

Current compiled boundary versus support-only repository areas.

fig:repo-boundary-map | figure

Generated from FIGURE-SPEC comments

Source

- ../CMakeLists.txt
- ../source/applications/gui/CMakeLists.txt
- ../source/applications/modelSpecific/CMakeLists.txt
- ../source/applications/worker/CMakeLists.txt
- ../source/tools/CMakeLists.txt
- ../source/tests/CMakeLists.txt

Purpose

- Show which parts of the source tree are in
- the current compile boundary and which are
- support-only.

Required content

- source subtrees that compile into targets
- support-only roots such as docs/models/packaging/scripts
- explicit note that the MCP workspace is outside the root build graph

Accessibility

- A boundary map that prevents readers from
- assuming every directory is a current
- compiled module.

Validation

- The separation between compiled targets and support/workspace roots must match the current root

The source block remains the authoritative specification.
The rendered asset is a compact visual summary.
