```
00001 /*
00002  * SimulatorFacade.h
00003  *
00004  * High-level non-owning facade over Simulator and its main composed services.
00005  *
00006  * This header delegates calls to Simulator, its managers, the current Model and
00007  * the current Model sub-services without forcing callers to navigate manually
00008  * through getPluginManager(), getModelManager(), getTraceManager(), etc.
00009  *
00010  * All methods tolerate a null _simulator or missing current model:
00011  *   - pointer returns  -> nullptr
00012  *   - bool returns     -> false
00013  *   - numeric returns  -> 0
00014  *   - string returns   -> ""
00015  *   - void methods     -> no-op
00016  *
00017  * Method prefixes resolve name conflicts between delegates:
00018  *   (none)            Simulator direct methods
00019  *   licence*          LicenceManager
00020  *   plugin*           PluginManager
00021  *   model*            ModelManager / Model
00022  *   info*             ModelInfo
00023  *   sim*              ModelSimulation
00024  *   data*             ModelDataManager
00025  *   component*        ModelComponentManager
00026  *   event*            OnEventManager
00027  *   trace*, setTrace* TraceManager
00028  *   parser*           ParserManager
00029  *   simulationExp*    ExperimentManager

00106               Random generator for Borland Delphi 3.0
00107
00108 Copyrigth(c) 1998 Private enterprise - firm SOFTLAND, Ukraine
00109
00110
00111 1.  What is it?
00112
00113     TMultiRand is a component intended for generating random variates of
00114     different distributions:
00115
00116                       Uniform
00117                       Triangular
00118                       Exponential
00119                       Erlang
00120                       Normal
00121                       Gamma
00122                       Beta
00123                       Weibull
00124                       Lognormal
00125
00126 2. Licensing.
00127
00128   a) This software is under Copyrigth(c) 1998 SOFTLAND,Ukraine
00129   b) This software is for free usage and distribution.
00130   c) The  conditions of the distribution are
00131         - remaining the source code, comments and manual without changes
00132         - supplying the manual
00133   e) The user assumes all risks associated with this software.
00134      Softland is not responsible for any loss or damage incured
00135      during the use of this software.
00136
00137
00138 3. Manual
00139
00140   The manual for this component is in mrand.pdf
00141
00142 4. Where is it used?
00143
00144 This component is used in the discrete-event simulation system Delsi 1.0,
00145 which is implemented as a set of components for Borland Delphi.
00146

00148
00149 5. What is Softland ?
00150
00151 Softland is Ukrainian software firm.
00152
00153 Our skills:
00154
00155             - Delhpi, C++
00156             - SQL
00157             - Computer simulation of queuing systems
00158             - Web-design
00159
00160 We are looking for the remote development job in areas of
00161 general client/server applications and computer simulation.
00162 The rate of our service is extremely unexpensive.
00163

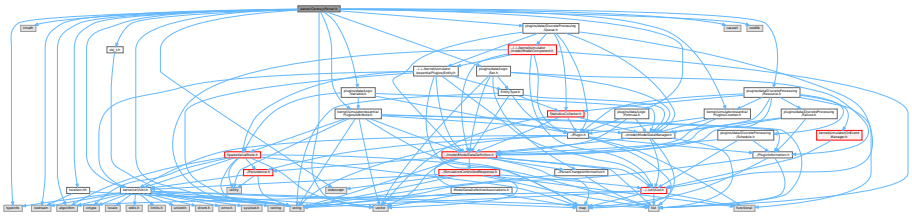
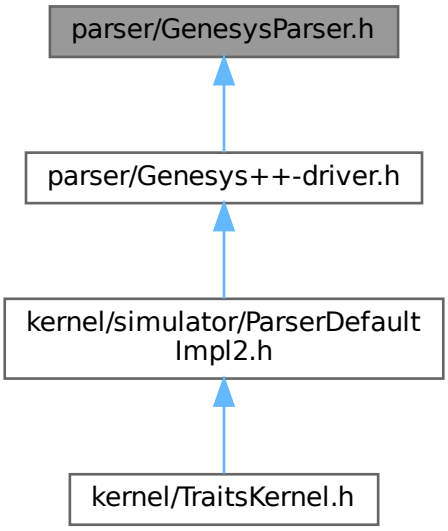
Include dependency graph for GenesysParser.h:



This graph shows which files directly or indirectly include this file:



Classes

- class yy::genesyspp_parser
  A Bison parser.
- class yy::genesyspp_parser::value_type
- struct yy::genesyspp_parser::syntax_error
  Syntax errors thrown from user actions.
- struct yy::genesyspp_parser::token
  Token kinds.
- struct yy::genesyspp_parser::symbol_kind
  Symbol kinds.
- struct yy::genesyspp_parser::basic_symbol< Base >
- struct yy::genesyspp_parser::by_kind
  Type access provider for token (enum) based symbols.
- struct yy::genesyspp_parser::symbol_type
  "External" symbols: returned by the scanner.
- class yy::genesyspp_parser::context
- class yy::genesyspp_parser::stack< T, S >::slice
  Present a slice of the top of a stack.

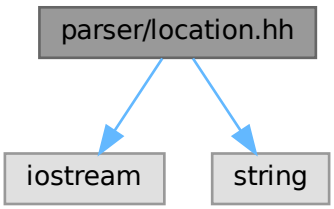
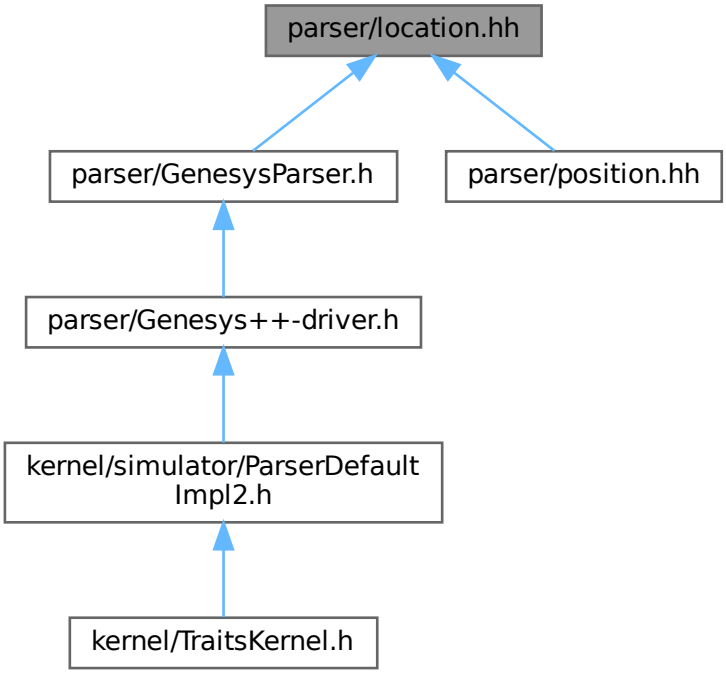
18.368 parser/location.hh File Reference

