## Process / flow

### Source

- ../source/plugins/components/WholeCellModeling/MetabolicStateProjectionComponent.h
- ../source/plugins/components/WholeCellModeling/CompartmentExchangeComponent.h
- ../source/plugins/components/WholeCellModeling/ResourceAllocationComponent.h
- ../source/applications/modelSpecific/wcm/WcmCompartmentTransportWholeCellMvp.h
- ../source/applications/modelSpecific/wcm/WcmYeastDidacticWholeCellMvp.h

### Purpose

- Show how fluxes become compartment pools
- and how exchange rules consume pathway
- activity.

### Required content

- source compartment
- target compartment
- projected flux
- exchange rule
- downstream expression/growth stages

### Accessibility

- A compartment map that shows transport,
- projection, and downstream consumption of
- metabolites.

### Validation

- The diagram must match the current whole-cell transport examples and their runtime order.

The source block remains the authoritative specification.  
The rendered asset is a compact visual summary.
