

Current persistence error-handling boundaries.

fig:model-persistence-error-handling | figure

Generated from FIGURE-SPEC comments

Source

- source/kernel/simulator/persistence/PersistenceDefaultImpl2.cpp
- source/kernel/simulator/persistence/GenSerializer.cpp
- source/kernel/simulator/model/Model.cpp

Purpose

- Show the current failure and recovery
- boundaries during persistence.

Required content

- unsupported format branches
- malformed line or missing typename handling
- unknown plugin typename handling
- unresolved component target handling
- clear() boundary before load

Accessibility

- A decision-flow diagram that makes the
- main failure classes explicit.

Validation

- The diagram must match the actual trace/error branches and the unsupported .cpp load behavior.

The source block remains the authoritative specification.
The rendered asset is a compact visual summary.