```
#include <iostream>
#include <string>
```

Include dependency graph for location.hh:



This graph shows which files directly or indirectly include this file:



Classes

- class yy::position

  A point in a source file.
- class yy::location

  Two points in a source file.

Macros

- #define **YY_NULLPTR** ((void∗)0)

Functions

- position & **yy::operator+=** (position &res, position::counter_type width)

  Add width columns, in place.
- position **yy::operator+** (position res, position::counter_type width)

  Add width columns.
- position & **yy::operator-=** (position &res, position::counter_type width)

  Subtract width columns, in place.
- position **yy::operator-** (position res, position::counter_type width)

  Subtract width columns.
- template<typename YYChar >
  std::basic_ostream< YYChar > & yy::operator<< (std::basic_ostream< YYChar > &ostr, const position &pos)

  Intercept output stream redirection.

- location & **yy::operator+=** (location &res, const location &end)

  Join two locations, in place.
- location **yy::operator+** (location res, const location &end)

  Join two locations.
- location & **yy::operator+=** (location &res, location::counter_type width)

  Add width columns to the end position, in place.
- location **yy::operator+** (location res, location::counter_type width)

  Add width columns to the end position.
- location & **yy::operator-=** (location &res, location::counter_type width)

  Subtract width columns to the end position, in place.
- location **yy::operator-** (location res, location::counter_type width)

  Subtract width columns to the end position.
- template<typename YYChar >
  std::basic_ostream< YYChar > & yy::operator<< (std::basic_ostream< YYChar > &ostr, const location &loc)

  Intercept output stream redirection.

18.368.1 Detailed Description

Define the yy::location class.

18.368.2 Function Documentation

18.368.2.1 operator<<() [1/2]

```
template<typename YYChar >
std::basic_ostream< YYChar > & yy::operator<< (
             std::basic_ostream< YYChar > & ostr,
             const location & loc )
```

Intercept output stream redirection.

Parameters

ostr	the destination output stream
loc	a reference to the location to redirect

Avoid duplicate information.

18.368.2.2 operator<<() [2/2]

```
template<typename YYChar >
std::basic_ostream< YYChar > & yy::operator<< (
             std::basic_ostream< YYChar > & ostr,
             const position & pos )
```

Intercept output stream redirection.

Parameters

ostr	the destination output stream
pos	a reference to the position to redirect

18.369 location.hh

00016 // of ODEs (central differences in space - see DiffusionMethodOfLinesSystem).
00017 // Then it integrates that system in time with a solver from OdeSolverFactory, so
00018 // the user can pick RK4 or Dormand-Prince 5(4), exactly like in BioNetwork.
00019 //
00020 // N is set by the Dimensions control; the grid has PointsPerDimension points and
00021 // length DomainLength on each axis. The boundary is Dirichlet (fixed value) or
00022 // Neumann (no flux, conserves mass), and the starting field is one of a few
00023 // named shapes (sine mode, Gaussian bump, constant).
00024 //
00025 // The class follows the same layout as BioNetwork (controls, save/load, _check,
00026 // simulate / advanceOneStep) to stay consistent with the rest of the code. The
00027 // grid doesn't change during a run, so each step just rebuilds the small system
00028 // object and reuses the stored field. The solver is never hard-coded - it comes
00029 // from the OdeSolver name through the factory.
00030 //
00031 // Equation representation (design choice): the diffusion PDE is encoded as a
00032 // dedicated C++ class (DiffusionMethodOfLinesSystem), not as a parser expression
00033 // nor as dynamically compiled C++. This is a deliberate scope decision - a
00034 // specific, well-tested class for diffusion - leaving a general user-defined
00035 // equation mechanism (parser or CppCompiler) as a future extension.
00036 //
00037 // Time semantics: with AutoSchedule enabled, the field steps once per kernel
00038 // InternalEvent (see scheduleNextInternalEvent), so the continuous solve advances
00039 // in sync with the discrete-event clock; otherwise simulate() runs the whole time
00040 // window synchronously when driven by the DiffusionSimulate component.
