

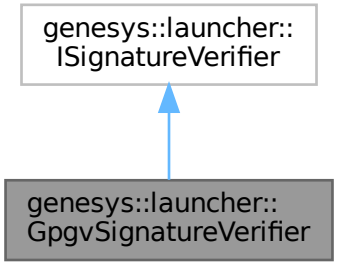
- kernel/simulator/persistence/GenSerializer.h
- kernel/simulator/persistence/GenSerializer.cpp

17.329 genesys::launcher::GpgvSignatureVerifier Class Reference

Inheritance diagram for genesys::launcher::GpgvSignatureVerifier:



Collaboration diagram for genesys::launcher::GpgvSignatureVerifier:



Public Member Functions

- **GpgvSignatureVerifier** (QString keyringPath, LauncherLogger *logger=nullptr, int timeoutMs=15000)
- VerificationResult verify (const QString &dataPath, const QString &signaturePath) override

17.329.1 Member Function Documentation

17.329.1.1 verify()

```
VerificationResult genesys::launcher::GpgvSignatureVerifier::verify (
            const QString & dataPath,
            const QString & signaturePath )  [override], [virtual]
```

Implements genesys::launcher::ISignatureVerifier.

The documentation for this class was generated from the following files:

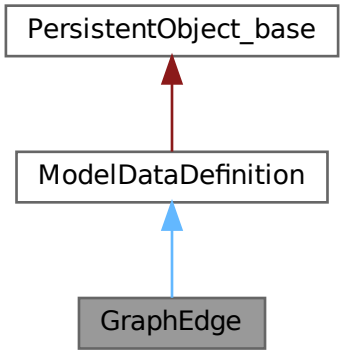
- applications/launcher/UpdateVerifier.h
- applications/launcher/UpdateVerifier.cpp

17.330 GraphEdge Class Reference

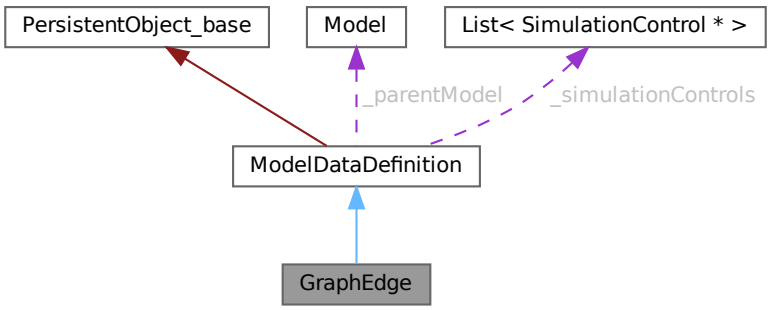
Mathematical graph edge between two GraphNode endpoints.

`#include <plugins/data/ModalModel/GraphEdge.h>`

Inheritance diagram for GraphEdge:



Collaboration diagram for GraphEdge:



Public Member Functions

- **GraphEdge** (Model ∗model, std::string name="")
- **GraphEdge** (Model ∗model, GraphNode ∗source, GraphNode ∗destination, std::string name="")
- void **setSource** (GraphNode ∗source)
- GraphNode ∗ **getSource** () const
- void **setDestination** (GraphNode ∗destination)
- GraphNode ∗ **getDestination** () const
- void **setDirected** (bool directed)
- bool **isDirected** () const
- void **setWeight** (double weight)
- void **clearWeight** ()
- bool **hasWeight** () const
- double **getWeight** (double defaultWeight=1.0) const
- std::string **getSourceNodeName** () const
- std::string **getDestinationNodeName** () const
- virtual std::string show () override

  Returns a textual representation of this data definition.

Public Member Functions inherited from ModelDataDefinition

- ModelDataDefinition (Model *model, std::string datadefinitionTypename, std::string name="", bool insertIntoModel=true)

  Creates a model data definition and optionally inserts it into the model.
- virtual ~**ModelDataDefinition** ()

  Releases resources owned by this data definition.
- Util::identification getId () const

  Returns the unique identifier of this instance.
- void setName (const std::string &name)

  Updates the logical name of this instance.
- const std::string & getName () const

  Returns the logical name of this instance.
- void setLabel (const std::string &label)

  Updates the user-visible label of this instance.
- const std::string & getLabel () const

  Returns the user-visible label of this instance.
- const std::string & getClassname () const

  Returns the runtime class name used by the plugin system.
- Model * getParentModel () const

  Returns the parent model that owns this definition.
- bool isReportStatistics () const

  Indicates whether this data definition contributes report statistics.
- void setReportStatistics (bool reportStatistics)

  Enables or disables report-statistics generation for this definition.
- ModelDataDefinition * getInternalData (const std::string &name) const

  Looks up a named internal child data definition.
- std::map< std::string, ModelDataDefinition * > * getInternalData () const

  Returns the full map of internal child data definitions.
- std::map< std::string, ModelDataDefinition * > * getAttachedData () const

  Returns the full map of attached data definitions.
- bool hasChanged () const

  Indicates whether this instance has been modified since the last reset.
- void setHasChanged (bool hasChanged)

  Updates the changed flag for this data definition.
- unsigned int getLevel () const

  Returns the hierarchical editing context containing this element.
- void setModelLevel (unsigned int _modelLevel)

  Sets this element's hierarchical editing context.
- List< SimulationControl * > * getSimulationControls () const

  Returns the simulation controls owned by this data definition.
- TraceManager::Level getTraceLevelSpecific () const

  Returns the trace level that applies specifically to this definition.
- void setTraceLevelSpecific (TraceManager::Level level)

  Updates the trace level used by this definition.
- void defineTraceLevelSpecific (TraceManager::Level traceLevelspecific, bool traceLevelSpecificEnabled=true)

  Defines the specific trace level and optionally enables it immediately.
- bool isTraceLevelSpecificEnabled () const

  Indicates whether the specific trace level is enabled.
- void setTraceLevelSpecificEnabled (bool traceLevelSpecificEnabled)

  Enables or disables the specific trace level.

Static Public Member Functions

- static PluginInformation * **GetPluginInformation** ()
- static ModelDataDefinition * **LoadInstance** (Model *model, PersistenceRecord *fields)
- static ModelDataDefinition * **NewInstance** (Model *model, std::string name="")

Static Public Member Functions inherited from ModelDataDefinition

- static ModelDataDefinition * LoadInstance (Model *model, PersistenceRecord *fields, bool insertIntoModel)

  Loads a model data definition instance from serialized fields.
- static ModelDataDefinition * NewInstance (Model *model, std::string name="")

  Creates a new instance of a data definition using the plugin registry.
- static void SaveInstance (PersistenceRecord *fields, ModelDataDefinition *modeldatum)

  Serializes a data definition instance into a persistence record.
- static bool Check (ModelDataDefinition *modeldatum, std::string &errorMessage)

  Validates a data definition instance.
- static void InitBetweenReplications (ModelDataDefinition *modeldatum)

  Resets simulation-time state between replications.
- static void CreateInternalData (ModelDataDefinition *modeldatum)

  Creates internal and attached data required by this instance.
- static bool CreateRelatedDataElements (ModelDataDefinition *modeldatum, std::string &errorMessage)

  Creates related data and validates the instance in a single call.

Protected Member Functions

- virtual bool _loadInstance (PersistenceRecord *fields) override

  must be overriden by derived classes
- virtual void _saveInstance (PersistenceRecord *fields, bool saveDefaultValues) override

  Saves object fields into a serialization structure.
- virtual bool _check (std::string &errorMessage) override

  could be overriden by derived classes
