

Symbol resolution from scanner token to model-aware value.

fig:expression-symbol-resolution | figure

Generated from FIGURE-SPEC comments

Source

- source/parser/parserBisonFlex/lexerparser.ll
- source/parser/parserBisonFlex/bisonparser.yy
- source/parser/Genesys++-driver.cpp

Purpose

- Show how a tokenized symbol is resolved to
- a model object or a runtime value.

Required content

- scanner lookup against the live model
- attribute, variable, queue, resource, set, counter, and formula branches
- simulation response and control fallback
- illegal-token branch

Accessibility

- A resolution diagram that makes it obvious
- which names come from the model and which
- ones become parser errors.

Validation

- The diagram must match the current lookup order and the current illegal-token fallback.

The source block remains the authoritative specification.
The rendered asset is a compact visual summary.
