

Petri net place/transition semantics in the current modal-model tree.

fig:petri-net-flow | figure

Generated from FIGURE-SPEC comments

Process / flow

Source

- source/plugins/components/ModalModel/PetriPlace.h
- source/plugins/components/ModalModel/DefaultTransitionExtensions.h
- source/applications/modelSpecific/smarts/ModalModel/Smart_PetriPlace.cpp
- source/applications/modelSpecific/smarts/ModalModel/Smart_ModalModelPetriNet.cpp

Required content

- places with colored tokens
- transitions with input/output weights
- enabling condition
- token movement after firing

Exclusions

- do not collapse Petri semantics into generic FSM semantics
- do not imply stochastic timing unless explicitly shown

Accessibility

- A token-flow diagram that shows the route
- from enabled transition to new

Validation

- The figure must match the Petri headers and the current model-specific examples.

The source block remains the authoritative specification.
The rendered asset is a compact visual summary.
