

Process boundaries and build switches for the current application surface.

fig:application-architecture-process-boundaries | figure

Generated from FIGURE-SPEC comments

Process / flow

Source

- ../CMakeLists.txt
- ../source/applications/gui/CMakeLists.txt
- ../source/applications/modelSpecific/CMakeLists.txt
- ../source/plugins/CMakeLists.txt
- ../docs/ai_assistants/ARCHITECTURE.md

Purpose

- Show where the runtime process boundaries
- sit and where build flags create or omit
- executables.

Required content

- separate processes for each application family
- static plugin libraries inside the simulator boundary
- optional GUI and examples flags
- the intentionally absent Do Experiments route

Accessibility

- A boundary diagram that prevents readers
- from confusing libraries, aliases, and
- processes.

Validation

- Each boundary and omission must match the current CMake options and architecture policy.

The source block remains the authoritative specification.
The rendered asset is a compact visual summary.
