

Build-time selection flow for the model-specific executable.

fig:model-specific-selection-flow | figure

Generated from FIGURE-SPEC comments

Process / flow

Source

- source/applications/modelSpecific/CMakeLists.txt
- CMakePresets.json
- scripts/regenerate-models-from-modelspecific.sh

Purpose

- Show how a single source file is selected
- and turned into the model-specific
- executable.

Required content

- GENESYS_MODELSPESIFIC_APP input
- optional class/header overrides
- legacy alias mapping
- build target and legacy compatibility copy

Accessibility

- A selection flow diagram that makes it
- clear that the executable payload is
- chosen at configure time, not at runtime.

Validation

- The labels and arrows must match the current CMake logic and the current script behavior.

The source block remains the authoritative specification.
The rendered asset is a compact visual summary.
