

Current model and kernel dependencies used by the parser.

fig:parser-model-dependency | figure

Generated from FIGURE-SPEC comments

Source

- source/kernel/simulator/Parser_if.h
- source/parser/Genesys++-driver.h
- source/parser/Genesys++-driver.cpp
- source/parser/parserBisonFlex/lexerparser.ll
- source/parser/parserBisonFlex/bisonparser.yy

Purpose

- Show how the parser depends on the live
- model, sampler, and kernel services.

Required content

- Parser_if contract
- genesyspp_driver as session object
- Model and Simulation access
- Sampler_if dependency for stochastic functions
- helper lookups for responses, controls, and data definitions

Accessibility

- A dependency diagram that makes the
- runtime coupling to the model explicit.

Validation

- The diagram must reflect the actual helper methods and data lookups in the current code.

The source block remains the authoritative specification.
The rendered asset is a compact visual summary.
