Tree / family map

Source

- source/plugins/components/ModalModel/ModalModelDefault.h
- source/plugins/components/ModalModel/ModalModelFSM.h
- source/plugins/components/ModalModel/ModalModelPetriNet.h
- source/plugins/components/ModalModel/DefaultTransitionExtensions.h
- source/applications/modelSpecific/smarts/ModalModel/Smart_ModalModelDefaultNetwork.cpp
- source/applications/modelSpecific/smarts/ModalModel/Smart_ModalModelFSM.cpp

Purpose

- Show how the modal-model family is split
- into default networks, FSM

Required content

- shared modal-model container
- FSM branch
- Petri-net branch
- trigger/probability transition helpers
- entry node / current node notion where relevant

Exclusions

- do not imply that modal models and Petri nets share identical semantics
- do not imply a fully unified runtime API

Accessibility

- A family tree that distinguishes the
- shared container from the specialized

The source block remains the authoritative specification.
The rendered asset is a compact visual summary.
