

Context-dependent evaluation for attributes and variables.

fig:expression-context-model | figure

Generated from FIGURE-SPEC comments

Source

- source/tests/unit/test_parser_expressions.cpp
- source/parser/parserBisonFlex/bisonparser.yy

Purpose

- Show how current-event state, entity
- ownership, and sparse indices affect
- expression evaluation.

Required content

- current event and current entity
- scalar and indexed attribute lookup
- scalar and indexed variable lookup
- assignment path for attribute and variable writes
- fallback to zero when the indexed slot is absent

Accessibility

- A context diagram that explains why the
- same symbol can evaluate differently
- outside and inside an event.

Validation

- The diagram must reflect the current event-dependent attribute path and the variable store path.

The source block remains the authoritative specification.
The rendered asset is a compact visual summary.
