Process / flow

Source

- source/plugins/data/Continuous/DiffusionField.h
- source/plugins/components/Continuous/DiffusionSimulate.h
- source/plugins/components/Continuous/ContinuousSystemComponent.h
- source/tests/demo_continuous_trace.cpp
- source/tests/test_continuous_system.cpp

Purpose

- Show how a discrete-event component or
- internal event drives a continuous

Required content

- discrete-event trigger
- continuous subsystem solve
- state update/diagnostic capture
- event-clock synchronization option
- trace or CSV evidence path

Exclusions

- do not imply that all hybrid flows are numerically validated
- do not imply that simulated time and solver step count are the same quantity

Accessibility

- A boundary diagram between the kernel
- event queue and the continuous solver.

Validation

- The figure must match the current trace/demo programs and diffusion headers.
- The source block remains the authoritative specification.
The rendered asset is a compact visual summary.
